Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

+ *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.

+ *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.

+ *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.

+ *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página `http://books.google.com`

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

ELECTRICITY.

THE POPULAR ELECTRICAL JOURNAL.

ILLUSTRATED.

PUBLISHED WEEKLY BY THE

ELECTRICITY NEWSPAPER CO.,

NO. 6 PARK PLACE,

NEW YORK.

VOLUME IV.

Nos. 1 to 26, inclusive.

JANUARY 18—JULY 12, 1893.

INDEX TO ELECTRICITY.

VOL. IV. NOS. 1 TO 26 INCLUSIVE.

JANUARY 18, 1893--JULY 12, 1893.

A

A 400 K. W. Alternator, 239.
A Boston Enterprise, 28.
A Brilliant Gathering, 45.
A Compact Plant, 126.
A Historic Group, 256.
A Mechanical Theory of Magnetism, Leon J. Le Pontois, 43.
A Model Lighting Station, 87.
A New Electric Tool, 171.
A Notable Event, 57.
A Preliminary Exhibit, 20.
A Sensation in the Beacon Lamp Case, 19.
Action of Compound Dynamos When Run in Parallel, W. L. Puffer, 332, 339.
Action of Continuous and Alternating Currents on Fuse Metals, C. P. Matthews, 259.
Adams, A. D., Wrought vs. Cast Iron for Field Magnet Frames, 96.
Adams's, Dr., Suit, 8.
Adams, E. B., Portrait, 257.
Alternating Current Plant at Clermont-Ferrand, 170.
American Electro-Therapeutic Association, 229.
American Theatre's Electric Plant, 350.
A Modified Deprez-D'Arsonval Galvanometer, C. D. Parkhurst, 274.
Amstutz, N. S., Glowing of Disconnected Incandescent Lamps, 80.
Andrews, D. A., Death of, 121.
A New Electric Railway System, 341.
An Important Decision, 248.
An Open Letter, 69.
An Underruning Trolley of 1884, 255.
A Large Wattmeter, 183.
Applegate Lamp, The, 132.
Armstrong, Hon., E. A., Portrait, 105.
Armstrong, E. A., Morals of Corporations, 129.
Armstrong, C. G., Electric Installations, 132.
Asbestos Porcelain, 2, 32.
Atomic and Molecular Motions, A. E. Dolbear, 228, 238, 256.
A Unique News Service, 352.
Austin's Water Power, 314.
Automatic Printing Speed Counter for Dynamo Shafting, George S. Moler, 273.
Ayer and Tesla Honored, 141.
Ayrton & Mather's Electrostatic Voltmeter, 326.

B

Bradley, Chas. S., Long Distance Transmission of Power, 111.
Brandies, Louis D., Portrait, 257.
Breslau Municipal Station, The, 54.
Brief Glance at Electricity in Medicine, W. J. Morton, 264.
Brophy, Wm., Relation of Insurance to Electric Lighting and Power, 97.
Brophy, Capt. Wm., The Fire Hazards of Electricity, 195; Portrait, 199.
Browne, W. H., Underground Conduits and Conductors, 114.
Burnham, Col. L. W., Portrait, 38.
Boston Notes, 9, 21, 34, 46, 62, 73, 122, 134, 150, 163, 177, 190, 207, 223, 232, 249, 266, 281, 294, 309, 322, 334, 346, 358.
Bedell, Dr. F., Some Mechanical and Electrical Analogies, 16.
Bell, Dr. Louis, Power Transmission for Central Stations, 113.
Bell, Prof. Alexander Graham, 45.
Berne Hydraulic Power Station, The, 303.
Book Notices, 8, 162, 177, 190, 220, 229.
Boston is Growing Suspicious, 145.

C

Canadian Electrical Association, 8.
Carter, E. Tremlett, The Deflection and Control of Galvanometers, 5.
Cary, Edward E., Portrait, 257.
Chicago Notes, 9, 20, 34, 46, 134, 150, 166, 177, 223, 234, 249, 281, 294, 309, 334.
Clock Winding by Electricity, 55.
Columbian Ball, The, 211.
Columbia Lamp Co. Wins, 204.
Commercial Paragraphs, 12, 24, 35, 48, 64, 92, 152, 168, 180, 224, 236, 252, 268, 284, 296, 312, 324, 336, 348, 360.
Communications — The Subject of Fire Risks, Walter F. Smith, 17; Bogus Enterprise, L. Steiringer, 17; From R. F. Outcault, 29; Multiple Images in Lightning Photographs, Elihu Thomson, 115; Photograph of Ribbon Lightning, Historical Exhibit at the World's Fair, 162; Edison Feeder Patent, 173; Gutman, Ludwig, Communication, 173; No Summer Meeting, A Correction from Dr. Newton, Stanley Kelly Motor, 218.
Competition for the N. Y. Edison Company, 305.
Conspiracy and Theft, 231.
Cost of Steam Power Produced with Engines of Different Types Under Practical Conditions, etc., Chas. E. Emery, 138.
Crehore, Dr. A. A., Some Mechanical and Electrical Analogies, 16.
Criminal Libel, Charged, 277.
Crocker, F. B., Dynamotors, etc., 232.
Cross, Charles R., Portrait, 257.

D

Dead Weight, 229.
Deflection and Control of Galvanometers, E. Tremlett Carter, 5.
Detroit Electrical Works, 189.
Detroit Lighting Matters, 205, 162.
Discharge Through Gases, 320.
Distribution of Electrical Energy, The, 154.
Distribution of Power by Alternate Current Motors, Albion F. Snell, 212, 240, 278, 292.
Dolbear, A. E., Atomic and Molecular Motions, 228, 238, 256.
Don't Want to Pay Duty, 8.
Drake, Payson and Whittier's Supply House, 206,

E

Edison Feeder Patent Sustained, 159.
Edison's Lamp Patent Stands, Judge Colt's Decision, 66.
Editorial Notes—The Trust's Onward March, The Fake's Progress, 6.

Fire Risks, Through by Lightning Regardless of Mud, 18.

The Incandescent Lamp Situation, 30; The Factor of Safety, 31.

The Goebel Lamp, A Patent Suggestion, 42.
Attitude of the General Electric Company, Fundamental Electric Railway Patents, The End is Not Yet, 58.

Municipal Electric Light Stations, The Birds, the Beasts and the Bat, In the Right Direction, 70; The Situation up to Date, 71.

The St. Louis Convention, The Association and the Supply Men, 84; Dividend Paying Stations, Common Sense Sacrificed for Dramatic Effect, 85.

The St. Louis Convention, Central Station Power Transmission, Power Storage, 100; The Papers, 101.

Lightning Photography, Direct vs. Alternating Currents, 116; Encouraging Symptoms, 117.

The Incandescent Lamp, Changing Defeat Into Victory, 130; Out of Darkness Cometh Light, 131.

Proposed Socialistic Legislation, Economic Steam Power Engineering, The Lamp Situation, 144; Facts Cannot be Longer Ignored, 145.

New York Telephone Rates, A Common Source, The Telephone Patents, 160; Tightening Their Grip, The Lamp Situation, Alternating Current Arc Lighting, 161.

The West End Road, The Conflict, 174; Electric Plants for Gas Works, The Rapid Transit Situation, The Feeder Patent, 175.

Electricity Does Kill, The Feeder Patent, 186.

European Lighting Practice, Figures and Words, Alternating Current Distribution, 200; The Situation up to Date, 201.

Candle Power of Arc Lamps, Electricity in Agriculture, 216; Sugar if Necessary, Alternating Current Power Distribution, 217.

Constant Current Transformers, A New Electrical Instrument, Atomic and Molecular Motions, Conspiracy and Theft, 230.

Suburban Electric Railways, More Patent Litigation, 244; The Westinghouse Report, Financiering or Swindling, 244.

The Trust in Cleveland, A Pleasant Incident, 260; Industrials or Frauds, Our Group of Portraits, The Institute Meeting, Electricity in Medicine, 261.

Our Platform is Unchanged, Heating by Electricity, Have We Libeled General Electric, No Garbling in this Office, What Are Debentures, A Suggestion, 276 ; Tesla's St. Louis Lecture, 277.

Facts, A Conundrum, We Will Notify Our Friends, 290 ; Electricity for Canals, High Speed Electric Railways, 291.

A Suicidal Mistake, Electric Heating and Cooking, Telephone vs. Traction, 304 ; The Anti-Trust Congress, The Entering Wedge, 305.

Hawks in the Eagle's Nest, Water Powers, Through by Lightning, 318.

The Battle Royal at Detroit, An Error at the Start, Electric Heating Applications, 330 ; Safe Medical Apparatus, 331.

Electric Railway Progress, Time for a Change, 342.

The Earth Return, An Expensive Lesson, 354 ; Business is Not Always Business, The Prophecy Fulfilled, Will the Fort Wayne Company be the Next, 355.

Effect of Dynamos on Ships' Compasses.
Elberfield Municipal Station, 66.
Electrical Experiments on the Erie Canal, 255.
Electrical Experts, G. Emil Hesse, 350.
Electrical Recording Meters, Caryl D. Haskins, 15, 33.
Electrical Shop Equipments, 338.
Electrical Quackery, 110, 182.
Electric Cooking and the Load Factor, 300.
Electric Curtains at the Comedie Francaise, 67.
Electric Headlight, An, 80.
Electric Heating, Carl K. McFadden, 271.
Electric Heating and Forging, 184.
Electric Heating, W. S. Key, 298.
Electric Installations, C. G. Armstrong, 132.
Electric Light at Munich, 271.
Electric Light in Spain, 343.
Electric Locomotive, An, 54.
Electric Meters, John F. Gilchrist, 26.
Electric Meters, Discussion, 67.
Electric Motor Factory, An, 2.
Electric Railways in Paris, 289.
Electric Railway Conduit, An, 111.
Electric Transmission of Power over Long Distances, W. F. C. Hasson, 314.
Electric Welding, 163.
Electricity and National Economy, 321.
Electricity for the Canals, 8.
Electricity in Agriculture, 214, 242.
Electricity in the Naval Review, 210.
Electro-Chemical Bleaching, 14.
Emery, Chas. E., Cost of Steam Power, etc., 138, 154, 197.

F

Farmer, Moses G., Death of, Portrait, 279.
Feldmann, C. P., The German Elmore Works, 138.
Ferris Wheel, The, 326.
Fire Hazards of Electricity, The, Capt. Wm. Brophy, 195.
Fire Insurance Rules, 66.
Forbes, Prof. George, Thermal Storage for Central Stations, 98.
Fowler, A. S., Portrait, 257.
Frei Lamp, The, 132.
Frequency in Transformers, 215.
Fundamental Patents Sold, 29.

G

Gas and Electricity, Emil Hesse, 107.
Gas Engine Sub-Stations, 319.
General Electric, 176; First Annual Report, 187, Second Paper, 203; What is Said of It Nowadays, 277, 306, 356.
General News, 9, 21, 34, 46, 62, 73, 90, 121, 135, 150, 163, 177, 190, 206, 222, 234, 250, 266, 282, 294, 309, 322. 334, 346, 359.

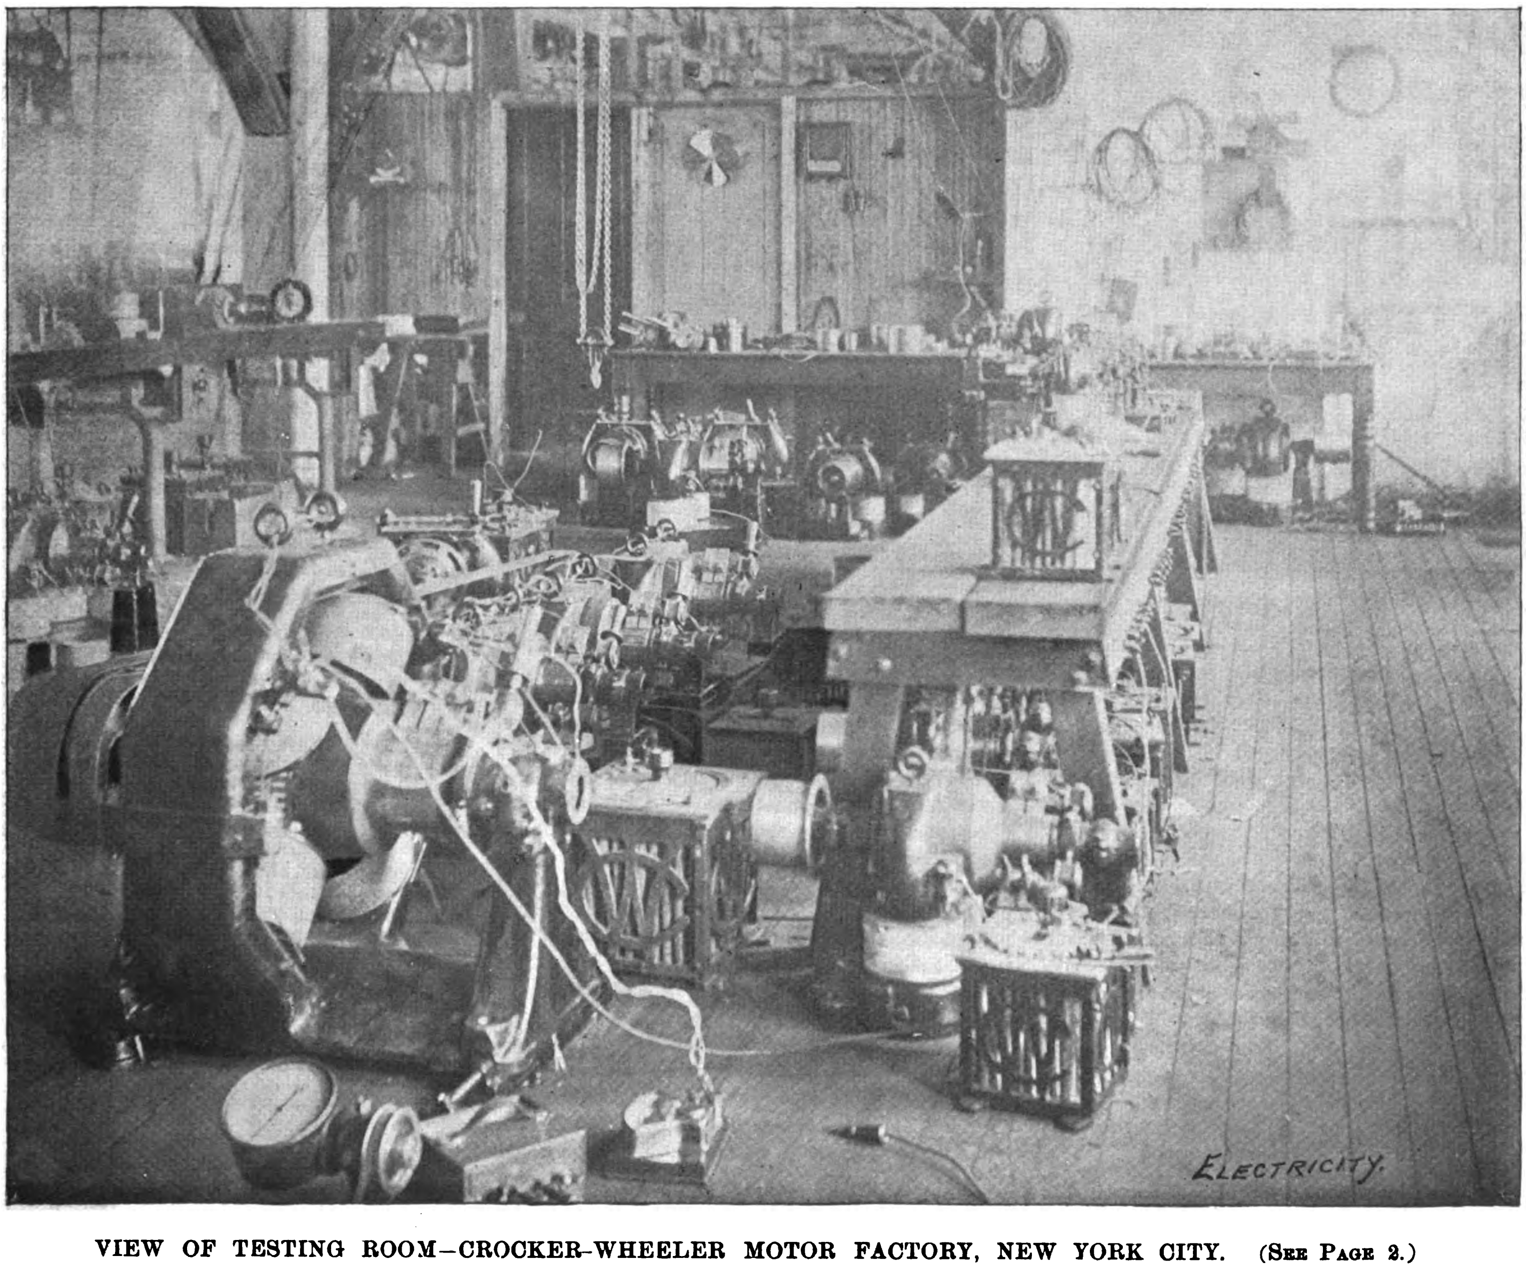
ELECTRICITY.

Vol. IV. New York. JANUARY 18, 1893. Chicago. No. 1



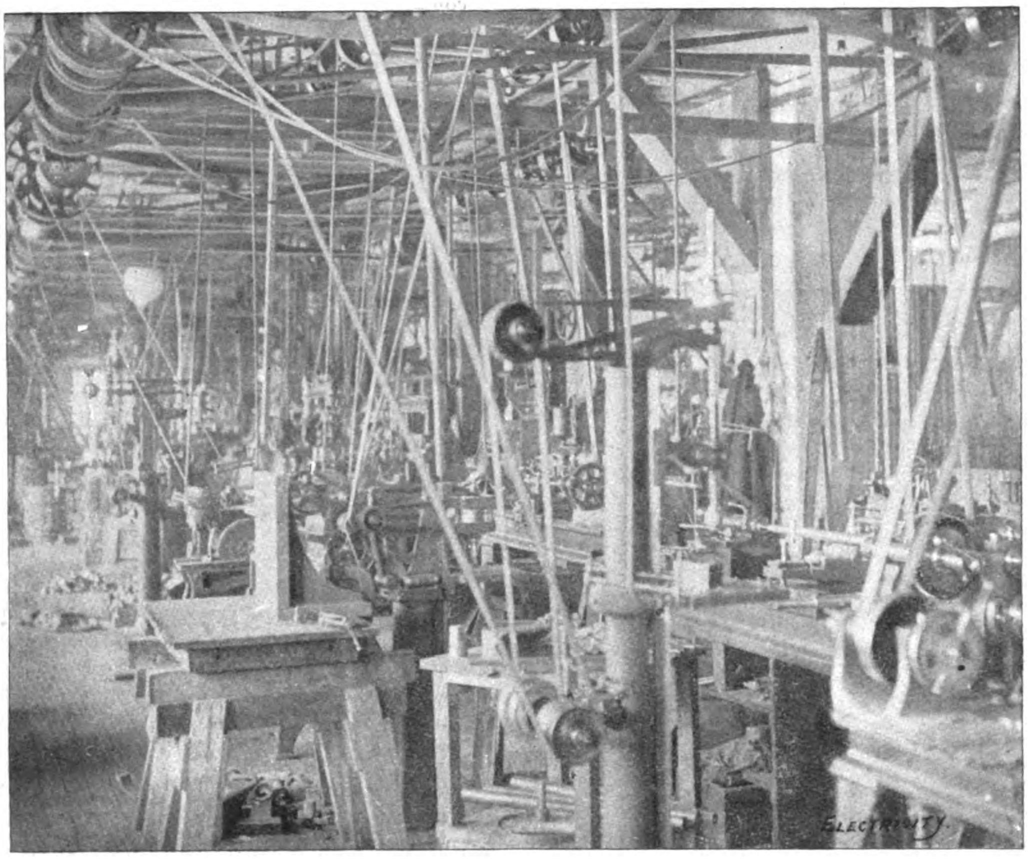
VIEW OF TESTING ROOM—CROCKER-WHEELER MOTOR FACTORY, NEW YORK CITY. (See Page 2.)

An Electric Motor Factory.

Works of the Crocker-Wheeler Company.

One of the most prosperous and enterprising electrical manufacturing concerns among the many which are to be found in New York is the Crocker-Wheeler Motor Company, whose present factory is situated on the corner of Fourteenth street and Tenth avenue. We say *present* factory advisedly, as this concern has now, for the second time, outgrown its factory capacity and is forced to seek larger quarters in order to meet the demands for its machinery, which have increased beyond the capacity of its present plant. The situation of the new plant has not yet been decided upon, but a change of location is definitely announced for the coming spring.

Notwithstanding the growing number of electrical concerns supplying small sized motors and accessories, the Crocker-Wheeler Company has doubled its business during the past year, and it was recently found necessary to increase the capital stock from $200,000 to $400,000. A feature of the new factory will be the conspicuous absence of belting and shafting throughout the entire works. The plan to be adopted is to transmit the power to each machine by wires which will connect to a motor on the machine and drive it direct. This method will be followed in the case of every machine where it is found possible, and will result in a considerable saving of power which would be otherwise required to constantly run lines of shafting and counter-shafts to each machine, as well as a large saving in the cost and maintenance of belts, counter-shafts, pulleys, oiling, etc.



Machine Shop—Crocker-Wheeler Motor Factory.

There are three hundred hands employed in the factory at present, but after removal the number will be considerably increased. The principal part of the works is situated on the second floor of the building in Fourteenth street, although the basement is used as a storeroom, and the fourth floor is utilized exclusively for a winding room for armatures of one-sixth horse power machines and under.

On the second floor, which is a long, narrow room covering the entire space of the building, is situated the machine shop. This shop contains all the machinery used in the manufacture of motors and is confined to about half of the entire floor, a central partition running the length of the room separating the testing room, armature and field winding room, where the larger sizes of machines are wound, and an erecting shop. Our frontispiece shows a view in the testing room, through which all the motors manufactured must undergo the ordeal of a thorough test before being put upon the market, and here every facility is to be found for accurately testing the motors down to any degree of precision.

It was formerly the case, and is still generally understood, that the Crocker-Wheeler machines are manufactured in sizes up to five horse power only. This is, however, no longer the case, as the company is now prepared to manufacture machines of any capacity up to thirty horse power, and after increasing its facilities for handling heavy machines will be prepared to furnish motors of any size desired. They will continue to make their small motors and the different machine combinations on which their reputation has been built.

The machines of the various sizes up to five horse power are almost too well known to need description. There is one point however in connection with them which is worthy of notice. It will be remembered that drop forgings are used entirely in all the machines up to five horse power, and these motors have been the means in no small degree of improving and extending the possibilities in the manufacture of drop forgings. It is but a few years ago that the forgings for the larger sizes of these motors were considered impossible to make, and for some time the sizes of these machines were limited to the sizes of the forgings possible to obtain. This company may therefore be considered as one of the leading factors in the promotion of drop forgings. The growing tendency in the direction of multipolar machines, especially in the case of those of larger sizes, has been appreciated by this company and has resulted in a type of motor which will be the one adopted for all sizes above five horse power. A machine of this type, in this case a fifteen horse power motor, is shown in the foreground of our frontispiece. This, unlike the small sizes made by this company, has a cast iron frame with four internally projecting pole pieces on which the field coils are wound.

The frame is divided through the centre horizontally, enabling the upper casting with its two pole pieces to be lifted off without otherwise disturbing the machine. The starting boxes used with these machines are also shown in the illustration. These are of the old style resistances arranged in spiral coils and placed in an open cast iron frame permitting ample ventilation. In addition to these the company furnishes the Carpenter enamel rheostats when desired, which consist of a set of resistance wires or plates coated with an insulating enamel permitting them to be placed in a very compact space where the matter of size is a consideration. The machines of the Crocker-Wheeler Company are all of remarkably small size for their capacity owing to the use of drop forgings for the smaller sizes and a multipolar type for the larger ones. The armatures are remarkably well designed for obtaining low speeds and reducing the magnetic resistance of the air gap. The cases are built up of insulated laminated discs, with teeth which are stamped out of sheet iron. The spaces in which the windings are contained being small at the circumference and wider at the bottom of the slot permit the core of the armature to run very close to the faces of the pole pieces and, in a great measure, prevent the winding from being thrown out by centrifugal action against the pole pieces. This method of armature construction greatly reduces the amount of winding on the fields. as the air gap between the armature core and the pole faces requires many more ampere turns than all the rest of the magnetic circuit in order to obtain the required saturation.

In the winding room the machines for winding the field spools are all provided with counters which register the number of turns at every revolution of the spool. It is thus possible to have the windings absolutely equal for each section, and perfect uniformity is obtained without the possibility of errors by the workmen.

These machines are otherwise noticeably well built, and their design is to be commended from a mechanical as well as an electrical standpoint. As an example of the refinements which have been included may be mentioned the use of self-oiling bearings on all motors down to the one-sixth horse power size.

The stock room equipment is a most extensive one. Besides containing material in the line of tools sufficient to stock a good sized hardware store, it contains a miscellaneous assortment of silk, rubber, shellac, paper, and in fact everything that enters into the make-up of an electric motor.

A method of application of motors to machines, not hitherto extensively adopted, consists in mounting a motor on each machine which drives it directly without the intervention of belts, and which is the plan described above, to be used as far as possible in the new factory.

Some of the machines in the present works are equipped in this way, and the lack of any apparent means of driving them presents a rather novel appearance.

Drills, shapers, circular shears, etc., are operated in this way, besides which are to be seen a number of automatically-controlled machines, such as pumps, organ bellows, etc., which are adjusted to vary in speed according to the service to be performed and to stop running at any predetermined stage of the work.

The Beacon Factory Not Closed Yet.

Boston, January 16.—Judge Colt, in the United States Circuit Court, to-day granted the Beacon Pump and Electrical Co. an extension of a week in which to prepare further evidence, in the action for an injunction brought by the General Electric interests. The case comes up for final hearing, Monday, January 3.

World's Electrical Congress.

Report of the Sub-Committee of American Institute of Electrical Engineers on Provisional Programme for the International Electrical Congress of 1893.

To the General Congress Committee of the American Institute of Electrical Engineers:

GENTLEMEN: The Sub-Committee on Provisional Programme respectfully submits to you the following report:

DUTIES.

The Sub-Committee understands its duties to be as follows:

To suggest what work it is desirable to have done at the coming International Electrical Congress to be held in Chicago in 1893.

To suggest a programme for carrying out this work in the most satisfactory manner to all parties, and with the least loss of time.

RECOMMENDATIONS.

Regarding the work to be done, your Committee's recommendations are as follows:

RATIFICATIONS.

(1.) *Ratification of the adoption of units, terms, symbols and definitions by previous International Electrical Congresses.*

This is a mere matter of form and an act of courtesy to the preceding Congresses. Your Committee understands that this was done at both the Paris Congress of 1889 and the Frankfort Congress of 1891.

NEW UNITS.

(2.) *Defining and adopting practical units for measuring and designating the measurements of the following quantities: Magneto-motive force; magnetic flux; magnetic intensity; magnetic reluctance; electric conductivity; illumination.*

It will be noticed that this refers only to the question of what the magnitude of the units shall be, or, in other words, what multiples or submultiples of the absolute units they are to be.

Your Committee is aware that objections are raised by some to the establishment of units not already in universal use. Past experience, however, has shown that the proper time to establish units is *before* their need is universally felt, in order to avoid the introduction by different persons or nations of units of different values, a contingency which will be very likely to arise if not anticipated by concerted action.

Your Committee recommends the following:

The value of the practical unit of magneto-motive force to be one-tenth of the absolute unit, that is, equal to $\frac{1}{4\pi}$ ampere turn.

The value of the practical unit of magnetic flux to be 10^8 absolute units or lines.

The value of the practical unit of magnetic intensity to be 10^8 absolute units, that is, 10^8 lines per square centimetre.

The value of the practical unit of reluctance to be 10^{-9} absolute units.

The value of the practical unit of electrical conductivity to be 10^{-9} absolute units, that is, to the reciprocal of the ohm. This makes it equal to the unit proposed some time ago and known to some extent by the name of "mho." It should be given this value in order that it correspond with the already adopted units.

The value of the practical unit of illumination to be a bougie-decimale at the distance of one metre. The bougie-decimale is the unit of light or candle power already established and is practically equal to one English standard candle; by making the distance a metre, the practical unit will be approximately equal to one-tenth of a carcel-metre, one tenth of a foot-candle (or "lux") or to one metre-candle or metre-kerze, all three of which units are already in use to some extent.

It has been announced that a proposition will be made at this Congress to change the values of some of the practical units which have been adopted by previous Congresses and are already in universal use. Among these are the ampere and the farad. It is urgently recommended by your Committee that such changes should not be favored, since they would necessarily be followed by great confusion and would of necessity have to be accompanied by some change in these well established names in order to distinguish these new units from those now existing.

NAMES OF UNITS.

(3.) *Adopting names for the following practical units: Magneto-motive force; magnetic flux; magnetic intensity; magnetic reluctance; inductance; electrical conductivity; illumination.*

The following names are suggested for these units:

For the practical unit of magneto-motive force, the name "gilbert."

For the practical unit for magnetic flux, the name "weber." This term was formerly applied to a unit of current, but its use in this sense was so limited and it has been abandoned for so long a time that no confusion would be likely to arise; the context alone would always be sufficient to prevent any possibility of misunderstanding. The name "weber" is preferred on account of the intimate relation between this unit and that of magnetic intensity for which the name "gauss" is suggested.

For the practical unit of magnetic intensity, the name "gauss." This name has already come into use to such an extent that objections to it will not be likely to arise.

For the practical unit of magnetic reluctance, the name "oersted."

For the practical unit of inductance, the name "henry." This name has already come into use quite extensively and it would therefore be very undesirable to change it. The value of this unit has already been fixed as equal to 10^9 absolute units or nearly to the length of an earth's quadrant. The definition "quadrant" is sometimes employed as the name itself, but its use as a name is evidently objectionable, as it already has several other meanings, which might readily lead to confusion.

For the practical unit of electrical conductivity, equal to the reciprocal of the ohm, the name "mho." This name has been in use for some time and is already well known. It is thought better to recommend it than to select and introduce a new name.

For the practical unit of illumination defined above, the name "bougie-metre."

It has been suggested to name the units "kilowatt hour" and "ampere hour." Your Committee, however, recommends that inasmuch as these terms explain themselves, and are no longer than some others in use, to give them special names would burden a system of nomenclature unnecessarily. The principal objections to the term "Board of Trade Unit," which is in use in England for the former, are, that it could never become international, that it is longer by one syllable than the term "kilowatt hour," and that there are now, or may soon be, units of other denominations adopted by the same Board of Trade from which this one will have to be distinguished by an additional affix or prefix.

CONCRETE STANDARDS.

(4.) *Defining and adopting modes of embodying the following principal units of measurement in concrete standards capable of being readily reproduced, and adopting names for them or for the theoretical units, by which they can be distinguished from each other: Ampere, ohm, volt, watt, standard candle.*

The following definitions of these units are recommended:

An ampere shall be that unvarying current which, when passed through a solution of nitrate of silver in water, in accordance with the specifications recommended in the recent report to the British Board of Trade, deposits silver at the rate of 0.001118 of a gramme per second.

An ohm shall be the resistance offered by a column of mercury at the temperature of melting ice 14.4521 grammes in mass, of a constant cross-sectional area, and of a length of 106.3 centimetres. It is recommended that material standards of this value, constructed in solid metal, should be preserved under the care of the several Governments as standards of comparison, and that they should from time to time be verified by comparison with the mercury standard defined above; also that for the purpose of replacing the standard, if lost, destroyed, or damaged, and for ordinary use, a limited number of copies should be constructed which should be periodically compared with the standard ohm.

A volt shall be the product of this ampere and this ohm.

A watt shall be the product of the square of this ampere and this ohm.

The other units, such as the coulomb, the farad and the joule, shall be taken as derivatives in terms of this ampere and this ohm.

In order to create as little confusion as possible by the introduction of this set of units which are to become the universal standards, and in order to distinguish them readily from the true theoretical, or abstract units defined in terms of the absolute units, it is recommended to call the former simply "amperes," "ohms," "volts," etc., or more specifically "standard amperes," "standard ohms," etc., and to call the theoretical units "true amperes," "true ohms," etc. The latter term has already come into use in this sense.

The unit of resistance known as the B. A. unit shall be taken as equal to 0.9866 of this ohm.

The electro-motive force of a Clark cell at 15° C., prepared in accordance with the specification recommended in the recent report to the British Board of Trade, shall be taken as not different from 1.434 of these volts by more than one part in one thousand. The coefficient of temperature shall be taken as..................................?

The standard candle shall be taken as equal to the light from a lamp like that known as the Hefner-Alteneck standard amylacetate lamp, which is to be defined by its dimensions and the height of the flame, the dimensions being such that the light shall be equal to that of the "bougie-decimale," the practical unit adopted at the Paris Congress of 1889, which is equal to one-twentieth of the absolute platinum standard adopted in 1884.

It has also been suggested that a universal wire gauge be defined and adopted. Desirable as this may at first seem, your Committee recommends that no action be taken by the Congress in this matter, as it is not likely that any one scale would ever be universally adopted by manufacturers, even if defined and adopted by a Congress. The universal introduction of the metric system and the designation of wires by their diameters in millimetres is thought to be the only satisfactory solution of this question for international work.

NOTATION AND SYMBOLS.

(5.) *Adopting an international system of notation and conventional symbols, for designating different quantities.*

The system suggested to the last Congress by Mr. E. Hospitalier, of Paris, is recommended by your Committee, although doubtless some amendments may be found desirable.

DEFINITIONS.

(6.) *Defining the following terms:—Impressed* *electromotive force, inductivity, inductance, reluctivity, Matthiessen's standard, north and south pole.*

The following definitions are suggested:

The impressed electromotive force is the ratio of the total activity in an electrically conducting circuit to its instantaneous current strength.

The inductivity at any point in an isotropic medium is the ratio, added to unity, of 4 π times the intensity of magnetization there existing to the magnetizing flux-density. Inductivity is synonymous with "permeability." The electro-magnetic dimensional formula is $L^0 M^0 T^0$; the conventional symbol is μ.

Inductance.—(*a*) Self-inductance is the ratio of the total magnetic induction linked with and established by an electric current to the uniform strength of the same. The inductance of a conducting circuit is constant when its environing medium has constant inductivity. (*b*) The mutual inductance of one electric circuit upon another is the ratio of the total magnetic induction linked with the second, due to a uniform current in the first, to the strength of that current. The mutual inductance between two electric circuits is reciprocally equal when the environing medium has constant inductivity. The electro-magnetic dimensional formula is $L^1 M^0 T^0$. The absolute unit is one centimetre; the practical unit, one henry.

The reluctivity of a medium at any point is the volume differential of the reluctance thereat. Simple definition: Reluctivity is the reluctance per unit volume. The electro-magnetic dimensional formula is $L^0 M^0 T^0$. The absolute unit is one C. G. S. unit of reluctance per cubic centimetre; the proposed practical unit is the same, or about one oersted per cubic earth quadrant.

The resistance of copper known as Matthiessen's standard shall be defined as follows: The resistance of a soft copper wire one metre long, weighing one gramme, is 0.14365 B. A. units at 0° C. This definition is recommended by the Committee of the American Institute of Electrical Engineers on Matthiessen's Standard. The reasons for selecting it are given in that report.

The north pole of a magnet to be defined as being that which seeks the geographic north pole, and the south pole that which seeks the geographic south pole. This is the generally accepted definition, but it is thought desirable to formally define it.

EXPRESSIONS.

(7). *Defining and adopting expressions:—For alternating currents of more than one phase; for describing phenomena of alternating currents and of electro-magnetic waves.*

It is recommended to adopt the following expressions: "Simple" alternating current for the usual alternating currents in which there is practically but a single phase; "di-phase" alternating currents for two alternating currents whose phases differ in time by 90 or 270 deg.; "tri-phase" alternating currents for three alternating currents whose phases differ in time by 60 or 120 deg.; "polyphase" alternating currents for such as have more than three phases.

For expressions describing phenomena of alternating currents and electro-magnetic waves, your Committee solicits suggestions.

UNIVERSAL USE.

(8.) *Recommending the more universal use:*

Of the term "voltage" as synonymous with "difference of electrical potential" or P. D. *in place of the terms "potential," "tension," or "pressure," the use of which in this sense it is recommended to abandon.*

Of the term "transformer" instead of "converter";

Of the term "dynamotor" for a continuous current transformer;

Of the term "continuous current" instead of "direct current";

Of the term "kilowatt" instead of "horse power";

Of the metric system of weights and measures, and suggesting means by which its introduction will be facilitated.

PROGRAMME.

Regarding the programme for carrying out this work in the most satisfactory manner to all parties, and with the least loss of time, your Committee's recommendations and suggestions are as follows:

PREPARATORY DISCUSSIONS.

It cannot be too strongly urged that an International Congress is the place to close but not to open a discussion on questions about which international agreement is to be had; it is therefore urgently recommended that action be taken at once to open the discussion of such matters now, in order that expressions of opinions, and, if possible, agreements, may be arrived at prior to the meeting of the Congress. To this end your Committee recommends that the suggestions embodied in this report, or as many of them as you may see fit to designate, be printed and sent to all the leading electrical and physical societies and journals in this country and abroad, with a request that they aid this work by making them public, by freely discussing them, and by sending copies of such discussions and any further suggestions to the General Congress Committee of this Institute, care of the Secretary, 12 West Thirty-first street, New York City. That a sub-committee of the Institute prepare from time to time a classified summary of such discussions to be sent to the leading electric and physical journals for publication here and abroad, and that it present a final summary of this international discussion at the Congress. This discussion ought to be closed by July 1, 1893.

It is recommended also that this Institute invite other societies to co-operate with it by appointing special committees to discuss and report to their respective societies on these international questions and to publish their conclusions in the electrical journals of their country.

It has been suggested that various committees be appointed to prepare reports on the international questions on which agreement is desired, and to submit these at the meeting of the Congress. Your Committee, however, believes that to postpone the discussion until the Congress is in session would lead to no satisfactory results, as was shown at the last Congress of 1891, in Frankfort. It therefore urges that the discussion take place through the medium of the journals *prior* to the meeting of the Congress, and that the only report submitted to the Congress be a summary of such discussions.

MEETINGS.

Regarding the meetings of the Congress, your Committee recommends that, as in the Paris Congress of 1889, the meetings be divided into (a) *General Meetings*, one at the opening and one at the closing of the Congress, which are to be devoted to the consideration of general questions and those on which agreements are desired, and to the reading of papers of a general character; (b) *Sectional Meetings* for the reading of all other papers. The following division into sections is recommended.

1. Electro-physics, units, measurements and all electrical matters of a purely scientific nature.
2. Dynamos, motors, transformers, etc.
3. Systems, central stations, installations, lamps, etc.
4. Electric telegraphy, telephony and signalling.
5. Electric railways.
6. Electro-chemistry, batteries, electro-metallurgy.
7. Electro-physiology and electro-therapeutics.
8. Legal questions.

PAPERS.

It is suggested that specific invitations be extended by the Congress Auxiliary to prominent electrical engineers and physicists to prepare papers on specified subjects to be read and discussed at the Congress meetings. Also, that a general invitation be extended for other papers, which are to be submitted not later than July 15, 1893, to a Committee on Papers appointed by the Chairman of the Congress Auxiliary; that this committee shall examine and accept or return the latter, and at its discretion shall print any or all of those accepted as well as those solicited, in form for circulation at least one week prior to the meeting at which they are to be read; that the papers shall be read in full, in abstract or by title, as that committee shall direct.

The following subjects of papers are offered as a suggestion to the Congress Auxiliary merely as a basis and not as a complete list:

The criterion of sensitiveness of galvanometers or on the theory of their construction.

The working of national or municipal laboratories for testing meters and instruments.

The practical results and economy of the employment of accumulators in central station systems of supply.

On the relation between weight of copper and iron in dynamos and their output.

Nomenclature and notation of magnetic circuit; or on standard and units of magnetism.

Magnetism.

On the economic use of transformers under various conditions of supply.

Electricity meters from a European standpoint.

Electricity meters from a British standpoint.

Electricity meters from an American standpoint.

Choice of materials for standards of electrical resistance.

Nomenclature of phenomena of electro-magnetic waves.

Standards for electrical measurement.

Alternating current transformers from an American standpoint.

High frequency and high potential phenomena.

Dynamo construction.

Your Committee suggests that papers should be solicited by the General Congress Committee of this Institute on the work of the early electricians of this and foreign countries considered from a modern standpoint, and their importance in the development of the science of electricity, including descriptions and illustrations of models and apparatus used.

TRANSACTIONS.

Your Committee suggests that the proper authorities be requested to have a stenographic report made of the proceedings and discussions at all of the meetings of the Electrical Congress, and that this report, including such of the papers and discussions as a committee appointed for the purpose shall direct, shall be printed and published in book form; that each member of the Congress be entitled to one copy of this report on the payment of $1 (one dollar) and non-members on the payment of $5 (five dollars).

MEMBERSHIP.

It is suggested that the membership of the Congress be divided into delegated members and members, and that the dues for each shall be $5 (five dollars); that only delegated members and members be admitted to the meetings and be permitted to take part in the discussions; that any one shall be entitled to become a member; that delegated members shall be appointed by Governments, physical and electrical societies, and shall be approved by an international committee whose decision shall be final; that questions on which international agreement is desired be decided by the delegated members, whose decisions shall be submitted to the whole Congress for approval or rejection in part or in whole, but not for alteration.

It is recommended that the United States Gov ernment be requested to extend a formal invitation to foreign Governments and societies to send delegates to this Congress.

ACKNOWLEDGMENTS.

In the present report, your Committee has embodied recommendations from the reports of the Institute's Committee on Matthiessen's Standard, and on Magnetic Units, from the recent reports of the British Board of Trade Committee, and from the suggestions of Dr. Silvanus P. Thompson to Dr. Elisha Gray, in reference to the Congress.

Respectfully submitted,
CARL HERING, Chairman.
WM. A. ANTHONY.
A. E. KENNELLY.
New York, December 28, 1892.

The Deflection and Control of Galvanometers.

BY E. TREMLETT CARTER.*

The observation of the conditions of electrical stress which produce and limit the amount of deflection in any measuring instrument is an interesting and profitable one; and it is proposed in this paper to make a short study of the sources of the energy which produces the deflection in magnetic and thermal galvanometers, whether for measuring current or voltage. It is well known that two forces are concerned in the deflection; one, the electrical or magnetic force of the quantity measured, which is caused by the coil or heated wire; and the other the controlling force, which is variously produced by magnetic, gravitational, or other elastic forces. In most instruments the controlling force has to bring the pointer back to zero when the current ceases; but there is an exception to this rule in the Cardew voltmeter type, in which the deflection is *produced* by the controlling spring and *cancelled* by the contracting wire. In any case, however, there is some transfer of energy when the deflection is being produced or cancelled; and the source and destination of this energy form a very interesting inquiry. In an ideal instrument the whole of the energy which produces the deflection would be given back when the pointer returned to zero. But, in practice, owing to the imperfect elasticity of the deflection—through friction—the energy is only partially restored. The frictional resistances are opposed both at the forward and at the return motion of the pointer, causing a waste of energy on each occasion.

The energy which is temporarily expended when the deflection is being made must not be confused with that constant expenditure which takes place the whole time the instrument is in circuit. The two have no necessary relationship. The mere C^2R energy does nothing useful—neither in a magnetic nor in a thermal instrument. It may at first sight appear that the C^2R function does some useful work in a thermal galvanometer; that, in fact, it supplies the heat by means of which the deflection is produced. But this supposition would be erroneous. The energy which does the work of the deflection is actually put into the instrument when it is manufactured, namely, at the moment the tension of the controlling spring is brought to the required amount. The *resilience* of the spring is a continual store of energy which is partially and temporarily drawn upon whenever a deflection takes place. This is restored to the spring in full amount when the heated wire cools and contracts. If we trace the passage of this energy from the instant it leaves the spring to the instant it gets back again, we shall follow a thermodynamic study of peculiar beauty. It is well known that all substances which expand on the addition of heat have their specific heats apparently raised by being subjected to increased external pressure, and lowered by being placed under tensile stress. The reason is that in the former case the expanding body does external work against the compressive force, while in the latter case the stress expends some energy in heating the expanding body. On this account, if a thin wire is heated by the passage of an electric current it will take less energy from the current, and will take less time in rising to its limiting temperature if it is under tension than if it is slack. Some of the stored heat of the wire is due to the current, but some of it is due to the expenditure of resilient energy under the relaxation of elastic stress of the spring which holds the wire tight. When the current ceases and the deflection is returning to zero, the conditions are reversed. The contracting wire expends heat on the tension spring, restoring its lost resilient energy; and, in the ideal instrument, the amount of heat which will thus be converted into work will equal the energy originally taken from the spring. Thus it will be seen that the true C^2R function has nothing to do with the source of energy which causes the deflection. If the stress-strain diagram of the hot wire of such an ideal instrument be plotted, the curves representing a complete cycle will inclose no area; but in an ordinary instrument this would not be the case. In such the curve of deflection would lie nearer to the axis of stress than the curve of restoration to zero; and the area enclosed would represent loss of energy on account of friction, pretty much as the area of the Ewing-cycle represents hysteresis losses.

In an electro-magnetic galvanometer the source of energy of the deflection is the electric circuit, but not through the medium of the dissipation function. The medium of exchange of energy is an electromotive force which is set up in the circuit when the needle moves. In a forward deflection there is a back electromotive force, which takes some energy from the circuit; while in the return of the deflection to zero there is a helping or forward electromotive force which restores this energy to the circuit from whence it had been taken. During the deflection this energy exists potentially in the controlling mechanism. Thus, if there is a bar-magnet control, the energy is stored magnetically in the ether; if there is a spring control, the energy exists as resilience of the spring; while if there is gravity control, the energy exists as a stress—*where?* Would that we could say where! *Is* it the ether?

---

[*] *The Electrician.*

Paris 1881 and Chicago 1893.

BY G. EMIL HESSE.

The Exposition in Paris, 1881, was a memorable one in many respects. From that time we count the commencement of one of the most remarkable inventions in electricity—the electric railway. Dr. Werner Siemens built one small road in Berlin in 1879, but there was no real life until 1881.

The United States was very quick to see the great advantages of electric propulsion; the rapidly growing cities, with the many suburbs, were peculiarly well suited for the trolley, and the 5,000 miles of electrically equipped roads of to-day tell a better story than any pen is able to describe. There has been very small progress in Europe during the same period; this is not on account of conservatism, but for various other reasons of which the disfigurement of the town is the principal. There is, therefore, a very large field for an electric railway system without the objectionable poles and overhead wire.

Paris in 1881 saw the first practical electric railway. What will Chicago show in 1893? If she should exhibit an underground electric road that worked in every way satisfactory, Europe would utilize this invention as sure as this country adopted the Paris discovery. That it also would be used in the large cities of this country follows as a matter of course.

There was another question decided upon in 1881, viz., a practical unit for measuring current, resistance, etc. The United States is very enterprising and generally prepared to adopt improvements of various kinds, but it shows a most surprising stubbornness when it comes to a change of existing measures, weights and thermometer. Even the scientific and engineering bodies use the old systems, here and there mixed up in beautiful harmony with the new, which in my opinion is very annoying.

What is the reason of this, and why not break with the old absolutely, and to the benefit of everybody? Most of the European countries have introduced the metric system, with of course the exception of Russia and England, most of the Central and South American Republics, Japan and many other less civilized countries.

We nevertheless in this country stick to the ancient English system, where one acre is equal to 48,560 square feet, a figure that nobody remembers; one pound equal sometimes to 16 and sometimes to 12 ounces, etc. Why is it that the future greatest civilized nation in the world is so slow in this respect? The developments of the resources of the country are so rapid, that they, together with the political questions, absorb every thought of the nation, and I think that is the reason why nothing is left for other important things.

Now that representatives from every part of the world will again meet in Chicago, why not discuss the matter thoroughly and decide then and there that the metric system and the centigrade shall be the only recognized measures in the future for this country, at least for scientific calculations, and that every effort be used to get Congress to pass a law to that effect. The result of the Exposition would then be a lasting one and worthy of the memory that it is about to celebrate.

The daily newspapers discuss all sorts of questions of more or less importance. We have monetary conferences, Behring Sea arbitrations, speculations as to this and that political job, etc., but not a word about the 43,560 square feet to the acre.

The technical press of the country ought to take the question up with vigor, and not rest until it is introduced. A continual dropping will wear away the hardest rock, and conservatism and disinterestedness have to give way if continually hammered on.

The St. Louis Convention.

Transportation Arrangements.

The various passenger associations have granted an excursion rate of a fare and a third to delegates attending the Convention of the National Electric Light Association to be held in St. Louis, February 28, March 1 and 2, 1893. To secure this rate it will be absolutely necessary for persons purchasing tickets to state to the agent from whom the purchase is made that they contemplate attending said meeting, and to procure from said agent a certificate, which, immediately upon their arrival in St. Louis, should be left in the secretary's office, addressed as below, to C. O. Baker, Jr., who will see that it is properly vised and returned to the owner.

Arrangements are now being made for a special train from New York to St. Louis, which will exceed in the way of equipment and appointments anything that has ever been in service between these two points. To bring this matter to a successful issue, it is very important that the number of passengers who wish to avail themselves of this train should be known at the earliest possible moment. Therefore, it is very desirable, and will facilitate transportation matters greatly, if all delegates who contemplate using this train will make application for space at once to Mr. C. O. Baker, Jr., Master of Transportation, 136 Liberty street, New York.

ELECTRICITY

The Popular Electrical Journal.

GEORGE R. METCALFE, - - - EDITOR.
R. H. WILLOUGHBY, - - ASSOCIATE EDITOR.

W. M. ALLISON, - - BUSINESS MANAGER.

B. E. GREENE, Publisher.

PUBLICATION OFFICES:

6 Park Place - New York

CHICAGO:
J. F CONNOR, - - 823 Monadnock Building.

BOSTON:
W. S. KEY, - Room 34, 620 Atlantic Avenue.

ELECTRICITY IS PUBLISHED ON WEDNESDAY OF EACH WEEK

Our columns are open for the discussion of any question in which the interests of the Electrical Industry are at stake. News notes, descriptions of new devices with drawings or photographs, are at all times desired.

SUBSCRIPTION RATES:

UNITED STATES, - - - - -	$2.50
IN CLUBS OF FIVE OR MORE, - - - -	$2.00
FOREIGN COUNTRIES, - - - - -	$4.50

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

"Electricity," under its present ownership, has never solicited the advertising patronage of the General Electric Company.

The Trust's Onward March.

Our news columns report the closing of the Sunbeam lamp factory in Chicago by a restraining order granted last Saturday in an action brought, not directly by the General Electric Company, but by the Chicago Edison Company, pending the final hearing on Saturday next.

Our predictions are thus verified, and ELECTRICITY is the only paper which had the news in advance.

If there was one company in the field which might reasonably have been expected to make an amicable royalty arrangement, that company was the Sunbeam. It was a fair assumption that Mr. J. B. Wallace, who has claimed Mr. Coffin as his personal friend, and whose close relationship to the Messrs. Terry is well known, would be able to exert so strong an influence in favor of such an arrangement that it would be brought about. It is possible, therefore, that the Chicago Edison Company demanded immediate action, and that the General Electric Company had no alternative. The fact that the Edison Illuminating Company of New York demanded some days since that the General Electric Company proceed immediately against all trespassers on their contract rights in this city lends color to this view. The New York licensees threatened to take the law into their own hands unless their demands were met.

But our view of the case is that the bringing of the suit in the name of the local Chicago company was only a smart trick on the part of Mr. Fish, who apprehended that an action brought by the Trust direct would not be successful.

However, it is best for all concerned that the Sunbeam Company was selected at this time. There is no longer any doubt whatever as to the policy of the Trust. While they have not had the courage to make an official announcement of their policy or plans, actions speak louder than words, and no one is now in the dark.

It is better as it is.

All that remains for other manufacturers is to bring out their new lamps which do not infringe the Edison patent, and there will be nothing more than a temporary interruption to the business. We are advised that the Sunbeam Company and some others will have such lamps ready to place on the market in short order.

Nothing better could have happened to justify the course of ELECTRICITY. The waiting policy advocated by the *Electrical Engineer* has already proved futile. Bankruptcy is not a pleasant thing to wait for.

ELECTRICITY says "Fight!" And do not wait to be attacked. The man who waits till his hands are bound is an easy victim. Fight! and fight now!

We cannot conceal our pleasure at the present turn of affairs. It has been a common criticism on our course that we were too soon—a year at least in advance of the times; that the Trust was not injuring any one. Chicago concerns, particularly, have seemed to think that the Trust had no power to harm them, even if it had the desire. Perhaps they will revise their opinions.

There is not in Chicago or in the United States an electrical manufacturing concern or a supply house that will not sooner or later feel the coil of the serpent.

IF INDEPENDENT CONCERNS WOULD ESCAPE EXTINCTION, IMMEDIATE ACTION IS NECESSARY.

The Trust invites the battle—who are the cowards?

* * *

The Fake's Progress.

The activity of the Press Bureau of the Chicago-St. Louis Through-by-Lightning scheme leads to the conclusion that the chief aim of the enterprise—the raking in of dollars—is not being attained rapidly enough. The rural papers, always glad to get "scare" matter (illustrations preferred) when it costs nothing, are treating the boomers handsomely, and their readers almost believe that the road will be in full operation by next All Fools' Day. If transportation tickets are placed on the market, and we suppose they will be shortly, there is bound to be a profitable advance sale among the grangers of Arkansaw and Texas.

Meantime, Dr. Adams preserves discreet silence as to the technical details of his motive power arrangements. No electrical engineer of any standing in this country believes there is any merit whatever in the scheme, or that the end will be anything more than a humiliating fiasco, throwing discredit and suspicion upon the whole range of new and legitimate electrical enterprises. And it is with this latter point that we are specially concerned. While there is no doubt that in the hands of competent engineers the speed might be attained, the introduction and booming of the thing from the first has not disclosed the name of any of our leading engineers as being identified with it. It is claimed, we believe, that the matter has been laid before such engineers, and has met with their approval. But the *leading electrical engineers of the world*, those who are recognized authorities, are not legion, and no one of these has announced his approval; in fact they all deny that it has been submitted to them.

The attainments and reputation of Prof. Nipher are not underestimated by us, but we look upon his connection with the scheme more as a misfortune to himself than otherwise.

We do not believe that there is, or has been, any definite plan, beyond the sale of stock. They will sell all they can, and trust to luck for the outcome.

Mr. Henry Villard is well known as a most sanguine investor in new enterprises. He has an almost boundless faith in electrical possibilities, and has frequently been called visionary. But we are enabled to state authoritatively that when Dr. Adams laid his scheme before Mr. Villard, several months ago, Mr. Villard said: "Dr. Adams, I do not feel at all complimented that you should assume to bring any such scheme to me." And that subsequently Mr. Villard was "not in" when the urbane Doctor called.

ELECTRICITY will lend a helping hand to all worthy electrical enterprises. But if a hundredth part of Dr. Adams's claims is correct, he needs no help. Let him but show proof that he has got a system to run 100 miles an hour safely, economically and satisfactorily, and he will not need to advertise his stock—capital would scramble to get in on the ground floor. We can give him no assistance in perfecting his motor, and we will not help him to sell stock, until he offers reasonable proof that the whole thing is not a swindle.

Twenty miles of road, we are informed, have been built—all but the track. This affords ample opportunity for a display of the wonderful machine, and there ought to be no delay in the exhibition. ELECTRICITY can be counted on to charter a special car—not exactly for the first trip—but as soon as the Accident Insurance Companies will take the risk on passengers.

In The Fake's Progress up to date marvellous ability of a certain order has been exhibited; and the man who gets up the prospectuses could command a munificent salary as the advance agent of Bailey's show.

The electrical papers on this side of the water, with the single exception of ELECTRICITY, have been guilty of short-sightedness, if nothing worse, in their treatment of this matter from its first announcement. Nothing better was to be expected from our fawning contemporary, the *Electrical World*, which has perhaps received a good-sized block of stock in exchange for advertising and puffing space. But from the *Electrical Engineer* we looked for better things.

The English papers have been led to believe that the scheme was really considered favorably by conservative men here. When the whole job reaches its inevitable end, and the stockholders lose their money, American electrical investments will all be discredited abroad, and no small portion of the blame will rest upon the American electrical papers which refrained, from whatever motive, from telling the truth.

We desire, with pardonable pride, to call attention to the remarks made in these columns (Vol. II., No. 21,) just after Dr. Adams, in his address before the American Institute of Electrical Engineers in this city, drew a square on the board, saying, "*This represents my motor.*" The editorial was headed "Rapid Transit by ——":

"There were many things in his lecture that could not fail to attract the attention of the least observant. One of these was the exceedingly happy way in which every detail of his plan was favored by nature and otherwise. One listening to him could not help being reminded of the fairy tales of his youth, where the fortunate traveler has but to call up his good fairy whenever obstacles occur to have them smoothed away. A straight line was desired—and a straight line was surveyed for two hundred and forty-eight miles, and nothing was found in the way to turn it aside; no churches, no graveyards, no cities, no rivers. It was originally intended to have but a single central station, but immediately that two were decided upon, locations unsurpassed sprang immediately into existence—not only that, but ready equipped, at somebody else's expense, for use. An entrance was desired into Chicago. Ordinarily the right of way for this would have cost millions of dollars, but the good genius again arises and provides it free of charge and partly equipped at that.

"High potentials were required for transmission and lower ones for the motors. This suggested the use of the alternating current, but since the motors must be capable of starting from rest with a load, multiphase currents would be required, but these necessitated two or more conductors while but one could be used. Behold, again the fairy appears, and a multiphase motor operated by a single phase current is produced at the projector's beck.

"The financial aspect of the scheme as presented by the projector could scarcely be more rosy. But, we take it, few will accept his statements without a little salt. According to his estimate there will be thirty million visitors at the World's Fair—does he mean visitors or admissions?—and of these 10 per cent. will ride over his road to St. Louis and back for $5.00. The road will cost six millions to complete, and in six months' time it will pay for itself two and a half times over from the custom of those who ride on it from curiosity solely. Of course, there will be additional receipts from other sources, which ought to round the receipts up to eighteen millions. Considering that 'the power will cost them nothing,' we wonder that the projectors are willing to part with their stock.

"We believe the feat of running from St. Louis to Chicago on a straight track at 100 miles an hour is perfectly feasible, but regret to say we are not convinced by Dr. Adams's plans."

About the only favoring circumstance which remains for Dr. Adams to claim for his heaven-blest enterprise is, that if electricity fails the natural grade is such that trains may run by gravity in either direction.

* * *

AMONG the many Trust rumors last week was one that the National Electric Manufacturing Company of Eau Claire had concluded that any further fight against the Trust was useless. There can be no doubt as to the source of rumors of this nature. They are put forth in the vain attempt to frighten outside manufacturers. The National Company is doing a prosperous business, and is in the field to stay. The formation of the Trust has actually improved, rather than injured, the business of this company.

* * *

IF there ever has been, or ever will be, a time when an independent paper is essential in the electrical field, that time is now! ELECTRICITY is that paper, and the only one.

* * *

THE present Legislature at Albany will no doubt give cordial support to Gov. Flower in his efforts to secure the introduction of the trolley or some other electric system as the motive power on the State canals. An opportunity is here offered to inventors which should be taken up at once. And may the best plan win.

* * *

THE pirate lamp factory at Lynn is still running full time, and lamps are being sold daily in the territory of Edison Illuminating Companies. We suggest that the programme be changed, and that the Lynn factory be attacked immediately.

* * *

A PROMINENT electrician of this city, who has just returned from Pittsburg, had ample opportunity to inspect the new Westinghouse lamp, and freely expresses his opinion that the lamp is an entire success.

IT SEEMS to us that if the National Electric Light Association is to fulfil its mission, it cannot do otherwise than arrange for a discussion at the St. Louis meeting of the one topic of supreme interest, "Will the proposed monopoly of the General Electric Company result in the greatest good to the greatest number? And if it will not result in the greatest good to the greatest number, is it nevertheless inevitable?"

A public discussion of this topic cannot be long postponed. And if it does not come at St. Louis, it will follow soon afterwards in a convention of a different make-up.

We are in receipt of many requests from leading central station men and manufacturers, urging us to advocate an independent meeting at St. Louis.

Such a course may be necessary, but it is our opinion that the Executive Committee of the National Association ought to have the first opportunity. If they fail to provide for such a discussion, an independent meeting will be in order.

The voice of the independents cannot be smothered.

* * *

THE Chicago and St. Louis Electric Railroad Company, which figures out cock-sure net earnings of $2,025,000 for its first year's business, is playing a scurvy trick on American manufacturers in endeavoring to get the right to import its outfit free of duty. And the General Electric Company should have more important business for its able counsel just now than opposing any such damphool proceeding.

There is no tariff on goods from the seaport of *Esgiebtnicht* in the land of *Wiessnichtwo;* and this is the *exact* location of Dr. Adams's outfit.

* * *

We present our compliments to our contemporary with more name than honor, *Electrical Progress and Development*, for its article on the Security Safe Deposit Company's burglar alarm system. Anything stolen from ELECTRICITY is sure to be good reading, and our illustrations are works of art.

We Stir Them Up.

Comments of Detroit Papers on the Lighting Situation.

The Journal.

The controversy over the letting of the public lighting contract has attracted the attention of the electrical journals throughout the country, and the result is that Detroit is getting some left-handed advertising.

Controller Black has received marked copies of ELECTRICITY. In one of its articles it says:

"Radical measures on the part of the city are necessary if there is to be any actual competition. The people of Detroit are so accustomed to being humbugged that they have been ready to believe the report started by the agents of the Trust that the Standard Company was also in the deal. A little investigation would prove the falsity of the report."

Another article in the same paper hits the Controller pretty hard, inasmuch as he is one of the old electric light magnates of the city. It says:

"There seems to be dense ignorance of electrical matters among the officials of the Trust-ridden city."

The New York idea, of course, does Controller Black injustice, as he has so far led the van in the fight for cheaper and better public lighting.

Controller Black said yesterday that no further steps will be taken in the lighting matter until after the new council is organized.

Mayor Pingree continues to receive calls from prominent citizens and tax payers who urge him to stand firm for a municipal lighting plant.

[ELECTRICITY has intended no injustice to Controller Black or to the city of Detroit. Both Mayor Pingree and Controller Black have been reported in the daily press as being of the opinion that the Trust controlled all efficient systems of arc lighting. We have endeavored to enlighten not only the city of Detroit but all the rest of the world on this point. And we are pleased to see that our efforts are bearing fruit.]

The Press.

ELECTRICITY, the anti-Trust electrical organ, published in New York, has a number of articles on the situation in Detroit. The paper says that Detroit's officials are not well informed on electrical matters if they imagine that the Standard or Western companies, of Chicago, are not entirely competent to carry out any sort of contract with the city.

The paper also states that R. T. McDonald, one of the chief moguls of the Trust, considers Detroit the ideal place for the operation of the Trust's schemes. The two sets of towers, both owned by the Trust, the act passed by the last Legislature and a number of other conditions make Detroit a heaven for the mammoth electrical Trust.

The Journal.

ELECTRICITY says that Detroit is considered by the electric companies as only "pudding" for them. People here, it says, "are so accustomed to being humbugged" that they have already two sets of towers and plants belonging to the Trust, and the last Legislature passed an act which in effect forbade them from owning an electric apparatus of their own. In fact Detroit seems to be looked upon by the Trust as the "Hungry Joes" look upon a feeble old man from the country with a wallet full of greenbacks.

The Octopus Reaches Chicago.

CHICAGO, Jan. 14.—A restraining order was granted to-day against the Sunbeam Incandescent Lamp Company and the Illinois Lamp Company in an action brought by the Chicago Edison Company. Chicago is therefore brought to a realizing sense of the situation.

The closing of the Sunbeam factory will be only temporary, as they will have a new lamp on the market within thirty days which will not infringe the Edison patents.

The Chicago Edison Company also advertise in the daily papers that they will enforce their rights, and that they have the exclusive right to sell incandescent lamps in that city.

Dr. Adams's Suit.

The suit of the Adams Electric Company against the Lindell Railway Company, which has been in progress before a Commissioner in St. Louis since December 1, is drawing to a close. The testimony has been voluminous, Dr. Adams's answer to one question filling 300 printed pages.

This suit, it will be remembered, is only a test case, the question at issue covering the fundamental patents on present methods of motor suspension on electrical street cars.

A large array of able legal counsel is engaged, including Marcellus Bailey, of Washington (who drew the patents), for the plaintiffs, and Eaton & Lewis, of this city, for the defendants.

Electrical men in this section consider the entire proceedings as farcical so far as any practical results are concerned.

The Electric Club Gives up the Ghost.

The Electric Club of this city, whose financial affairs have been going from bad to worse, has concluded to dissolve. Mr. George M. Phelps, of the *Electrical Engineer*, is the receiver, and Stephen H. Olin has been appointed referee to hear objections, if any, on April 20 next, at his office, No. 32 Nassau street.

Moralizing would be useless. Cross-roads villages will still maintain prosperous electric clubs, to the common good of all their members, but the metropolis of the country cannot maintain one.

Prof. Thomson to Make a Special Exhibit.

BOSTON, January 16.—Professor Elihu Thomson is reported as having arranged to make an exhibit at the World's Fair of his many beautiful and useful electrical inventions, altogether distinct from and in addition to the extensive display that is to be made by the General Electric Company, with which he is identified as electrician-in-chief. The brilliant inventor has done so much to advance the electrical science that such a display is bound to form one of the most attractive features in the department of electricity.

Canadian Electrical Association.

The annual convention of this association will be held at Toronto, January 25-26. Following is the programme :

WEDNESDAY, JANUARY 25.

2 P. M.—President's Address; Secretary-Treasurer's Report ; Reports of Committees.

Paper by Mr. George Black, of Hamilton, on "Electrical Measurements."

Paper by Mr. W. A. Tower, Toronto, on "Underground Construction."

An invitation is extended to the members of the Association to visit and inspect the Toronto Electric Light Company's new station.

8 P. M.—Dinner at McConkey's.

THURSDAY, JANUARY 26.

10 A. M.—Discussion on proposed Amendments to the Constitution.

Paper by Mr. J. M. Campbell, of Kingston, on "Free Wiring."

Paper by Mr. R. G. Black, of Hamilton, on "The Incandescent Lamp."

Paper by Prof. Rosebrugh, School of Practical Science, Toronto, on "Speed Control."

Paper by Mr. Breithaupt, of Berlin, Ont., on "Probabilities as to the Success of Distribution of Power at Considerable Distances by High Tension Currents of Electricity."

The members are invited to visit and inspect the Bell Telephone Company's new Exchange.

Electricity for the Canals.

Governor Flower Confident that the Idea is Practical.

In an interview in the daily press last week Governor Flower expressed himself more at length in regard to the plan of adopting electricity for the motive power on the State canals. The Governor said :

"I believe that the running of canal boats by some form of electric motor is as certain to come, and come soon, as I am that I am sitting here in the State executive chamber as the Governor of the Empire State. Why, it is easy enough, and not so costly as many suppose. I had an engineer experienced in electrical matters give me some estimates, and I am satisfied that the State can equip the Erie Canal from Buffalo to Albany with an electric power plant by which we can furnish boatmen the necessary power to propel their boats at a cost to them of only about sixty cents a day per boat. The cost of this plant and equipment of power stations, poles, and two trolley wires for up and down boats, I do not think would be much over a million dollars. How do I figure it out? Simply by this: The power house here in Albany cost $160,000, and it furnishes power to run electric cars of six or seven tons each over thirty miles of track. Now, a power house can be constructed for anywhere from $50,000 to $100,000, just as you please to equip it. For the plant on the Erie we should need thirteen or fourteen power houses or stations, situated about thirty miles apart. At a cost of $50,000 each the State could erect fourteen between Buffalo and Albany at a cost from $700,000 to $750,000. The balance of a million-dollar appropriation, or about $300,000, would suffice for the erection of trolley poles and wires. Such a plant would, as I said, furnish power to canal boats at a cost of about sixty cents a day. Now, as I understand it, the canal men have to pay at least $3 a day, while they have to feed and keep five or six mules, which furnish the motive power at present ; so that the paying of sixty cents a day to the State for power would be economy for the boatmen. It would cost each boatman, I am told, about $150 or $200 to equip his boat with the necessary dynamo, or whatever apparatus is needed to operate a small screw propeller, but this cost would not be as much as to equip it with mule power. The State would save by the operation, I think, because a large proportion of the repairs to the canal yearly are made on the tow path, which would not have to be kept up. Oh, it's bound to come ; if not by the trolley, by some other system of applying the electric power to canal transportation, and when it does come it will put the canals in a position to compete with the railroads, and prove their salvation."

Don't Want to Pay Duty.

The promoters of the Chicago-St. Louis Electric Road appeared before the Senate Committee on Commerce, on the 12th, and endeavored to show cause why the Government should permit them to import necessary construction material free of duty. Wellington Adams, John Muir and Representative Seth Cobb, of St. Louis, represented the interests of the company, while the General Electric Company was represented by Eugene H. Lewis, of New York, as counsel. The committee took the matter under consideration.

Harvard's Electric Club.

The Harvard Electric Club, founded in '88, has recently been reorganized, and the old constitution has been amended. The following officers were elected : President, P. W. Davis; vice-president, G. B. Pierce; secretary and treasurer, F. E. Frothingham; librarian, E. Clark; executive committee, the above officers and J. C. D. Hitch, T. H. Soren and J. F. Vaughn. The meetings are to be held bi-weekly; prominent electricians will address the club, and members will read papers before it.

Valuable Stock at Auction.

Great excitement occurred among the brokers in the Real Estate Exchange on January 10, when Messrs. R. V. Harnett & Company offered 20,500 shares of the United States Porte Electric Company's stock at auction. The first bid was $10 for the lot. This was raised successively to $100, $1,000, $2,500 and up to $500,000. There it jumped up $250,000 at each bid, until finally $1,800,000 was realized—on paper.

BOOK NOTICES.

STANDARD TABLES FOR ELECTRIC WIREMEN, with underwriters' rules, instructions and other data. By CHARLES H. DAVIS. Third edition. THE W. J. JOHNSTON COMPANY, LTD., New York. Price $1.00.

This edition of Davis's Wiring Tables has been thoroughly revised and edited by W. D. Weaver. The tables have been recalculated on a uniform basis of 55 watt lamps, and a number of new tables have been added. The method of determining the sizes of conductors, formulas for the horse power of engines, and tables for the limiting sizes for wiring are published for the first time in the present form. A revised copy of Ayer's Instructions for Wiremen has also been reproduced, as well as the rules for wiring adopted by the National Electric Light Association.

TIPS TO INVENTORS. By ROBERT GRIMSHAW, PH.D., M.E. THE PRACTICAL PUBLISHING COMPANY, 21 Park Row, New York. Price $1.00.

This book consists largely of a republication of articles published by the author in the New York *World* and the *Practical Mechanic*, and contains a number of hints as to the directions in which the field for invention is open. It will be forwarded to any address, post paid, on receipt of one dollar, but has not been offered to the book trade.

The *Wall Street News* reports that the sales of the General Electric Company for the first nine days of the present month equalled those of the entire month of January, 1892, and that the Westinghouse Electric Company is known to be thus far $2,000,000 behind its orders.

Boston Notes.

Mr. Paul G. Fiedler, of the Boston Braid Company, was in New York last week on a business trip.

The fierce and destructive conflagration in the wool and leather districts of Boston which broke out last Tuesday morning, and which the fire department is still trying to completely drown out at this writing, has proved a trying experience for all parties concerned. It occurred at a point where there are more overhead wires than at any other part of the city. The entire electric system—telephone, telegraph, light and railway, have been completely demoralized for the time being. What wires were not fused by the excessive heat were either broken by the falling debris or had to be cut to give the firemen a fair show. Owing to the sharp frost that has prevailed all the week, the spray and water froze in such masses on the trolley feeder wires, weighing them down so seriously that even the eight inch steel poles supporting the wires were bent in such fashion that they are having to be removed, and entirely new construction will have to be put up ere the car and other service can be resumed. It is only the truth to state that the entire overhead system of wires has come in for a large share of criticism in consequence of this big fire with its attendant excitement, losses and accidents.

Work is to commence at once on a large building wherein electric cars are to be constructed at Millbury, Mass. A company with a capital of $150,000 has been incorporated, and it is expected that nearly 200 men will be employed.

At the first regular meeting in the New Year held by the Thomson Scientific Club, Lynn, last Thursday evening. Professor Elihu Thomson gave an address on "The Induction Coil," in the course of which the subject of high frequency currents was entertainingly and instructively dwelt upon. Allusion was made to the remarkable experiments in which currents of high voltage were discharged through five feet of air, Professor Thomson expressing his confidence in being able to construct a machine that would discharge a current through a space of no less than fifty feet of space. An attractive course of lectures is being arranged for. Subjects and speakers we hope to publish at an early date.

The new central light and power station in the shoe town of Haverhill, Mass., was started up a week ago. It is one of the best built and equipped stations in Massachusetts. The plant consists of two Harris compound engines of 350 and 250 H. P. capacity respectively; one T.-H. alternating machine of 2,000 light capacity and a Brush alternating dynamo of 1,000 lights; one generator of 100 H. P.; one Brush arc dynamo. The entire work has been erected under the personal supervision and from plans prepared by Mr. Charles H. Herrick, Boston, a gentleman who enjoys an enviable reputation for his skill and ability throughout the electrical field in New England.

Some of the handsome electric fixtures to be seen in Boston have recently been fixed in the new Hotel Reynolds, this city. The ladies' dining room, which is fitted throughout in Louis XVI. style, is generally admitted to be the most beautiful dining room in this country. The electric fittings alone cost over $1,800.00.

New Bedford and Fall River, Mass., are to be connected at an early date by an electric railway which is projected by a wealthy corporation. It is likely to be used for both freight and passenger service.

Chicago Notes.

J. B. Wallace, of the Electrical Supply Company (Ansonia, Conn.) was in Chicago last week, on his annual visit to the headquarters of his company.

H. T. Paiste, of the Paiste Switch Company, was in the city last week visiting his many business friends.

At the last regular meeting of the Chicago Electrical Association the following officers were elected for the ensuing year: President, Albert Scheible; F. S. Hicock, vice-president; C. A. Pratt, librarian; M. B. Speirs, secretary; L. G. Bassett, treasurer; H. G. Dimick, auditor; directors, C. A. Brown, Fred DeLand, E. G. Hovey.

The Englewood and Chicago Electric Street Railway Company was incorporated last week to build an electric street car line from Chicago to the suburb of Englewood. The road will be extended to all the small suburban towns located in a southerly direction from the city.

It is reported that Charles H. Morse, of this city, has purchased the Eclipse Clutch Works and the Williams Engine Works, of Beloit, Wis. It is understood that Mr. Morse will consolidate the two companies and move the plant to Chicago.

General News.

What is Going on in the Electrical World.

St. Louis, Mo.—The mayor has approved the Manchester Electric Railroad bill.

Cheshire, Mass.—There is serious talk here of starting an electric light plant to furnish light for the town.

Columbus, Tex.—The citizens of Columbus are responding liberally to the call for an electric light plant.

East Orange, N. J.—The township committee have decided to procure an electric light plant and do away with gas.

Bay City, Mich.—The Union Street Railway Company are equipping their road for electricity and will dispose of their horses.

Gainesville, Fla.—From Gainesville *Leader*: "Electric lights are what the people of Gainesville demand and will insist upon."

Oakesdale, Wash.—The council has passed an ordinance giving to the Oakesdale Electric Light Company a franchise for thirty years.

Shelbyville, Ky.—The subject of electric lights is a chief topic here, and the people are thinking it is about time they were introduced.

Windsor, Can.—The Sandwich, Amherstburg and Windsor Electric Road has been sold to W. Ryckman, M. P., and others, of Hamilton, Can.

Windsor, Conn.—The people of Windsor are anxious to have electrical railway communication with Hartford and are actively moving in the matter.

York City, Pa.—The Westinghouse Electric Light Company's plant here is nearly completed, the building and its equipments being all of the best class.

Chenoa, Ill.—The citizens after holding a meeting to discuss the matter, voted that the city council should at once contract for lighting the city by electricity.

Menasha, Wis.—The council here is wrestling with the question whether the city would better establish an electric lighting plant of its own or continue the contract system.

Philadelphia.—The People's Passenger Railway Company, according to a statement of President Carson of the company, intends to introduce the trolley system on all its lines.

Reading, Pa.—The electrical department of the Philadelphia and Reading Railroad Company are preparing electric light plants for Coxeton, in the coal regions, and Port Reading, N. J.

Lebanon, Pa.—The Lebanon and Annsville Electric Street Railway Company has just declared a dividend of 6 per cent. although the road has been in operation only sixteen months.

Seabright, N. J.—A number of business men, believing they can get light cheaper than it is furnished by the Long Branch Company, are talking of setting up an electric light plant here.

Indianapolis.—In addition to the building of the Virginia Avenue line the Citizens' Street Railroad Company intend to construct an electric line out Indiana avenue to the Cerealine Works.

Fremont, Ohio.—The proposed electric railway seems in a fair way of becoming a reality, S. Brinkerhoff having asked the council for a franchise, and the members of the council being in favor of the project.

Mobile, Ala.—The bondholders of the street-railway are waking up to the necessity of equipping the road with electric motive power.—The electric cars have begun running here and are giving satisfaction.

Seattle, Wash.—Seattle has nearly ninety miles of street railways—forty-seven miles of single and the remainder double track; twenty-two miles are cable, sixty-five miles electric. There is not a horse car in the city.

Wheeling, W. Va.—The franchise of the Martinsburg Electric Light and Power Company has been accepted by the incorporators of that company, and as soon as arrangements can be made the new company will go to work.

Bridgeton, N. J.—Application has been made to council by the Thomson-Houston Electric Motor Company and by other electric concerns for authority to construct electric railway lines in and about Bridegton and Millville.

Montgomery, Ala.—The Montgomery Terminal and Street Railway Company has resolved to equip its entire system of street and suburban roads with electricity, dropping the mule. Bids for first class equipments are to be called for immediately.

Norwalk, Ohio.—The Sandusky, Milan and Huron Electric Railway Company has been granted a franchise to construct an electric street railway on East Main street from the east line of Norwalk City to East Norwalk. The line is to be completed by July 1, 1893.

Lockport, N. Y.—The long-contested suit between a local electric smelting and aluminum company and a similar concern in Pittsburg was decided yesterday in favor of the Pittsburg company, which practically gives it a monopoly of the business in America. The fight was over patents.

Columbus, Ohio.—It is said that the Thomson-Houston Company is negotiating for the purchase of the plant of the Jeffrey Manufacturing Company. By making this purchase the Thomson-Houston Company would remove its strongest competitor in the manufacture of electric mining machinery.

Youngstown, Ohio.—A special committee of council, appointed to investigate the electric lighting question with a view of ascertaining the advisability of the city erecting and maintaining its own plant, will visit a number of cities for the purpose of getting all available information on the subject.

Hamden, Ohio.—The electric railway that is to connect our town with Wellston has taken a new impetus. Harvey Wells, the originator of the scheme, has just returned from the East and reports that he has secured the co-operation of capitalists there, and that work will begin as soon as the weather will permit.

Flatbush, L. I., N. Y.—The Kings County Electric Railway Company has obtained the consent of the town board and the local authorities to permit it to build and operate a street railway between Brooklyn and Flatbush, running through Rogers avenue in the latter place, to the town line between Flatbush and Flatlands.

Portland, Me.—A harbor dredge now in the harbor is said to be the first dredge on the Atlantic coast to use electric light in its operations at night.—By the application of vaseline to all the trolley wires of the electric railroad in Portland they have, it is said, been kept so clear of ice and snow that no difficulty from the former has arisen.

Natchez, Miss.—The Natchez Street Railway Company has been granted a franchise by the board of aldermen to construct and operate an electric railway system in this city, the franchise continuing until 1912, but the line to be built and in operation on or before the 1st of January, 1896. Morris Moses is general manager of the company.

Hoboken, N. J.—The new electric plant of the New York and New Jersey Electric Company is now in readiness, so far as electric power is concerned, to run cars to North Hudson. A line of cars will be established. The electric lighting of Hoboken will also be served from this plant, which is one of the most costly and complete in the State.

Lancaster, Pa.—The electric railways of Lancaster during the year 1891 carried 1,074,086 passengers, and during the year 1892 the fares numbered 1,684,921, an increase of 610,835. A local paper says: "The enterprise of the company in fitting up parks and affording pleasure resorts for the public is in a large degree responsible for the increase of over half a million passengers in a year's time."

Kent, Ohio.—A petition signed by several prominent citizens has been presented to the council asking for the right of way over various streets of the town for an electric railway. A like petition has been presented to the county commissioners for the right to erect a line over the roads leading to the various lakes which dot the county.

Wilmington, Del.—A report is in circulation here that some Boston capitalists have been looking over the ground and have about decided to build an electric road from Wilmington to Brandywine Springs. If they succeed in purchasing the grounds there, they will convert them into a public park, with such attractions as will make them a popular resort.

Denver, Colo.—The Platte Valley Electric Railway Company has petitioned the county commissioners for right of way for an electric road between Denver and Brighton—fourteen miles—and will probably obtain the grant.—A certificate has been filed by the Amethyst Electric Power and Light Company that its capital stock of $200,000 is fully paid up.

Buffalo, N. Y.—A test of the Sachs Fire Alarm Telegraph System was successfully made here recently. An expert electrician who witnessed the test says "the science of the apparatus is correct and its operation perfect."—The Buffalo Electrical Association held its sixth annual meeting on the 9th and elected officers. The membership is stated to be 306, an increase for the past year of 145.

Fair Haven, Conn.—The people here are demanding quicker transit and are urging the Fair Haven and Westville Street Railway Company to adopt electricity on its lines. They are also desirous that a new electric line be run from the Quinnipiac drawbridge through East Chapel street connecting with the Fair Haven and Westville road at the corner of East street, and another spur from East Chapel the entire length of Ferry street.

Grand Rapids, Mich.—A scheme is in progress here to use the water power at Lowell for the generation of electricity to be transmitted to this city. The Peninsular Electric Company will continue doing business on the present basis, and a new company will be organized with substantially the same stockholders to take charge of the long distance enterprise. The company will have a capital of a quarter of a million dollars at least, and possibly more.

Cincinnati.—H. P. Bradford, of Little Rock, Ark., has been appointed manager of the Mt. Auburn electric road. Mr. Bradford had been manager of the electric lines in Little Rock for a long period, and was so successful that the roads of that city are considered among the best in the country.—The Siemens & Halske Electric Company deny all knowledge of the survey for an electric railroad from this city to Springfield, by the way of Dayton, and say that they do not build roads, but manufacture supplies.

Haverhill, Mass.—It is reported here that the stock of the Haverhill, Merrimac and Amesbury Electric Railroad is to be pooled with that of half a dozen other electric roads in New England. Among the roads which will be affected are those in New London and Norwich, Conn., the South Shore line at Plymouth, Mass., and the Bangor, Me., system. The consolidated companies will, it is stated, form one of the largest companies in the business, and it is understood that one purpose is to antagonize the Thomson-Houston syndicate.

New Orleans.—The New Orleans and Carrollton electric railroad is nearly completed, and a number of the cars have already arrived in the city. It is expected that the trip from Canal street to Carrollton will be made by the new cars in twenty minutes. In reply to a question by an inquisitive reporter as to the danger of running electric cars in a large city as compared with the mule system, Mr. Haile, the superintendent of the Carrollton road, remarked that he thought "there was more to be dreaded from the tail end of a mule than from any trolley car."

Norristown, Pa.—A trolley road from Norristown to Wissahickon, within the Philadelphia city limits, seems to be reasonably assured if the plans of the projectors do not go awry. The Citizens' and Norristown Railways, of Norristown, have been practically sold to a syndicate in which the Shepp Brothers, of Philadelphia, are deeply interested. The Roxborough and Barren Hill Railway, extending from Wissahickon, in Philadelphia, to Barren Hill in Montgomery County, was recently purchased by a stock company, and now it is proposed to connect the two lines.

Nashville, Tenn.—The Union Bank and Trust Company has had a chime of bells put up in the bank building that are rung by electricity. The chimes at the first quarter strike two bells, at the second quarter four bells, at the third quarter six, and at the hour a selection from some opera or some well-known melody follows the time strokes. A different air is played every hour for the six days of the week, making seventy-two in all. A large regulating electric clock governs the movement and operation of these chimes, and will also operate an electric time dial to be placed in the front window of the bank.

Detroit, Mich.—The franchise granted to E. W. Cottrell for an electric line from the city limits on Grand River avenue through the township has been assigned by Mr. Cottrell to George H. Russell, W. C. McMillan, M. S. Smith and himself under the corporate name of the Detroit and Greenfield Electric Railway Company. The company will begin the construction of its line early in the spring.—The Detroit Electrical Works propose an issue of $500.000 preferred stock by conversion of that amount of authorized common stock into preferred, to be sold at par with a bonus of 50 per cent. of common stock.

Jersey City, N. J.—Chancellor McGill, acting on the application of the receiver of the United Traction Company, whose main works are at Marion, for leave to sell the Newark plant, has ordered the plant to be sold at public or private sale, subject to the mortgages and confirmation of the sale by the court. The plant was established to furnish electric power to manufacturers and others. The petition of the receiver sets forth, among other things, that the property was covered by two mortgages aggregating the sum of $700,000. — The Montgomery street electric cars have already become popular and are filled almost every trip. The horse cars have all been taken off.

Kansas City, Mo.—The *Star* is in favor of municipal lighting, and says "the only men who oppose the city having its own lights are the stockholders in the electric light companies or their tools."—A letter from A. J. O'Reilly, supervisor of city lighting at St. Louis, in regard to electric lighting in that city, was laid before the board of public works of this city lately. Mr. O'Reilly says: "The city of St. Louis does not own an electric light plant. The streets are lighted by 2,273 arc lights, of 2,000 nominal candle power, from sunset to sunrise, at a cost of $74.95 per year; and 1,792 incandescent lights of thirty candle power, at a cost of $17.50 and $26 per year. The Heisler and Westinghouse incandescent systems are used." Kansas City, it seems, pays $43.55 a year per lamp more than St. Louis.

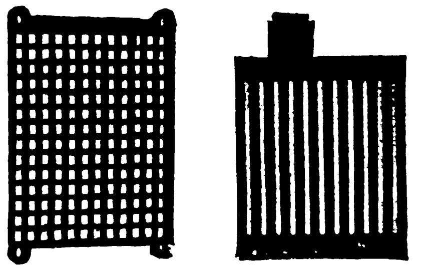
Baltimore.—The electric locomotives to be used in hauling the trains on the Belt Railroad will be six in number, of 400 horse-power each, and each will weigh thirty tons. Three of them will be coupled together, giving 1,200 horse-power, and it is in this form they are expected to be most used, although they can be easily separated, and one motor of 400 horse power can be used when necessary to move light local trains. The generators to be used will be of 700 horse-power. Thirty miles an hour is the speed guaranteed for passenger trains moved by the motors in the tunnel for trains of 500 tons weight, and fifteen miles an hour is the guaranteed speed for freight trains. The plant for the movement of trains is being built at Schenectady, N. Y. — The *Herald* in calling attentention to the enormous development of rapid transit in Washington and Baltimore and contiguous territory within a few years says: "Trolley lines have been projected along the Potomac into Western Maryland. A street railway from Washington to Bay Ridge and down the Potomac into Southern Maryland are also possibilities of the future. Only this week was the Lonaconing and Cumberland Electric Railway Company incorporated with a capital stock of $250.000 to build a railway from Cumberland to Westernport, a distance of twenty miles."

A Storage Battery Car.

On Wednesday a party of electricians, at the invitation of Messrs. McDougal & Woolcott, made a trip over the Ninth avenue railroad from the car stables at Fifty-third street to the end of the route and back to the stables. The car in which the party made this trip was equipped with the McDougal motor and Acme storage batteries, and its performance was such as to elicit the highest encomiums from all who participated in the trial trip.

The Acme cell weighs twenty-seven pounds against forty pounds for a cell of the same dimensions using lead grids.

These grids are of a non-conducting material which is not attacked by the acid and which is sufficiently elastic to yield to the expansion of the active material without buckling, warping or breaking. On the other hand the active material is retained with sufficient firmness in contact with the conducting plate of lead which is situated in the middle of the complete plate. There is an equal amount of active material on each side of this lead conducting-plate, thus insuring an equal distribution of current



Ribs on the non-conducting grids meet through slots in the conducting plate, and are cemented together, uniting the whole into one solid plate. The openings for the reception of active material are smaller on the outside to aid in the retention of their contents. The exposed surface of active material is about forty inches on each plate, or about 200 square inches for the five positives. The maximum steady discharge on the hill was 130 amperes, or about sixty-five amperes per square inch.

Patrick Kennedy and Charles J. Diss, the inventors of the battery, and W. M. McDougal, the inventor of the motor, expressed themselves as being well pleased with yesterday's trial trip. They claim that the car will be able to travel at the rate of twenty miles an hour; that the capacity of discharge of the Acme battery is the highest yet attained. They also said that the supporting plates in the batteries could not be affected by acid, thus prolonging the life of the cell considerably.

The Diamond Transformer.

It is only within a comparatively short time that transformers have been manufactured apart from generating apparatus, or since both articles were made by the same companies. Practical experience, however, suggested so many economies that might be effected by improved types of transformers that about two years ago factories outside of parent companies were established for the exclusive manufacture of transformers and kindred articles. Realizing, as these factories did, the necessity for producing transformers of marked superiority over the older types, they succeeded in producing a grade of transformers considerably in advance of those that had theretofore been in general use, and by this means not only established a market for their own products but also stimulated the parent companies to active exertion towards improving their own transformers.

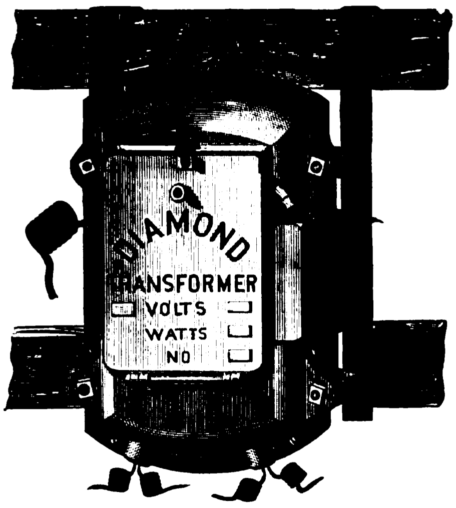


FIG. 1.

The Diamond transformer is the latest type which has been placed upon the market and embodies all that experience has obtained from the good qualities of other converters, while it succeeds in evading all of their defects.

A transformer to be popular in these days with the superintendents of central stations and with linemen must be convenient and unattended with any abnormal difficulties in placing of upon poles or buildings.

Fig. 1. illustrates the transformer as it appears when attached to the cross arm. It will be seen that this converter is easily adjusted and held in secure position by the hooks engaging with the cross arms. The ring in the top is for hoisting upon a pole by means of a block and tackle. Should it be necessary, however, to attach this converter to brick walls, the hooks may be easily removed and the converter secured to the wall by means of the four lugs seen in the cut. The Diamond transformer is also made three-point, and is easily and quickly convertible from 50 to 100 volts on the secondary wires without the use of a more or less clumsy and inconvenient switch.

Fig. 2 shows the transformer with fuse box exposed to view. The primary and secondary connections are readily seen, and it will also be noticed that when the door is closed each fuse is in a separate compartment, so that in case one should blow out it would have no effect upon the other by excessive heating. The porcelain box and fuse blocks are highly glazed, and it is claimed that there is no danger of their absorbing moisture. The convenience of this style of fuse box will, we believe, be apparent. The fuse blocks are attached to the door itself. If follows that when the door is opened the connection is completely broken, and a lineman may replace fuses upon a live wire with perfect safety, at the same time having the fuse blocks entirely exposed to view. The fuse blocks themselves may be detached by means of a little gnarled thumbpiece, seen by the side of the detached block. These fuse blocks are interchangeable for all sizes of transformers, so that a central station by keeping a few of them on hand may always be assured of a fuse block in case one upon the line should be broken by lightning or otherwise.

It has been a source of inconvenience and expense to central stations heretofore to return burned out converters to their respective factories to be repaired or replaced. The delay has often caused serious inconvenience and it has resulted in many cases in the stations making ineffectual attempts to repair the converters themselves.

Fig. 3 illustrates one of the most important claims of the Diamond converter to the appreciation of practical central station men. It will be seen that the secondary coils are in two parts, the primary coil being securely imbedded between the two, thus affording a common center of magnetism. After the primary coil is in position, the secondary coils are adjusted and firmly bolted together, completing a perfect magnetic circuit. Should, however, a primary coil be burned out by lightning or otherwise, it is only necessary to have another coil sent by express, when the central station man can readily place it in position himself, thus obviating all the delay and expense which was a necessary part of the old methods.

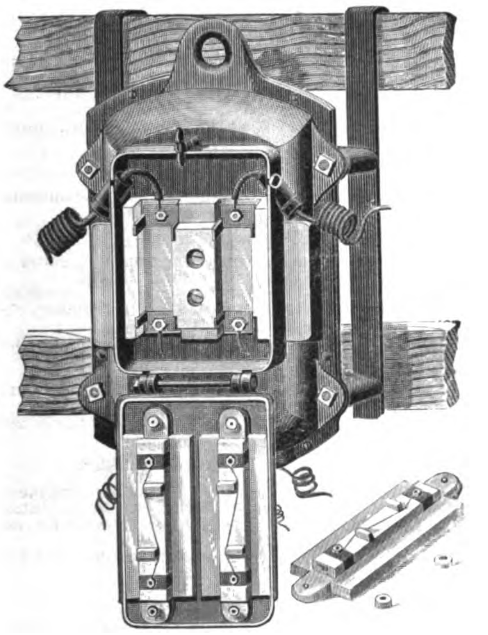

FIG. 2.

The Diamond converter is of very high efficiency, low leakage current and excellent regulation. It is made as light in weight as is consistent with the best practices, and is well ventilated through the top and bottom of the case so that a free passage of air will aid in keeping the coils at a low temperature This converter has so many points of excellence that it will, we believe, meet with ready appreciation among all practical central station men.

Taylor, Goodhue & Ames, 827 Monadnock Block, Chicago, have taken the exclusive agency for the sale of this converter and have in course of preparation a pamphlet treating quite extensively of its merits

The Waterhouse Arc Lamps.

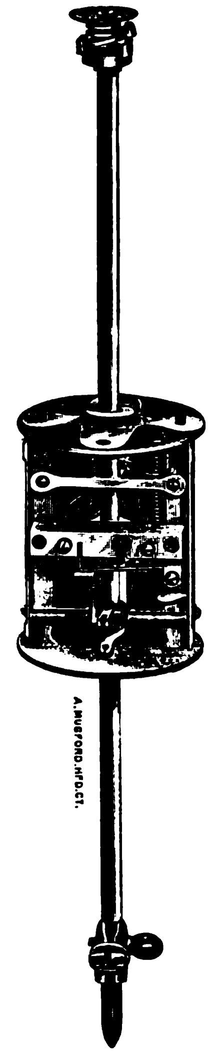
The firm of Waterhouse, Gamble & Company, of Hartford (New York office 45 Broadway), are meeting with excellent success in the sale of their various types of arc lamps. Mr. Gamble is widely known as a successful business man, and the name of Waterhouse is one of the oldest in the electrical trade. Mr. W. T. Partridge, of the firm, is in charge of the New York office.

Mr. Waterhouse has been a fertile inventor, and the line of lamps handled is varied and covers everything needed.

Their specialties just now are Ornamental Lamps of extra finish and artistic design; Railroad Circuit Lamps to run on currents of variable E. M. F., controlled by an automatic current regulating device; and a Fifteen Hour Lamp for 5-8 inch single carbon, guaranteed to burn from thirteen to fifteen hours under all conditions.

The special points of merit claimed for the Waterhouse Lamp are the following:

1. There *are no insulating washers* used in their construction, the insulations being confined to four solid pieces of cement, thus doing away with short circuiting and the other annoying features heretofore so common in other kinds of arc lamps.



A.MUSFORD.HFD.CT.

FIG. 1.

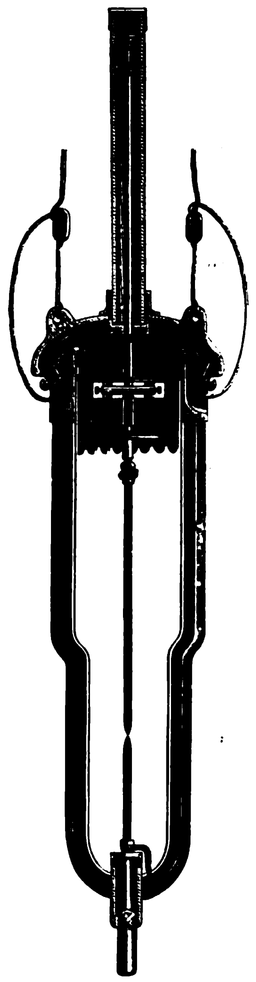


FIG. 2.

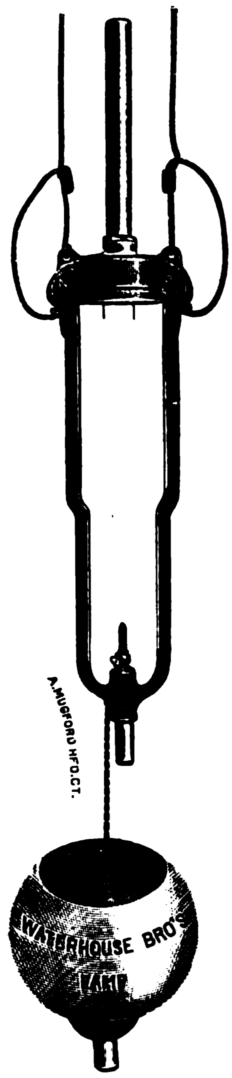

FIG. 3.

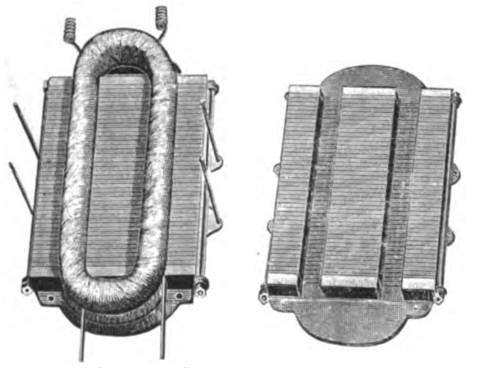
2. The magnets are double, strong, and adjusted in their position so perfect alignment is secured.

3. The armature hangs and has its pull on the clutch in an exactly perpendicular line, so that all side friction or necessity of transmitting motion through pivots is avoided, thereby securing a sensitiveness as near perfect as can be reached.



DIAMOND TRANSFORMER. FIG. 3.

4. The clutch is made durable, and by the assistance of the atmospheric clamping device shown at the top of Fig. 2, a steadier and finer feed is secured than is to be found in other lamps on the market, making them particularly desirable on incandescent circuits. The durability of the plunger used in this device is beyond question, it being made of soft, pliable material that prevents the possibility of sticking or hanging and is practically free from wear or deterioration, as has been proven by a test to 750,000 strokes, equivalent to trimming a lamp once a day for over 2,000 years.

5. The Globe Holder is a great improvement over all forms, being dust-tight for inside and well drained for outside use, and enabling the attendant to clean out the globe without unscrewing it.

Fig. 1 shows cage made of a single casting containing all working parts of the lamp and showing atmospheric clamp on top of carbon rod.

Fig. 2 shows all insulations (four pieces) in black.

Fig. 3 shows lamp frame for either incandescent or arc, with chimney and globe holder attachments, works removed. The two wires extending down from underside of top are the electrical connections

Any good uncoated carbons can be used with these lamps if lamps on incandescent circuits receive 110 volts or more per pair. If less than 110 volts, cored carbons for top and solid for bottom will be required.

An English company has been formed to associate with Waterhouse, Gamble & Company, and Mr. Addison G. Waterhouse, has recently sailed for Liverpool to assist in starting a plant on the other side. The machinery is already purchased, and the tools, which have been made at Hartford, will be shipped this month.

The Varley Magnet Winding.

The method of winding magnets in vogue to-day is the same, with the exception of some minor details, as when the industry was first created. A recent invention of Mr. Richard Varley, Jr., is quite a departure from the old-time methods of winding, as well as the design of the machinery used in the manufacture of electro-magnets.

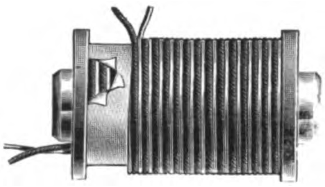


FIG. 1.

Owing to the fact that insulated magnet wire of small size costs in the neighborhood of twice as much as bare wire of the same size, it will be seen that by the use of the duplex system, as it is called by Mr. Varley, its inventor, a considerable saving in the cost of manufacture is effected by this system in this item alone.

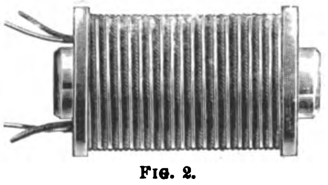

FIG. 2.

The definition of an electro-magnet has been given as "a soft iron wire surrounded by many turns of insulated wire," and while the illustrations show that this definition is not literally adhered to in the case of the Varley magnet, the conditions which are implied are attained by a cheaper method.

Fig. 1 shows the Varley magnet partly constructe and the general method of construction. Two wires are wound simultaneously by means of a special machine, one of these being a bare wire, the covering of the insulated wire serving the purpose of insulating the two parallel strands. The different layers of wire are separated by means of a layer of paper which serves to insulate them.

Fig. 2 shows a complete spool as turned out by this machine. There are four ends exposed which may be connected so as to put the windings either in series, parallel or differential connection as desired.

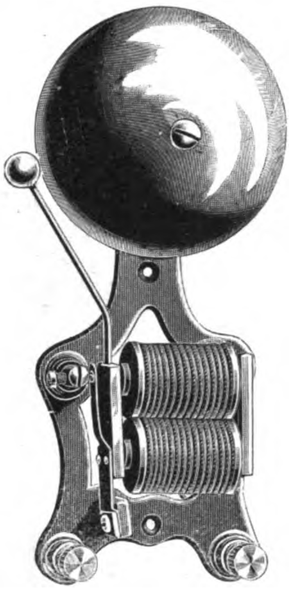

FIG. 3.

Fig. 3 shows an electric bell fitted with the "duplex" magnets.

The chief object of the manufacturer to-day is to cheapen the cost of construction, and the Varley magnet reduces this cost to the lowest point. The saving of space which results from the use of this electro-magnet also adds to its effisiency by reducing the amount of copper wire used as well as the size of the spool. In this respect the Varley winding will be of great service, as considerably more wire can be used in the same space than is possible with all-insulated wire, and in the cases of apparatus using small currents the insulation resistance need not be extremely high.

Cincinnati's Leading Supply House.

Houliston & Company, 161 Plum street, Cincinnati, are doing a thriving business in the sale of supplies and various specialties. They are agents for several of the "good things," chief among which being the Mather dynamos and motors, Perkins lamps, Carpenter heaters, and Eureka tempered copper. Everything needed for a lighting plant can be bought of Houliston & Company, and perfect satisfaction is guaranteed to their customers.

COMMERCIAL PARAGRAPHS.

The Card Motor and Dynamo Company of Cincinnati are doing a flourishing business, and will move into more commodius quarters early in the spring. They purchased a factory site some time ago, and work on the building is progressing rapidly. Mr. Wilshire is demonstrating the fact that he knows his business.

The Phosphor-Bronze Smelting Company of Philadelphia, who were the original manufacturers of this line in America, maintain their position at the head of the column. Their "Elephant Brand" is as popular as ever.

Mr. George W. Beatey, who has constructed quite a number of electric roads in New England and formerly handled Westinghouse apparatus, now occupies an extensive suite of offices in the Hathaway Building, 620 Atlantic avenue, Boston, and represents the Dewey Electric Heater Company, also the Detroit Electrical Works. He has at the present time quite a number of important contracts in hand, and with his wide reputation and extensive facilities, he is in a fair way for continuing to do a large business. He is one of those who have a fortunate way of getting ahead and is adding to his excellent reputation right along.

The Consolidated Electric Manufacturing Company, of Boston, has recently issued a neat little illustrated catalogue in cloth and gold, which will be found invaluable to all in the elecctrical business. The multitudinous devices this company manufactures and handles are described and prices given, so that prospective purchasers can make no mistake when placing their orders. Under the enterprising management of Mr. C. E. Bibber, this company is rapidly getting to the front and is about to place on the market certain apparatus that is bound to secure popular favor. The little New Year's souvenir, consisting of a celluloid whist marker, circulated by this company is in extraordinary demand.

Mr. H. C. Hawks, well known throughout New England as a first class constructing electrical engineer, has sold out his business to the Hawks Electric Company, which occupies a handsome suite of offices in New England Building, Sumner street, Boston, where a full line of supplies and specialties will be carried. Mr. Hawks has been retained as treasurer and general manager of the company, and the many important contracts now in hand will be carried out under his personal supervision.

The prosperous Electric Gas Lighting Company has just removed into a large factory on Dover street, Boston, where with greatly increased facilities it will still further extend its now colossal business in the manufacture of every kind of domestic electrical apparatus. This company occupies a foremost position in the country in this branch of the electrical business.

The Mather Electric Company, Manchester, Conn., and Boston, has recently issued a handsome little pamphlet entitled "Practical Thoughts by Practical Men," in which, among other interesting matters, are given the opinions of many eminent men and companies on the merits of the well-known Mather system of electric lighting. The voluminous list of purchasers and users of this system furnishes convincing proof of its efficiency and popularity. The company has had to enlarge its factory to keep pace with the demand for its apparatus.

The Electrolier Manufacturing Company of Pittsfield, Mass., will soon be in the market with a full line of fans, bells, automatic adjusters for electric lamps, etc.

The Giant Motor Company of Portland, Me., is about to erect a very large manufacturing plant, being four two-story iron buildings, each 150x75. The Berlin Iron Bridge Company has the contract for the work. The Giant Company has bright prospects.

The Jenney Motor Company of Indianapolis has just put in a fine electric power and lighting plant for the Williams & Powell Brass Works Company of Cincinnati. The plant is a model one, and has attracted considerable attention.

The Belknap Motor Company of Portland, Me., has just installed a 150 light dynamo in the factory of the Portland Stone Ware Company. This company has built up a very satisfactory local trade, and is now working over a wider territory.

INCORPORATIONS.

The Durango Light and Power Company, Durango, Colo. Capital stock, $200,000. Directors Clinton Reed, Sam P. Rose, William C. Henry, E. R. French and H. V. Johnson. The design of the company is to operate a gas and electric light plant in Durango.

The Spartanburg, S. C., Electric Light and Power Company, having made application to the Secretary of State for power to increase its capital stock from $30,000 to $75,000, has been empowered to do so.

The Columbus and Harrisburg Electric Street-Railway Company, Columbus, Ohio. Capital stock, $1,500. Incorporators: Joseph M. Briggs, Adam G. Grant, Gideon D. Martin, John S. Young, J. H. Chenoweth, Levi Hite and George M. Stark.

The following certificates have been filed with the Secretary of State at Lansing, Mich.: Edison Illuminating Company, Detroit, capital increased $300,000 to $350,000; Excelsior Electric Company, Port Huron, capital increased to $150,000.

The Electrolier Manufacturing Company, Newark, N. J. Capital stock, $100,000. Incorporators: Benjamin E. Chapin, Newark; Henry D. Sisson, Charles H. Robinson and Mortimer H. Haynes, Pittsfield, Mass; and Henry [illegible] Sisson and Edward F. Blodgett, Mill River, Mass.

The Waterhouse Electric Company, Hartford, Conn. Capital stock, $20,000. Incorporators: Addison G. Waterhouse, Frank G. Waterhouse and George L. G. Waterhouse, all of Hartford. The company was organized for the manufacture and repair of all kinds of electrical apparatus and machinery, to buy, sell and deal in the same, promote electrical inventions and to conduct experiments therefor.

The New Haven Electric Company has increased its capital from $300,000 to $400,000, and the number of shares from 3,000 to 4,000 of $100 each.

The Brooklyn Traction Company, Brooklyn, N. Y. Capital stock, $10,000. Directors: E. D. Phillips, Albert Strauss, Henry S. Glasier, E. J. Kavanagh, of New York City, and P. F. Vaughan and J. H. Lockman, of Brooklyn. The company was formed for the purpose of constructing street railways and equipping them with electricity and other power. The principal office of the company will be in Brooklyn.

The Englewood and Chicago Electric Street Railway Company has just been organized and incorporated with a capital stock of $1,000,000. The road will be twenty-five miles in length. James P. Mallette, of the real-estate firm of Eggleston, Mallette & Brownell, Chicago, was the prime mover in the organization of the company.

The Pittsburg Gas and Electric Fixture Manufacturing Company, Pittsburg, Pa. Capital stock, $10,000. Directors: John M. Thompson, Edmund Mudge, David F. McKee, Robert B. Ivony.

MUNICIPAL ELECTRIC LIGHT CO.,
BROOKLYN, N. Y., July 19, 1892.
HENRY A. REED, SEC'Y BISHOP GUTTA-PERCHA CO.
Dear Sir: We can candidly vouch for the superior quality of the Bishop insulation, as it has withstood the weather, falling wires, etc., during our two and a half years' service without accident or trouble of any nature on our aerial lines or in our house wiring. The severe storm of the winter of 1890-'91, which obliged all other plants to "shut down," caused no injury to our alternating circuits. Yours respectfully,
JAMES FERGUSON, *Sup't.*

THE WARD :-:

Lancaster, Pa.,
Write as follows: "We must change some of our cars, so as to use your 'Lyon' brake handle. Fill enclosed order as soon as possible."
All railway companies which desire first class equipment are falling into line and ordering "Lyon" brake handles, made only by the
Consolidated Electric Manufacturing Co.,
355 Congress Street,
Boston, Mass.

THE best system for an Electric Light plant in a mill, factory or any large building is the incandescent and arc combined.

Put in a low voltage incandescent plant; use the incandescent lamps for offices, etc., but wherever you have large spaces to light use the

"WARD" Arc Lamp.

Safe, reliable and economical. The only satisfactory lamp made for such circuits. Many thousand in use.

We manufacture single and double carbon, street railway, photo-engraving, theatrical and search lamps.

Established 1881.

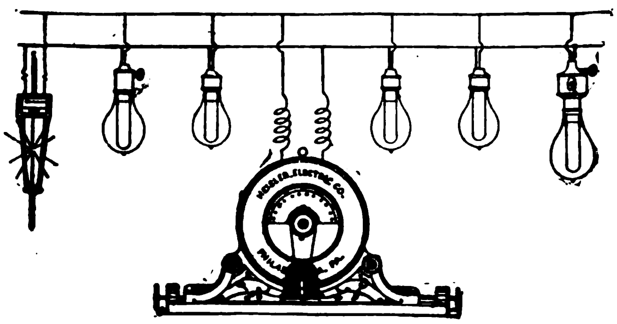
The Heisler Alternating Current CONSTANT POTENTIAL Incandescent System,



EQUIPPED WITH REGULATING LAMP SOCKET.

With this system it is possible to regulate each individual light at any desired degree of brilliancy, resulting in a saving in current as well as prolonging the life of the lamp.

This system is efficient and reliable, and specially adapted for isolated plants for the lighting of Hotels, Educational Institutions, Hospitals, Municipal and Office Buildings, Private Residences, etc.

The apparatus is simple, compact and economical, having no complicated appurtenances, self-gulating, and can be installed as conveniently as the ordinary direct current type of apparatus.

If desired, arc lights and motors can be operated upon the circuits.

Estimates furnished of complete installation of isolated plants. Satisfaction fully guaranteed.

PREMIUM ANNOUNCEMENT, 1893!

* * *

As a Special Inducement for New Subscribers to

"ELECTRICITY"

we make the following very liberal offer:

To any one sending us SIX new subscribers and $15 we will send, postage paid, any BOOK or BOOKS mentioned in our BOOK LIST, to the value of $5.

AND

IF YOU WANT A BOOK

which is not mentioned in our list, please advise us, and we may be able to include it in our offer.

B. E. GREENE, Publisher,
6 Park Place, New York.

Westinghouse Electric & Mfg. Co.,

Pittsburgh, Pa.

TO THE USERS OF INCANDESCENT LAMPS.

The shipment of our new stopper lamps will begin early in January.

In making this announcement, and in quoting prices, we take pleasure in giving particulars which will indicate some of the many advantages the users of our apparatus will enjoy.

FIRST—The new lamps are made in separable parts, so that the carbon burners may be replaced, and the glass parts used repeatedly; and their bases being molded of uniform size to fit a specially designed socket, the lamps are neater in appearance than the all glass-globe form.

SECOND—The carbon burners will be preserved by an attenuated atmosphere of nitrogen, and their candle power maintained more nearly constant than heretofore by means of a recent important discovery.

THIRD—Special sockets of neat design will be employed for these lamps, and special fittings will be supplied at five cents each, which will adapt any of the forms of sockets now in use to receive the new lamps, thereby bringing about exact uniformity in lamp bases.

FOURTH—By reason of the manufacture of the lamps by special machinery and improved methods, by the use of nitrogen for preserving the carbons, and by means of pumping and charging apparatus recently perfected, WE HAVE BEEN ABLE TO SO REDUCE THE COST OF MANUFACTURE AS TO FIX OUR PRICES FOR 8, 10 AND 16 CANDLE POWER LAMPS AT

30 CENTS EACH,

subject to a discount of 10 per cent to our central station customers,

and to others from 2 1-2 per cent. upward, according to quantity,

with an allowance of 10 cents for every burned out lamp returned unbroken

to any one of our factories, making the net cost OF RENEWALS FOR THE 8, 10 AND 16 CANDLE POWER LAMPS 17 CENTS to our central station customers. For 20 and 25 candle power lamps the prices will be 35 cents each, subject to the same discount and allowance for burned out lamps.

By long and careful tests, and by the use of a large number of these lamps in our works, we have demonstrated that the new lamp will have greater advantages for users than the Edison lamp or any of those heretofore upon the market.

The importance of the improvements in manufacture by which we have been enabled to offer these lamps at so low a price will be appreciated by all users who are aware of the constant deterioration in the carbon burners, and of the fact that the real commercial efficiency of a lamp is its average efficiency. With a constant amount of electric current the ordinary 16 candle power lamps rapidly fall below 10 candle power from deterioration of the carbon, when they must be renewed; and it results from this that the users, with cheaper lamps, will get from

15 TO 20 PER CENT MORE LIGHT

from a given expenditure of electricity by a more frequent renewal of lamps than is now customary. Thus the low cost of the lamps may be made to add to the revenue of a lighting station in one of two ways, viz., either by giving a greater lighting capacity at the present cost of lamp renewals, or by actual saving in the cost of lamps with renewals made at the present period of renewal.

The problem of manufacturing a sufficient number of lamps to supply the entire demands expected from the users of electric light is a difficult one to meet quickly. We are preparing to turn out from

15,000 TO 20,000 LAMPS DAILY,

and in addition to this to renew the carbons in returned burned out lamps to any extent that may be required. During the month of January we expect to be able to take care of all of our customers who must have the new lamps, and rapidly thereafter to fill all the orders with which we may be favored.

We are also contemplating the erection, as the business develops, of "renewal stations" in all large cities, such as New York, Boston, Philadelphia, Chicago, Cincinnati and St. Louis,

thereby reducing the cost of shipment and return of lamps for renewals and still further reducing the net cost of the lamps to our customers.

THE "CLARK" WIRE.

INSULATION GUARANTEED WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE.

In a letter from the Inspector of the Boston Fire Underwriters' Union, under date of March 29, 1886, he says: "A thoroughly reliable and desirable Wire in every respect."

THE rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound and special extra finish, which we have now adopted for all our solid wires as an extra weather proof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fire-proof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Light from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

CLARK JOINT GUM should be used for making water-proof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inches wide, and when wrapped about a joint and pressed firmly it makes a solid mass. FOR RAILWAY and MOTOR use, we make all sizes of stranded and flexible cables with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE,
And our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

GENTLEMEN: The lamp we received from you a few weeks ago works first class. We put it on and tested it with a 5-8 inch plain carbon, and it burnt fourteen hours and fifteen minutes actual time. I have since placed it out on the street and it is working first class. I consider you have got as good a lamp as I have ever seen. Please send me a rod and chimney to fit the other lamp that I have, also a pair of hooks to go on the hanger board to hang the lamp with, as none came with the first one sent me.

Respectfully yours,
GEO. W. PHILLIPS, Supt.

WESTINGHOUSE ELECTRIC AND MANUFACTURING CO.

PITTSBURGH, PA.

MANUFACTURERS OF APPARATUS FOR

ARC and INCANDESCENT LIGHTING

LONG DISTANCE TRANSMISSION OF POWER, STREET RAILWAY GENERATORS,

MOTORS AND APPLIANCES

OUR alternating current incandescent apparatus is in use in 430 central stations. 1000 isolated plants. Our arc apparatus is in use all over the world. We are now transmitting light and power various distances up to 28 miles from the source. Our multipolar railway generators and noiseless single-reduction motors have worked a revolution in the electric railway field in two years.

Orders for APPARATUS, REPAIRS and SUPPLIES, formerly furnished by the United States Electric Lighting Company, Newark, N. J., should now be sent to this Company, where they will receive prompt attention.

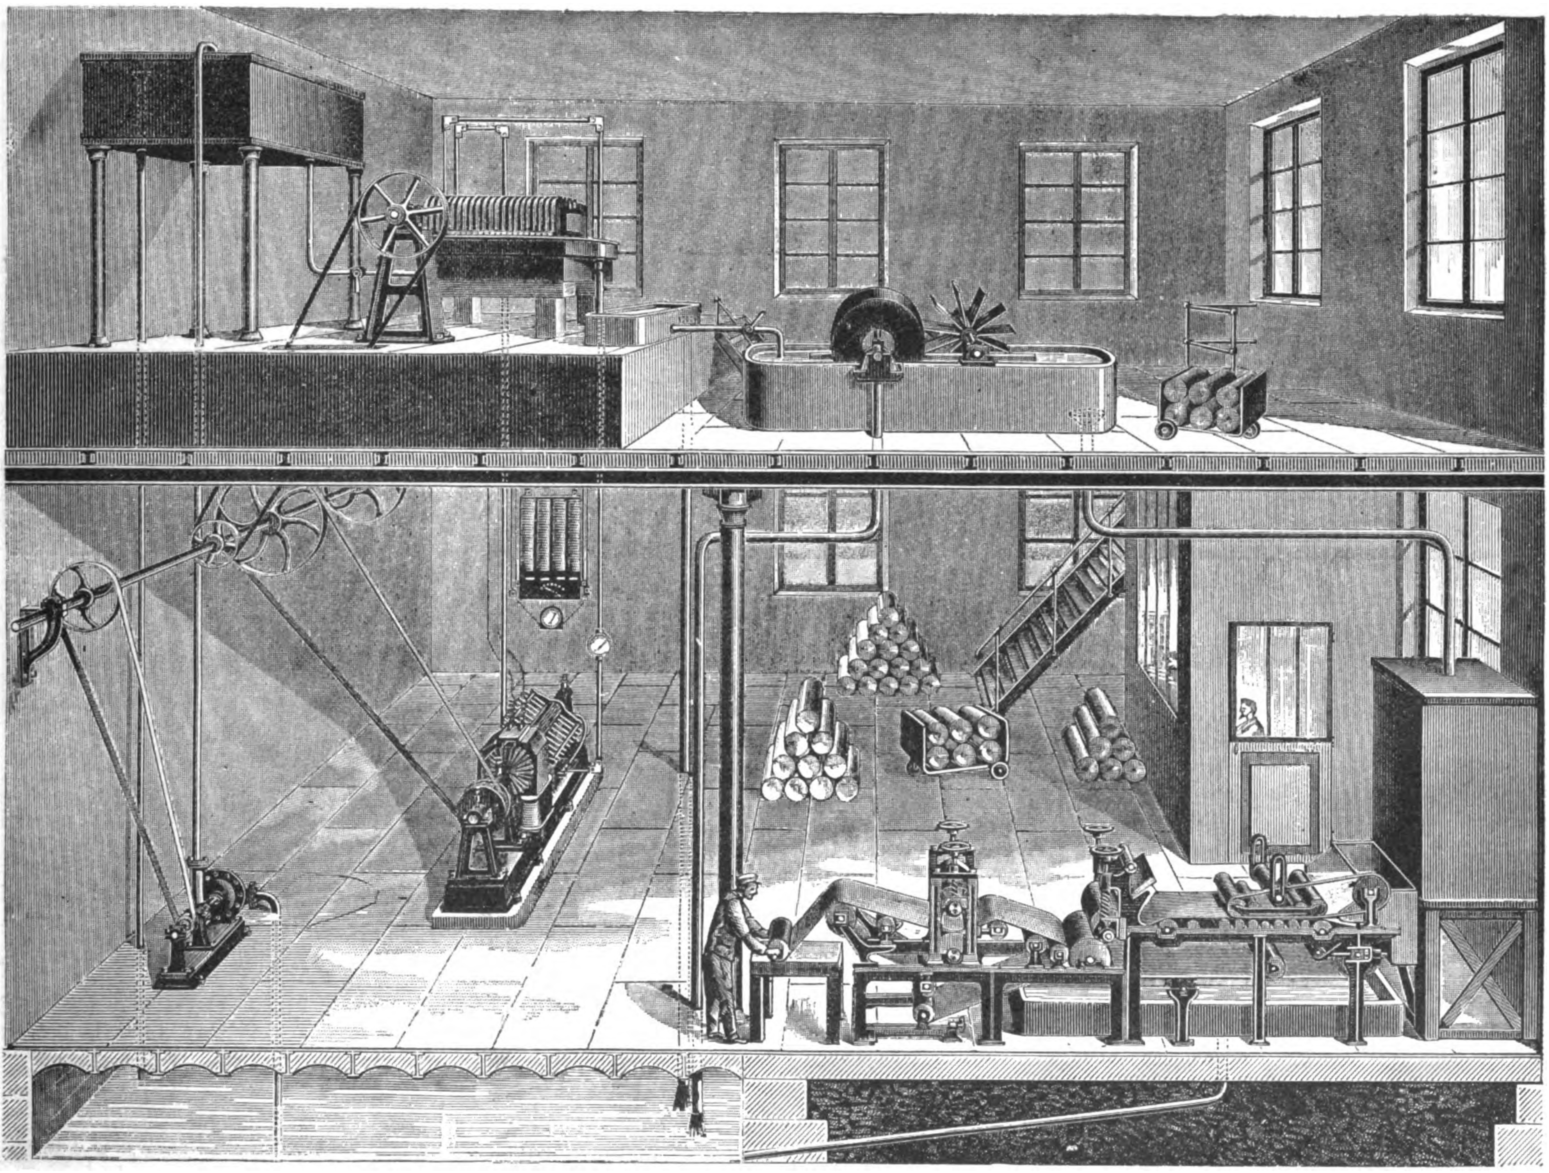
ELECTRICITY.

VOL. IV. NEW YORK. JANUARY 25, 1893. CHICAGO. No. 2



GENERAL VIEW OF PAPER PULP BLEACHING PLANT. (SEE PAGE 14.

Electro-Chemical Bleaching.*

At its meeting of May 8, 1892, Mr. Hermite gave the Society an explanation of his new process for bleaching vegetable materials by means of electricity. Your committee on chemical arts, recognizing the importance of Mr. Hermite's work has appointed a committee of two members to inspect the works of Montgolfier & Company, where this process is in operation, in order to study in detail this new method and make its report to the Society. I have the honor to present the following report embracing the results of the committee's investigation :

The principal bleaching agents for vegetable fibres are the chlorides of lime or of sodium, which are formed by the action of free chlorine on lime or sodium. In order to obtain a continuous flow of these chlorides without recourse to the use of free chlorine, it has been customary to decompose an aqueous solution of sodium chloride by an electric current with the idea of producing directly a solution capable of replacing with advantage those generally employed. These attempts, however, have not succeeded in producing practical results.

Mr. Hermite resumed experiments in this direction in 1883, after having carefully studied the reactions which occur in decomposing chloride of sodium by electricity; and after becoming convinced that the use of this salt alone was impracticable, he was led to examine the processes of decomposition of the various alkaline chlorides and alkaline earths and finally chose chloride of magnesium, a salt found in abundance and besides being quite inexpensive offers the following advantages : it is neutral, the solution properly diluted offers only a slight resistance to the current, the heat generated by its chemical union is slight, and its decomposition by the current is consequently easy. In the free state it does not produce any deterioration of the fibres, and it is well known that vegetable fibres are less affected by the action of magnesium hypochlorite than by any of the other alkaline hypochlorites or alkaline earths. In his experiments to determine the conditions under which the chloride of magnesium could be utilized, Mr. Hermite found that it could not be used alone, as in its decomposition an oxychloride was formed which coated the electrodes, and thus hindered the passage of the current. In order to avoid this, Mr. Hermite made use of a dilute solution of chloride of magnesium mixed with another saline solution.

The following was found to give the best results :

Water	1000
Sodium chloride	50
Magnesium chloride	3

When this bath is decomposed by the current only the chloride of magnesium and the water appear to be acted upon by the current and there is formed at the positive pole a compound capable of energetic bleaching action, while at the negative pole gelatinous magnesium is deposited which, on account of the small quantity of chloride of magnesium present in the solution, is prevented from forming an oxychloride.

As the magnesium deposited at the negative pole does not remain in the liquid long enough to combine with the compound of oxygen and chlorine liberated at the positive pole, Mr. Hermite adds to the solution a certain quantity of magnesium hydrate produced by precipitation of magnesium by caustic soda. There is no trouble on account of the presence of free soda which is produced by the decomposition of chloride of sodium as this reacts immediately on the chloride of magnesium.

Besides, the solution always contains some combined magnesium, which is shown by the deposit that is precipitated at any moment by an alkaline solution.

The standardizing of the bleaching liquid is done in the same way as for the commercial hypochlorites, by means of a standard solution of arsenious acid. The baths employed by Mr. Hermite contain from ½ gram to 2 grams at the maximum of chlorine per litre.

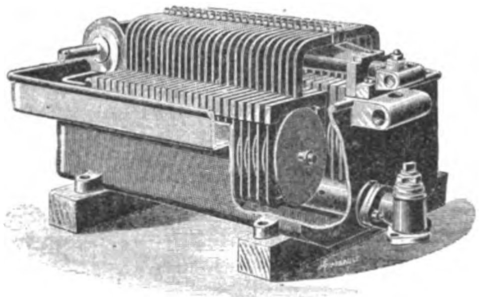


FIG. 1.

According to the inventor, the liquid should contain a hypochlorite entirely neutral, and it is to this condition that he attributes the remarkable properties of this product, which bleaches the most delicate fibres without otherwise affecting them, and even materials which we could not think of treating with the commercial hypochlorites.

The apparatus employed by Mr. Hermite for this process is illustrated in Fig. 1. A rectangular galvanized iron tank is provided with a channel around its upper edge, and a perforated tube provided with a zinc faucet runs along the bottom of this tank in the direction of its length. The solution is taken from an elevated reservoir into one end of this tube, and after filling the tank overflows into the channel and is led off by a pipe opening into it. A continuous circulation of the solution is thus maintained through the tank.

On each side, and a little above this perforated tube, are two shafts which revolve slowly and which as well as the tank are connected to the negative pole of the generator. On these shafts a number of zinc discs are mounted as shown, which together form the negative electrode.

The positive electrodes consist of plates of platinum gauze mounted on ebonite frames (Fig. 2). These plates are connected to a copper bar on top of the tank by means of insulated lead strips. The plates have also a slot, as shown, through which the shafts containing the zinc discs pass without making contact, leaving the positive and negative plates situated alternately along the shaft. The current enters at the copper bar, passes from the platinum plates through the solution to the zinc discs, and completes the circuit through the iron tank.

In order to maintain the zinc discs in position, flexible blades of ebonite are placed on the positive plates which press against the discs, and as the latter revolve continually the blades detach any deposits forming on the zinc. The arrangement is such that positive plates may be separately removed and repaired without interrupting the progress of the work, and the tank may be easily cleaned by means of a lateral opening with which it is provided.

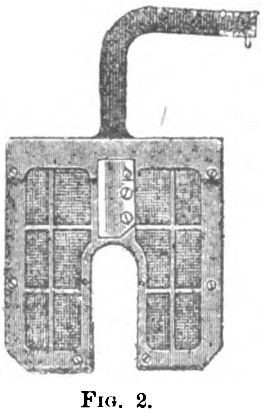

FIG. 2.

When several of these machines are used they are connected in series. At Haye-Descartes a current of 1,200 amperes at an E.M.F. of five volts is used. Measuring instruments are placed in the circuit which enable the work of the apparatus and the power consumed to be calculated at any moment. The operation of the machine is very simple ; the wear on the electrodes is practically nothing, and every month the tanks are thoroughly washed.

In order to give a more complete idea of the use of Mr. Hermite's apparatus, a description is given of the manner in which it is employed for bleaching paper pulp. Fig. 3 shows the arrangement of the plant.

The solution passes from the reservoir A into the electrolyzing tank B, and from that into the bleaching battery C, which is provided with a washing drum D that draws off the liquid after its action on the pulp into a lower reservoir of cement or galvanized sheet iron E from which it is pumped into the reservoir A. The solution is thus kept in continual circulation through the system. The pulp in the bleaching battery is lowered into tank G, from which it passes under a press. The liquid pressed out falls into the lower reservoir E, and is raised to A by the pump J.

As the quantity of pulp put into the bleaching battery in a given time is estimated so as to absorb only the chlorine compound which the machine will produce in the same time, the standard of the composition of the circulating bath remains almost constant. This effects the bleaching very rapidly and very completely.

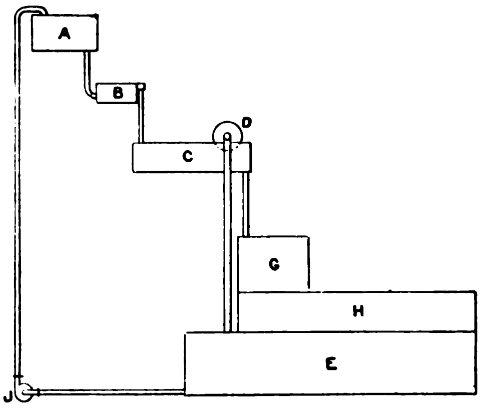

FIG. 3.

The liquid which has been exhausted in the bleaching process on the pulp contains among its products of decomposition some hydrochloric acid which with the magnesium hydrate in suspension in the bath restores the magnesium chloride.

Mr. Hermite estimates that for 100 kg. of dry pulp there is lost about 150 kg. of liquid which remains in the pulp and cannot be recovered ; this corresponds to a loss of 7.5 kg. of sodium chloride and 0.75 kg. of magnesium chloride. The economy which results from this process of bleaching varies with the location of the paper factories and the cost of motive power. It is from 40 to 70 per cent. The following figures are furnished by Mr. Hermite :

An electrolyzing machine of the Hermite system produces in twenty-four hours the equivalent of 100 kg. of dry chloride of lime using a maximum of 10 H. P. Chloride of lime is worth 20 to 22 francs per 100 kg. in France, delivered at the factories. Consider now the cost of the equivalent of this 100 kg. of chloride of lime in the cases where water power or steam is employed.

In factories using water power the cost is 5.22 francs—including the purchase of the electrical supplies, but not taking account of the labor, which is the same as with the use of chloride of lime—being approximately a saving of 80 per cent. These figures are based on the actual operation of the system for two years.

---

* Report of the Committee of Chemical Arts of the Society for the Promotion of National Industry, by Mr. De Luynes. Translated from *L'Industrie Electrique*.

In factories where steam power is employed the net cost will be 10.02 francs, being 50 per cent. saving. This latter estimate may be reduced in localities where coal is very dear, but according to Mr. Hermite it will always reach 40 per cent.

It is under these conditions that your delegates have seen the operation of the Hermite system, for which the motive power is supplied by turbines situated on the Creuse River. The batteries are composed of two groups of five cells each which produce annually the equivalent of 300,000 kg. of chloride of lime.

The importance of these results which open a new path to the industry of bleaching, and the careful use which Mr. Hermite has made of this scientific method to add another solution to the problem of bleaching vegetable matter, are worthy of the Society's greatest interest.

Your Committee of Chemical Arts propose to thank Mr. Hermite for his interesting communication, to offer him congratulations on his success and to insert this report in the *Bulletin*, with drawings of the apparatus.

A view of the installation for bleaching paper pulp is given in the frontispiece.

On the upper story is seen a reservoir connecting with an electrolyzing tank, and the solution on leaving the latter falls into a cement vat, and from that into the bleaching battery, in which has previously been put a suitable amount of the pulp to be bleached.

This pulp after being bleached is carried by a pipe, which passes under the floor of the first story, to the press, while the solution contained in the battery is taken by the washing drum and carried to the tank below, shown at the left of the basement.

The pulp is collected after leaving the press while the solution pressed out is carried to the lower tank, which also receives the various additions necessary for the work.

The centrifugal pump, represented at the left in the basement, raises the solution to the upper reservoir, thus keeping up a continual circulation of the solution.

The dynamo at the right of the pump furnishes the necessary current, and behind it on the wall is arranged the regulating apparatus.

Electrical Recording Meters.

BY CARYL D. HASKINS.*

I propose to briefly describe and discuss the leading elements which, singly or combined, have gone to make up the typical meters presented to the public up to the present time. I find myself limited to generalities, and the mathematical theory, and strictly technical considerations have necessarily been neglected that the field might be approximately covered.

The earliest meter patent was granted in 1872 to Mr. S. Gardner of New York City, and the principle of a magnetic or electro magnetic release for a simple clock movement is preserved in two or three so-called time-counters to-day and is doubtless very useful for many purposes; as for example in the Spaulding clock for registering the hours of use of a motor, or other similar devices for registering the hours of use of arc circuits. These devices I shall neglect; they are not meters within the true sense of the word, and their simplicity is obvious.

The earliest successful meters, if we consider classes rather than individual instruments, were the chemical meters, closely followed by thermo-meters.

The chemical meter is obviously capable of giving most accurate results: in fact, with proper manipulation, it is very doubtful whether any measuring device which has up to to-day been designed could more correctly sum up passing power. It is in the manipulation and care which such meters require that their fault lies—if fault there be.

An electro-plating bath in its meter form as generally used does not, however, give a dial indication, and the consumers ask for a dial indication almost invariably, unless they have already become thoroughly familiarized with Edison meters as used by many large Edison stations.

Many very ingenious and some quite successful attempts have been made to actuate a train of gears by the electro-deposition of an electrolytic bath. Thus, we have two electrodes suspended at the opposite ends of a walking-beam, as shown in Fig. 1. This walking-beam is in various ways connected with a pole changer, and as but a small portion of the current being measured passes through the true meter (for of course almost all chemical meters are shunted) the pole-changer is not perhaps a very serious objection.

The action of such a meter as this is obvious; we have a deposit from one electrode onto the other, until the second electrode becomes the heavier, when the beam tips and the recording device is set one notch ahead, the pole-changer is thrown over and the deposit takes place in an opposite direction, the former plus electrode becoming the minus, and so on. This device deposits and reposits the same zinc, or rather electrode material. Again, we have a modification of the same device in the form of a wheel bearing a number of electrodes, and on the same principle setting up continuous rotation.

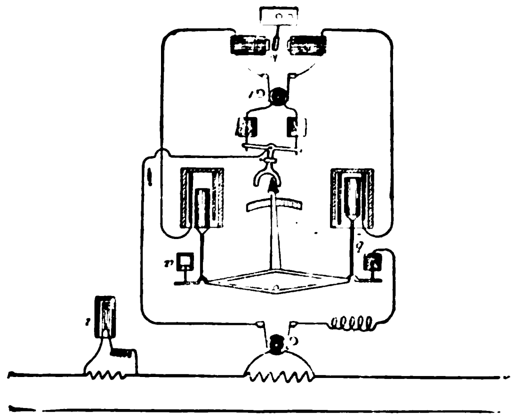

FIG. 4.

It should be noted that in this first digression from the chemical meter we at once meet with the prime factor of difficulty in all motor meter construction—that of friction, which, if uncompensated, must invariably introduce more or less serious error.

Another form of self-registering electrolytic meter has a cathode plate suspended from a spring balance, an ordinary sensitive spring weighing machine, and the heavier the cathode grows so much greater is the registration of the spring indicator. This device is perhaps preferable to the reciprocating movement just described, but is limited in the capacity of the spring, and probably lacks sensitiveness to small amounts, being dependent of course solely upon the nicety of construction in the spring-balance.

Mercury has at times been employed in the construction of electrolytic meters, and with at least moderate success, for with a mercury anode and a cathode of the same or other material, a record easily measured may be obtained, and such a meter may even be made self-registering in a graduated tube or by half a dozen other more or less simple means. Such are the more typical electrolytic meters.

Another form of chemical meter formerly quite popular among inventors depended for its registration upon the decomposition of water, generally acidulated water, and sometimes upon the decomposition of more volatile substances. This class of meter may very properly be divided under two heads:

First, those meters simply dependent upon the measurement of the gas developed by the decomposition of water through any gas registering device. In fact, we may say that such meters are mere decomposing baths connected to a gas meter. There are some devices of merit which may be classed under this head, but the principle is probably not commercial, for we have nothing very successful of this kind in use to-day.

One of the more ingenious meters of this kind provides a diagonally placed rotating wheel with pockets; the decomposition takes place directly under each pocket progressively, and as the air pocket fills with gas the wheel rotates sufficiently to free this gas at the surface of the fluid, bringing another pocket into place. Others have a rising and falling diaphragm like the popular gas meter, and still others a delicately poised air fan over a minute aperture. This last device is obviously most inefficient.

The second group of meters under this classification bring us to the thermo-meters, a typical group containing a few meters of more or less pronounced merit.

Those thermo-meters depending upon volatization of a fluid generally have two or more sealed bulbs partly filled with some volatile fluid, as for example, naphtha or ether. When two such bulbs are used, they have generally been mounted on a walking-beam mechanism combined with a pole-changer, each bulb containing some kind of a rheostat or heat developing device dependent for its heat on the current passing through the meter, the two bulbs communicating with one another. The rheostat in but one bulb is in circuit. The heat developed in the rheostat in circuit volatilizes more or less rapidly the fluid contained in this bulb, according to the current passing through it. The gas developed either passes in gaseous form into the second bulb and condenses, or else, as is more common, forces the fluid remaining by the simple increase of pressure into bulb No. 2, which at once becomes heavier and causes its end of the beam to fall. This throws the pole-changer, and the rheostat in the second bulb is thrown into action, repeating the operation as just described. To be successful, such a device must be very sensitive, and to be sensitive, the construction must be of a more or less expensive character and so delicate as to be to a greater or less degree prohibitive. Like the walking-beam meters just described, instruments of this class have been designed with a number of bulbs mounted on a rotating wheel; the same actuating principle holding true for all such devices.

Another ingenious form of thermo-meter, no longer in any sense a chemical meter, is an instrument dependent for its action upon the heat in a confined but circulating atmosphere. Thus a rheostat dependent for its heat upon the amount of current passing is so arranged as to heat a body of air, which, by the peculiar construction of its receptacle, at once commences to circulate more or less rapidly, dependent upon the heat. It is obvious that if a delicate air fan, a screw propeller in fact, be suspended over such a circulation of air, its speed would increase with the speed and volume of circulation, and one of the most ingenious and most interesting meters that it has ever been my good fortune to see is the Forbes meter, constructed on this plan. But here friction is the most serious consideration, the torque obtained in this manner being necessarily small.

While the Forbes meter cannot perhaps be properly considered as a motor meter in the true sense of the word, it still must be classed as such in a certain sense, and I think it may safely be accepted as an axiom that to be successful in practical operation a motor meter of any kind must be of high torque, for it is only by the combination of high torque and compensated friction that accurate results can be obtained on light loads. I might say that almost any one can build a meter which will record fairly accurately on heavy loads; the difficulty is to build a sensitive and accurate meter for very light loads down to one lamp.

---

*Abstract of a paper read at the Seventy-third Meeting of the American Institute of Electrical Engineers, New York, January 17, 1893.

Some Mechanical and Electrical Analogies.

BY DR. F. BEDELL AND DR. A. C. CREHORE.

No phenomena are so readily comprehended as those which may be compared directly with facts that are familiar, and no reasoning is so quickly grasped as reasoning "by analogy." The analogies between certain mechanical and electrical relations are so striking that when either relations are understood the others follow, and from the laws of mechanics we can readily write those of electricity. The process is a reversible one and the electrician can with equal ease step over into the realms of dynamics. To enable one to reason accurately in this manner and to reach definite results with absolute certainty, it is necessary to give with exactness the fundamental relations of mechanics and electricity. The accompanying tables are, therefore, given showing the analogies between linear motion, motion of rotation and the electric current. Starting a current of electricity in a circuit is analagous to imparting motion to a body and requires an impressed force. This force must overcome the resistance (electrical resistance corresponding to that of friction) and the inertia of the mass or current. In the case of the electric current this inertia is called "self-induction." A revolving fly-wheel may well represent the flow of electricity, its velocity corresponding to the current, its moment of inertia to the coefficient of self-induction and the friction to ohmic resistance.

A study of the tables will make these analogies more clear. It is to be noted that the fly-wheel or moving mass in slowing down gives back its kinetic energy and the wheel is carried on, after the impressed force is removed, until this is entirely consumed in overcoming friction. Similarly, when the current diminishes upon the removal of the impressed electromotive force, the energy stored in the magnetic field is restored to the circuit and the current keeps flowing until the energy is entirely used up in overcoming the ohmic resistance.

These analogies cannot be considered as rigorous proof. The truth of the relations here given for the electric current has been fully established and may be found in the introductory chapter to our work on alternating currents. Other striking analogies will suggest themselves, but space will not permit calling attention to any but the most fundamental ones given above.

TABLE I.—LINEAR MOTION.

Notation.

1. time $= t$.

2. distance $= s$.

3. linear velocity $= v = \frac{ds}{dt}$. $ds = vdt$.

4. linear acceleration $= a = \frac{dv}{dt} = \frac{d^2s}{dt^2}$.

5. mass $= M$.

6. momentum $= Mv$.

Frictional Resistance.

7. frictional resistance $= R$.

8. force to overcome resistance $= F_R = Rv$.

9. energy expended in overcoming resistance in the time dt $\Big\} = dW_R = F_R ds Rv^2dt$.

Inertia.

10. force to overcome inertia $\Big\} = F' = Ma = M\frac{dv}{dt}$.

11. kinetic energy acquired in the time dt $\Big\} = dW' = F'ds = Mv\frac{dv}{dt}dt$.

12. kinetic energy $= W' = \int_0^v Mv\frac{dv}{dt}dt = \frac{1}{2}Mv^2$.

Inertia plus resistance.

13. total force applied $= F = F_R + F' = Rv + M\frac{dv}{dt}$.

14. total energy supplied in the time dt $\Big\} = dW = dW_R + dW'$;

or, $Fds = F_Rds + F'ds$;

or, $Fvdt = Rv^2dt + Mv\frac{dv}{dt}dt$.

TABLE II.—ROTARY MOTION.

Notation.

1. time $= t$.

2. angle $= \Phi$.

3. angular velocity $= \omega = \frac{d\Phi}{dt}$. $d\Phi = \omega dt$.

4. angular acceleration $= \alpha = \frac{d\omega}{dt} = \frac{d^2\Phi}{dt^2}$.

5 moment of inertia $= I$.

6. angular momentum $= I\omega$.

Frictional Resistance.

7 frictional resistance $= R$.

8. torque to overcome resistance $= T_R = R\omega$.

9. energy expended in overcoming resistance in the time dt $\Big\} = dW_R = T_R d\Phi = R\omega^2dt$.

Inertia.

10. torque to overcome inertia $= T' = I\alpha = I\frac{d\omega}{dt}$.

11. kinetic energy acquired in the time dt $\Big\} = dW' = T'd\Phi = I\omega\frac{d\omega}{dt}dt$.

12. kinetic energy $= W' = \int_0^\omega I\omega\frac{d\omega}{dt}dt = \frac{1}{2}I\omega^2$.

Inertia plus resistance.

13. total torque applied $\Big\} = T = T_R + T' = R\omega + I\frac{d\omega}{dt}$.

14. total energy supplied in the time dt $\Big\} = dW = dW_R + dW'$;

or, $Td\Phi = T_Rd\Phi + T'd\Phi$;

or, $T\omega dt = R\omega^2dt + I\omega\frac{d\omega}{dt}dt$.

TABLE III.—ELECTRIC CURRENT.

Notation.

1. time $= t$.

2. quantity $= q$.

3. current $= i = \frac{dq}{dt}$. $dq = idt$.

4. current acceleration $= \beta = \frac{di}{dt}$.

5. coefficient of self-induction $= L$.

6. electro-magnetic momentum $= Li$.

Ohmic resistance.

7. ohmic resistance $= R$.

8. electromotive force to overcome resistance $\Big\} = e_R = Ri$.

9. energy expended in overcoming resistance in the time dt $\Big\} = dW_R = e_R dq = Ri^2dt$.

Self-induction.

10. electromotive force to overcome self-induction $\Big\} = e' + L\beta + L\frac{di}{dt}$.

11. energy acquired by the magnetic field in the time dt $\Big\} = dW' = e'dq + Li\frac{di}{dt}dt$.

12. energy of magnetic field $\Big\} = W' = \int_0^i Li\frac{di}{dt}dt = \frac{1}{2}Li^2$.

Resistance plus self-induction.

13. total electromotive force applied $\Big\} = e = e_R + e' = Ri + L\frac{di}{dt}$.

14. total energy supplied in the time dt $\Big\} = dW = dW_R + dW'$;

or, $edq = e_Rdq + e'dq$;

or, $eidt = Ri^2dt + Li\frac{di}{dt}dt$.

Meeting of the Advisory Council of the Chicago Electrical Congress.

A meeting of the Advisory Council of the Chicago World's Congress of Electricians was held at the rooms of the American Institute of Electrical Engineers, New York, on January 17.

The following gentlemen were present: Dr. Elisha Gray, Chairman, Prof. Wm. A. Anthony, Prof. Chas. R. Cross, Dr. Louis Duncan, Dr. Wm. Geyer, Mr. Carl Hering, Mr. Geo. A. Hamilton, Prof. F. B. Crocker, Mr. A. E. Kennelly, Mr. T. D. Lockwood, Mr. T. C. Martin, Mr. Geo. M. Phelps, Dr. M. I. Pupin, Mr. R. W. Pope, Prof. H. A. Rowland, Dr. Herbert Laws Webb.

Mr. H. L. Webb was elected Secretary of the meeting, in the absence of Prof. Carhart, permanent Secretary of the Council. The preliminary reports of the English and American Committees, already made public, were received.

It was resolved that the Electrical Congress of 1893 shall consist of two Chambers, of which the Legislative Chamber shall decide on units, names of units and standards, and shall consist solely of delegates named by their respective Governments.

A committee was appointed to determine the total number of official delegates and their apportionment to the various countries to be represented.

The following apportionment of delegates was made by the committee, whose report was adopted by the meeting. Great Britain 5, France 5, Germany 5, Austro-Hungary 5, United States 5, Belgium 3, Italy 3, Switzerland 3, Holland 2, Denmark 2, Norway and Sweden, 2, Russia 2, Spain 2, Portugal 1, British North America 1, Australian Colonies 1, India 1, Japan 1, China 1, Mexico 1, Brazil 1, Chili 1, Peru 1, Argentine Republic 1; making a total of 55 official delegates.

It was resolved that a Committee on Invitations be appointed by the chairman, this committee to consist of 5 members who shall select and recommend to the chairman the names of electricians, electrical engineers and others who shall be members of the Electrical Congress. Said committee to co-operate with the foreign committee.

It was further resolved that in addition to invitations to deliberating and voting members of the Congress, a general intimation shall be extended through the journals or otherwise that the meetings will open to the public, for attending the proceedings, but not for taking part therein.

It was resolved that a Committee on Programme and Papers be appointed by the chairman. This committee shall consist of eight members, whose duty it shall be to invite, receive and consider papers and other documents relating to the work to be done by the Congress. And it was further resolved that it shall be the duty of this committee to formulate a programme for the Congress.

It was resolved that the reports of the English and American sub-committees which were received at the meeting should be referred to the Committee on Programme and Papers, and that the committee confer with the English committee as fully as possible and with such other foreign committees as may be formed.

It was resolved that the Electrical Congress of 1893 shall last one week, beginning on August 21st.

It was resolved that a committee of three be appointed by the chairman as a Finance Committee.

It was resolved that an Executive Committee of five shall be appointed by the chairman, said committee to have full power to act for the Advisory Council.

It was resolved that the question of charging a fee for membership of the Congress and fixing the amount of such fee be referred to the Executive Committee.

A Westinghouse Victory.

The Hopkinson Three-Wire Patents Sustained in England.

The suit of the London Westinghouse Company against the Pall Mall and St. James Electric Company has been decided in favor of the plaintiff by Justice Romer. This suit was brought to sustain the validity of the patents of Dr. John Hopkinson on the three-wire system.

Mr. Reginald Bellefield, who has been in charge of the London business of the Westinghouse Company ever since the English branch was established, is at present in this country. He is reported as follows in an interview in the daily press:

"The Pall Mall and St. James Electric Company is one of the richest companies in London, and covers with its lighting plant probably one of the best fields in the world. It supplies the leading clubs and many theatres and a great many shops through Regent street. The suit was very bitterly contested and the arguments were heard in the early part of November and extended over a period of ten days, an extremely long time for a case to be before a judge in an English court. The counsel for the Westinghouse Company were Sir Richard Webster, Q. C., M. P.; Mr. Milton, Q. C.; Mr. Ashton, Q. C., and Mr. Hopkinson, Q. C., the latter being a brother of the inventor. The effect of the decision will be to place in the hands of the Westinghouse people the complete control of all three-wire systems throughout Great Britain. There are a large number of other users than the Pall Mall Company who will now have to pay large royalties to the Westinghouse Company, thus materially increasing the revenues of the latter.

"The importance of the decision can best be determined when it is known that according to English law it gives the Westinghouse Company the right to take possession of all plants using the three-wire system and compute and collect all profits accruing from the use of the patent, and also to compel the payment in the future of such royalties as the company in whose favor the decision was rendered may fix upon.

"The Hopkinson patent in England bears a date of several months prior to Edison's patent in the United States for substantially the same system.

"The value of this decision to the parent Westinghouse Electric and Manufacturing Company is, of course, very great, as it is the principal stockholder in the London company.

"The Westinghouse Company now practically control the electrical business in Great Britain. The Shallenberger converters, which are manufactured in Pittsburg, have been adopted in England. Some time ago a test was made of the various makes of converters and the Shallenberger came out on top. These converters have now been recommended by the Board of Trade. The meters made here in Pittsburg have also been recommended by the Board of Trade. The appliances I speak of are now used almost exclusively all over the Eastern Continent. They are all shipped direct from the Pittsburg works to London and distributed from that point."

COMMUNICATIONS.

The Subject of Fire Risks.

A Suggestion.

To the Editor of ELECTRICITY:

The timely article in the *Electrical Review* of January 14th, "The Insurance of Electrical Risks," attracted the attention of the writer, who considers it a subject well worthy of the careful consideration of the electrical fraternity, especially those engaged in the manufacture of apparatus for lighting and power purposes.

It is a well-known condition in the business that manufacturers frequently dispose of their apparatus to parties who see fit to arrange for the installation and construction work to be done by others than the company furnishing the apparatus, removing the opportunity for the manufacturer to exercise any control over the very important details of construction, notwithstanding he (the manufacturer) is fully cognizant of the fact that upon the character of the construction work depends in a great measure the successful operation of the apparatus, but owing to the existing conditions in the field of competition he is compelled to accept the situation and run the risk of the construction work being done by incompetent persons.

It cannot be questioned that there exists in all the principal business centers competent and experienced engineering and construction companies, fully equipped to install apparatus and do construction work in a satisfactory manner, but there also exists in the same localities a horde of locksmiths and bell-hangers, who conspicuously display upon their elaborately written signs the information that in addition to their ability to repair a lock or install a bell they are also electrical engineers. It is this class that come in competition with the capable engineering or construction company, and to them, as a rule, can be directly traced a large proportion of the imperfect electrical construction that exists in localities where electricity has been introduced for lighting and power purposes.

These conditions are not attributable or within the power of the manufacturer to prevent, and they are brought about by the desire of purchasers of electrical apparatus to secure a cheap installation of their plant, losing sight of the fact that upon the proper installation of their apparatus will depend its success and commercial efficiency.

No doubt the same individual who has engaged the incompetent construction company to do his electrical work has called to his aid the most competent architect that he could procure to prepare plans and specifications for his building operation, but has ignored the fact that his electrical installation was worthy the same skill in order to properly plan and lay out the work. Until purchasers of electrical apparatus realize the fact that the services of a competent electrical engineer is as indispensable in electrical matters as that of the architect or civil engineer in building operations, we may expect to be confronted with cases of imperfect electrical construction, which will result in indifferent results from first class apparatus and subject the parties using the same to a special rating or possible cancellation of insurance by the underwriters.

We recognize that the relations of the insurance interest with the manufacturer of electrical apparatus and the legitimate construction company should be of a mutual character, for the reason that it is quite as important to the manufacturer as to the insurance interest that apparatus be properly installed and construction work done with the greatest factor of safety and it is the endeavor of the manufacturer, as well as the responsible construction company, to work in perfect harmony with the insurance interest upon the matter above referred to. But I doubt if the electrical interest of the country have any intention of permitting their business to be arbitrarily placed on a hazard basis with petroleum or its products. We would also state that we cannot see the justice in the demands of the insurance interest that any portion of the expenses incidental to the conduct of their business or a proper surveillance upon their risks should be borne by the electric companies, and their demand for a fee of $10 for the services of an inspector to perform a duty which is a part of their own business is about as reasonable as their recent reclassification of hazards, and we would ask them how they would expect to be received with a similar proposition made to the various individuals and corporations who furnish gas, kerosene and other illuminants.

The available facts are that the insurance interest themselves are in a measure responsible for the conditions that they are now endeavoring to cover by a reclassification of hazards, for the reason that they have not employed individuals who in every case were sufficiently well versed in electrical matters to secure the results as anticipated by their principals. It has occurred to the writer that a proper solution of the question of proper rules and regulations as well as harmonious action between the two interests could be readily secured by the formation of a joint board, composed of the insurance interest representatives and representatives from the principal manufacturing or construction companies. It is self-evident that the interchange of opinions of such an organization would tend to elevate the standard of electrical construction and generally secure better results to both interests, and on the above point much sooner than they could be accomplished by either interest alone.

WALTER F. SMITH,
838 Drexel Building, Philadelphia.

Bogus Enterprise.

To the Editor of ELECTRICITY:

Reliable news regarding the progress of the plans for the World's Columbian Exposition is now of much importance to many electrical readers. The attempt of the *Electrical World* of this week to show in advance of the proper time of publication features which have not yet been decided upon regarding the proposed illuminated fountains recalls a similar effort by the same paper less than three years ago.

At that time I sent to the *Electrical World* for publication the following letter, which never appeared in its columns:

44 Wall street, New York City.
Editor of the Electrical World.

DEAR SIR:—I am greatly interested in the sketch in your issue of this week of the "Proposed Edison Light Tower at the Minneapolis Exposition," more especially because having the responsibility of designing and erecting this tower I am still undecided as to nearly all the detail which your sketch purports to illustrate.

I congratulate you upon the vividness of the imagination of your artist, and only regret that his idea and my own should have happened to be entirely dissimilar, and that his picture of this feature of the coming Exposition fails entirely to give your readers an adequate conception of the magnitude and beauty of the proposed structure and its surroundings.

Yours very truly, etc.

Both these unreliable batches of information came from the same source, the artist whose name appears on the illustrations. In the case of the Minneapolis tower the disclosure was simply imaginative and premature; in the present case of the Chicago fountains it is both imaginative and inaccurate and also a breach of faith. I presume it will be characterized as "newspaper enterprise"—the sort of enterprise that when it cannot print a genuine interview prints an imaginary one.

I believe it was the celebrated A. Ward who once said: "I had rather no nothing at all than no what aint so."

L. STIERINGER,
Consulting Electrical Engineer World's Fair.
Chicago, January 20, 1893.

"Electricity," under its present ownership, has never solicited the advertising patronage of the General Electric Company.

Fire Risks.

In another column will be found a communication from Mr. Walter F. Smith in regard to the attitude assumed by fire underwriters concerning the equipment of buildings with electricity and the consequent increase in the insurance rates now demanded. This struggle between the insurance companies and the electrical fraternity is one of long standing and at the same time one for which no apparent necessity now exists. The facts leading up to this are sufficient to explain the origin of the trouble, but the primary cause has now entirely disappeared.

In the early days of electric lighting the matter of insulation was not understood as it is today, and almost any covering on the wires was considered sufficient.

The grade of wire known as "underwriters'" was the kind commonly used in almost all installations and it proved a costly experience, as it was found a totally inadequate insulation except for aerial lines. The result was that numerous fires occurred, the suspicions of the insurance companies were aroused and electrical installations came to be considered dangerous risks, and probably rightly so at that time.

These conditions are now entirely changed, and the subject of insulation has received most thorough attention, so that at present any specified degree of resistance to leakage can be guaranteed unquestionably.

In view of this the former attitude of the insurance companies is no longer warrantable, provided electrical installations are properly equipped. There is no doubt in the mind of anyone who has studied the subject that it is entirely possible to make an electric system safer than any other known method of illumination.

The only factors of uncertainty which exist now are the character of the work and the materials employed, and these are evidently so readily controllable that the efforts of insurance companies to make electricity a bugbear and an excuse for high rates have the appearance of an attempt to take an undue advantage of the public.

There is, however, one fact pointed out by our correspondent which is the only justification of this policy, and that is poor construction work—a circumstance which we have often taken occasion to condemn in these columns. Nevertheless, as this is now the exception, it seems hardly fair that the users of electric light, who are numbered by thousands in all the principal cities, should be heavily taxed on account of the few who in defiance of past experience continue to practise the false economy of employing the cheapest bidder regardless of consequences.

It has been the universal experience that no system of lighting can compare with electricity from the standpoint of safety ; and even including the cases where defective work has been the cause of fires, the total loss from this cause compared with that resulting from the use of gas, kerosene or candles is insignificant.

It is far from our object, however, to uphold the practice of installing cheap construction work, but it seems as though the suggestion to mutually establish the proper regulations for this work, as well as harmonious relations between fire underwriters and the reputable electrical manufacturers and engineers, could hardly fail to be of benefit to all concerned.

Shut out all botchwork in the line of electrical construction and the fire risk where it is installed will be found the most desirable and the least expensive to the underwriters.

* * *

Through by Lightning Regardless of Mud.

We trust our readers will pardon us for again devoting a little space to the Chicago-St. Louis Electric Road project.

We know Dr. Adams will pardon us, because space in ELECTRICITY costs him nothing.

It is admitted by electrical authorities that there are no considerable obstacles in the way of building a motor which will propel a train at the rate of 100 miles an hour safely and practically.

It is also admitted that no such motor has yet been built.

But let us suppose that Dr. Adams will be able to enlist the services of competent engineers, and that the motor for his road materializes, sustaining his rosiest claims. This is a charitable supposition, as no electrical engineer of brains and reputation could now be induced to identify himself with the scheme; but we will be charitable.

The magnet to draw the silver of small investors, the mucus to catch the flies, has been the claim that the road would be in operation by the time the World's Fair opens; that the novelty of the scheme and the marvellous speed would attract the curious, and that large, very large, profits would be made the first year from World's Fair traffic.

We will now proceed to prick this bubble.

The World's Fair opens in May. The Chicago and St. Louis road is not yet built. Twenty miles of track have been graded, we are told, but this is all the projectors claim. If the remaining 230 miles, or thereabouts, including depots, power houses, motors, cars, etc., etc., etc., can be built in ninety days, it would be the most remarkable example of hustling ever known in the West. The feat cannot be accomplished. The World's Fair gates will be closed before the road is fully equipped.

Further. If the track were all graded now a speed of one hundred miles an hour, or even fifty miles an hour, would not be attempted under a year by anyone but a lunatic.

To safely attain a speed of one hundred miles an hour by any method of traction whatever, upon a roadbed of Illinois mud, within a year after the road is built, would be as impossible as that Chicago should become a moral city or a New York police captain be faithful to the constitution.

Of course Dr. Adams will claim that his road will be the first favored exception in the great general plan of the Almighty—that it will not be subject to the effects of frost or thaw, of rain or sun.

But this view will not be treated seriously in the office of ELECTRICITY. We assert, first, that this road will not be built in time to carry World's Fair tourists; and second, that when it is built it cannot equal for many months the regular running time made on the Illinois Central or other old and settled roadbeds between Chicago and St. Louis.

* * *

THE Buckeye factory at Cleveland is still very much on deck, and the company has found no cessation in orders. No Ohio factories have as yet been moved against.

A Sensation.

Brand New Testimony Introduced by the Beacon Vacuum Pump and Electrical Company.

No Decision Expected.

BOSTON, January 24.—In the United States Circuit Court yesterday, before Judge Colt, the case of the General Electric Company v. Beacon Vacuum Pump and Electrical Company came up for hearing.

Mr. Fred. P. Fish, representing the plaintiff company, opened the case. Mr. Witter, of the law firm of Witter & Kenyon, appeared for the Beacon Company.

The chief argument for the General Electric Company was made by Mr. Dyer, of New York, who was followed by Mr. Witter, submitting an affidavit of Henry Goebel, a German optician and watchmaker, who made incandescent lamps soon after his arrival in this country in 1849, continuing his experiments until 1872.

Several of the lamps were shown in court and created much interest. The affidavit took the entire afternoon to read, and it proved to contain much evidence that was entirely new, interesting and surprising. The court adjourned until Tuesday, when much additional evidence of an even more interesting character is expected.

Everybody seemed taken aback by this new evidence, even Prof. Elihu Thomson, Clarence Seward and other prominent men present regarding it as somewhat of an "eye opener."

Some of Goebel's lamps were offered in evidence.

In the crowd that thronged the court room the general feeling was that even if the new evidence doesn't bring about a revocation of all that has already been done, at any rate it may prolong the fight indefinitely.

The news that after the years of litigation over the Edison lamp patent something new had been discovered, and that that something was of such a nature as to render the overthrow of the Edison patent as entirely probable, created great excitement in this city among those interested.

Goebel's experiments were begun before 1860, and his lamps were practically on the same lines as those made years afterward by Edison.

Of course it is well known that there were no dynamos at that time, and Goebel's lamps were necessarily run by a primary battery current.

Early in the sixties his outfit was a familiar sight in the Bowery and other crowded thoroughfares of New York.

His battery and lamps in circuit were carried about on a truck, along with a big telescope. After attracting the attention of the multitude with his wonderful lamps all aglow, he solicited the people to view the glories of the heavens through his telescope at "ten cents apiece."

The Beacon people first learned of Goebel about three weeks ago. He is now in a Home for the Aged in this city.

Convinced by his account of himself that he was no humbug, they took him to a laboratory, where he went to work at once and turned out in a very brief time lamps similar to those of his earlier work, and bearing out to the minutest detail his descriptions.

We present herewith an illustration of the Goebel lamp of 1860. Other styles were made, some of them with an arched filament.

In the cut here given (Fig. 1), A represents a glass tube corresponding to the globes now in use, B platinum leading-in wires, and C the portion of the glass tube in which the platinum wires are embedded. D represents a wire of a size that will carry the necessary current without undue heating, and which is connected, as shown, to the platinum leading-in wires. E is a bamboo filament which is inserted in the conductor, D. This filament is of high resistance, and becomes incandescent on the passage of the current. The ends of the filament are flattened in order to join it to the wire conductor. In some of these lamps the incandescent filament was in the form of a loop as in the present lamps.

Trust Methods.

The Sinews of War.

Where They Come From.

The following is a copy of a late advertisement in the Boston daily press. It was first ordered for three insertions, and was subsequently continued for six more :

UNITED ELECTRIC
SECURITIES COMPANY
7 PER CENT. CUMULATED PREFERRED STOCK.

Total Amount Authorized, $4,000,000.

Amount of Present and First Issue, $1,000,000.

At a special meeting of the stockholders of the United Electric Securities Company, held December 29, 1892, an issue of preferred stock was voted, the terms of preference and issue being substantially as follows:

A dividend at the rate of 7 per cent. per annum, to be cumulative, payable semi-annually, in preference to any dividend on the common stock.

No dividend to be declared or paid on the common stock unless the company shall have at the time a net surplus sufficient in amount to pay all dividends to accrue within a period of three years on the preferred stock then issued and outstanding.

In case of the liquidation or winding up of the business of the company, the preferred stock to be paid in full at par before the common stock receives anything.

Preferred stock to be issued only as the total interest actually received during the year next prior to any such issue, from the bonds deposited by the company as collateral security for the payment of its own outstanding collateral trust 5 per cent. bonds, shall exceed the interest accrued during the given year on said collateral trust bonds by an amount at least 50 per cent. more than one year's dividend on the preferred stock, including both that outstanding and any additional issue proposed at the time.

The company makes the following statement of its business:

Actual difference between the annual interest at the present time upon the company's collateral trust 5 per cent. bonds and the annual interest upon the bonds deposited to secure the same		$131,235
This difference will be increased within 30 days by the issue of the ninth series of the company's collateral trust bonds to		156,235
Annual dividend required on $1,000,000 preferred stock	$70,000	
50 per cent. surplus required	35,000	
		$105,000

CONDENSED BALANCE SHEET.
Dec. 31, 1892.

ASSETS.

Stocks, bonds, cash and cash assets (net)	$1,173,220 17
First mortgage bonds, at par value, deposited with the American Loan and Trust Company, to secure collateral trust 5 per cent. bonds	4 707,500 00
	$5,880,720 17

LIABILITIES.

Capital stock	$1,000,000 00
Collateral trust 5 per cent. bonds	3,444,000 00
Reserve of 20 per cent. of first mortgage bonds to secure collateral trust 5s	953,684 25
Accounts payable, etc	107,277 82
Surplus	875,758 10
	$5 880,720 17

From July 31, 1892, the date of the last annual report of the company, to December 31, 1892, the total profits of the company, after the payment of all fixed charges, have been $102,867.27, being at the rate per annum of $246,882.89.

The company has issued to date eight series of collateral trust bonds, aggregating $6,000,000. The first, second, third and fourth series, each of $500,000, each secured by $625,000 or more first mortgage bonds of various electric railway, light and manufacturing companies; the fifth, sixth, seventh and eighth series, each of $1,000,000, and each secured by $1,250,000 or more first mortgaged bonds.

Of the first series, $382,000; of the second series, $399,000; of the third series, $232,000; of the fourth series, $213,000; of the fifth series, $270,000; and of the sixth series, $190,000, have been retired by the sale of collaterals.

We offer at 97½, subject to previous sale, any part of $750,000 preferred capital stock.

LEE, HIGGINSON & CO.,
No. 44 State street, Boston.
PARKINSON & BURR,
No. 53 State street, Boston,
January 17, 1893.

A leading Boston financier says: "These 7,500 shares of stock are the property of the General Electric Company, and the proceeds go into the General Electric Treasury. When the United Securities Company was organized it had a capital stock of $1,000,000, or 10,000 shares. Of these the Thomson-Houston Electric Company had 7,500 or 8,000 shares, and the trustees of the United Company were given the balance to be used as a bonus in selling its series of bonds up to $2,000,000, a share of stock being given with a bond. The idea was conceived of issuing preferred stock, though why this should be done is not entirely obvious. However, it was done, and of the total authorized issue of $4,000,000 a first issue of $1,000,000 was made and sold to the General Electric Company, payment being accepted in securities of subsidiary companies held in its treasury. A deal has been made with the public holders of common stock of the United Company for an exchange of five shares of the same for six shares of the 7 per cent. cumulative preferred stock. If the public now has 2,000 shares common it will hold, after the exchange, 2,400 shares of the 10,000 shares first issue of preferred, and the General Electric Company will have 7,600 shares. It is 7,500 of these shares, $750,000, which are now offered for sale at 97½ in the market.

"By this means the General Electric Company realizes $731,250, less brokerage, and thus converts a lot of treasury assets into cash. A peculiarity of this preferred stock is that the preference applies to the principal in the distribution of assets in liquidation, and becomes a rather choice security for the holders. It is practically a bond without foreclosure rights. The lien of the principal is upon treasury assets only. The concern holds no real estate. Of course, the common stock of the United Company suffers by what seems like the unnecessary creation of a lien before it, but the General Electric Company will be the common stockholder, and that company is supposably a gainer through the opportunity to realize on its treasury assets, and thus obtain ready money for use in its business."

The Press Agent Gets Down to Business,

And Uncovers the Claws of the Tiger.

The following is abstracted from a reading notice which has recently been sent out broadcast to country editors. The capital letters are copied as the Press Agent wished them to appear.

No further evidence is required that Mr. Coffin's company intend to "do this business," and that all others may as well "fold their tents and get out"—provided Mr. Coffin's plans do not miscarry. The wording of this notice is worth careful study:

"Of course the question arises 'What is embraced in the decision (sustaining the Edison patent)? What does it mean? and what do the benefits amount to?' It would seem that the language of the court makes it perfectly plain. It says:

"'Every one of the manufacturing corporations or competitors of the Edison commenced their operations with the knowledge of the existence of the patent suits. They were controlled by business men of intelligence and experience. Their promoters and managers may have believed, and probably did, that the patents could not be successfully maintained, but they entered upon the business with the understanding of its risks and of the consequences which would befall them as infringers if the patents should be sustained. None of them can now be justly heard to say that an injunction which is essential if not indispensable to the protection of the owners of the patents and their lessees ought not to be granted because of the great pecuniary loss which may result. If in consequence of being deprived of the use of the lamps their investment in their electrical apparatus will be greatly depreciated, THEY MUST TAKE THE CONSEQUENCE.

"'Again, as to the users, however, who have acquired these plants subsequent to the decision of the circuit court, if they are deprived of the use of the lamps, and as a consequence the value of their plants may be greatly impaired, THEY MUST ACCEPT THE RESULT AS A CONSEQUENCE OF THEIR OWN IMPRUDENCE.'

"Verily, this is plain English and certainly is amply sufficient to put any and all good business men on their guard.

"If this decision means anything, it says that the owners of the Edison patents are the only parties who can legally manufacture and sell the incandescent lamp, and as the owners of the Edison patents are now the General Electrical Company of New York, and as it seems to be 'a condition, not a theory,' that confronts the purchaser of incandescent lamps, he must buy his lamps from the General Electrical Company or their duly authorized agents. This being the case, the electric light gentlemen, when called upon, should be required to identify themselves and show from whence they come, as the general public or innocent purchaser should have some protection.

"It is reasonable to suppose that the owners of the patents, having made such a long, continuous and expensive fight, are likely to follow up the advantage they have gained, hence it behooves all users of incandescent lamps to familiarize themselves with the present condition of affairs as a matter for their own protection."

A Preliminary Exhibit.

The Westinghouse Company has an "At Home."

Special to "Electricity."

PITTSBURG, January 21.—The Westinghouse Electric and Manufacturing Company sent out invitations early this week to the people of Pittsburg and prominent electrical men throughout the country to inspect the company's plant which has been built to light the World's Fair on the contract which has become famous and which made the Electrical Trust tired.

The dynamos, twelve in number, are the largest yet built, and are of 15,000 16 C. P. light capacity each. Twelve engines, each of 1,000 H.P., are being built to drive these dynamos. The armatures weigh alone 42,000 pounds each, and the total weight of each dynamo is about eight tons.

Notwithstanding the magnitude of this exhibition of machinery, the chief interest of your representative, and of most electrical men, centred in the new incandescent lamps, which were shown in large numbers. Visitors were thus enabled to make as close an inspection as they desired, not only of the lamps burning, but of their separable parts.

Doubting Thomases were very scarce after the exhibition, and it should be a matter of congratulation to all independent concerns that the Westinghouse Company have solved the problem of incandescent lighting outside of the Edison patents.

ELECTRICAL COMPANY ELECTIONS.

The following are the officers chosen at recent elections by electrical companies in various cities:

Chester, Pa., Electric Light Company: President, G. P. Denis; directors, F. G. Sweeney, C. W. Perkins, N. A. W. Darling, J. R. Sweeney, H. B. Black, Joseph Deering, Joseph McGolrick, H. J. Riley, D. P. Paiste, William Burnley.

Reynoldsville (Pa.) and Rathmel Electric Railroad Company: President, F. K. Arnold; vice-president, Jos. Morrow; secretary, C. Mitchell; treasurer, W. B. Alexander; directors, F. J. Black, F. K. Arnold, H. S. Belknap, Jos. Morrow, Geo. Sprague, W. I. Cathers, M. C. Coleman.

Indiana (Pa.) Electric Company: Directors, Edward Rowe, Wellington B. Kline, W. S. Daugherty, G. P. McCartney, James St. Clair.

Canton (N. Y.) Electric Light and Power Company: President, L. P. Hale; secretary and treasurer, A. T. Martyn; superintendent, Luman Bailey; directors, Murray N. Ralph, R. B. Ellsworth, Judge L. W. Russell, Hon. W. R. Remington, Hon. J. C. Keeler, L. P. Hale, A. T. Martyn, C. S. Haley, Luman Bailey, R. D. Sackrider, Dr. J. C. Preston.

Columbia (Pa.) and Marietta Electric Railway Company: President, D. R. King; secretary, Robt. T. Ryon; treasurer, J. K. Sigfried; directors, D. R. King, J.K. Sigfried, C. H. Dengler, Jos. H. Black, George W. Ryon, R. T. Ryon and J. A. Ryon.

Norwalk (Conn.) and South Norwalk Electric Light Company: President, Charles Olmstead: vice-president, Horace F. Boardman; treasurer, E. T. Jackson; secretary, John H. Hoyt; auditors, D. J. Glazier and Thomas I. Raymond; directors, E. T. Jackson, Horace F. Boardman, J. N. Kemp, Charles Olmstead and John H. Hoyt.

Carondolet (Mo.) Electric Light Company: President, John Krauss; secretary, F. W. Mott; superintendent, R. J. Kilpatrick.

City Electric Light Company, Kalamazoo, Mich.: Directors, Leroy Cahill, Wm. E. Hill, G. E. Fisher, Wm. Shakespeare, J. W. Adams, J. Schuster.

Grand Rapids (Mich.) Electric Light and Power Company Directors, William T. Powers, William H. Powers, Henry Spring, John L. Shaw, Edwin S. Peirce, Jacob Kleinhans and James W. Converse. After the adjournment of the stockholders' meeting, the newly-elected directors met and organized by electing William T. Powers president, Henry Spring vice-president, and William H. Powers secretary and treasurer.

Schenley Park and Highlands Railway Company, Pittsburg, Pa.: Directors, Richard G. Wood, E. M. Fulton, of New York; S. J. Macferren, T. A. Noble, E. F. Hays and R. P. Cunningham. Mr. Macferren is vice-president and general manager.

East Reading (Pa.) Electric Railway: Directors, Jonathan G. Leinbach, John H. Printz, William R. McIlvain, Geo. W. Bard, A. H. Fegely, Jacob A. Strohecker, Frank P. Esterly and A. J. Brumbach.

The Electric Brake Company, Salem, Mass.: President, H. B. Walmsley of Lynn; secretary-treasurer, William Stopford of Beverly; directors, W.K. Bigelow of Salem, W. Y. Ober and F. S. Alley of Lynn, C. Keans of Danversport, and Ziney Goodell of Salem.

Sandy Hill (N. Y.) Electric Light and Power Company: Directors, Marcus C. Allen, John H. Derby, Charles T. Beach, John J. Cunningham, James E. Howland, Grenville M. Ingalsbe, S. H. Kenyon and Seymour Taylor. Mr. Howland was re-elected president, Mr. Allen vice-president, Mr. Beach treasurer and Mr. Ingalsbe secretary.

Consolidated Electric Light Company, Birmingham, Ala. Col. J. F. B. Jackson, the president and owner of a controlling interest, recently sold his stock and bonds to Mr. H. E. W. Palmer, general superintendent of the southern district of the Thomson-Houston Electric Company. At a meeting of the board of directors subsequently, the old board was re-elected with the exception of F. W. Dixon, who resigned. Mr. Palmer was elected a director and Col. Jackson is still a director, having retained some stock. The board of directors elected George Morris president, vice Col. Jackson, resigned, and Robert Jemison vice-president and general manager.

The Evansville Gas and Electric Light Company, Evansville, Ind. President, R. K. Dunkerson; vice-president and general manager, Herman Wilkemeyer; treasurer, Samuel Bayard; secretary, James H. Foster; directors, R. K. Dunkerson, Samuel Bayard, Francis J. Reitz, Thomas E. Garvin, John Gilbert, Jacob Weintz, Jacob Eichel, Herman Wilkemeyer.

Card Electric Motor and Dynamo Company, Cincinnati, Ohio. President and treasurer, J. W. Wilshire; vice-president and secretary, George Bullock; superintendent and electrician, O. W. Jantz; directors, S. R. Burton, P. R. Mitchell, George Bullock, C. B. Simrall, J.W. Bullock, J. W. Wilshire and Otto W. Jantz.

The Chicago Edison Company re-elected the old board of directors as follows: A. F. Seeberger, John B. Drake, Lambert Tree, R. C. Clowry, Robt. T. Lincoln, J. W. Doane, F. S. Gorton, A. A. Sprague, E. M. Phelps, Byron L. Smith. In regard to the consolidation with the Chicago Arc Light and Power Company, the matter was left to the directors to decide, and it is almost an assured fact that it will carry.

Duquesne Heat, Light and Power Co., McKeesport, Pa. President, C. F. Keyser; vice-president, C. W. Allebrand; secretary, H. L. Black; directors, Dr. C. F. Keyser, Charles W. Allebrand, J. Ren Wiley, M. G. Conlin, Thomas Carr, H. L. Black and Lewis McDonald.

Altoona [Pa.] and Logan Valley Electric Railway Company. President, John Lloyd; directors, Cornelius Campbell, A. C. Shand, John Lloyd, M. H. Canan of Altoona, and Wm. P. Smith of Hollidaysburg.

The City Electric Street Railway Company, Little Rock, Ark. The old directory was re-elected and H. G. Allis elected president, and H. G. Fleming vice-president and general manager.

The Electric Street Railway Company, Adrian, Mich. J. H. Blain was re-elected president. M E. Chittenden treasurer, and Charles Barker secretary.

Chicago Notes.

The directors of the Chicago City Railway Company, whose lines cover the entire southern portion of the city, evidently have begun to appreciate the value of electric roads. In the president's report at the annual meeting it was stated that sixteen miles of track had been equipped and the poles set for carrying the trolley wires. A new power house is most completed. Nearly all the motors and electric equipments are on the ground ready for operation as soon as the current is turned on. The cars are to run on four parallel streets, viz., Thirty-fifth, Forty-seventh, Sixty-first and Sixty third. The company expect to equip seventy-five miles of their cross town lines electrically, for which purpose they increased their capital stock from $7,000,000 to $9,000,000.

During the spell of cold weather which has lasted for over two weeks, Chicago has been in the throes of a coal famine. Most of the numerous electric light stations were pushed for want of fuel. The factories engaged in the manufacturing of electrical apparatus were also materially affected by the shortage. The Western Electric Company were nearly compelled to shut down as they had almost reached their last shovelfull when a load of coal arrived to tide them over.

At the last annual meeting of the Chicago Edison Company, the question of consolidating with the Chicago Arc Light and Power Company was discussed. No formal action was taken on the subject, excepting that the decision of the question was left to the board of directors. As both of the companies are licensees of the General Electric, and it is the known policy of the Trust to consolidate all of the central stations operating in the same city, it is almost an assured fact that the consolidation will go into effect. Should this take place, the patrons of the companies are speculating on the limit that will be placed on the already high rates.

The Illinois Legislature being in session, a Chicago Representative has introduced the bill, which annually appears in the House, to give the city of Chicago the right to extend its electric lighting system so as to compete with local companies for furnishing light and power to private consumers. There is little doubt that the bill will be killed as usual.

Louis Van Ness has associated himself with Mr. Henry Bishop to represent the Massachusetts Chemical Company in Chicago and the West.

Boston Notes.

Several Boston electrical firms are busy getting their exhibits ready for the World's Fair, and it looks as if the "Hub" would be well represented in the electrical department. Why shouldn't the bean-eating city make a big display? Boston is entitled to rank as one of the most important electrical centres in the world.

On Thursday evening Mr. W. H. Knight, of the General Electrical Company, gave an impromptu talk on "The Electrical Equipment of Central Stations" before the members of the Thomson Scientific Club, Lynn. There was a good attendance of members and the address was listened to with close interest by all present.

One of the finest brass bands in the State of Massachusetts is the one connected with and composed entirely of employees in the General Electric Company's factories at Lynn. During the past summer this band filled many important engagements; this winter the band is in frequent demand, while the outlook for the approaching pleasure season favors the belief that they will have many opportunities of entertaining thousands of music loving people.

The committee of the Thomson Scientific Club, Lynn, has arranged for the following lectures to be delivered in the club house during the next few weeks: "The Steam Equipment of Modern Central Stations," by Alfred A. Hunting, M. E., one of the prominent engineers of New England, on February 2; "The Design and Construction of Central Stations," by E. E. Pettee, February 16; "Atomic Molecular Motions," by Prof. A. E. Dolbear, the eminent scientist of Tufts College, March 2; "A Review of Astronomical Progress," by Prof. G. W. Carey, March 16. The foregoing list of speakers and subjects is certain to attract large audiences, the young men engaged in electrical pursuits showing an earnest desire at all times to increase their stock of accurate scientific knowledge.

Mr. F. H. Whipple, well known throughout the electrical field as the former publisher of "Whipple's Electrical Reports" and other publications, was found guilty in the Superior Court, Pittsfield, Mass., Friday, of obtaining money under false pretences.

An electric car is being constructed at the General Electric Company's factories in Lynn, for the post office department at Camden, Me., and will be used for collecting and distributing mail matter at that place.

The Quincy and Boston Street Railroad Co. has been experimenting with electric heaters. If they prove satisfactory all the cars on the road will be equipped.

The latest phase of the long-continued fight between the Old Colony Railroad and the Interstate Electric Railway Company over the grade crossing at Hebronville came up in the Massachusetts State Legislature Thursday, when Mr. J.H. Benton, counsel for the Old Colony Railroad, offered the following amendment to Section 37 of Chapter 113 of the Public Statutes, so that it should read as follows:

> "A street railway company may use such motive power on its tracks as the aldermen of cities or the selectmen of towns through which it is located may from time to time permit, but if it uses electric power it shall not cross the tracks of any steam railroad at grade, without the consent of the Railroad Commissioners."

It is not thought likely that the Legislature will adopt this amendment inasmuch as the Interstate Company holds a charter that entitles it to construct its road, and it has done so. Public opinion is decidedly with the electric railway company and against the Old Colony Railroad.

Last Saturday a most ambitious movement was inaugurated in Worcester, Mass. The promoters are to organize a State central street-railway, forty-five miles long, including branches, and the territory to be covered will include Worcester, Shrewsbury, Northboro, Marlboro, Grafton, Westboro, Auburn, Leicester, Oxford and Webster. The capital stock is to be placed at $450,000. The parties interested are chief owners of the Spencer, Leicester and Millbury electric roads. These gentlemen may not get all they want, for the Worcester and Shrewsbury Railway Company is seeking authority to extend its system through to Marlboro.

The movement recently made by a number of American capitalists for purchasing the entire street-railway system of the city and valley of Mexico is regarded very favorably by Boston people. The price to be paid is said to be $7,000,000 Mexican money. When the purchase has been effected the entire system, aggregating about 100 miles, will be equipped for electricity throughout.

General News.

What is Going on in the Electrical World.

Little Rock, Ark.—The telephone line between Pine Bluff and Little Rock has been completed.

Salem, Mass.—The new line of electric railway between Salem and Lynn has been opened for traffic.

Dover, N. H.—An electric railroad between Salmon Falls and Durham is projected, the line to run through Dover.

Greenville, Tex.—The city council are considering the question as to whether or not they shall sell the electric light plant to a corporation.

Rochester, N. Y.—The Denio fire alarm system has been approved by the executive board of the city and will probably be put into use here.

Rockville, Conn.—The preliminary survey for the proposed electric road from Rockville to Ellington is about completed, and work will begin on it in the spring.

Cleveland, Ohio.—The St. Clair street railway line is to be equipped for electricity.—The W. D. Graves Electrical Manufacturing Company has made an assignment.

Newburg, N. Y.—Colonel Dickey proposes to establish an electric street railroad in the place of the present horse car line and to extend it southward into New Windsor.

Woodbury, Pa.—Nearly all the stock of the projected electric road between Woodbury and Philadelphia has been subscribed, and the company will be incorporated at once.

Hoboken, N. J.—The electric cars began running on the North Hudson Railroad between Pavonia and Bergen avenues on the 18th. The route extends to the Hoboken Ferry.

Conshohocken, Pa.—The town council has been asked to grant permission to a company headed by James and Daniel Shepp to operate an electric railway line through this borough.

Seattle, Wash.—Guy C. Phinney has filed a petition for the privilege of locating and maintaining an electric street railway system from Pioneer place, this city, to Woodland Park.

Fort Wayne, Ind.—The work of repairing the damage done by the fire at the Electric Works is making rapid progress.—A movement is on foot to construct an electric street car line to New Haven.

Woodhaven, L. I., N. Y.—The taxpayers of this town and vicinity petitioned the town board to establish an electric lighting district in Woodhaven and the board has given its sanction to the project.

Paterson, N. J.—As soon as the weather permits work will begin on the new electric railway that is to connect Paterson and Hoboken, passing through Boiling Springs, Rutherford and Carlstadt.

Athens, Ga.—A new electric plant to be operated by water power is being set up here by the Athens Manufacturing Company, which will supply power to motors and machinery in different parts of the city.

Brownwood, Tex.—The Westinghouse incandescent lighting system is being installed here. The plant will have an eighty horse power Russell engine, a 125-horse power boiler, with a five mile circuit.

Plainfield, N. J.—It is probable that a company will shortly be organized, including the Plainfield Street Railway Company, to connect Plainfield, New Brunswick and Bound Brook by a system of electric railways.

Buffalc, N. Y.—Reports are in circulation here that a company is to be formed to build a $200,000 electrical works in the vicinity of Buffalo, to turn out a new incandescent lamp invented by Philip K. Stern, the electrical expert.

Santa Rosa, Cal.—The city council has granted a franchise to J. W. Morris, of Oakland, who is connected with the Sessions electric roads in this city, for an electric line to connect with the San Francisco and North Pacific road.

Waverly, N. Y.—At a special meeting of the trustees, a few days ago, the franchise for an electric railway in Waverly was granted to the Susquehanna Valley Electric Traction Company, of which A. N. Broadhead, of Jamestown, is president.

Tiffin, Ohio.—The Edison Electric Light Works in this city, together with a $15,000 plant which the company had almost completed to furnish power to the two electric street railway companies, has been burned, entailing a loss of $30,000.

Georgetown, Mass.—Surveyors are laying out a route for an electric railroad throughout Georgetown. It is reported by some that it will run through Rowley, Ipswich and Hamilton, but the surveying is through Boxford, Topsfield and Danvers.

St. John, N. B.—General Manager Jones of the street railway says he expects to have the electric railway in operation as early in the spring as possible, and the public will then get a street railway service equal to that of any city in America.

Harrisonville, Mo—The authorities are considering a proposition from the Fort Wayne Electric Light Company to put in a $10,000 plant, the city to pay for it in yearly instalments of $1,000. Mayor Bird believes the proposition is a good one for the city.

New London, Conn.—The electric plant of the New London Horse Car Company is to be sold to the owners of the Norwich street railway. It is said that ex-Governor Waller will be interested in the new company. The two electric roads will henceforth form one system.

. **Petersburg, Ind.**—An electric lighting company has been formed here composed of Gustoff Frank, president; Charles Burger, vice-president; Moses Frank, treasurer; George E. King, secretary; Sol Frank, W. V. Hargrove, S. J. Haines, L. J. Dunning and Clay Lemons.

Hightstown, N. J.—The Electric Supply Company of Asbury Park has secured the valuable franchise for lighting Hightstown with electricity. The terms include the lighting of the public streets on a contract, the lighting of Peddie Institute, and a large number of private lights.

Galena, Ill.—The stockholders of the Galena Electric Light Company have voted to increase the capital stock to $15,000, and to introduce the arc system. When the change has been accomplished the company will compete with the gas company for the contract for illuminating the streets.

Scranton, Pa.—James E. Burr, attorney for J. B. Newcombe, has had a writ of foreign attachment issued against the Thomson-Houston Company and for all of their property in the hands of Robert E. Dunstone, assignee the People's Street Railway Company and the Scranton Traction Company.

Hartford, Conn.—The Hartford Light and Power Company have in contemplation the erection of a dam on the Farmington River for the purpose of obtaining water power for the generation of electricity, which will be transmitted thence to the Pearl street station of the company in this city.

Bridgton, Me.—An electric road for freight and passengers, connecting Bridgton and Harrison, is likely to be built. It is said that the Giant Electric Company of Portland is largely interested in the enterprise, and proposes to equip the road and also furnish electric light for both places.

Akron, Ohio.—The Cuyahoga Falls and Akron Railway and Power Company has forfeited its franchises and new parties have taken up the work. M. N. Beatty, of Lima, has practically secured the right of way, and will push the work forward for the Brice Construction Company, which will own the new line.

Tacoma, Wash.—The Sunset Telephone Company has decided to build immediately a new copper line connecting Tacoma with Grays Harbor and South Bend. It will start at Centralia and follow the line of the Tacoma, Olympia and Grays Harbor Railroad to Aberdeen and Ocosta, continuing thence along the sea coast to South Bend.

Braintree, Mass.—At a special town meeting held here it was voted to expend $16,650 to make such additions to the present electric light plant as to enable the town to furnish light for its own buildings and for domestic and commercial uses. The service has been heretofore performed in part by corporations situated in different sections of the town.

San Antonio, Tex.--Charles E. Harris's petition for right of way over certain streets in the city for an electric railway line has been reported favorably by the council committee.—At a late meeting of council the committee on telephone, telegraph and railways reported favorably upon the petition of the Alamo Electric Street Railway Company for franchises for four different routes.

Brooklyn, N. Y.—The Brooklyn, Bath and West End Railroad has been sold to a syndicate, of which E. E. Dennison, of Philadelphia, is one of the heaviest stockholders. It is understood that the West End road will be connected with the Fifth avenue line of the Atlantic Avenue Railroad, and will be run by electricity. The new system will be in operation before the summer is over.

Toledo, Ohio. -- The Robinson Company's electric plant here is receiving some important additions. The company has bought two engines of 750 horse power each, which will be delivered in a few weeks, and is now contracting for a proportionate increase of boilers from three to five. A number of Westinghouse alternating current generators for incandescent lighting has already been added to the plant.

Philadelphia.—The *Ledger* says: "The trolley fever continues to rage. Eleven trolley ordinances were introduced in Common Council yesterday (19th); one other was passed by Select Council, and still another was reported favorably from committee. It is hard to keep track of them all, but apparently every railway line in Philadelphia is to be turned over to trolley or cable except the Chestnut and Walnut streets line."

Albany, N. Y.—The Erie Telegraph and Telephone Company has filed its annual report with the Secretary of State. The capital is $5,000,000, of which $4,000,000 has been paid in. The debts do not exceed $250,000 and the assets are not less than $250,000. The report is signed by Arthur H. Andrews, Levi Sprague, Charles J. Gladden, A. C. Russell, James A. Weston, A. S. Adams, C. E. Adams, Francis Jewett, Wesley A. Gove, H. A. Whitney and J. W. C. Pickering. —In the case of the Hudson River Telephone Company against the Watervliet Railroad Company, the decision of the Court of Appeals was in favor of the railroad.

Freeport, Ill.—After a recent meeting of the stockholders of the Freeport Street Car Company, held to discuss the advisability of adopting the electric or trolley system, the secretary of the company was instructed to open up communications with parties that are prepared to fully equip an electric system for operating street cars and ascertain what the cost of the same will be. It must be a first-class equipment and not defective in any way. The estimate will be on the district that the present system covers, with eight miles more added to it, which will cover the entire business portion of the town as well as a great many miles of the suburban part of the city.

Pittsburg, Pa.—The reorganized Squirrel Hill electric road, under the name of the Schenley Park and Highlands Railway Company, is shortly to be extended to Homestead and ultimately to McKeesport.—The *Leader* says that R. S. Waring, who is at present in Pittsburg, will leave for France about February 1 to personally superintend the execution of one of the largest orders yet given for telegraph and telephone cables at any one time in any country. Negotiations between Mr. Waring and the French Government have been concluded. The cables will be laid underground. They will be made in France. That was one of the stipulations of the contract. The machinery will be turned out in the United States--some of it in Pittsburg, the bulk in Eastern places.

Pullman, Ill.- The Illinois Electrical Forging Company, which has recently filed articles of incorporation, is equipping a factory at West Pullman with $70,000 worth of machinery, including dynamos of energy equal to 100,000 horse power. Walter G. Campbell, who owns nearly all of the stock of the concern, is a wealthy mine owner of California. The *Inter-Ocean*, from which we borrow the above information, says of the new process of forging to be employed by this company: "A bar of steel, for instance, will be laid on an anvil, the necessary quantity of current passes through it, heating it properly, evenly, and with constancy, as against the repeated heatings and coolings of ordinary forgery. A rail sixteen feet can be handled as easily, it is claimed, as a short bar one inch square."

New York.—On the evening of March 11, in Hardman Hall, Fifth avenue and Nineteenth street, a fast telegraphic tournament, or contest between expert telegraphers, will be held, the committee in charge being M. H. Toomey, R. L. DeAkers, M. W. Russell, J. N. Johnston, H. F. Warren and Charles Orr. The tests are intended, among other things, to develop the maximum carrying capacity of an absolutely "clear" and approximately perfect conductor when manipulated by the fastest operators and most expert receivers; to ascertain how much "press" matter might in an emergency be crowded over such a conductor, Walter P. Phillips's code of abbreviations being used, and to test the comparative worth of the pen and the various typewriting machines for recording Morse signals.—The trouble between the National Brotherhood of Electrical Workers and the Electrical Contractors' Association has at last been settled. The agreement, which is to go into effect February 1, provides that nine hours shall constitute a day's work at $3 a day, and the agreement to remains in effect for one year. The association is to employ none but union workmen, and union workmen will work for none but members of the association. No sympathetic strikes or lockouts are to be undertaken.

Spokane, Wash.—A syndicate of Spokane capitalists has purchased 1,100 acres of land within five miles of the city, and intend laying it out for suburban residences. An electric road to the locality will be built as a part of the scheme, which it is thought will be immensely profitable as the land was purchased for $110 an acre, and other parties are selling lots about the same distance from the city at $250 to $300 apiece, or at the rate of $1,250 to $1,500 an acre.--The plant of the Edison Electric Illuminating Company at this place is said to be the largest on the Pacific Coast, not even excepting San Francisco, and the hydraulic equipment both in design and magnitude is considered superior to any yet produced in any other part of the United States, and probably in the world. The total amount of horse power now used in this station for all departments is 2,300, of which amount 645 horse power is utilized by the street railroads, all of which now get their power from this station. The hydraulic equipment consists of two parallel flumes over 500 feet in length, each seven feet in diameter, constructed of steel, capable of discharging 425 cubic feet of water per second, and of delivering 2,700 horse power.—The construction of the electric road from Spokane to Cœur d' Alene is expected to begin early in the spring. The distance is thirty-two miles, and power will be supplied from two stations, one in Spokane, and the other at Post Falls, about twenty miles above, on the Spokane River.

The New Stanley Transformer.

A pamphlet is about to be issued by the Stanley Company announcing a new transformer, which is the result of their extensive experience in this line, and embodies a new method of insulation which has been perfected and which is said to be much superior to anything heretofore in use.

Every effort has been made to produce a thoroughly good article and detail improvements in design, methods of construction, etc., have been frequently adopted, but no radical changes made. Now, however, the company announce a change of the greatest importance because it goes to the very root of the most essential feature in a transformer, namely, insulation.

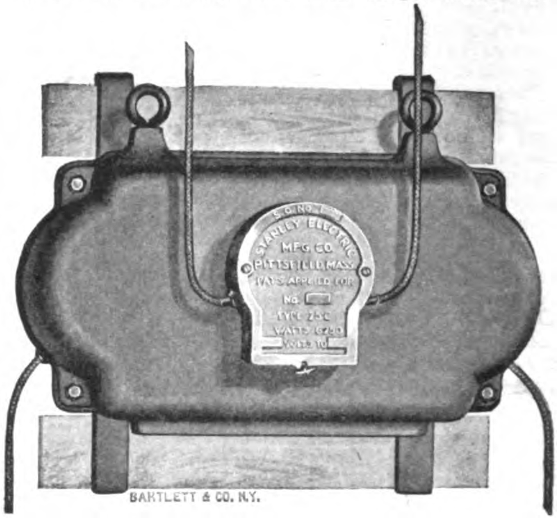

FIG. 1.

They have delayed the commercial introduction of this new transformer for the purpose of making absolutely sure of the value of the changes and the entire reliability of the transformer itself and the methods adopted for its manufacture.

The coils in the new instrument form a solid mass and are embedded in an insulating material of very high resistance which will not deteriorate with use.

These coils can be submerged in water indefinitely without injury to their insulation and as moisture is one of the worst enemies to electrical insulation it will at once be seen what a great step in advance this is. And the company will prove their confidence by insuring these transformers for five years for a nominal sum against all accident, and even against lightning.

The cost of this insurance will be but five per cent. of the selling price.

Every transformer made is submitted to severe tests, and must come up to a predetermined standard before it can leave the factory. These tests are made to determine efficiency, regulation and the insulating resistance of all parts of the transformer, and in addition to this the transformer is run for a long time on more than its full rated capacity, and afterwards is subjected to several times the E. M. F. on which it is to be used in practice, in order if there is any weak spot in the transformer that the company and not the customer may discover it.

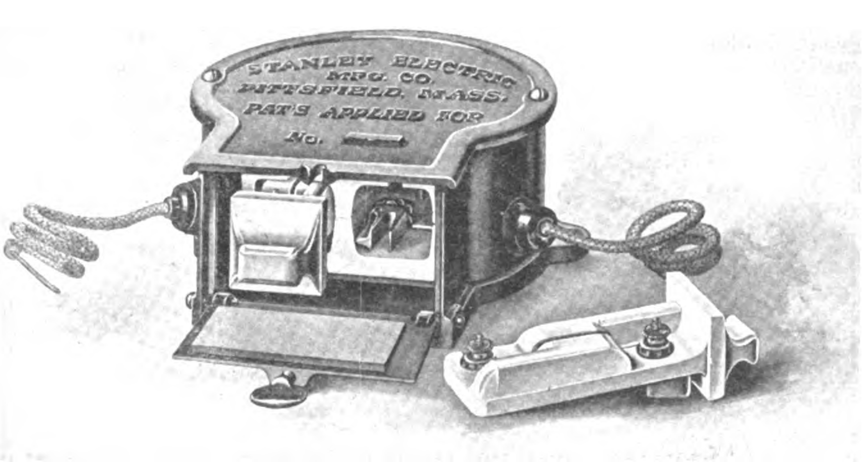

FIG. 2.

Fig 2 shows the details of the fuse box on these transformers. Only the primary circuit is fused, secondary fuses in the transformer itself being now very generally and properly regarded as unnecessary. The fuse is a double pole, each link being carried on a separate porcelain block.

To replace a fuse the door is dropped down by simply loosening one thumb screw, the plug pulled out and an extra one inserted, or a new fuse wire attached.

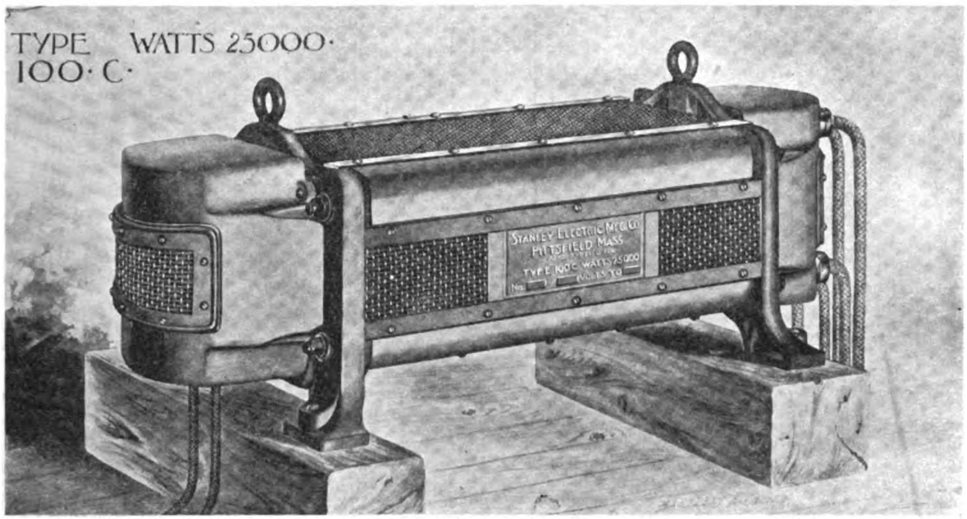

FIG. 3.

This company are now manufacturing regularly 500-light transformers, a cut of which appears above [Fig. 3], and are also supplying separate primary fuse boxes, shown in Fig. 4.

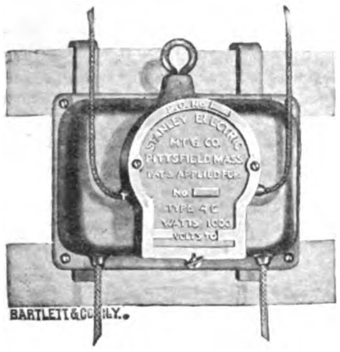

FIG. 4.

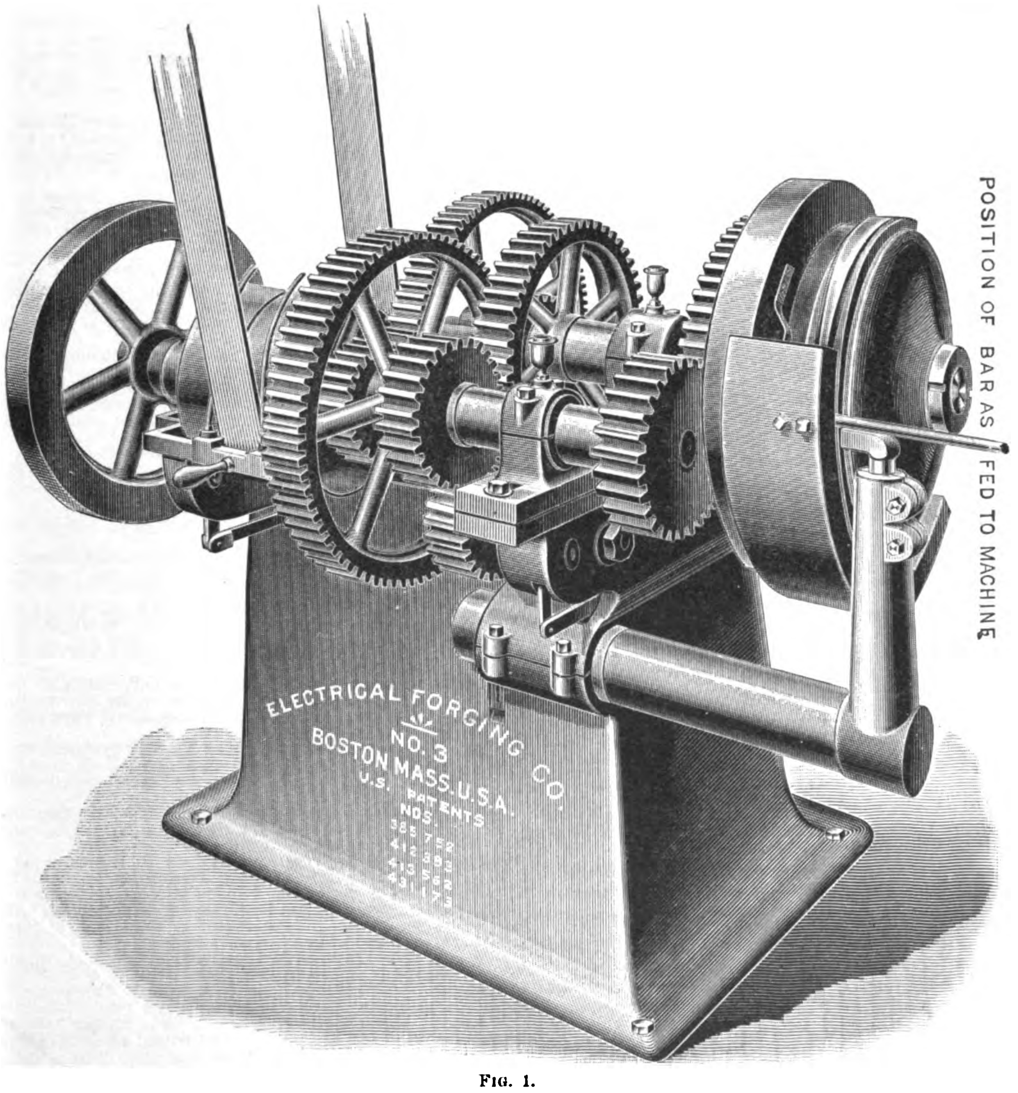

FIG. 1.

These transformers show a remarkably high efficiency throughout the whole range between no load and full load, and have come to be recognized as a standard of excellence by central station men.

Electrical Metal Working.

Round shapes have puzzled metal workers through all past ages. It has been generally conceded that the usual method of forging an approximate shape and then turning to accurate size on a lathe are tedious and expensive ways of doing the work. For nearly one hundred years the attempt to make round forgings by rolling process has been going on, but with indifferent success. A history of the attempts shows many partial successes, but in every case some vital principle has been omitted, or some mistake made which has prevented ultimate success.

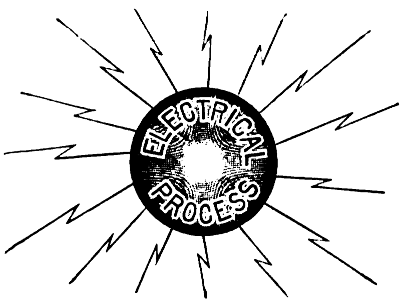

FIG. 2.

The accompanying cut shows the Electrical Forging Company's latest improved No. 3 Patent Rolling Machine for manufacturing rolled forgings. This machine was designed and built for rapid and accurate work, being rotary in all its movements no time or power is lost in the return of the dies to their working position. The machine may be worked at any speed from slow to fast according to the nature of the work required, it is quickly adjusted and automatic in all parts, and work from ⅛ up to 6 inches long and from ⅛ to 2 inches in diameter is turned out by this size machine. These machines are built in sizes ranging from 0 for the smallest work up to No. 10 for the largest and heaviest kind of work.

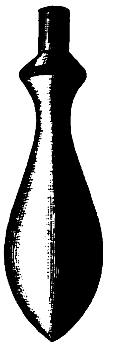

FIG. 3.

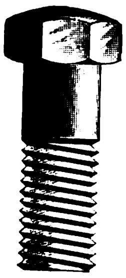

FIG. 4.

FIG. 5.

FIG. 6.

The uses to which these machines can be put are many and varied, as a great variety of things now produced are made of iron or steel of low carbon in order that they may be turned out economically. By this process highly carbonized steel may be worked equally as well as iron or soft steel and insures increased strength, an advantage of the first importance in all kinds of work. It is within the range of these machines to roll successfully steel of the highest grade of crucible down to the open hearth and Bessemer; also copper and brass are successfully worked. It is claimed that these machines stand alone in the matter of producing rolled forgings of irregular shape without leaving them hollow or piped, and articles rolled on this machine whether of regular or irregular shape are perfectly solid.

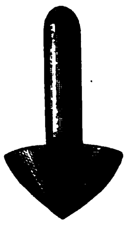

FIG. 7.

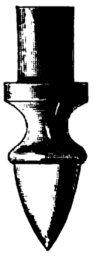

FIG. 8.

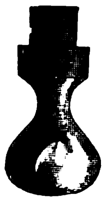

FIG. 9.

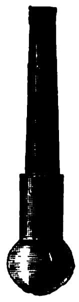

FIG. 10.

Steel handles of all sizes and shapes heretofore invariably made on the turning lathe may now be produced by the electrical rolling process at a saving of 99 per cent. over the required machine labor, it being possible to roll 100 perfect handles in the time required to make one by former methods; also in making handles a considerable saving is effected, in that there is practically no waste of metal.

Anti-friction steel balls from ⅛ up to 2 inches in diameter are made by the electrical rolled forging process at a speed unapproached by other methods. The work done by this process is perfectly accurate and the operation quick. A red hot steel bar is inserted between the revolving dies (the position of the steel bar is shown in the cut of the machine), and for every revolution of the dies a ball is forged, or a conical shot, a chair screw, a bolt with thread and head complete, a boiler rivet, tiny calks for lumbermen's shoes, or a spindle or taper pin, etc.

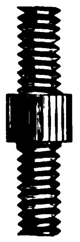

FIG. 11.

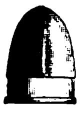

FIG. 12.

FIG. 13.

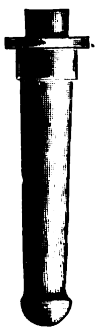

FIG. 14.

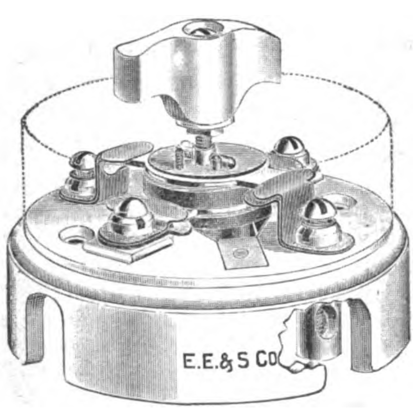
FIG. 15.

One hundred millions [100,000,000] of anti-friction steel balls are now required to supply the trade in the United States alone, and from 3,000,000 to 10,000,000 of boot calks, and the custom heretofore has been to forge these with a trip hammer, and a manufacturer has been unable to make over 4,000 per day, generally not over 2,000, while with our improved rolling machine 30,000 a day are made at a cost far below the price at which they have been heretofore produced.

The foregoing cuts show a few of the many samples of work made on our improved rolling machine: Fig. 2, Electrically heated and rolled forged Steel Ball. Fig. 3, rolled forged Machine Handle, made in several shapes and sizes. Fig. 4, rolled forged Hexagon Bolt, head and thread made at one operation, square and round headed bolts made by the same dies complete at one operation. Fig. 5, Shoe Calk, made in four sizes. Fig. 6, Conical Shell. Fig. 7, Shuttle Tip. Figs. 8 and 9, Hinge Tips. Fig. 10, Hames Start, made in several sizes. Fig. 11, Right and Left Hand Thread, made at one operation. Fig. 12, rolled steel Cane and Umbrella Tips. Fig. 13, rolled Bicycle Spindles, all sizes. Figs. 14 and 15, rolled Castor Pins.

Double Pole 25 Ampere Snap Switch of the Electric Engineering and Supply Company.

A close examination of this switch will show quite an improvement in this line of goods, and in the absence of the many defects of its predecessors it will compare very favorably with them. The contact is made by rotating metal arms mounted on a spindle insulated from each other, so that they pass between two metal contact pieces mounted on each of the four binding posts so as to make a long wiping knife contact between the parts on both sides of the contact arms. In order to make and break instantly there is arranged in a recess in the porcelain base two elliptic steel springs which press against the sides of a square frame-work holding a roller in each of its corners, so that in turning the handle the square frame-work is rotated until the rollers on two of the corners have compressed the two springs and are just passing the highest point when the contacts are about to be made or broken. Having passed this highest point, the springs press the rollers on the corners towards the center so as to rotate the switch through the part of the circle in which it travels. Owing to the lost motion left in the spindle there occurs instantly the make or break of the circuit with a sudden snap. The openings left in the side of the base facilitate surface wiring, so that the wires may pass directly into the binding posts, which are drilled in the side to receive the wires, which are held by a screw passed downwardly through the binding post, or, if preferred, the post is bored from the bottom up through the top and the wires held by a binding screw passing through the side of the contact post.



This switch has more carrying capacity than most switches designed for 25 amperes, and the wiping contacts constantly keeping the surface clean, the parts always run cool, and the sudden break is of such length as to make the switch safe for use with currents of an electro-motive force of from 400 to 600 volts.

This switch is finished in the same neat and workmanlike manner as all the goods of the Electric Engineering and Supply Company, Syracuse, N. Y., who are prepared to fill all orders promptly.

COMMERCIAL PARAGRAPHS.

Queen & Company, Incorporated, Philadelphia, are congratulating themselves upon the increasing demand for their "Magnetic Vane" Ammeters and Voltmeters as evidenced by the fact that more than twice as many of these instruments were sold by them in 1892 than in the preceding year. This advance is perhaps not astonishing when efficiency and cost of the apparatus are considered, but it shows a degree of appreciation on the part of the purchasers that is very significant.

The "M. V." are adapted for constant and switchboard use, and voltmeters as well as ammeters can be left in circuit constantly, a feature of great importance to the central station manager.

The makers are manufacturing in large quantities to supply demands which come from all over the United States. A number of prominent dynamo building companies have adopted the above type to install with isolated plants for incandescent lighting and for power circuits.

Descriptive circular No. 420, recently issued by Queen & Company, contains further information of value and will be mailed upon application.

Queen & Company, Incorporated, Philadelphia, have sold nearly all the Ayrton and Perry ammeters and voltmeters which they advertised so extensively at reduced prices, but a few still remain which are offered at a mere fraction of the original manufacturing cost; for instance, an ammeter with capacity of 400 amperes being placed at $16.00.

Any one who wants a portable instrument for general testing, where great accuracy is not required, will find it very advantageous to purchase now, before the stock is entirely exhausted. Descriptive circular No. 355 will be mailed by the makers upon application.

The annual meeting of the stockholders of the Railway Equipment Company, Chicago, was held on Tuesday, 17th inst., and the report of General Manager W. R. Mason showed a most satisfactory state of affairs. The business of the company has been very greatly in excess of expectations and is daily increasing. The late devices brought out by the company have had an unprecedented sale and are being adopted throughout the entire country. Mr. Mason called attention to the need of further increasing the manufacturing facilities, and it is understood that a prominent capitalist has become interested in the company with the intention of still further increasing its business.

The *Street Railway Review* of Chicago has recently moved to more commodious quarters at 269 Dearborn street, its former offices having proved too small for the business of this enterprising journal.

The firm of O. F. Zurn & Company, Philadelphia, has been dissolved by mutual consent. The business of said firm will hereafter be conducted by the same parties and incorporated under the name of O. F. Zurn Company, who will assume all liabilities and receive all money due the old firm.

The Railway Equipment Company, Chicago, announces that the business of that company during the last season, especially in the Type G overhead material of their manufacture has been enormous. It has been impossible to fill orders promptly on account of this large and constantly increasing business, and arrangements have been made whereby their manufacturing facilities will be very largely increased at once, and they will be able to fill orders promptly in the future.

INCORPORATIONS.

An act has been introduced in the Maine Legislature to incorporate the Portland and Yarmouth Electric Railway Company to construct an electric street railway from some point on Congress street, Portland, between Elm and Washington streets, thence through certain other streets and over Turkey's bridge to Deering; thence through Falmouth and Yarmouth over Martin's Point bridge, if desired, to Yarmouth. The capital stock must not exceed $300,000. Many moneyed men of Portland are among the incorporators.

The Electrical Company, Omaha, Neb. Capital stock, $1,000,000, of which $100,000 is paid up. Incorporators: S. D. and G. W. Mercer, of Omaha; Charles Suter of St. Louis, and T. J. Evans and S. B. Wadsworth of Council Bluffs. The business is the supplying of electricity for power, heat and all the purposes to which it may be put.

The Automatic Telephone and Electric Company, Chicago. Capital stock, $250,000. Incorporators: J. R. Griffith, Victor C. Sanborn and Sidney Coolidge.

A new electric light company has been organized at Delta, York county, Pa., with these officers: President, J. F. Crawford; vice-president, E. L. Ramsay; secretary, J. Egbert Smith; treasurer, C. O. McConkey.

Jenkintown Electric Railway Company, Jenkintown, Pa. Capital stock, $150.000. President, William Wharton, Jr., of Germantown, Pa. The line will be eight miles long.

The Lancaster and Terre Hill Electric Railway Company, Lancaster, Pa. Capital stock, $200.000. Directors: John D. Skiles, J. Hay Brown, W. W. Griest, John I. Hartman and A. B. Hassler. The proposed road will be eighteen miles in length, and will extend from the northern boundary of the city of Lancaster, where the Lancaster and Lititz turnpike road and the Lancaster and Ephrata turnpike road intersect to the village of Terre Hill, passing through the villages of Browntown, Farmersville and Martindale.

The Lancaster and Middletown Electric Railroad Company, Lancaster, Pa. Capital stock, $500.000. President, Luther S. Bent; directors: E. C. Felton, John Q. Denny, James Young, John A. Coyle, J. B. Long, W. M. Franklin, J. W. B. Bausman, M. D. H. Herr, B. J. McGrann, John D. Skiles and E. G. Smith.

The Electric Light and Power Company of Kennett Square, Pa., has applied for a charter of incorporation. It has a capital stock of $20,000, all of which is taken by eight persons, namely: Theo. Pennock, W. W. Gawthorp, J. M. Palmer, John M. Yeatman, D. W. Hutchinson, Horace W. Gawthrop, J. E. Worrall and Henry C. White. W. W. Gawthrop has been elected president, J. M. Palmer vice-president, and J. E. Worrall treasurer.

The North Kankakee Electric Light and Railway Company, at Kankakee, Ill., has increased its capital stock to $40,000.

The East St. Louis Belt Suburban Dummy or Electric Railway Company has filed articles of incorporation at Springfield, Ill. The principal office is to be at East St. Louis. Capital stock, $500,000. Incorporators and first board of directors: Louis Gross, James P. Slade, John W. Renshaw, M. F. Geary, Paul W. Abt, Henry Voss and W. H. Bennett. The company proposes to build the line from East St. Louis to East Carondolet, Kahokia, Brooklyn, Venice and Madison.

The Bridgeport (Conn.) Electric Light Company has increased its capital from $200,000 to $300,000, and the number of shares from 8,000 to 12,000.

The Carterville (Mo.) and Webb City Electric Railway Company. Capital stock, $100,000. The road is to extend from the twin cities to Carthage, ten miles.

Buffalo and Tonawanda Electric Railway Company. Capital stock, $100.000. Directors: Frederick Swift, Charles A. Lebritter, Wendell Goodwin and L. O. Mey of New York; W. P. Whitlock, of Elizabeth, N. J.; G. H. Wirth, of Brooklyn; Francis Gilbert, of East Orange, N. J.; and W. Caryl Ely and Frank A. Dudley, of Niagara Falls. Its business is to maintain and operate a street railroad from the Military Road at the northerly city line of Buffalo to Sweeney street in North Tonawanda.

The Illinois Electrical Forging Company, Pullman, Ill. Capital stock, $2,000,000. Incorporators: Walter G. Campbell, John P. Skinner and Thomas Crafty. The business of the company is to manufacture tools, rails and miscellaneous articles, the forging being accomplished by electricity.

The Lancaster and Manheim Electric Railway Company, Lancaster, Pa. Capital stock, $250,000. President, John A. Coyle; directors, Dr. M. L. Herr, Jacob B. Long, Walter M. Franklin and J. W. B. Bausman, of Lancaster. The company was chartered to build an electric railway from North Prince street, Lancaster, to Manheim borough.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JANUARY 17, 1893

ELECTRIC RAILWAYS AND APPLIANCES.

489,944. Electric Railway Switch. August C. Goetz, Milwaukee, Wis. Filed Sept. 27, 1892.

489,972. Electric Car Brake. Andrew C. Miller, Auburn, N. Y. Filed Nov. 30, 1891. Renewed Aug. 17, 1892.

490,028. Trolley. John C. Love, Chicago, Ill., assignor to the Love Electric Traction Company, same place. Filed May 17, 1892.

490,248. Electric Railway System. Thomas Harris, Detroit, Mich., assignor to the Harris Electrical Propulsion Company, Limited, same place. Filed Dec. 28, 1891.

DYNAMOS AND MOTORS.

490,081. Commutator Brush and Holder. James F. McLaughlin, Philadelphia, Pa. Filed March 31, 1890.

490,183. Commutator Brush. Carl O. C. Billberg, Philadelphia, Pa. Filed Sept. 20, 1890.

TELEPHONE AND TELEGRAPH APPARATUS.

490,012. Electric Telemeter Transmitter. Fernando J. Dibble, Peabody, Mass. Filed Nov. 21, 1891.

490,013. Electric Telemeter Transmitter. Fernando J. Dibble, Peabody, Mass. Filed Nov. 21, 1891

490,014. Electric Telemeter System. Fernando J. Dibble, Peabody, Mass. Filed May 12, 1892.

490,064. Telegraphy and Telephony. Fred. H. Brown, Chicago, Ill., assignor, by mesne assignments, of one-fifth to the Brown Telephone and Telegraph Company, same place. Filed Feb. 27, 1891.

489,990. Telephone. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 1, 1888.

BATTERIES.

489,938. Electric Battery. John H. Davis, Detroit, Mich. Filed March 28, 1892.

490,231. Galvanic Battery. Noah M. Powell, Galesburg, Ill., assignor to the United States Burglar Alarm Company, same place. Filed Dec. 19, 1891.

490,254. Secondary Battery. Henry H. Lloyd, Philadelphia, Pa., assignor to the Electric Storage Battery Company, Gloucester City, N. J. Filed Aug. 30, 1892.

MISCELLANEOUS.

489,931. Pneumatic Dispatch or Transit System. Henry Clay, Philadelphia, Pa., assignor to the Electric Pneumatic Transit Company, same place. Filed Oct. 26, 1889.

489,932. Pneumatic Dispatch or Transit System. Henry Clay, Philadelphia, Pa., assignor to the Electric Pneumatic Transit Company, same place. Filed Oct. 26, 1889.

489,983. Electric Cut Out. William B. Potter, Lynn, Mass., assignor to the Thomson-Houston Electric Company of Connecticut. Filed July 5, 1892

490,011. Electric Meter. Fernando J. Dibble, Peabody, Mass. Filed Nov. 21, 1891.

490,034. Electric Heater. Thomas E. Morford, Minneapolis, Minn., assignor of one-half, by direct and mesne assignments, to the Enamel Insulator Company, of Illinois. Filed Dec. 19, 1890.

490,082. Electric Heater. James F. McLaughlin, Philadelphia, Pa. Filed April 28, 1892.

490,161. Electric Alarm Lock. Joseph A. Nadeau, Detroit, Mich. Filed Sept. 2, 1892.

490,178. Electric Circuit Breaker. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed Oct. 28, 1892.

490,256. Electrically Heated Soldering Iron. George R. Meltzler, Cincinnati, Ohio, assignor of one-half to William H. Osborne, Prince's Bay, N. Y. Filed March 31, 1892.

ELECTRICITY.

VOL. IV. NEW YORK. JANUARY 26, 1893. CHICAGO. No. 2

IS THE EDISON LAMP PATENT VOID?

STARTLING TESTIMONY INTRODUCED BY THE BEACON VACUUM PUMP AND ELECTRICAL COMPANY.

HENRY GOEBEL MADE HIGH RESISTANCE INCANDESCENT LAMPS WITH BAMBOO FILAMENTS NEARLY THIRTY YEARS PRIOR TO EDISON'S INVENTIONS.

Summary of Proceedings in United States Circuit Court, Boston.

In the issue of ELECTRICITY for January 25 we printed a very brief outline of the new evidence which had been offered at the first day's hearing in the matter of the application for an injunction by the General Electric Company against the Beacon Vacuum Pump and Electrical Company.

Anxious to place the latest news before our constituency at the earliest possible moment, we print herewith, as a supplement to our regular issue, the leading matters of interest which came up at this trial.

The new evidence produced was of startling importance, and while the case has not yet been decided, the best opinion of those present at the trial is that the Beacon Company have performed a real service to the public and to the trade in the thoroughness with which they have prepared their case in a very brief time, and in bringing out new evidence the utility of which will not be exhausted in the present case whatever the outcome.

Goebel's early work was not entirely unknown, but it remained for the present defendants to trace it out and place it before the court in an intelligent manner.

Plaintiff's were represented by Messrs. Clarence A. Seward, Benjamin F. Dyer, and Fred. P. Fish; and the defendants by Messrs. ——— Brandeis of Boston and Witter & Kenyon of New York.

Following is a summary of the proceedings, Goebel's affidavit being given in full but the remainder necessarily condensed :

Court convened at 11 A. M., Monday, January 23, but was adjourned for an hour upon request of Mr. Frederick P. Fish, that counsel for plaintiff might have an opportunity to look over the new matter which was to be introduced by defendants.

On reconvening, Mr. Fish said: "We have gone over the affidavits and find that the defence is : Anticipation, viz., constant and continuous manufacture of lamps from about the year 1850 to the time when a patent was first granted, such manufacture being known to many persons. We propose ourselves to prepare two affidavits in reply to those that the opposite side is to submit."

Mr. Fish was followed by Mr. Benj. F. Dyer, who made the opening argument for the plaintiff. Mr. Dyer said in introduction : "After sustaining our patent through protracted litigation extending over seven years against a defendant more strongly entrenched than those who appear to-day and with large capital invested, we come here to-day to ask for a preliminary injunction against a company which went into the business during the pendency of that litigation and was protected by the strong arm of the first defendant, and has been enabled to continue in business making lamps that infringe our patent without the slightest molestation.

"The first question of importance to be settled upon is the question of infringement. We claim that in the denial of infringement of the patent in the affidavits we have looked over the defendants' lamps are admittedly an infringement of our patent. Our affidavits show that the defendants' lamps are identical with other lamps that are being made elsewhere.

"In the suit against the United States Electric Light Company, which was the one we prosecuted first, all the questions involved were tried. The investigation was thorough. The defendants had unlimited means in hand and every question was discussed. The investigation included a complete history of the art and its publication to the world. They claimed prior use of the art, but we claimed that point ourselves. We had made a complete research into the subject as set forth by the Sawyer-Man Company, which testimony filled from 700 to 800 pages.

"What is the character of the testimony we have brought here in these affidavits?

"It is that for upwards of thirty years a German named Henry Goebel has been making these lamps in quantities ; has exhibited them on the street, being placed on a wagon for that purpose, and they were seen by many people. It seems to us this story cannot be true.

"As is known, we have all over the country local companies which have paid large sums of money for exclusive rights, yet these local companies have not yet enjoyed what they have paid for. We have been paid money and stock for these rights, yet have never been able to deliver those rights which form the basis of these contracts.

"I cannot but express my conviction that an injunction against this company is necessary to prevent irreparable injury to our company, and such an injunction will bring about a cessation of the manufacture that is now going on."

The court then adjourned until 2 P. M.

When the court re-assembled, at 2 o'clock, Mr. Dyer continued: "I omitted to call the attention of the court to a rule which is now well established for the orderly administration of justice in this country. It is this: Where a patent has been sustained after protracted litigation in which the court has been asked to grant an injunction on new evidence, the law leaves that for final decision. That principle is applicable to a case of this kind as where priority of use and manufacture is claimed. The Adams prior use proved in the former case rested on depositions which were not attacked. The facts were accepted by the complainants, and the argument proceeded. In that instance the circumstances surrounding Dr. Adams's work made it probable that he would do the very thing he did do.

"That matter was discussed and the court concluded that it was not an anticipation, but an abandoned experiment.

"One material fact developed in the record in that case probably led to that conclusion of the court. The publicity given Edison's invention, and the public interest in what he was attempting, were factors in the matter (the decisions in the Adams case). In the fall of 1878, it was stated that Edison had subdivided the electric light in an incandescent lamp. That was sent all over the world, causing a great fall in gas stocks. Scientists, electricians and experimenters came forward and discussed these questions, with the result that it was declared impossible to divide the electric light. Treatises on the subject were published in scientific journals. That discussion continued throughout 1879, and every report was received with great interest and was discussed in the public press and the scientific press. Everybody who ~~had done anything in the business had~~ his attention called to the fact that Edison had claimed to divide the new light. When he gave a description to the world, the preconceived opinions on this subject were so strong that the scientists criticised his lamp and said it could not be done. Until he had accomplished it, they would not believe it possible. That fact undoubtedly influenced the courts in every action. There are other facts which go to prove that the Goebel lamp was not so well known and so familiar to the public. In view of these statements we urge it upon your Honor that this is a case to which the argument of prior use should not be applied. It should be relegated to the final hearing for its trial."

ARGUMENT OF MR. WITTER—FOR DEFENDANTS.

"In view of the statements made to the court just before adjournment, I will not repeat them. I will simply say that in view of the rush with which we have been brought before this tribunal by our adversaries we shall ask for an opportunity of submitting a report that the court may have it, and we ask for time to prepare the same.

"Before touching upon the subject of the prior state of the art, I may say that the question of non-infringement by the defendant in view of the new or present state of the art, must not be forgotten.

"I will allude to some considerations submitted by our adversaries.

"In the first place there has been but one decision on this patent. There has been no more than one, and that was by the Circuit Court of Appeals in the case of Edison and the United States Electric Light Company. That court said in its decision—the decision of Judge Wallace—that the court is agreed with the state of the art presented to me. We are agreed that the conclusions brought against the Sawyer-Man Company could not be denied. The same set of facts obtained when this same company became identified with a Pittsburg company. The same might be said when in Connecticut a verdict was given against the Perkins Lamp Company. In its case the Mather Electric Company asked permission to go into court; but through some misunderstanding their counsel did not appear. Patent Counsel Mitchell attended in court to object to the argument used. But it will be set right sometime. In St. Louis and Chicago there was no objection raised against the case.

"The opposing counsel says that the proposal made by us does not appear relevant to the case. He knows that something has been discovered that will give an entirely new view to this patent case. With some slight feeling of resentment, I beg to say that we are not here to deceive the court on that point. These people here to-day are new defendants, represented by new counsel to present new evidence which they have discovered, evidence that will convince the court that the injunction ought not to be granted. My brother says it is not the custom of the court to listen to claims of prior use. When the counsel asked if prior use had been set up in the United States case, I say it was not set up. Our position in relation to the case is found on page 320 of the Report of the Norton Door Check trial. Here was a case of final hearing, in which prior use or prior patent was set up in the case, yet a verdict was given for the complainants.

If that case had been appealed to the Supreme Court of the United States and it had declared that it found an infringement, we should find no decision in the opinion of the court below. In the Norton suit another defendant, named Hall, came into the case and said: 'We find new evidence which we think ought to convince the court that the case was rendered definitely and you ought to withhold any such order.'

"Now, in the prosecution of our case we present many such cases as the foregoing. A little man ought to have the same protection as a great company. This is the keynote of our defence, something we have got that was not known to the defendants and so was not used in the previous cases. Upon that subject I may say when your Honor comes to understand the construction we put upon our case I think you will see that it is a construction which even Mr. Edison himself has approved. In the Circuit Court it was declared that we want to give Mr. Edison all the breadth of construction we can, notwithstanding the defendants' lamp filament is different from Mr. Edison's. The contention of Mr. Edison and the objection we shall make to it is that the filament is entirely different. It is a filament coiled upon itself and the patent is limited to that ~~filament and~~ not to the present state of the art of lamp making.

"This will be evidence enough for our case.

"My brother made it easy for the court to assume that Goebel, who made this invention before Edison, told Mr. Crosby all about what he had done in this prior use, a statement which is not borne out by facts.

"When Crosby went to view Mr. Goebel's work, he found the latter had made many filaments. That was in 1882, and he engaged Goebel to make lamp filaments in New York. This filament proved to be better, and the lamps too, than what were being made by Edison himself, and so he continued making them for the American Electric Manufacturing Company.

"It does not appear that the latter company was connected at that time with the other two companies of which we have heard to-day."

Judge Colt—Is it not extremely improbable that the defendants in New York should not have known, or did not bring, evidence forward to protect themselves?

Mr. Dyer—Suppose they had known it all, it is not pertinent to the case that they did not use the information they possessed. It is not pertinent that if they did know anything about the matter they should have been under any obligation to present it. Suppose they did suffer in consequence of their own neglect.

Judge Colt—Of course the Beacon Company is not to suffer, but suppose Goebel had made these lamps, does it not seem strange that he is found out and yet not brought forward by the parties in their defence?

Mr. Witter—I think we can prove to the court what the reasons were that Goebel has not been brought forward. I now refer to the Adams use, and state what was the distinction between the Adams and Goebel use. The plaintiffs say that Adams may have done something prior to 1869, though he apparently did nothing until 1879, when Edison made his invention. They state that Adams's use was not an anticipation of the Edison patent; that the filament was not then in discussion. They assert that everything that appeared in the state of the art prior to Edison's change of material from platinum to a rod is of importance. The difference in size is all important, and the claim is not in degree but in quality.

The problem of electric lighting is as important as many other things. The complainants assert that to build a lamp plant would cost from $150,000 to $2,000,000 under the present patent, while to make Adams's type of lamp would mean an outlay of something like $421,000,000.

There was no abandonment by Goebel. There were never six months that he did not make and show these lamps to somebody. As to the filament, there can be evidence produced to prove that it was a filament, being about 8-1000ths of an inch in diameter, while the Edison filament was 64-1000ths. Now we can produce just the things that Goebel made.

The distinction between Adams's and Goebel's work does not appear anywhere in the statement made, though it would appear as if Adams's men used the lamps he made, and yet my brother stated that Adams's use was parallel to Goebel's—was identically the same. When this case is finally tried, it will be seen where the distinction lies.

I now propose to take up briefly this patent of Edison's, and see how some of the things of which he complains apply in relation to the use of these patents. The object of this invention is to produce light by a high resistance. If Goebel produced it he is entitled to be credited with all the uses that were gotten out of the device, whether as a series or a multiple arc lamp. It has seemed at times as if the lamp possessed certain qualities, whereas the distinction was in the uses to which it could be put. The invention consists of a carbon wire arranged so as to afford great resistance to the current, yet at the same time give off great resistance.

When your honor refers to the drawing, you will see that it states that this is a rod to be used for the light. The invention consists in placing the same filament in a perfect vacuum to prevent oxydization or disintegration, and in a manner to secure perfect contact between the filament and the conductors,

There were then the following points to be noted:

A coiled filament.

A filament of high resistance.

There must be a nearly perfect vacuum.

~~A wire to connect~~ the ~~filament with~~ the leading-in wires.

In making these lamps the globes have been made entirely of one piece for one and the more general type, while another plan was to make it in two pieces which were secured together with cement, which proved not to be the best way of securing a perfect vacuum, and so making a lamp of commercial value.

We have been challenged by our opponents to make a globe in two pieces and so make it a practical useful lamp. We shall show a glass globe Goebel made, glass and nothing else. We shall show you that the filament was not a carbon filament but a rod.

The patent says that two leading-in wires have always been used, and efforts have been made to reduce the resistance of the carbon rod in some other way. The inventor says the disadvantage of following this plan of making the lamps cannot always be followed. He says the leading-in wires may be made so large that they become very expensive. Mr. Dyer says the patent does not refer to the conductors leading into the lamp, but the conductors of the socket only.

The use of gas in the receiver of an incandescent lamp at the atmospheric pressure serves to destroy all air washing or attrition of the passage of the gas, which disintegrates the filament. The Goebel lamp did not contain any gas, therefore it was not subject to those objections which enter into the Edison patent, or in any of his works. By reference to the testimony in the United States Courts, it will be seen that the filaments in Edison's experiments were unsuccessful and that the bamboo fibre used for filaments came later in the development of the art.

Because Edison accomplished so much, and because we do not find in the state of the art either the bent horseshoe shape or a spirally coiled filament, although in his patent a claim is made of a coiled filament, we are going to give him both, because the claim is for a carbon filament.

Goebel used a bamboo fibre and never used any one of those articles which appear in the specification, every one of which Edison and his assistants say were used.

I would now refer to the testimony of Edison and his witnesses on the particular point under dispute. By an examination I have made, Edison says he produced a carbon of high resistance. That is synonymous with a filamentary carbon. Whenever a filament is defined it is an article made of this or that substance, of sufficient resistance to produce incandescence and with resistance enough so that it may be kept at its proper illuminating point by a small current from any point. Edison claims to have made the carbon filament. Now it is not denied that a platinum wire as fine as you please had been used as the light-giving part of a lamp, but it is said when you get to the point of heating a platinum wire that it will give a suitable light you have reached the point when it may disappear and go out. It is then argued that it was an obvious thing to change from a filamentary rod to a carbon, which is the real invention of Edison. This may have been an obviously desirable change, but the change of material is not so obvious. Goebel used filamentary carbon in his lamps but of different shapes. This man does not speak much English. He never reads the newspapers, and when in various papers and magazines in 1879 so much was being written about Edison and his inventions, Goebel had no idea what was being talked about. He is a foreigner who has always lived in his own little circle in New York.

Of what Edison was doing he knew nothing until he connected himself with the American Electric Light Company, though he made his carbons at home and was never employed in their factory. This man was in business as an optician and watchmaker. He never seems to have interested himself with people outside his own relations and neighbors. In his affidavit, which I will now read, he states:

"I came to the United States in 1848 and settled in New York. My business in Germany was that of a watchmaker. I learned my trade at Springer in Germany. I formerly assisted Professor Moenighausen in making experiments in physics, among them being the making of light from electricity. I also made many instruments for use by teachers. We made experiments in electric lamps. Besides understanding how to make an electric arc, I believed a practical and useful light could be made by a carbon in a small globe. We perfectly understood the use of the common exhaust air pump, the use of the blowpipe, the manner of producing a vacuum by the use of mercury. We were frequently engaged in this kind of work. While I was still at Springer, before I came to the United States, in 1848, we used authracite coal for producing a light. The capacity for producing light by carbon is accomplished by being placed in a vacuum. We thus learned that this material was a suitable conductor. I also learned how to burn carbons by burning the wood inside the ferule of a broken walking-stick. This suggested to my mind how wood could be carbonized. I found that carbonized wood was a good conductor. I also made a magnetic machine for generating current. I used carbon for producing electric arcs. I found that incandescence could be produced by passing a current through a carbon after being placed in a vacuum. Professor Moenighausen had told me that these carbons when placed in a chamber from which the oxygen had been removed would burn steadily. At this time I became familiar with the fact that the co-efficients of platinum and glass were the same.

"I studied chemistry off and on for ten or twelve years. My father was a manufacturer of chocolate. I became familiar with persons moving in the higher ranks of society. I left Germany in 1848 and reached New York in 1849. First I lived at 391 Monroe street, then at 271 same street, next at 500½ Grand street, then at 468 Grand street. My name is Heinrich Goebel. Immediately on my arrival in New York I began my business. I have had and still have a thorough knowledge of the art of watchmaking. I always had an inventive turn of mind and have always been busy trying to make inventions and improvements. As soon as I got over here I began to work at my electrical devices. I exhibited an arc lamp on the roof of my house and soon had a fire engine around to put out the supposed fire. Soon after this I turned my attention to glow lamps, or incandescent lamps as they are now called. What I have done in that line I have always tried to carry out the idea of Professor Moenighausen, and used such material as I had in hand. The first incandescent lamp I made in the early fifties had its filament in the form of a fiddle bow or a meat-saw bow. These lamps are shown in the sketches herewith given. The matallic wires were directly fused into the glass, no cement being used in the lamps at all.

"The first lamps I made of this kind were made from cologne bottles and afterwards I made them from tube glass. I was living at the time in Monroe street, New York. I left that street in 1872.

"The next form of lamp I made was the hairpin lamp, from the shape of the carbon, the leading-in wires being sometimes made of iron, platinum, or copper. Sometimes I made them of other metals. As late as 1890 lamps with platinum leading-in wires were made. In the accompaniyng sketch the support (B) was first made of glass. This lamp I made as follows: The top (F) was first made and cut off. At A A the incandescent conductor having been heated it was placed in the tube (F). The glass cup or tube (D) was thin, the air being exhausted by a blowpipe. While working on this lamp I lived in Munroe Street, where I made many similar ones.

"I made from time to time many more of the fiddle-bow type. After gas was laid through Monroe street some of the employees of the gas company would sometimes come in to see my lamps burning. These men became so suspicious that I was stealing their company's gas that they insisted on going down into my cellar to investigate. I would not show them my battery and its connection with the lamps.

"When I went out of business in 1890 my possessions got scattered and with them about all my lamps, some of which I now know are in existence somewhere. I sometimes made the platinum wires into curious shapes. I then moved into Grand street. No six months ever elapsed during which I did not make and exhibit some of my electrical devices. In 1881 I was sent for by some one connected with the American Electric Light Company and made them carbons for a long time. All the incandescent lamps I made were fitted with carbons which I made from vegetable material. The carbons had a diameter of about 1-100th of an inch, and whenever I increased the resistance I found I had not a sufficient number of cells of battery to supply current for them.

"The reason why these lamps never came into commercial use at that time was really because there was not, at that time, an adequate source of electricity, the battery being unreliable then as now. The conductors I made were carbonized in crucibles and I used flax, black cane, tampico, a species of grass, and other materials. I built a furnace wherein my carbons could be properly carbonized. I even tried to use the lead from lead pencils, but found it was too earthy. In those early days I used to attach the ends of the wires to the filament proper, twisting them together. For sealing up the aperture that led into the lamp proper I used stove polish and found it to answer very well. My electrical current was produced by battery, and when in Monroe street I had a battery of 80 cells; it required so many to illuminate a single meat-saw lamp. From 1860 to 1880 I showed these lamps to my customers and friends. I gave away many of these lamps at different times. When I lived in Grand street in 1890, I had about twelve lamps. The lamps I exhibited in Monroe street attracted a large share of attention. I could make them very incandescent at times. When I found that a thick carbon was not so efficient as a thin one, I began to make the latter thin and with very gratifying results. About this time I built a large telescope and exhibited in Union Square and elsewhere. This was while I was living in Monroe street. When I got it where I wanted it to be, I made a small charge for looking through it. I had the telescope in a wagon and around the vehicle I hung a number of these lamps, current for which was supplied from a battery placed under the driver's seat. I sometimes took my son with me to assist me. One use of my lamp was to illuminate the face of a large case clock which stood in my own bedroom. I attached the wires to the mechanism of the clock, the circuit being made through the lamp. When the hours struck the current was turned on automatically, thus illuminating the face of the clock for a few moments. This was in practical operation for years. After removing from Grand street I fitted up another clock with a similar device. There was no time from 1861 to 1880 when I had not some lamps in hand to show my friends. I made no secret of their construction or any part of them. Prior to 1879 I made and used over one hundred lamps. I removed from Grand street in 1879. I made lamps of various sizes and gave them away to my friends. I never heard of a dynamo machine for lighting until I worked for the American Electric Light Company in 1882. I never heard of Edison until 1881 or 1882. I had to buy all the materials for my battery and lamps, which made it expensive for me. I did not hear or know that anybody had made or used an incandescent lamp. About that time I first heard of a dynamo machine for lighting purposes.

"I had never read in the newspapers for I cannot read. Until my engagement with the American Electric Light Company, I knew very little of what was doing. I never saw Edison; in fact, never knew his name. About the year I came to this country I made a vacuum pump which I have used from time to time. It was with some considerable difficulty I got this mercurial pump applicable for my lamps. When I heard of the Geisler pump I made one and was successful in exhausting my lamps; I then made a larger sized one. This was in June, 1882. I afterwards met Mr. Crosby; he was much interested in my lamps. I gave him some of them to try. He wanted me to go into the employ of his company. He allowed my son Adolph to work for them. He pressed me to make their carbons and I did so in my own workshop. For more than a year I made lamps of various kinds. The company furnished me with men to do the work while I attended to my own business. I recognize the Goebel lamps numbers 1, 2 and 3. They were made by me in Munroe street. I laid the gas into my house in that street, and immediately after I fitted up an apparatus for using my blowpipe. I used a double blow-pipe. I tried to work cologne bottles but it did not do, the glass was very brittle.

"Prior to 1867 I invented a hammer and attachment. This was attached by the Singer Company without any profit to myself."

Mr. Crosby's affidavit was then read, in which he detailed the manner of making the acquaintance of Henry Goebel. He first heard of the latter in 1880 and found him in his workshop in Grand street. Goebel told him that such lamps as he was then making he had made for years past. He gave Crosby some of his carbons to take away with him, and subsequently his company employed him to make carbons. His carbons were of very high resistance. Goebel's lamps proved to be very superior to the American Company's lamps. Mr. Crosby asserted that Goebel's knowledge of and familiarity with incandescent lamps greatly surprised him. As a former assistant of Mr. Edison's at Menlo Park, Mr. Crosby claimed to know a good deal about such lamps.

Mr. Witter then read the affidavits of John C. Goebel, son of Henry Goebel, which strongly supported in minute detail the statements made by Henry Goebel.

Affidavits were also read of Henry Goebel, Jr., another son of the inventor, H. Schenalenberg, John J. Benson, W. Newman, George Linden, W. Heghter, Thos. Brader, Sophia Stearns, daughter of Henry Goebel, Nicholas Finck, Jacob Fey, Julius Zoller, James F. Conerty, James Benson, J. Harrigan, Celeste West, W. W. Nykart, Elias Brush, H. McArthur, H. Vanrance and D. L. Foss. These various deponents testified that they had each and severally known Henry Goebel for many years, had seen him at work on his lamps, had seen them displayed on the wagon whereon his telescope was erected, had seen the lamps illuminating his clock, also show cases and work table in shop. Goebel, according to their statements, had kept working on from his first coming to this country to a few years ago, and they never knew him when he was not experimenting with these lamps.

A long affidavit, which included sketches of the lamps shown in court, together with a technical description of incandescent lamps, was read.

The testimony of Mr. Franklin L. Pope was then read. This evoked a discussion on the respective thicknesses and nature of various lamp filaments and the methods of their preparation and application.

Mr. Henry S. Kaliske, manager of the Beacon Vacuum Pump and Electrical Company, also testified by affidavit.

Professor Elihu Thomson deposed that he read of Henry Goebel being engaged to make carbons for the American Electric Company. He did not think there was much in the story of Goebel's inventions. In 1881 he visited Goebel's workshop and saw what was being done, but he (Thomson) could not be induced to believe in the commercial value of Goebel's inventions.

The affidavit of John E. Randall, lamp examiner for the General Electric Company, also of Mr. J. W. Howell, endorsed Prof. Thomson's opinion as to the value of Goebel's lamps.

Professor Charles R. Cross by affidavit deposed to the character of Goebel's lamps, pointing out their prominent features and enumerating the usefulness and value of such an early invention.

After the reading of the affidavit of Mr. L. E. Curtis, the court then adjourned until 10 A. M. Wednesday, with the understanding that the case should be closed that day.

The case was renewed at 10 A. M. Wednesday.

Mr. Kenyon, in behalf of the Beacon Vacuum Pump and Electrical Company, proceeded to consider an affidavit sworn to by Mr. Edison himself, in which that gentleman went over the history of the efforts that had been put forth in the accomplishment of producing an incandescent lamp; also describing the state of the art as it was in 1879, when Mr. Edison succeeded in making a filament that proved to be a commercial success by reason of the fact that it was of a high resistance and did not disintegrate. Mr. Kenyon could not concede that twenty-five witnesses could be mistaken in their opinion as to what they had all seen and were familiar with.

It might be urged that the story embodied was an improbable one, but that was not so.

The first argument against the improbability of the story was that it had not been brought up in any previous case. Mr. Curtis, an eminent lawyer, had asserted that he knew Goebel in 1882. His talk with that individual impressed him with the belief that Goebel was honest and truthful, and was confident of his invention, but Mr. Curtis drew the inference that Goebel's work had been abandoned after 1850. That was a wrong inference and Mr. Curtis had stated just how the misunderstanding arose and his explanation was a very plausible one. It was entirely owing to Goebel's imperfect knowledge of English, which fact also explained why Goebel had never heard of Edison and his patent until about two years after it was granted.

Coming to Prof. Thomson's affidavit it was shown that no criticism whatever was made by the deponent of the methods adopted by Goebel whether in the matter of a vacuum, the filament or the leading-in wires. Prof. Thomson would appear to have been interested in the lamps and the ingenuity displayed. Mr. Pope and Professor Charles R. Cross in their evidences, showed that they examined Goebel's lamps carefully and formed favorable opinions about them for the merits they appeared to possess.

Mr. Brandeis, on the same side, then called the court's attention to a point that had not been discussed, and that was the defendant was a company in good financial standing, doing a good business, not cutting down prices, in a position to bear the expenses it incurred. Capital had been invested, a large plant equipped, many hands employed, and were an injunction to be issued the company would be wronged, unless it could have a full hearing of its case, and that was just what they asked for and nothing more.

ARGUMENT OF MR. SEWARD.

Mr. Clarence Seward then addressed the court in behalf of the plaintiff company. He alluded to the litigation that had continued for seven years which had proved very expensive to his clients. It was a contract with the Government, this patent, and all that was sought was to secure a fulfilment of the contract.

In the case under discussion no attempt had been made to deny infringement, and therefore they were entitled to what they asked for.

Nothing had been brought forward to disprove Edison's right to his patent. It could be proved that even in 1845 a man named King had accomplished all that Goebel now claimed to have accomplished, so what was the value of the latter's work? The entire case as presented was simply the Sawyer-Man Company's case over again. But not only had King done so much in 1845 and given it to the world, other men in different countries also did much in the same direction. Even Sawyer and Man had laid claim to having invented an efficient incandescent lamp years before Edison made his discovery.

The evidence about the Goebel lamp was anything but convincing, and it was impossible to admit that such a device could ever have been made a commercial success.

Continuing after recess, Mr. Seward argued that no actual service had been performed by Goebel's lamps; they were only glow lamps. There was no evidence that they were uniform, no proof that they were 16 c. p. or any other c. p. The vacuum was not proved, and there was no evidence as to what Goebel's carbon was in any certain lamp. They could not be called filamentary; there were no filaments to show the court.

Mr. Witter showed some impatience here, and interrupted Mr. Seward to exhibit the three Goebel lamps which still retain their filaments; although broken, enough remained to show that they were not only filamentary carbons, but had been pronounced by good authority of high resistance.

Mr. Seward contended that Goebel's carbons must dave been much larger thirty years ago, and that they had grown smaller with age, that there was no evidence that these carbons were of over 25 to 30 ohms resistance, while Edison's lamps, to be practicable, had a resistance of 100 ohms and upwards.

Mr. Seward was followed by Mr. Frederick P. Fish, who spoke for about an hour, closing the plaintiff's case. Mr. Fish's argument was largely citations from the authorities.

No Restraining Order Granted.

At the close of Mr. Fish's remarks, Judge Colt, at the request of counsel for the defence, granted one week for the filing of briefs, and the printed affidavits in the case, leaving it open for both sides to hand in meantime, such additional affidavits, etc., as they may desire.

The result of this case was awaited with much interest by the trade throughout the country. The result is anything but satisfactory to the General Electric Company. Mr. Fish remarking at the close of the trial that he did not see how he could make any further move just now in other cases.

Among those present at the hearing were Messrs. Rothamel, of the Columbia Lamp Company; Barton, of Barton & Brown, Chicago; Wheelwright, counsel for the Germania Company; Curtis and Terry of the Westinghouse interest; Prof. Elihu Thomson; Paul G. Friedler, of the Boston Braid Company.

All the New York electrical journals were represented, the *Electrical World* by Messrs. N.W. Perry and —— Walters, ELECTRICITY by W. S. Key and B. E. Greene, and the *Electrical Engineer* by Mr. Geo. M. Phelps and Mr. A. C. Shaw.

BEACON 16 CANDLE POWER INCANDESCENT LAMPS, 35 CENTS.

Reduced Prices for all other Candle Powers furnished on application. Unrivalled quality! High efficiency! Perfect satisfaction guaranteed!

16 CANDLE POWER.......ANCHORED FILAMENT RAILWAY LAMPS.......40 CENTS.

In order to make these reduced prices available, orders must not be for less than 200 lamps, which may, however, be made up of various sizes if desired.

LAMPS FOR EVERY SYSTEM IN USE. TERMS—Net 30 days.

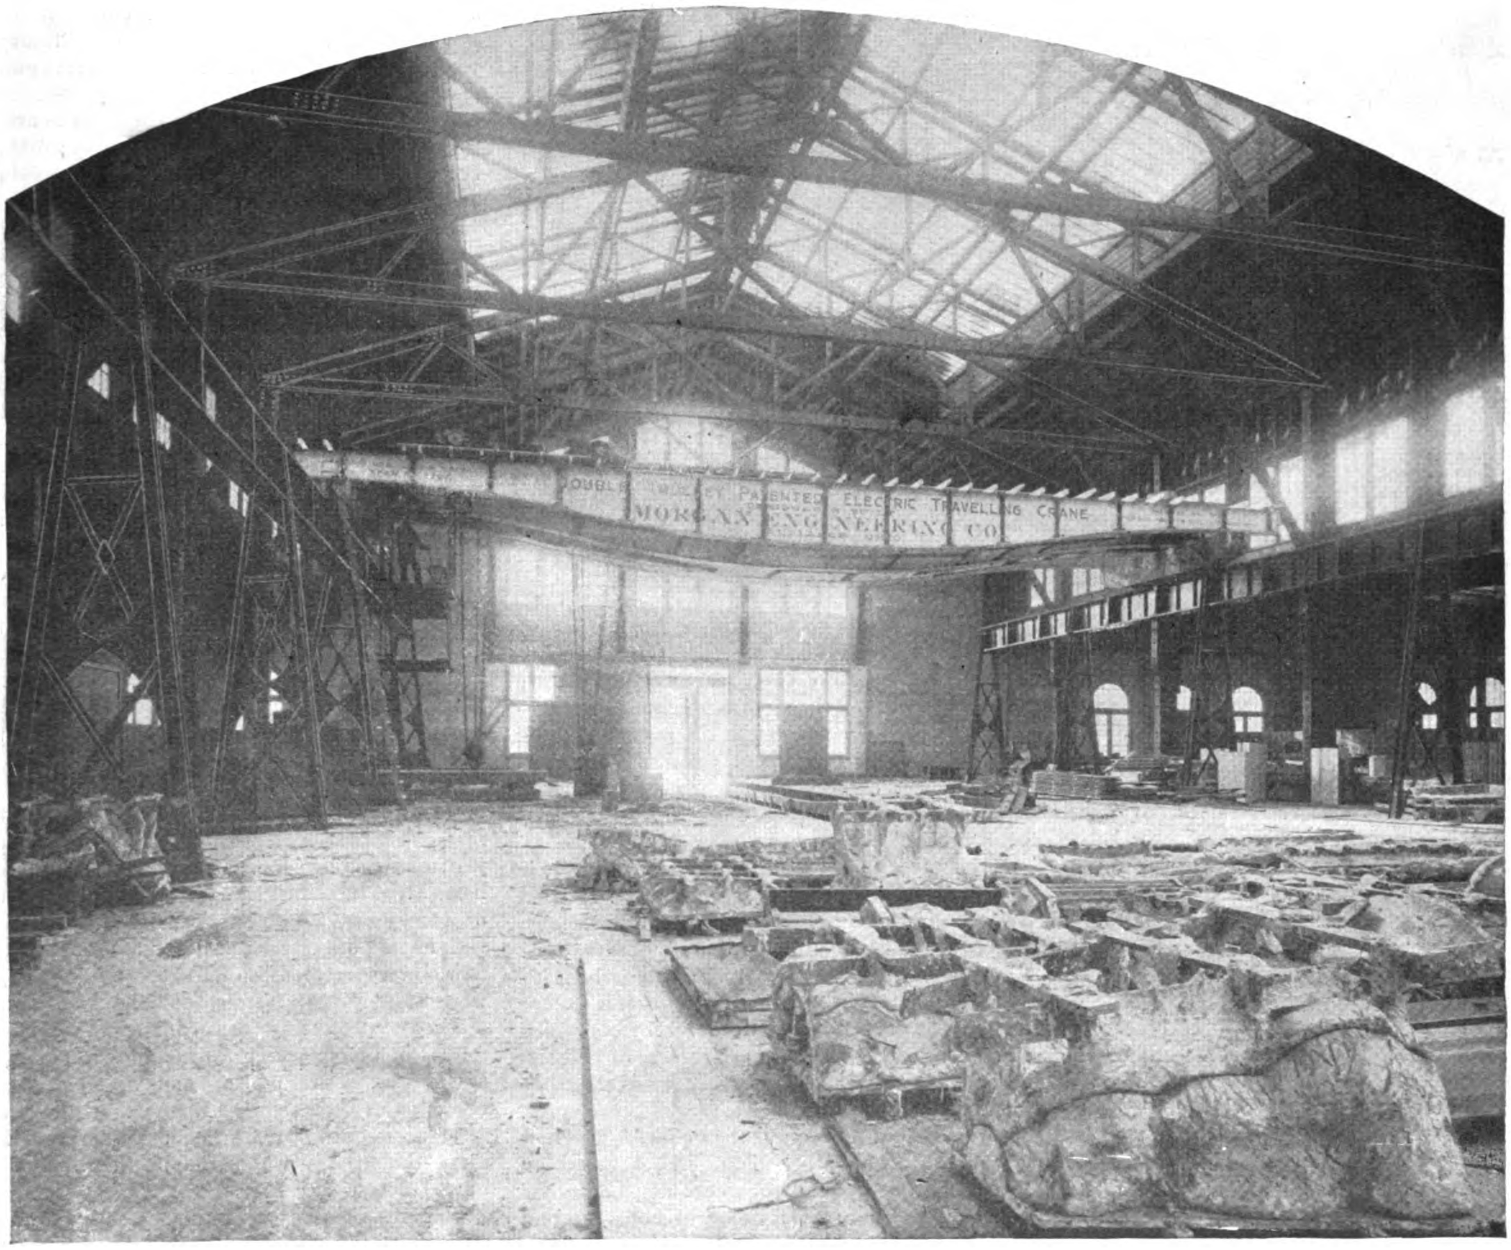
ELECTRICITY.

VOL. IV. NEW YORK. FEBRUARY 1, 1893. CHICAGO. No. 3



A MAMMOTH ELECTRIC CRANE. (SEE WORLD'S FAIR NEWS, PAGE 26.)

World's Fair News.

That the head of the Department of Machinery has made ample provision for unloading and handling the heavy machinery which will be on exhibition in Machinery Hall may be seen by the illustration of the electric crane shown in the Frontispiece. The crane is capable of lifting and transferring a weight of 40,000 pounds. The span between the two tracks is seventy-five feet, the tracks are mounted twenty-five feet above the floor and run the entire length of Machinery Hall and its annex, a distance of some 400 feet. Two of these cranes are now in operation handling the exhibits as they arrive at the building. The electric crane was designed and built by the Morgan Engineering Company of Alliance, Ohio.

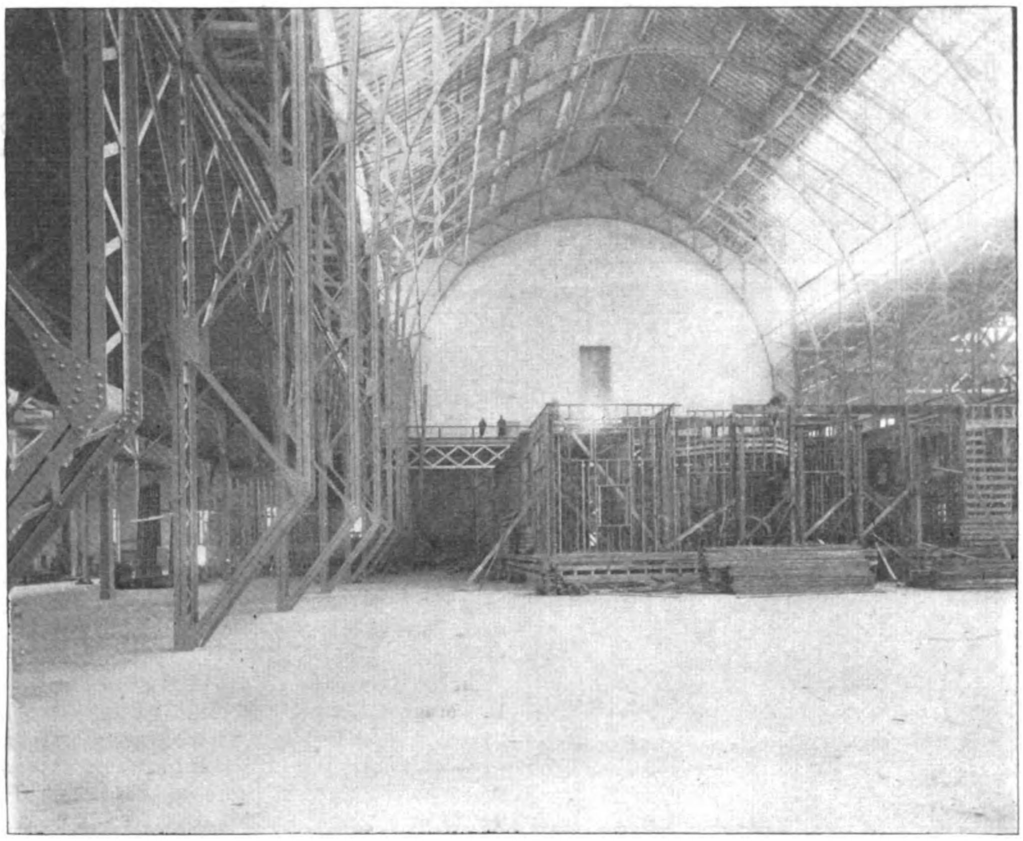


Fig. 1.

Fig. 1 shows a portion of the interior of the Electricity Building, and also the work that has been done by the Bell Telephone Company. This is the first booth that has been erected by any of the intending exhibitors. A portion of the space on the right is to be occupied by the Western Electric Company.

The report of the Committee on Ways and Means shows that out of the total of $3,500,000 revenue to be obtained from concessions granted the Intramural Railroad will yield $400,000. The electric launch privileges will return $75,000. It is thought by members of the committee that these estimates are very low, as the companies to whom concessions have been granted are obliged under their contract to pay a certain per cent. of their gross receipts to the Exposition treasury.

Proposals are advertised for by Director Burnham to furnish the electric light fixtures in the Administration Building. As these fixtures are to be of the very highest grade, there is expected to be considerable competition between the different companies who manufacture them.

The St. Louis Meeting.

Mr. James Cox, secretary of the St. Louis Autumnal Festivities Association, extends an invitation to newspaper men offering them the free use of the office of the Association during the Convention next month.

Electric Meters.

BY JOHN F. GILCHRIST.*

With the first appearance of electricity upon the markets of the world as a commercial commodity came the demand for an electricity meter. Business men were interested and enthusiastic over this new force which was attracting the attention of so many of their scientific brethren. They were anxious to see it developed and to assist in procuring the benefits which would result to the world, but when the time came to offer it to them as an article of commerce, something to assist them in their business and for which they must pay, they were none the less exacting. If electricity was on the market to be bought and sold as merchandise, there must be some way devised to measure it, or placing it in some tangible form so that it could be transferred from one to another for a price, so that buyers would know whether they were getting the full worth of their money or not. Here was a hard nut for the electrical men to crack—but crack it they must, for all the plans for doing business without a means of exact measurement were showing defects and proving unsatisfactory both to producer and consumer. A meter must be devised.

Naturally, in their labors in this direction their first thoughts were something like this: In what ways does this current make its force known which are subject to control and observation? By what facts can an idea of its force be estimated? It creates heat in conductors, it excites magnets, it decomposes water, and by combined chemical and mechanical application of this last law it will deposit metal from one plate or electrode to another. This last named action of the current, known as electrolysis, was the one with which it was most easy to experiment, and it was soon found that the quantity of metal deposited by a given current in a given time was constant, and that the amount of current was accurately measured by the weight of metal deposited. Here then was something to work on, and from which has come the electrolitic meter, a meter for continuous current of constant potential in which the amount of current passed is determined by the weight of metal deposited on small plates submerged in a metal solution by the electrolitic action of the current.

When the first experiments were made with the chemical meter the entire current to be used was conducted through the measuring bottles, but this was soon found to be not only impracticable but unnecessary, and a high resistance circuit of which the measuring bottle formed a part was connected in shunt with the main line so that only a small percentage of the current measured was conducted through the bottles.

Numerous experiments have proved that absolutely accurate measurements can be obtained even in cases of very small amounts of current by passing a 1-1000 of the entire current through the measuring bottles, and from that up to 1-14000 in the case of heavy currents.

In theory this might be carried out to infinity, and even in practice to a much smaller amount, if the most favorable conditions of operation could always be relied upon, but under ordinary conditions it is unsafe, for the obvious reason that any slight increase of resistance which may occur in the bottle shunt creates an error which is greatly magnified in the main circuit. This change referred to was made before the meter was put into practice, and no radical changes have been made since. With the exception of small details of construction intended to facilitate operation, the meter is the same to-day as when first brought out. All the patents on this meter are owned and controlled by the Edison Company, and its use is confined almost entirely to plants installed by this company; for this reason I will refer to it hereafter as the Edison meter.

The first Edison meters constructed were made of tin, shallow rectangular boxes designed to be fastened upon the wall. These boxes were provided with hinged doors, full size of one side of meter. The meter was divided by a shelf into two equal compartments. In the lower space were placed the heavy conductors extending from one side to the other of the space. The ends of these conductors were set in binding posts made to admit and secure the main circuit wires. To these binding posts the small wires of the shunt circuit were fastened. This smaller circuit included a resistance coil and the measuring bottles, the latter being connected in circuit by flexibles provided with binding posts at the loose end to be fastened to the rods of the electrodes in the bottles.

Operation proved that improvements could be made. The metal case, which demanded great care in insulation and which also proved too flimsy to stand the work, was discarded and a substantial wooden case somewhat larger took its place. The flexible connections for receiving the measuring bottles required too much time to adjust, and also had the bad habit of getting their heads together and short-circuiting the bottle, or worse yet, getting mixed with the opposite pole and putting out customers' lights, so that in these new meters metal clips or strips of spring copper were substituted, fastened to the back of the meter and projecting forward in a way which admitted of being sprung up and down, but rigid as regarded lateral motion, and were placed just far enough apart so that the ends of the bottle electrodes could be placed beneath them and thus close the circuit when the bottle itself stood upon the meter shelf.

The three-wire type of this meter is shown in this figure, being simply two two-wire meters placed in the same case, the two left hand bottles measuring the current of the upper outside wire and the two right hand measuring the lower one, the two bottles on one side being wired in multiple with each other, and the circuit thus formed in multiple with the main conductors.

---

* Paper read before the Chicago Electric Club.

Thus you see the two bottles should read the same, one acting as a check upon the other. The resistants used in these meters are small coils of copper wire varying in resistance according to the size of the meters, or rather the size of the main conductors, so that the ratio of resistance of the bottle circuit to the resistance of the main circuit is the same in all sizes of meters, namely, as 1: 974. The measuring bottles, as you will see by illustration, as well as sample, resemble a patent fruit jar in appearance, having a glass cover provided with two small holes for the rods of electrodes and held in place by metal screw rings, while a rubber gasket and small corks fitting over the rods into the holes in the cover prevent the fluid from spilling or evaporating. Each bottle is equipped with a pair of plates or zincs, small rectangular pieces stamped out of ¼" metal and having a copper rod screwed into one end for the purpose of making contact. These plates are provided with small holes through which pass the rubber bolts which fasten the pair together, while small rubber fittings prevent their coming into actual contact with each other. The bottles are filled so that the zinc portion of the plates are entirely submerged with a light solution of zinc sulphate. These bottles and plates vary in size according to the amount of current they are designed to measure. The smallest ones are constructed to measure a three ampere current, holding a quarter of a pint of fluid and their plates having an electrolytic surface about ¾ square inch. From this they increase in pressure by geometrical progression, the largest bottles holding over a quart of fluid and weighing when prepared five pounds.

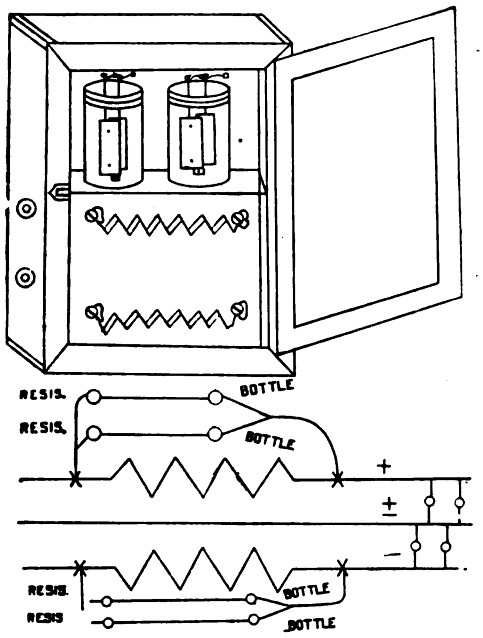

FIG. 1.

This is the meter which is most largely used by the Edison station to-day, and is very satisfactory with the single exception of being quite expensive to operate. The last meter brought out by the Edison people, known as the "Standard Meter," has still further lessened the labor of operation, and would be more generally used were it not for the fact that it is constructed to use a heavier solution, so that it is not wise to use it with the old meter when all are operated from the same room, as a chance for error is created by getting the solutions mixed. In this meter the bottles are placed in the lower part of the meter, which is an improvement over the old style for several reasons: the fluid from the broken bottle cannot drip into the zigzag of the main conductor and thus eat it out by the action of the current; there is less danger of the meter man making an accidental short circuit on the main wires if he is not obliged to reach up over them in changing bottles, and as meters are generally placed above a man's head they are easier to reach. But the change which most facilitates operation is the use of one size of bottles in all meters. This is accomplished by varying the ratio of resistance between the main circuit and the bottle shunt in the meters of different capacity.

Whereas in the smallest meter the ratio is that of 1223 : 1 and a deposit of 1 milligram on the plates means that one ampere hour of current has passed on the main wires, in the largest meters the ratio is that of 9784 : 1, and one milligram on the plates means that eight ampere hours of current have passed in main circuit, this of course requiring a different constant for each size of meter when figuring out bills.

In this meter the bottles are about the size and shape of a whiskey glass, and have a large cork instead of a glass cover and rings of the old style bottle, by which much labor is saved.

The plates also are something of a departure in size and shape. When this meter was brought out the confidence in the chemical meter had become so great, and the system of bottles in multiple used in checking showed so little variation from absolute accuracy that the second bottle in the smaller size of meter was deemed unnecessary and was discarded.

Aside from these changes the meter is the same as before, being made in about the same sizes and of the same material. In the Edison meter everything depends upon operation, and in order to operate well the first and greatest requirement is one which has not up to the present time been fully appreciated, namely, a spacious and commodious meter room, well provided with necessary apparatus and furniture, good light and all the red tape and system in the matter of handling that can be used.

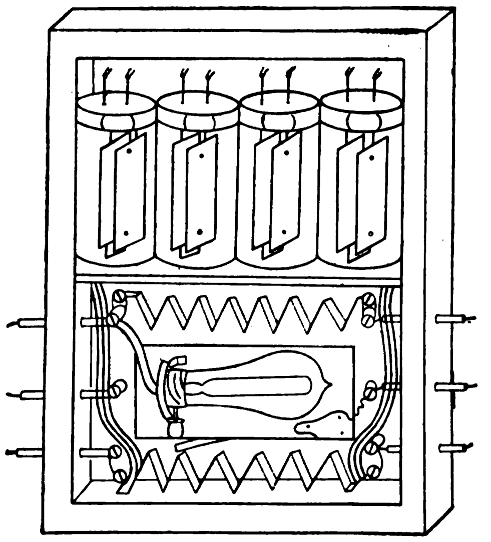

FIG. 2.

For the sake of getting an idea of the necessary work and care let us follow a set of meter bottles through the mill. The zinc plates are first ground in order to clean and brighten the surface. For this a sand paper is used, run by a motor, then the tops and joints between the plates and rods are carefully painted with asphalt varnish to protect the paint from the action of the mercury. After grinding and painting the plates are amalgamated, then brushed off carefully with a stiff nail-brush, or better yet, a revolving brush, and placed in racks to dry over night.

When the mercury is thoroughly dry the plate is found to be covered with crystals of mercury. These must be removed before weighing. This is done by polishing them on a scratch wheel or steel buff, which removes the crystals and leaves a clean smooth surface. The plates are then wiped off with a clean crash towel to remove dust and particles of mercury, and are turned over to the scale man to be weighed.

The scales used for weighing plates are the finest assayer's balances, laboratory style, and will weigh to 1-10th of a milligram. Here the plates are weighed, each one having attached a tag bearing the name of the consumer, the weight of the plate and a letter designating the position of the bottle in the meeting; only one plate in each bottle is weighed. The plates are then made up, that is, fastened together by rubber bolts, placed in the bottles which are filled with fluid and the covers adjusted, no small part of the work; the bottles sorted into sets, and placed in carrying cases, ready to be carried out to the meters. In putting the bottles into the meters the only care necessary is to see that good contact is made between rod and clip, and that the bottle is so placed that the weighed plate in each bottle shall come under the positive pole, and thus become the losing plate. This is really immaterial, as the theory that one plate gains the exact amount that the other loses is well borne out in practice; but it is well to have some system, and in occasional cases where the deposit is not firm, having been deposited very rapidly, it is better to have the positive plate, as nothing but current will loosen the firm new zinc of the losing plate, while the crystals of the gaining plate may be removed by abrasion due to careless handling. The new bottles having been put in place, and the meter resealed, the old bottles taken from meter go into the case, are returned to the meter room, knocked down, that is, plates removed from bottles and taken apart, and are put into racks to dry. When dry, plates are again weighed, the weight being entered upon customer's record directly beneath the weight of same plate when it left the meter room the previous month; then, having accomplished their mission, they are sent to the grinding room to go through the same form for some other meter the following month. Meter plates in ordinary use will last from six to eight months, when they become thin and small and go to the scrap pile.

Between the losses of plate from multiple bottles an average is taken and from this the bill is easily figured, using for convenience a previously figured constant. The action which takes place between plates when current is passed through bottle, and upon which the entire system is based, is the same as that employed in electroplating. As we say in explaining to customers, it is a chemical action which amounts practically to deposit of metal from one plate to the next. The exact action is this: a molecule of zinc sulphate solution is decomposed at the negative electrode; the zinc in the molecule immediately adheres to the zinc plate, while the other elements seize

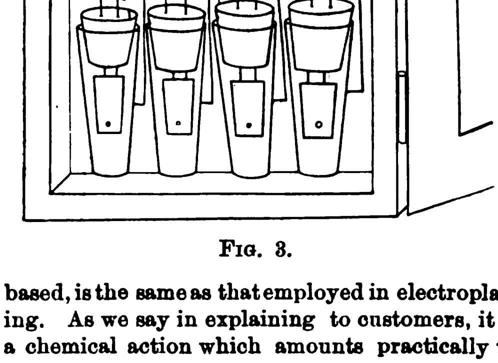

FIG. 3.

upon the zinc of the molecule behind and toward the other plate and form a new molecule; this action keeps up throughout the distance from one plate to the other until the freed element of the lost molecule seizes upon an atom of zinc from the positive plate, and the chain is complete.

This action is very slow and of course entirely invisible, but extremely sure. Occasional cases will occur when, on account of overloading, the deposit will not be good, but they are safe and are taken care of by the use of the second bottle. This is the whole of the Edison Meter System.

The meter stands upon its own merits; it is more largely used to-day than any other meter; its accuracy is unquestioned, and the fact that it is somewhat cumbrous is the only fault that can be found in it by any one who will take the trouble to familiarize himself with it, and this to the practical man resolves itself immediately into a question of dollars and cents, and when results are taken into consideration it is a very cheap meter to operate. It has great advantage over other meters in the matter of first cost, and it will stand wear and tear and rough usage very well, while damp cellars and an occasional shower bath do not affect its accuracy. There is nothing about it to get out of order, and repairs amount to nothing, while the double check system and the matter of starting fresh each month act as detectives to immediately locate any error or defection in reading.

This is only a brief outline of the construction and working of this admirable meter, but I hope it will open the way for thoughts and questions in answer, to which you will find more entertainment and instruction than in the paper itself.

Must Sell Lamps.

Chicago Edison Company Strikes a Snag.

Chicago, January 28.—The Chicago Edison Company as a lessee of the Trust has taken it upon its shoulders to stop all sales of lamps in Cook County, which it claims as its territory. In the injunction suit against the Sunbeam Lamp Company, which has been postponed till February 20, a new feature has developed. The National Electrical Construction Company interjected a plea to become a party in the suit, as it was previously to the granting of the injunction a customer of the Sunbeam Company, and under the present decision it claims that it has been unable to buy any lamps for its circuits.

The trial has consumed the greater portion of Judge Grosscup's time for the last week. After Attorneys F. W. Parker for the National Electric Construction Company and W. G. Beale for the General Electric Company had made their arguments before the court, and considerable quibbling on minor points, the Judge ruled that the Chicago Edison Company as agent of the General Electric Company would be obliged to furnish the National Electric Construction Company all the lamps necessary to supply its customers, and at a price not to exceed forty-two cents per lamp. The complainants in the case claim that the decision is all they asked for, and the verdict is a decided victory for the users of incandescent lamps.

Manager Tebbets of the Chicago office of the Westinghouse Electric and Manufacturing Company had the pleasure of exhibiting a number of the new lamps to the many customers who called during last week to inquire into the truth of the General Electric Company's statements regarding the incandescent lamp situation. Those who called at the Western office of the Westinghouse Company saw ample proof that the new incandescent lamp was a reality.

The Chicago office expects to receive a consignment of 10,000 lamps the latter part of next week.

Discussion of the Paper on Micanite Read Before the American Institute of Electrical Engineers.

Mr. Hammer—We have seen what seems to be a most important advance in the art of armature insulation, which, while it may be new to many, has, I understand, been thoroughly tested, endorsed and adopted by the largest electrical company in this country.

Mr. Thompson very truthfully remarks "that change of volume has caused nine-tenths of the armature breakdowns." This change of volume has been mainly due to mechanical strains and heat.

Moisture by lowering the insulation between adjacent coils, framework and coils, commutator and shaft, etc., causes grounds and short-circuits followed by overload, charring and burning of insulation and disastrous results; besides this, the swelling of substances used upon the armature which absorb moisture create serious mechanical difficulties, such as bursting of wire bands, chafing against field magnets, putting armature out of balance, etc.

Increasing the speed involves increase of mechanical difficulties due to centrifugal force, which strains connections at commutator bars, lugs and radial bars, endangers the insulation of overlapping coils at ends of the armature, and strains the bands.

From the foregoing it is self-evident that it is of paramount importance in armature construction that materials be employed possessing strength, rigidity, excellent qualities to resist heat and moisture, and to the highest degree insulators of electricity. These qualities, experience has shown us mica possesses perhaps to a greater degree than any substance known, and apparently the inventors of the process which has resulted in the remarkable samples we see here to-night have by using "scrap mica" silenced the objections to its extensive use on account of its price, and by the methods of manufacture, enabling them to form this refractory material into almost any shape, have very greatly enlarged mica's sphere of usefulness and conferred a great benefit upon the electrical profession and the world at large. It would be interesting to know the specific inductive capacity and specific resistance of the micanite or combination of mica and shellac.

Fleming Jenkins gives the specific inductive capacity of mica as compared with air as 5, while that of gum lac or shellac is as low as 1.95.

Gordon and Silow give shellac a value as compared with air of 2.74. Mica not given.

Culley gives shellac fourth place in the list of materials of highest resistance and lowest conductivity, rating dry air first, ebonite second and paraffin third.

Munroe and Jamieson give the same rating excepting in case of certain kinds of glass, which they rank as second.

Ayrton and Perry give the approximate specific resistance of shellac after several minutes' electrification as over 100 times that of mica.

Extension of alternate current practice, and use of high potentials, especially in power transmission work, gives a far greater importance to insulating substances, such as are here shown, and they should meet with an extensive application.

Besides its application to dynamo and motor work, there are other fields of great importance, such as in the construction of alternate current transformers, this method admitting of the forming of the insulating substance for separating the high and low potential coils, insulating the core and encasing the high potential leading-in wires, and in the construction of direct current motor transformers, which I look to as developing a large field in this country, this material should find an extensive application in insulating the high and low potential wires in the armature.

In physical apparatus, such as induction coils of large power, the problem of insulation is of vital importance. It is interesting to observe that the largest two coils ever made in the world, the Apps or Spottiswood coil in England and the Wallace coil of this country, have both been pierced, due to insufficient insulation at the high potentials employed, notwithstanding the great care in manufacture. I have here a photograph of the great Wallace coil, made by William Wallace of Ansonia, Conn., in 1869-70, which gave a spark 27 inches in length.

Mr. Thompson refers to the use of micanite in long tubes aboard ship and in general interior conduit installations. I should like to learn if it can be made cheaply enough in this form to fill such requirements.

Mr. Thompson—As to interior insulation for shops and houses, a micanite tube, I suppose, would be used in the most important places, as through partitions, if too expensive to use generally. I simply mentioned that as a possible use of it. The principal object in bringing the tubes before the meeting was to show in what curious forms the substance could be produced, the tube being probably the most difficult one, natural mica being never known in a tubular form. In ships its cost would not prevent its use, because so superior to cheaper insulators. The *best* should be employed in ships, regardless of cost.

Mr. Chas. P. Steinmetz—We have listened to-night and at the last meeting to some very interesting statements regarding that quantity which is called electrical resistance—not the resistance offered to the currents flowing in our electric circuits which we want as low as possible, but that resistance which hinders the escape of current from our circuits, which resistance we want as high as possible; that is, in other words, the insulation resistance. I have given the problem of electric insulation a good deal of attention also in the last year, and have made quite a number of tests which I hope to be able at a future meeting to report more fully.

My experience, however, has led me to an opinion somewhat different from that generally expressed. *I believe very little in insulation resistance.* It is a very nice thing indeed—on paper—to read that the insulation resistance of a a machine is twenty or thirty megohms, or even higher. But when you have determined the insulation resistance in the usual way, by the deflection of the galvanometer using a storage battery of say 100 volts, and then starting the machine, relying upon the "insulating resistance" of 30 megohms, it is not so nice upon breaking the circuit for the first time to see the inductive discharge from the series field break clear through your 30 megohms, reducing the insulating resistance to nil and burning out the armature, while, on the other hand, the insulation resistance of the machine may be suspiciously low, only a few hundred thousands of ohms, and still the machine may run continuously for years and years under all conditions of bad and over load, without breaking down, nay, getting better all the time, the more the insulating material dries by the heat developed in the machine.

What we want is to insulate the electric circuits of the machine so that the machine will stand and work without breakdown under all conditions of usage and as long as air, which is the *poorest* insulation, that is, which breaks down easiest, has an *infinite* electric resistance, while just the *best* insulating materials — best in "disruptive strength," that is, standing electric stresses without giving way—as mica, have a comparatively *low* electric resistance, the insulating resistance gives us no indication as to the reliability of the insulation of the machine. To see this more plainly, let us examine the behavior of different insulating materials.

Take, for instance, two plates, put them against each other at a distance of say one-tenth of a millimeter, that is, 1.250 of an inch of air between them. Now, measure the resistance at say 100 volts difference of potential between the plates. It is infinitely high. For I do not think anybody ever measured the true resistance of air and found any other result than infinite. Now raise the potential difference between the plates to 500 volts. A spark will pass across the gap and this insulating resistance which a moment before was infinite is now reduced to nil; it has broken down. Now replace the air-gap by a piece of dry fibre of the same thickness, and measure again the insulating resistance in the usual way. You will find the resistance measurable, hence infinitely smaller than the resistance of your air-gap. Still you may raise the potential to 500 or to 1,000 volts, and the fibre will stand the pressure. It will break down under a stress of about 1,300 volts. Now replace the fibre sheet with a sheet of mica. The resistance is very much smaller than the resistance of the fibre, to say nothing of the air. But you may raise the difference of potential at the terminals to 10,000 or 20,000 volts and the mica sheet will stand. The electricity will rush out from the terminal plates upon the mica sheet in long, glowing streamers, beating against the mica with a hissing noise, and forming a broad, electrostatic aurora of violet light, and still the mica will not break down. This is the property we want, but this disruptive strength has nothing to do with insulation resistance. On the contrary, those insulating materials which have the highest resistance, like air, just happen to have the lowest disruptive strength, while those materials which are relatively inferior in insulating resistance, like mica, stand electric stress best. I have never found another material which will stand such enormous electrostatic stress, for the same thickness, as mica will stand, and still its resistance is comparatively low. The consequence, therefore, is, if we insulate a machine or any other apparatus, the measured insulating resistance will say nothing to us about the disruptive strength of the machine. There may be, perhaps, two bare wires almost touching each other, with a thin film of air between; a galvanometer test will show a resistance of heaven knows how many megohms, and still the machine will break down instantly, while you may insulate this whole machine with, say ordinary fibre or mica, and you will find—if the fibre is a little damp—perhaps only a few hundred thousands of ohms resistance; still the longer the machine runs, the higher its resistance becomes, and the better the machine gets, and it will not break down. So a very high insulating resistance is not a measure of the reliability of the machine against breakdowns. If we consider it from this point of view, we may learn something even from the civil engineer, though we generally boast—properly—that we are farthest advanced in exactness of methods. When the civil engineer wants to build a bridge, for instance, he does not measure the elongation of a test piece of the iron to be used by a micrometer, but he loads it until it breaks, and then determines the breaking strain, and thereupon bases his calculations.

Resistance tests will not show how safe the machine is. But it will show if we connect the copper part to one terminal and the iron part to the other terminal of a circuit carrying a potential of 3,000 volts and then see the machine not broken down. The megohms might be all right—the fire underwriters occasionally require them. But otherwise it is safer to test by applying a higher potential than the machine has to carry. Because if an insulation stands a potential of 3,000 volts we are sure it will stand a potential of 500 volts. But then there are other points to consider in insulation—the mechanical behavior of insulating materials. While mica has enormous strength against breakdowns, the least kink in a mica sheet, the least bend, will reduce the strength enormously, and while a single sheet of mica will stand enormous potential, simply bend it over a couple of times—you hardly see any kink—still it breaks down at a much smaller potential. But still it is very much better than air or even dry fibre.

Furthermore, you have to consider how the insulating material behaves not only against heat but against electric arcking, because in many cases, for instance at the commutator or the breaking-switch, you want insulating material which is fire proof and keeps up its insulating qualities against the electric arc. All organic compounds are not fire proof and consequently not fit for places where the electric arc strikes. Take any one of these mixed compounds, even micanite, put it between the discharge plates and raise the potential difference until a spark, followed by the arc, strikes across—it is set on fire. Micanite may stand the heat of the armature all right where the spark does not touch it. The temperature may rise several hundreds of degrees, so that the micanite gets black, the cement is charred, and it will continue to insulate, but still the arc will set it on fire. While if you take a sheet of genuine mica and let the arc strike across, along the edges of the mica sheet, the arc simply melts the mica down farther and farther, but it cannot set it on fire. Most of the other organic compounds are very much worse indeed, because they are set on fire by the least arc, some even with a kind of explosion. This is another point to be considered.

Hence we must make up our minds that there is no insulating material which is fit for every purpose; that each insulating material has its special application; what is very good for one case is not good for another. So for places where arcking is to be expected, as on commutators or switches, I do not think that we can ever get anything better than genuine mica, or asbestos paper, or soapstone, porcelain, or any other mineral compound. In all places, where not exposed to arcking, mixed organic compounds will be very good. The disruptive charge will not pass through micanite at even more than moderate potential. It is not as strong as genuine mica—perhaps not more than one-half or one-quarter as strong, but even then far superior to any other similar material. In other cases ordinary dry fibre is a very good insulating material; it has come into discredit more than it deserves, because it gets damp, and when it gets damp it no longer insulates, but in places where it cannot get damp, especially where it is kept slightly warm, it is a very reliable material and has a much higher value than is often supposed. Again, where very high insulating resistance is required, as in electrostatic apparatus, there is paraffin and hard rubber, which surpass, I believe, all materials except air. So we have to find out which insulating material is the best for a particular use; there is no insulating material which is good for every purpose.

Mr. A. E. Kennelly—I would like to say, in reference to the subject last mentioned, that the value of a material like micanite does not seem to lie wholly in its insulating capabilities, but rather in the fact that enables us to employ in it a substance with say one-fourth of the resistance to electrostatic rupture that true mica has, at a far lesser cost; and it is surely better to have something which has a quarter of that capability and which is within your commercial means than to know that a substance exists having the full capability but which is so precious that you cannot use it at all. I think the paper is an interesting one, because it gives us a number of details which can only be gained by experience.

In regard to mixtures, I should think that any material which contained silicate of soda would be a suspicious one, for silicate of soda is not an insulator. It is, of course, a high resistance material, but it conducts quite appreciably.

CORRESPONDENCE.

NEW YORK, January 27, 1893.

To the Editor of ELECTRICITY:

You printed last week in your columns a letter from Mr. Stieringer, in which he terms my drawings of the electrical fountains at the World's Fair "a batch of unreliable news." While in Chicago recently I sketched carefully the situation of the fountains and the surrounding grounds. Before I disposed of my drawings, however, I received from Mr. Stieringer an order for a large birdseye view of the fountains. In order that I should have his drawing correct he showed me all the plans and drawings, and gave me a great many figures regarding them. I finished his drawing and subsequently corrected and finished my original with the aid of the information I had gained. Had I not seen Mr. Stieringer's plans I might have assumed that with him in charge of the fountains an exact copy of what had been done by others in the past would represent his work and have had a fairly good idea of what I was doing.

Respectfully yours,
R. F. OUTCAULT.

The Pulse of the People.

A Sample Letter.

ELECTRICITY NEWSPAPER CO.,
6 Park Place, New York.

Gentlemen: Inclosed find P. O. order for $2.50, amount of my subscription in your bill, also enclosed, which you can return to me receipted. I take much interest in paying this with the hope that it may encourage you to fight the Trust that all of us central stations are beginning to feel so seriously. Yours respectfully,

D.

From a Dynamo Builder.

B. E. GREENE, Publisher ELECTRICITY:

DEAR SIR: We wish to say to you, in view of the *Electrical World*, *Engineer* and *Electrician* being wholly subsidized by certain manufacturing concerns, they are practically worthless to men who are in this business in a smaller way. We have been in business since Sept., '88, and have done very well.

We have frequently asked the editors of the above named papers for information on some points not well understood by us. They always professed ignorance. L. H. J.

Personal.

Mr. James W. Godfrey, of the New York Insulated Wire Company, left for Chicago on Saturday, where he will remain for several weeks looking after the company's construction work on the World's Fair buildings.

No Jobbers Need Apply.

The following is a copy of a circular letter mailed to supply houses throughout the country which explains itself. When the "actual users" apply, they will doubtless be required to prove that their dynamos are of the proper brand:

GENERAL ELECTRIC COMPANY.
44 Broad st., New York.
620 Atlantic Ave., Boston.

New York, Jan. 21, 1893.

Your are hereby respectfully notified that until further notice orders for incandescent lamps will be filled by us only when coming from actual users of the lamps.

Yours very truly,
CHAS. T. HUGHES,
District Manager.

The Prizes Awarded.

Two Former Editors of "Electricity" are Winners.

CHICAGO, January 28.—The three cash prizes of $100, $50, and $25, offered by *World's Fair Electrical Engineering* for the best three essays in answer to the question, "How can the Department of Electricity of the World's Columbian Exposition best serve the electrical interests?" have been awarded respectively to Herbert Laws Webb and Nelson W. Perry of New York City, and W. Clyde Jones of Chicago.

His Decorations are Gone.

PARIS, January 28.—A decree is officially published announcing the removal of the name of Dr. Cornelius Herz from the roll of the Legion of Honor.

Fundamental Patents Sold.

The Green trolley patents, owned by Mr. O. S. Kelley, of Springfield, Ohio, are reported to have been sold to the General Electric Company for a sum amounting to several hundred thousand dollars.

The patents of Green are among the earliest taken out on electric railways and claim to be fundamental. They were prosecuted in the Patent Office and the courts for a number of years, and previous to this sale were owned outright by Mr. Kelley.

Who Will Get It?

A Handsome Contract for Some One?

The Cataract Construction Company award a most important contract next month. It will be for the construction of dynamos of 5,000 horse power, the largest ever built, and also for a system of transmitting the power from the generating station at Niagara Falls to the place of use with small loss of power.

Five electrical companies—three foreign and two domestic—have entered in competition. These are the Oerlikon Electrical Company of Zurich, Brown, Boverie & Co. of Baden, Compagnie de l'Industry Electrique of Geneve, the General Electric Company of New York, and the Westinghouse Electric and Manufacturing Company of Pittsburg.

All these have submitted plans, designs and miniature plants for the inspection of the Cataract Company. These designs will be finally passed upon by Prof. George Forbes, of London, England, the electrical expert of the company.

George A. Scott.

The late George Augustus Scott, Superintendent of the Gold and Stock Telegraph Company, whose funeral took place on Tuesday of last week, was a prominent electrician. A native of Canada, he came to New York some years ago. In the study of his profession he visited France, Italy and Germany, and while at Berlin gained a thorough knowledge of the dynamo from its inventor, the late Dr. W. Siemens. At the time of his death Mr. Scott was electrician of the Interior Conduit and Insulation Company in New York.

The Incandescent Lamp Situation.

The sensation of the hour among electrical men continues to be the startling evidence introduced by the Beacon Company in answer to the application for an injunction by the General Electric Company, of which a complete synopsis was published exclusively by ELECTRICITY in a supplement issued on the morning following the close of the trial.

The claim of anticipation by Goebel which was set up by the defendants was a well-directed attack on the validity of the Edison patent, and unlike former attempts to prove priority of invention by Weston, Sawyer & Man, Brush and others whose work was contemporaneous with Edison's, Goebel's work was so far in advance of these others—and this fact was supported by numerous affidavits—that the chief argument in rebuttal of this point attempted by the plaintiff's attorneys was to express the conviction that the story could not be true for the reason that it had not been offered in evidence during the previous litigation over the patent.

The affidavits of Goebel and those who witnessed his experiments, together with the lamps exhibited which were made by him thirty years ago, lend an aspect to this case different from that of any of the previous ones, and present the strongest defence that has ever been offered in opposition to Edison's claims.

It must be remembered, however, that the burden of proof lies with the defendants, and the patent holds good unless absolute proof of priority of invention is established. In case Goebel's affidavit can be sustained by conclusive evidence, there would be little doubt as to the outcome of the suit, as the lamps exhibited by him conform with remarkable accuracy to the second claim of the Edison patent, which is the one upheld by the Court of Appeals.

This court says the claim may be paraphrased thus: "A combination of three elements, consisting of a tube or tubes, a carbon filament in a glass receiver and conductors passing through said glass receiver."

A reference to the diagram of the Goebel lamp given in the last number of ELECTRICITY will show a striking illustration of this claim.

There can be no question but that the proof of Goebel's invention of the incandescent lamp will be found a most difficult task, as every reasonable doubt must resolve in favor of the patent. A preponderance of evidence is not sufficient to overthrow a patent. The proof must be absolute.

The defense as presented by the Beacon Company appears to have been sufficient, however, to demoralize the plaintiff's attorneys, as their answers to many of the points submitted by the defendants seem to be vague enough to be classed as humorous.

Mr. Seward submitted that the Goebel lamps did not perform any actual service; that they were only glow lamps; and the affidavit of Mr. Goebel did not relate any instance of their actual use. Concerning this the courts have decided that novelty is negatived by prior knowledge and use in this country, even by a single person, of the thing patented. This rule applies even to cases where that knowledge and use were purposely kept secret; and it applies no matter how limited that use may have been.

Novelty is also negatived by the evidence that even one specimen of the thing patented was made in this country prior to the invention of the patentee, even though it was not used prior to that time, for the reason that patent laws do not contemplate rewarding inventors for producing articles which, while new to them, are known to other people. The use of his lamps by Goebel while exhibiting his telescope appears to constitute actual use.

It was also claimed that there was no evidence to show that Goebel's lamps were uniform, or that they were up to sixteen candle power, or any other candle power, and the vacuum in the bulb was not proved.

In regard to this there is no apparent reason why the lamps should be uniform, or why they should be equal to sixteen candle power, or to any other candle power, in order to constitute priority of invention. The Edison patent does not specify the candle power of the lamps for which the invention is claimed, and the fact that Goebel's lamp burned for any length of time would prove that the filament was in *vacuuo*, otherwise the filament would have been consumed at once, as will be shown by breaking the bulb of a lamp.

Mr. Seward further objected that there was no evidence to prove what Goebel's carbons were originally; that they were not filamentary, and only one carbon remained; that they would not resist disintegration, had grown smaller with age and use, and were merely abandoned curiosities and experiments,—all of which was pretty well refuted by the testimony and exhibits of the defendants.

As to what Goebel's carbons originally were, with respect to being filaments or rods, it is merely a quibble hardly worthy of answering. A carbon in the neighborhood of three inches in length which, at Mr. Seward's estimate, has a resistance of from 25 to 30 ohms, is not a rod in this sense, and if the Goebel filament does not resist disintegration it presents another striking analogy to the present lamps, as will be noted by the black coating on the interior of the bulbs of the lamps now in use.

In the discussion of the question of high resistance of the filaments, considerable irrelevant argument was advanced, involving the meaning of this term. It was contended that the Goebel filaments, having withered with age, had probably not more than twenty-five or thirty ohms resistance originally, while Edison's lamps, to be practicable, needed a resistance of 100 ohms or more.

If this be true there are many impracticable Edison lamps on the market now, as the municipal lamp first manufactured by the Edison Company had a resistance of 3.3 ohms (4 ampere 16 c. p. lamp) and the present 3 ampere lamp has a resistance of 3.8 ohms. Besides these, their low volt 16 c. p. lamps for batteries run from 8 to 13 ohms, which is not far from and probably somewhat less than the hot resistance of the Goebel lamp. Their 50 volt 16 c. p. lamps (B lamps) have a resistance of 35 ohms, while in the old style of domestic lamps (100 volts 16 c. p.) the resistance is 139 ohms, and in the present lamps it is 201 ohms.

As these figures show a range for 16 c. p. lamps of from 3.3 ohms to over 200 ohms, it is evident that the term *high resistance* is merely a relative one, the value of which depends entirely on the current and pressure which is to be used.

It is only necessary in order to produce a practicable lamp to have the resistance of the filament enough higher than that of the leading-in wires to produce incandescence in the former without burning the latter. Of course the higher the resistance of the lamps for a distributing system the greater the economy, but this increase in the resistance does not constitute a patentable novelty, as it has been decided in several other cases that the novelty of an article that performs a useful function, even if but poorly, is not negatived by another thing which is practically similar and which performs the same function much more efficiently. If the authenticity of the Goebel lamps can be proved it can be shown that Edison lamps of a resistance much lower than these are being manufactured now.

The lamps alleged to have been manufactured by Goebel about 1860 are obviously too nearly identical with the present type of lamps in use to admit any claim of novelty for the Edison lamp patent. The important points which must be established by the defendants are the conclusive evidence of the priority of Goebel's work and the identity of the lamps exhibited in evidence.

* * *

The Factor of Safety. In calculating the strength of a mechanical structure, or in testing the capacity of a machine, the civil or mechanical engineer assumes the load to be carried to be from three to forty times the normal amount for which the structure is intended, in order to secure a margin of safety against unforeseen and incalculable conditions. This factor of safety, although it has been derisively called the factor of ignorance, is a well recognized necessity, and there appear to be grounds for its adoption, in the case of insulation tests at least, by electrical engineers.

The fact that a dynamo can be designed which will agree within two or three per cent. with the conditions assumed in calculating its proportions shows that the science of electrical engineering is in general an exact one, and may be reduced to a strict mathematical basis. There is a vital point in the designing of these machines, however, and one upon which their continuous successful performance depends, which cannot be predetermined with certainty, and that is the question of resistance to the passage of induced currents or disruptive discharge between insulated parts of the armature. It is for this reason that the insulation of the machine should be maintained at the highest resistance that is practicable, and the insulating material should be carefully chosen with a view to its adaptability to the part of the armature where it is to be used.

Mr. Steinmetz pointed out in the discussion at the last meeting of the Institute of Electrical Engineers, printed elsewhere, that the liability to rupture of the insulation is, in a measure, independent of the insulation resistance, but depends more directly upon the nature of the material used. This he illustrates by the fact that a discharge is effected between two plates separated by an air space which offers practically an infinite resistance more readily than when the plates are separated by some solid insulation whose resistance is infinitely lower. At the commutator the conditions differ from those of the other parts of the machine, and its insulation requires special properties not so essential elsewhere. From this it will be seen that the suitability of any insulation is determined as much by other properties as by its electrical resistance.

The causes which operate to break down the insulation of the armature are both electrical and mechanical, and are subject to wide and sudden variations under different conditions of use of the machine. For this reason the use of a large factor of safety for the insulation is desirable, and from the remarks of Prof. Crocker and others during the discussion mentioned above, the practice of testing electrical machines at four or five times their normal pressure appears to be extending among manufacturers. This is certainly a step in the right direction, and is of importance to the purchasers, for it is usually under the condition of severe service that faults in the armature insulation develop, and these defects are the cause of a large proportion of the accidents which occur in this class of machinery. An excessive overload or short circuit is almost sure to burn out the insulation of the windings, but with the core properly insulated an armature should be able to carry its normal current for any desired length of time without undue heating. If eddy currents are formed through the lack of insulation in the core, the heat developed not only reduces the capacity of the machine, but causes it to deteriorate rapidily by destroying the insulation or the armature wire, cutting the bearings, fusing any soldered connections, and melting the brushes. The expansion of the meter due to heating also introduces a number of troubles.

When the armature insulation, however, is tested up to several times the pressure it is to withstand in practice without breaking down, it is safe to predict that the machine will run continuously without any of the annoying accidents which keep a hot running machine in a continual state of being repaired.

THE manager of one of the leading manufacturing concerns in the West writes an appreciative letter to ELECTRICITY, in which he says: "We realize that the fight which is on in the electrical world in this country is one to the death. We have nailed our flag to the mast, and it will not be hauled down. . . . We cannot be killed by any legitimate means."

HERR HEINRICH GOEBEL, hoch, Hoiero!

* * *

"By dint of no small effort night and day, and by the unstinted use of the long-distance telephone, we are enabled to present our readers with that which is . . . one of the most remarkable stories of invention we are acquainted with." —*Electrical Engineer*, January 25.

Mr. Franklin L. Pope has never been in the habit of dictating to his stenographer over the long-distance telephone, and we don't believe he did in this case. What was the need of telephone or telegraph? Go to.

* * *

THE question of the authenticity of the drawings of the Stieringer fountains bids fair to take its place among the Unsolved Mysteries of Journalism, along with the authorship of "Beautiful Snow" and "Ta-ra-ra Boom de Ay." The comment of one of our contemporaries, however, the *Western Electrician*, is decidedly unfair to the editor of the *Electrical World*.

An eminent Shakspearian commentator, Mr. J. O. Halliwell, F.R.S., F.S.A., has truly said: "While criticism requires likelihood and consistency with the truth from an author, it must not be too literal and exacting; if so, it breaks the poet's [or editor's] wing, and dooms him forever to grovel on the ground." To have described these fountains with the designer's own data at hand would have been an easy matter for any penny-a-liner, and would at best have proved dry reading. But to produce a readable, nay, an enchanting, description out of one's own mind, without commonplace details, was the work of a true literary artist. But Chicago never did appreciate art, or poetry.

* * *

Dr. Cornelius Herz was placed under arrest within twenty-four hours after a solitary copy of the *Electrical Review*, eulogizing him, reached England. One more similar effort on the part of our microcephalous contemporary, and Herz will be hung without trial.

* * *

THE Westinghouse Company announces in a recent circular letter that "The company proposes, if it can secure the needed space, to make as part of its exhibit at the World's Fair a model lamp factory where it will produce new lamps and renew the carbon burners of those burned out, thereby making a most interesting and instructive exhibit, and at the same time effecting a saving in the cost of lamp renewals." No exhibit could surpass this in interest, and we hope the space will be granted.

* * *

ONE word from Mr. C. A. Coffin would close the Thomson-Houston lamp factory at Lynn and the Bernstien lamp factory at Boston, both pirates. The Edison Illuminating Companies should give this matter immediate attention.

Favorable Mention.

The General Electric Company is the Subject.

The Pekin (Ill.) *Post* says that "the General Electric Company of Chicago that is 'bucking' the Pekin and Peoria Electric Railway Company, which is composed largely of Bloomington men, is trying to 'sandbag' the latter company into buying their supplies from the Thomson-Houston Company, and that the former has no intention whatever of building any railroad in the town."

Is the Syracuse Deal "Arranged"?

We Infer That It Is.

An official of the Onondaga Electric Light Company of Syracuse, which lately received some mention in these columns, is reported as follows in the Syracuse *Standard*, in an interview regarding a consolidation rumor;

> "You can say without hesitation," said he, "that there will be no consolidation of the electric light companies. It is true that the old company has made us an offer, but it has not been accepted. We have purchased and paid for a lot at the corner of James and Pearl streets and will build on it. The letting of the contracts has been necessarily delayed. We can't change our identity as a company without losing the Edison contract for which we paid $25,000. Since the negotiations for the new plant have failed some of the stockholders in the old company are trying to buy up stock in the new company. They may acquire an interest in the new company, and some of the stockholders in the new company may acquire an interest in the old company. The Onondaga Electrical Company will be distinct from the Syracuse Electric Light and Power Company, but if there is an exchange of stock, as there probably will be, the contracts may be modified."

Technical Literature Disgraced.

Our Servile Contemporaries the Subject of Unfavorable Comment.

(*From the London "Electrical Engineer."*)

There is a lying spirit abroad, and we are sorry to see technical literature so disgraced as it is at the present moment. Politicians and religious communities find it convenient to run their own organs, so that their views may be faithfully promulgated and those of their opponents satisfactorily criticised. It has been left to technical journalism—to the electrical era—for company-mongers and wire-pullers of companies to obtain control of special organs. The technical journals so controlled are run for no worthy object. They are intended to mislead the multitudes who are ignorant of the behind-the-scenes. They pretend to the highest respectability, and at the same time are *carefully abstaining from obtaining or* TELLING THE TRUTH in directions which in every case it would not be difficult to indicate. Not speaking is ofttimes worse than too much speaking. These journals are not intended to benefit the trade generally after benefiting the proprietors specially; they are intended to benefit a portion of the trade by the active propaganda of biassed opinions, and to injure the remainder of the trade *by the suppression of what might with advantage be told.*

Articles are written in these papers, not for the purpose of telling the truth, but solely with the object of influencing opinions in certain directions. The general public, who can for a time, and for a time only, be influenced by these pernicious measures, is to be pitied. Some are induced to entrust work in directions in which, if the truth was known to them, it would not go. But not only is damage done in these directions, but the investing public is hoodwinked.

Financial difficulties are very real in electrical work, and everything possible should be done to give investors a firm belief in paying capabilities for electrical work, when carried out honestly and faithfully. You cannot get this independent criticism from papers which are run by company promoters, directors and financial agents.

The corporation of Neuchatel offers prizes of 12,000 francs for the best three schemes submitted for the utilization of the water power of the river Reuss for lighting the city, which is distant nine kilometres from the proposed generating station at Poé au Clíes. "Tenders will be required," says the *Electrical Engineer*, "for turbines, dynamos and mains. The turbines are to give 950 H. P. at minimum and 2,800 H. P. at maximum. Head available, 56 metres; flow—maximum, 5,000; mean, 3,000; minimum, 1,700 litres per second."

A bill has been introduced in the New York Legislature by Mr. Cahill requiring the placing underground of all electric wires used in operating street cars.

The Citizens' Street Railway of Indianapolis announces that in 1888, when horses were used, the gross earnings of the company were $389,319.40; and in 1891, with the trolley system, they reached $689,413.73.

Committees for the Chicago Electrical Congress.

At the meeting of the Advisory Council of the Chicago World's Congress of Electricians, four committees were decided upon to take up the active work in connection with preparations for the Congress. These committees were the Finance, three members; Executive, five members; Invitations, five members, and Programme and Papers, eight members. Dr. Elisha Gray, Chairman of the Advisory Council, has now selected the following members of these committees from the Advisory Council and his local Chicago committee:

Executive Committee—Prof. Elihu Thomson, Enos. M. Barton, G. M. Phelps, F. S. Terry and Prof. B. F. Thomas.

Finance Committee—B. E. Sunny, Prof. E. J. Houston and W. A. Kreidler.

Programme and Papers Committee—Prof. H. A. Rowland, Prof. H. S. Carhart, Carl Hering, A. E. Kennelly, Prof. W. A. Anthony, Prof. F. B. Crocker, Prof. E. L. Nichols and Prof. T. C. Mendenhall.

Invitations Committee — T. C. Martin, Dr. Louis Duncan, Prof. C. R. Cross, T. D. Lockwood and C. H. Wilmerding.

Of all these committees, and any others that may be formed, Dr. Elisha Gray is a member *ex officio*. He will participate actively in the work of each. It is proposed to establish headquarters for the Congress at Chicago at an early date, at which Mr. R. W. Pope, the secretary of the American Institute of Electrical Engineers, will probably be stationed to carry on all the detail work in conjunction with Prof. H. S. Carhart, the acting secretary.

Electric Railway Projects in Connecticut.

The New Haven *Register* says that "one of the big subjects before the present Legislature will be that of street railroads run by electricity," and the same paper furnishes the following list of petitions that have been placed on file with the Secretary of State:

Charles O. Hotchkiss and others, for an electric road in Bridgeport.

The Bridgeport Horse Railroad Company, for an extension of the line and permission to use electricity.

W. H. Allen and others, to build a surface road in Groton to be operated by electricity if necessary.

Frank W. Cheney and others, for a tramway company in Manchester, the same to be run by electricity if the company feels so disposed.

The Norwalk Tramway Company, for charter amendment to extend lines and to use electricity.

John W. Nichols, of Branford, and E. A. Smith, of New Haven, for an electric road that will run through Branford, East Haven, Orange, Woodbridge and Hamden.

A. J. Muzzy and others, for a tramway company to operate electric lines in Bristol, Plainville, New Britain and other towns in that locality.

C. H. Prince and others, of Enfield, for an electric railway in that town.

Charles Perrin, of Stonington, and others, for a street railway in Stonington and Pawtucket, to be operated by electricity if the owners desire.

A. A. Young, of Griswold, Windham County, for an electric road in Plainfield, Killingly, Putnam, Pomfret, Hampton, Canterbury, Brooklyn and Windham.

Eugene S. Boss, O. H. K. Risley, J. Griffin Martin and John M. Hall, of Windham, for a horse car road in Franklin, Sprague, Coventry and Morefield and to use electricity if the owners want to.

Norwich Street Railway Company, for amendment to charter for extension of the company's lines and to use electricity.

Lucius Briggs, for street railroad in Griswold and Voluntown.

F. M. Manning and others, for a charter for a street railroad in Mystic, Mystic River and Mystic Bridge.

"In every one of the petitions so far recorded," says the *Register*, "whether it is for a new road or whether for an extension of the lines of the old company, there is certain to be found mention of the fact that the petitioner wishes the right to use electricity. There is evidence in this fact alone that in many localities citizens have suffered and been tormented by the slow-going horse cars just as they are suffering in New Haven from the same kind of miserable horse car accommodations on some of the roads."

Asbestos Porcelain.

M. Garros is the inventor of a new substance somewhat resembling ordinary porcelain, but which possesses, as he claims, many advantages over that substance. The fibres of asbestos are exceedingly fine, their diameter varying between .00016 millimetres and .0002 millimetres, and consequently a very fine powder can be obtained from these. If it were possible to amalgamate these small particles without the addition of any foreign substance it is evident that a substance could be obtained which would be porous in nature, but with pores so fine that they could hardly be seen under the microscope. This substance is formed by pulverizing the asbestos, a process which is rather difficult if the ordinary mortar is used, but which is comparatively easy when the proper apparatus is employed. From this powder a paste is made by mixture with water, and this paste is kneaded, diluted with water, dried and kneaded again, and then molded into the proper form. By heating the objects in a crucible to a temperature of 1,700° Centigrade, a porcelain is obtained with a translucency comparable to that of ordinary porcelain, and for this reason the inventor has given the name of asbestos porcelain to the substance. If it is heated for 18 hours at a temperature of 1,200° Centigrade, then porous asbestos porcelain is obtained of a light yellow, or white color, if care be taken to wash the asbestos powder with sulphuric acid. Professor d'Arsonval states that porous cups made of asbestos porcelain used in electric batteries have much less resistance than the ordinary porous cups, and it has been found that this substance is about 2.75 times a better insulator than the porcelain in common use at this time.—*Electricity*.

What Constitutes Good Vulcanized Indiarubber?

An investigation has recently been conducted by Lieut. L. Vladimiroff, at the St. Petersburg Technical Institute, with a view to establishing rules or tests whereby the quality of vulcanized indiarubber may be efficiently judged. It is a notorious fact that no method of chemical analysis gives reliable results for this substance; hence the tests applied were chiefly of a physical nature. From a lengthy series of experiments the following conclusions were deduced, namely: 1. Indiarubber should not give the least sign of superficial cracking when bent to an angle of 180° after five hours of exposure in a closed air bath to a temperature of 125° Centigrade. The test pieces should be 6 centimetres thick. 2. Rubber that does not contain more than half its weight of metallic oxides should stretch to five times its length without breaking. 3. Caoutchouc, free from all foreign matter except the sulphur used in vulcanizing it, should stretch at least seven times its length before rupture. 4. The extension measured immediately after rupture has taken place should not exceed 12 per cent. of the original length of the test piece of rubber. The test piece should be from 3 to 12 mm. long, 3 cm. wide, and not more than 6 mm. thick. 5. Softness may be determined by measuring the percentage of ash formed on incineration; it may form the basis for deciding between different grades of rubber for certain purposes. 6. The vulcanized rubber should not harden under the influence of cold temperature. These conclusions are to serve in the establishment of rules governing the introduction of vulcanized rubber in the Russian Navy.—*The Electrician*.

Faster and Faster.

The east-bound Empire State Express made another magnificent run over the Mohawk Division last Tuesday, covering the distance from Syracuse to Utica, 52 miles, in 46 minutes, an average of 67.38 miles per hour; rather fast running for an average railroad, but only an ordinary spurt on the New York Central, which leads the world in speed and equipment.—*Utica Morning Herald.*

Electrical Recording Meters.—II.

BY CARYL D. HASKINS.*

Another ingenious and quite positive form of heat meter consists of two metallic rods, or in some cases of two bimetallic rods, somewhat similar to an ordinary thermostat; such meters being in fact a simple application of the thermostat principle to a recording device. Two rods of this kind may be placed vertically, one under each end of a walking-beam mechanism, the familiar pole-changing device being again brought into play to throw the current first through one rod and then through the other. The character of the walking-beam must be such that only a slight movement is needed to actuate the recording mechanism and also the pole-changer.

The method of operation of a meter of this kind is obvious; the alternate expansion and contraction of the two rods as they are thrown in and out of circuit will occur with a rapidity dependent upon the current passing, and, as each rod lengthens, it throws over the walking-beam onto the shorter cool rod, and the same action follows from that side.

I think no comments are needed on such a device as this; it probably lacks sensitiveness to a marked degree and it has other objections which are sufficiently apparent.

Probably better than this is the system of bimetallic rods with one contracting and one expanding side, which bend to right and left, or up and down, with a rapidity dependent upon the strength of the current, a pole-changer of course being used as before.

The method of actuating a train of gears by this system is comparatively simple, and not open to as many objections as the device just described.

I have neglected to state heretofore that the bulk of the thermo-meters are actuated on the shunt principle. It is obviously out of the question to operate a pole-changer by means of a meter which shall cause one to break the full current passing to the lamps. As a rule, a very small portion of the total current is carried through the meter around a positive shunt. Instead of shunting the current, this device has at times been applied to alternating work by the introduction of a kind of transformer which takes a few turns of wire in series with the lamps and transfers the energy through a secondary to actuate the meter; thus the meter is not on the lamp circuit at all, but on the independent secondary. But this intervention of induction is probably not desirable in cases of this kind.

A patent issued in the year 1889 to a Mr. Dahl tells us of another quite unique form of thermometer, and this is probably the only heat meter actuated by an actual field and armature arrangement. In this instrument, the inventor provides a field of iron excited by a few series turns on the lamp circuit. The strength of the field should therefore bear a more or less definite relation to the amount of current passing through its turns. On a shaft is suspended a kind of armature consisting of a flat disc-like ring of iron, supported by a number of spokes and mounted as a wheel; in fact it is mounted on a quite ordinary shaft mechanism suspended in proper bearings. The iron portion of the wheel rotates between the poles of the electro-magnet or at times permanent magnet just described. We have, in fact, a disc armature rotating in such a manner as to pass between two poles of a more or less strong field. On the principle of the familiar thermo-magnetic motor, rotation is obtained in this meter by so placing coils of wire or other suitable material under certain portions of the disc, and in series with the lamp circuit, that the disc is differentially heated at the proper point; thus, with the peculiar armature construction described, a thermo-magnetic action is set up, somewhat akin probably to the action of the thermo-pile. The portion of the disc heated is attracted toward the field coils, and thus the disc being progressively heated and cooling rapidly owing to its thinness, continuous rotation is set up. Sometimes in this construction the field is in series with the heating device and sometimes the heating device alone is in series with the lamp circuit, and the field is either a permanent magnet or independently excited by a battery. Neither of these changes involves the principle of the meter, which is assuredly ingenious.

The final form, and I think I may say the last form, of thermo-meter at all worthy of description is distinctly a clock meter also. The clock meters will come under our consideration somewhat later in this paper, but this meter which I am about to describe can scarcely be separated from its kindred, the heat meters. Briefly, however, I may define the clock meter as one whose recording device or whose movement is actuated by an independent source of power, generally a clock, though sometimes a constant speed motor or other device.

The thermo-meter now under consideration is also a thermometer (a commentary perhaps on the English language). An ordinary thermometer of somewhat modified construction is surrounded at the bulb by a coil of wire in series or in shunt series with the circuit to be measured. It is apparent that the rise and fall of this thermometer will be *more or less* dependent upon the heat developed by the coil, and the heat again will be more or less dependent upon the current passing, but of course the temperature of the surrounding atmosphere must necessarily introduce serious error.

To compensate for external temperature it was suggested that the meter be so encased as to practically insulate it from heat or cold; but this is probably not feasible.

Clock mechanism can be combined with any indicating device; it is only necessary to supply the connection which shall cause the indicator to mark the paper, and draw a crooked line. First attempts of this kind are generally made with an ordinary solenoid, or sometimes with a simple coil and iron core rising and falling with the current. Whatever the character of the indicator or method of communication between the indicator and paper, it remains necessary to keep the friction of contact low.

First attempts were made with a pencil bearing directly upon the paper, but the friction introduced by this device was fatal to accuracy. A glass pen has been substituted for the pencil with better results, but even this caused too much friction. The photographic method of line drawing is one of the best systems yet introduced, and is probably more familiar to the majority of us than the other methods, because it forms a component part of the Walker meter which has attracted attention at various times.

One of the best methods of accomplishing the registration, perhaps when all things are considered the very best, is to attach to the pointer of the indicator a steel point or needle with an iron armature mounted in the form of a spring, or in some similar manner. By placing an electro-magnet behind the paper to be marked, and sending through this magnet an electrical impulse at fixed periods of say one, two or five minutes, the pointer is drawn sharply down to the paper, puncturing it, and is immediately released by the cessation of energizing current in the electro-magnet. Thus the paper when removed will have a continuous marking of punctures tantamount to a curved line. This device presents practically no friction, and is more or less simple and easy to carry out. The make-and-break necessary for the electro-magnet is easily actuated by the clock movements. But we may say of these forms, as well as of the forms of clock meter which are to follow, that there is one serious objection to them all—they have to be wound up, which is certainly a fault. We may modify this statement by saying that many of these devices have an electrical attachment which makes them self winding, and this is a step in the right direction at least. Whether it fully meets commercial necessities is, I believe, an open question.

All of these instruments being curve-drawing meters, they cannot properly be considered as the thoroughly commercial article, which the successful electric meter must be. For to be successful the meter of to-day positively must have a direct reading dial, equally available for the consumer and supplier.

This brings us to a second form of clock meter of a preferable character. This class comprises those meters whose clock mechanism is accelerated or retarded by the strength of the current passing through them. There are several methods of accomplishing this, all of which apply the influence of the current to the pendulum of the clock.

The most successful and probably the best form of meter of this kind consists of two clocks with a differential gear between. One of these clocks runs at a constant speed, the speed of the other being governed by the circuit to be measured. When nothing is passing through the meter, the speed of both clocks is the same and the differential gear does not move; but when lamps are turned on, and the regulating device begins to act, one clock is accelerated or retarded according as the principle may be applied, and the difference between the constant speed clock and the varying speed clock indicates the consumption in directly read units.

The Aron meter, the typical meter of this type, proved itself so accurate at the recent meter competition in Paris that it succeeded in dividing the first prize of 10,000 francs and a gold medal with the Thomson recording wattmeter.

In the majority of cases, motor meters have been designed for alternating circuits, and these again naturally divide themselves into two classes, those actuated by inductive principles and those whose motive powers act direct and which are similar in character to the electric motor.

Now the theory of meters as set forth in most of the patents on file claims a torque proportional to the square of the current, which doubtless would be correct could we neglect the effect of certain minor influences. In reality, careful tests seem to show that torque falls somewhat below the square and above the direct proportion, and the proportion does not seem to hold good at various points of load.

The speed of motor meters is naturally approximately proportional to the torque, and they therefore tend to run too fast and have to be restrained.

None of the inductive meters will run on direct current, of course. We now come to the second form of motor meters—those which are not dependent upon inductive action for their rotation, and are consequently equally serviceable for alternating or direct circuits.

Of these there are but a few, all of them having a field in series with the lamps and an armature —sometimes in series and sometimes in shunt. Of the former kind but few have been tried carefully enough to thoroughly prove their merits.

The remaining class of motor meters embraces those with a series field and shunt armature.

---

*Abstract of a paper read at the Seventy-third Meeting of the American Institute of Electrical Engineers, New York, January 17, 1893.

These are somewhat of a departure from the others, since they are not current meters but power or watt meters. Their construction is in all cases quite similar to an ordinary shunt motor, the conditions of field and armature being reversed.

The field is in series with the lamps; the armature, which is of high resistance, and generally of Siemens construction, with a commutator of a few segments, is placed "in shunt across the line," the shunt being taken off beyond the field coils. An outside resistance is placed in this shunt circuit, to reduce the current in the armature to the necessary small quantity and to prevent any appreciable waste across the line.

The strength of armature then may be seen to be dependent on the pressure, whilst that of the field depends on the expenditure of current. The torque of this meter then is directly proportional to the power passing, and the speed is naturally proportional to the torque (again minus the friction), but the friction is balanced in these meters, as in the previous one, by the presence of a "shunt field," since the armature circuit is taken off beyond the fields, and consequently passes through them in addition to the current for the lamps.

Motor meters, as a class, rotate far more rapidly than is allowable in practice. It has been found necessary, therefore, to introduce a "drag," or resistance to rotation, to slow the meter to a reasonable speed. This has been done in several ways; perhaps the most common method being to attach to the shaft a number of air fans. These are quite largely used and with fair success. The resistance of an air fan to rotation is approximately proportional to the square of the speed. Therefore this device is only fitted for combination with such meters as have a torque increasing with the square of the current. But since the torque of such meters does not quite reach the square, the retarding effect increases rather too rapidly and has a tendency, though not always pronounced, to cause the speed of the meter to fall off proportionately on high loads.

An effort has been made to overcome this disproportion of the fan's resistance by substituting folding fans which close by centrifugal force, on the principle of the steam engine governor. This novel idea, whilst a decided improvement, scarcely overcomes the difficulty.

Another method of drag which has been used with some success is the rotation of a small fan in liquid, a method perhaps rather better than the previous one, since resistance to rotation falls below the square of the speed when the liquid itself begins to rotate. Much depends in this case on the shape of the receptacle containing the fluid.

A third method, certainly by far the best, consists in rotating a small inefficient dynamo, generally a mere disk, turning between permanent or electro magnets. This resistance is of course directly proportional to the speed, and therefore to the torque, being indeed the machine reversed. By applying this drag, friction is again the only difficulty to contend with.

One other important point in connection with the drag and the friction we must not neglect. The greater the drag (commensurate, of course, with sufficient speed), the smaller the proportion of friction to the total load will be, and the greater the accuracy of the instrument's registration.

To sum up, then, it would seem that the most practical and useful meter, according to our present light, would be a motor meter of other than inductive type—preferably an energy rather than a current meter—with some force to balance friction, with a drag which is directly proportional to the speed, and which will be comparatively heavy, making the irregular friction as small a portion of the load as possible.

There is another form of motor meter somewhat akin to the clock meters which we discussed some little time ago. This comprises those instruments whose motors would rotate at a constant speed provided the resistance to rotation were also constant. In other words, the current passing through the meter would be so arranged as not to cause fluctuations of speed in the motor directly. This is easily accomplished by placing the motor in shunt across the line like a lamp, and properly proportioning its windings. Variation in speed of the motor which is geared directly to the dial is accomplished in this class of meters by varying the resistance to rotation or drag.

(Concluded.)

Good Words for the Trolley.

The Salem, Mass., *Gazette* says: "The determined opposition to the trolley system shown in New York, Brooklyn, Philadelphia, Baltimore and other of the large cities of the country seems strange to people in this vicinity. To read the discussions in the legislative chambers of those places, and the editorials in the leading papers there, one would think that some frightful monster was about to be let loose upon them. People at all familiar with its workings know that these evils and dangers exist almost wholly in the distempered fancy of those not well informed in the matter. As we write, we can recall no single fatality directly traceable to this source. The fires supposed to spring from it are nearly as imaginative. It is, as yet, the only practicable method of electrical propulsion. And despite the vigorous opposition made, it is gaining a foothold in nearly all these cities. Once in full operation there, all will see that in delaying its introduction they have been standing in their own light."

Boston Notes.

The Electric Railway Company at Springfield, Mass., contemplates a large power station next spring. While enjoying satisfactory service from the local electric light company, its business is rapidly becoming so extensive that it is deemed advisable to own its own power station. It is estimated that about 1,500 H. P. of generators will be installed at first.

The promoters of the electric railway extending between Pigeon Cove and Rockport, Me., are beginning to fear they may have to abandon their undertaking owing to their inability to secure authority that would enable them to do a freight as well as a passenger business.

A wealthy syndicate has secured possession of about all the electric roads in the northeast part of Massachusetts. Under the title of the Lowell, Lawrence and Haverhill Street Railroad Company, this syndicate will absorb the Haverhill and Amesbury railway, which runs to Salisbury and Newburyport, thus connecting Lowell, the Spindle City, directly with the ocean. The system will include sixty miles of track. Along the route a series of parks and picnic grounds will be laid out for the pleasure of the big crowds of patrons which the road is certain to secure.

The Thomson Houston Electric Band gave a concert and dance last Friday evening in Larter's Hall, Lynn. Mr. J. B. Claus, the accomplished bandmaster, presented a splendid programme. About one hundred couples enjoyed the terpsichorean part and gayly twirled on the light fantastic toe. Mr. John J. Mitchell, a popular member of the factory staff, was floor director.

It is some time since there was so lively an interest taken in things electrical as in the suit of the General Electric Company vs. Beacon Vacuum Pump and Electrical Company. As will be seen from our report of the case, the General Electric Company has struck an ugly snag at last, and the case of the Beacon Company is a strong one.

The opinion is gaining ground in this city that the outcome of the recent numerous and costly fires, in which several million dollars of property either went up in smoke or down in ashes, will be to stir up public opinion against all overhead wires, and create a demand that they be buried for all time.

A massive 50-ton crane built by the Morgan Engineering Company is being placed in the new foundry just erected at Lynn by the General Electric Company. It will be equipped with electric motors and be operated on an elevated track running 300 feet, the entire length of the building.

Bellows Falls and Paxton Mills, Vt., are to be connected by an electric railway eight miles long. The undertaking will open up a section of country that hitherto has not enjoyed any great advantages of an electrical kind, and it is confidently expected that the entire territory to be traversed will enjoy a boom at once.

The various electrical supply houses of this city are doing excellently well just now, booking orders for spring delivery. Some really large contracts have recently been placed, and everything points to a fine spring trade in both departments of lighting and railroading.

The Richmond paper mills plant in East Providence has been sold to the American Electrical Works of Providence. The American Electrical Works will use the newly acquired property for the extension of their present business, the manufacture of insulated electric wire. E. F. Phillips, president of the company, expects to have the work in operation about the first of June. The heavy work of the business will be done at the East Providence branch, and an additional force of 200 men will be employed.

Chicago Notes.

W. E. Lewis, the St. Louis representative of the National Electric Manufacturing Company, was in Chicago this week.

Mr. James H. Dean, a prominent electrical engineer of St. Paul, was married last week to Miss Adelaide M. Gordon. Mr. Dean's many Chicago friends wish him success.

Mr. Chas. D. Jenney, of Indianapolis, Ind., was a visitor in Chicago this week.

Robert L. Allen, of Joliet, has been appointed warden of the Illinois State Penitentiary. Mr. Allen has become quite prominent in electrical circles as manager of the Consolidated Electric Light and Street Railways Company of Joliet.

Al. J. Veneman, until recently a member of the firm of Masters & Veneman, Evansville, Ind., has again resumed his position with the Electrical Supply Company of Chicago.

A number of prominent electrical men gave a banquet to Geo. B. Burton, the inventor of the Burton Heater, at the Victoria Hotel last week.

General News.

What is Going on in the Electrical World.

Burlington, Vt.—The Winooski and Burlington horse railroad will be equipped with the trolley system in the spring.

Portland, Ore.—The Portland and Vancouver Railroad is, using the local vernacular, to be "electrified" within six months.

Kansas City, Mo.—The stockholders in the Kensington branch of the "L" road are actively engaged in an effort to equip it as an electric line.

Big Timber, Mont.—It is reported that a company has been formed to build and operate an electric railway between this place and Boulder.

Hartford, Conn.—The Schuyler Electric Company is preparing electric devices to be used for illuminating purposes at the World's Fair at Chicago.

Toronto, Can.—The Toronto and Scarboro' Electric Railway Company have applied to the Mayor for permission to lay their tracks down the east banks of the Don.

Bristol, Pa.—The borough councils of Langhorne and Hulmeville have practically agreed to grant the right of way for the proposed electric road from Bristol to Newtown.

Reading, Pa.—The mayor has signed the bill granting the Reading City Passenger Railway Company permission to operate its entire system of nearly twenty miles with the trolley.

Trenton, N. J.—Among the bills recently introduced in the State Legislature was one repealing the act of last year creating a State Electrical Subway Commission.

St. Louis.—Work upon the Delmar Avenue and Clayton Electric Railway will be begun early in the spring, and the projectors promise to have it completed within six months.

Marion, Ind.—A franchise has been granted for an electric railway to Gas City. It is probable that all the principal points in the Indiana gas field will soon be connected by an electric railway system.

Peekskill, N. Y.—The board of trustees have set February 4 as the date on which the legal voters of the town are to vote on the question, "Whether Peekskill shall have an electric street railroad or not."

Auburn, Ind.—At the electric-light station at Nappanee, on the Baltimore and Ohio road, in Elkhart County, a few days ago, the boiler exploded with terrific force, instantly killing Electrician Johnson.

Hoboken, N. J.—The North Hudson Railway Company propose to establish an electric mail route on their several lines and also to substitute the trolley system for the present horse cars on their line to Jersey City.

Erie, Pa.—Some Venango capitalists will ask the present Legislature to grant a charter for the Meadville and Erie Electric Railway. The water power at George's Mills, Venango, will be utilized for generating the electricity to be used.

Greenport, L. I., N. Y.—The feasibility of building an electric railroad between Greenport and Orient, and possibly Orient Point, is being discussed among some of the stockholders of the Greenport Electric Light and Power Company.

Elgin, Ill.—The Elgin, Aurora and Fox River electric road is making progress. The boulevard between Geneva and St. Charles is developing renewed interest in connection with the proposed electric railway from Carpentersville to Montgomery.

New York.—The application of the various electric light companies, the Metropolitan Telephone Company and the Empire Subway Company for permission to construct subways in streets where overhead wires have been ordered down has been granted.

Peoria, Ill.—The power house of the Central Railway was recently destroyed by fire, causing a loss of about $100,000. It furnished the motive power for the Adams street, Hurlburt, Knoxville avenue, Main street, Rapid Transit and Lakeside electric railways.

Wheeling, W. Va.—Work is progressing rapidly on the new power house on the South Side for the electric street railway company. The boilers are already in position, and it is expected that in thirty days the system will receive power from the new plant.

Altoona, Pa.—The Altoona and Logan Valley Electric Railway Company have closed the the contracts with the Pennsylvania General Electric Company, who are the proprietors of the Edison and Thomson-Houston devices, for the complete equipment of the line.

Moorestown, Pa.—The contract for street lighting expires in March.—The Moorestown Electric Light Company are making experiments with arc lights for incandescent circuits, with a view to their substitution for the present incandescent lights in the principal streets.

Jersey City, N. J.—The company that is building the trolley line from Jersey City to Newark is pushing the work with great rapidity. This line is of great importance as it will connect with the street car lines of Essex and Hudson Counties as well as with the projected lines to Paterson and Passaic.

Indianapolis. Ind.—R. T. McDonald, the millionaire capitalist of Fort Wayne, has agreed to purchase Dr. Light's park at Broad Ripple, convert it into a summer resort, and make it a place of suburban attraction, provided he can secure a franchise to build an electric line from the city to that point.

San Francisco, Cal.—It is evident that important changes in the electric light business throughout this State are pending. Heretofore that business was almost entirely controlled by two corporations—the Edison Light and Power Company and the Electric Improvement Company. The companies are understood to have made arrangements to consolidate.

Brattleboro, Vt.—A company composed of E. L. Waterman, S. N. Herrick, E. C. Crosby, S. S. Hunt and H. F. Weatherhead has been organized here for the purpose of constructing and operating an electric railway.—The Pettingill-Andrews Company of Boston have obtained from the incorporators the right to build an electric road between Brattleboro and Saxton's River village.

Needham, Mass.—A company is about to be formed to be known as the Needham and Newton Electric Railroad Company. It is proposed to build the road from Railroad Square, Needham, to the Boston and Maine depot at Newton Highlands. There is also talk of another electric road to run from South Natick through Needham to Dedham, and parties interested are now looking over the ground.

Schenectady, N. Y.—The managers of the General Electric Company of Schenectady have in contemplation the erection of two enormous new buildings. They will be at least 200 feet long and will be very wide. One of these buildings will probably be used for the manufacture of porcelain ware, such as is used for electrical fixtures. The other building will be used for general machine shop work.

Colorado Springs, Col.—Local and Eastern capitalists are pushing the prŏject to connect Colorado Springs with Cripple Creek by an electric railway. The route is to follow the new county road over Cheyenne mountain to Beaver Creek. The power is to be obtained from the electric plant in this city. The route will be made as direct as possible and will be selected for its scenic attraction by way of Seven Lakes.

Springfield, Mass.—The Electric Meter, Governor and Power Company, now in process of organization, has bought a tract of land on the Wilbraham road, near the New England Railroad Depot, for the purpose of establishing an electrical plant there. The capital stock is $250,000. L. G. Watkins is the local manager of the project; George M. Jewett, General George B. Hibbard and A. T. Pierce are the executive board, while Fred T. Greenwood is the secretary.

Bay City, Mich.—A comprehensive electric railway system is being arranged by the West Bay City Electric Railway Company. The company has not decided just how to arrange the lines. The street cars that are being changed at present will have a single Westinghouse motor of 25 horse power. The wheels of the truck are 33 inches high, or three inches higher than those of the present electric cars. Greater speed is promised. Eighteen cars are to be rebuilt.

Liverpool, Eng.—The elevated electric road has been completed and a trial train was recently sent over the road at a speed of twenty to thirty miles an hour despite a heavy fall of snow. The power is generated by four horizontal compound engines of 400 H. P. each. Each train has a motor at either end which takes the current from a steel conductor at the side of the line by means of a brush or slipper. There are thirteen stations on the line. All the signals are worked by electricity.

New Bedford, Mass.—A proposed electric railway is to commence at a point on the Dartmouth road in this city, thence to Padanaram village in South Dartmouth, from thence by the Tucker road to the village of Smith Mills, thence through the Hathaway road in Dartmouth to Rockdale avenue and Mount Pleasant, its terminus. Its entire length will be about ten miles. The company will be named the New Bedford and Padanaram Street Railway Company.

Bridgeport, Conn.—The Newark, N. J., *Advertiser* says a syndicate comprising several prominent citizens of Newark has purchased the East End Railroad of Bridgeport, Conn., $300,000 in cash being the price paid. The purchasers are Elias S. Ward, Gottfried Cruger, Andrew Radel, H. M. Doremus, Julius Stapff, William Scheerer, Wilbur A. Mott and others, of Newark; Colonel N. H. Heft, of New York, and John Fritz, of Bethlehem, Pa. The road has hitherto been run by horse power, but electricity will be introduced at once, as the necessary permission has been obtained from the city.—The Waterbury, Conn., *American* says: "Bridgeport is to have a new industry in the shape of a corporation formed to introduce in this State the recently discovered Pennock storage system of electricity. The new company will be organized under the Pennock Battery Electric Light and Improvement Company, which is at present located at 22 Exchange Place, Boston, but the headquarters of which are at Chicago. The new company will open a plant within sixty days and proposes to have an exhibition car on the tracks in ninety days."

ELECTRICAL COMPANY ELECTIONS.

The Seattle Consolidated Railway Company, Seattle, Wash. President, F. T. Blunck; vice-president, Jacob Furth; secretary, V. Hugo Smith; treasurer, R. R. Spencer; auditor, A. Dunn; general superintendent, C. S. Clark. Mr. Blunck, the new president, is a wealthy capitalist of Davenport, Iowa, and the largest individual stockholder in the company. In addition to the above, Wm. D. Wood and F. Fonda compose the directory.

Saco River Telephone and Telegraph Company, Saco, Me. President, Mark P. Emery; vice-president, J. R. Libby; secretary and treasurer, John Berryman; superintendent, Freeman Palmer; directors, Mark P. Emery, J. R. Libby, F. H. Hargrave, John Berryman and S. B. Sheperd.

City Passenger Railway Company, Reading, Pa. President, John A. Rigg; vice-president, Matthias Moyer; secretary and treasurer, Frank S. Livingood; directors, M. B. McKnight, William McIlvain, Matthias Moyer, W. L. Leaman and Frank S. Livingood.

West Side Electric Street Railway Company, Kansas City, Mo. President, W. N. Coler, Jr.; vice-president, B. F. Moats; secretary, C. F. Hutchings; directors, C. F. Hutchings, L. H. Hale, W. N. Coler, Jr., B. F. Moats, Ben Jacobs and W. S. Nelson.

Chicago Telephone Company. Directors, John De Koven, John B. Drake, Arthur G. Fuller, John E. Hudson, J. Russell Jones, Robert T. Lincoln, C. E. Perkins, Henry B. Stone and Norman Williams.

Edison Illuminating Company, Brooklyn, N.Y. President, Ethan Allen Doty; vice-president, Edwin Packard, secretary and treasurer, Royal C. Peabody; directors additional to above: E. Le Grand Beers, Charles E. Crowell, F. S. Hatings, C. N. Hoagland, Martin Joost, J. G. Jenkins, D. R. James, George Foster Peabody, Lowell M. Palmer, Charles M. Pratt and George H. Southard.

The Edison Electric Light Company, Philadelphia. Directors, Samuel B. Huey, Wm. D. Marks, Charles M. Swain, Amos R. Little, John Lucas, H. Blake Tyler, D. S. Lindsey, L. D. Brown, Arthur Colburn, Wm. T. Tiers and C. A. Coffin.

The Chicago City Railway Company, Chicago. The old officers were all re-elected as follows: President, George H. Wheeler; first vice-president, James C. King; second vice-president, Erskine M. Phelps; treasurer, T. C. Pennington; secretary, F. R. Greene; superintendent, M. K. Bowen. The directors elected are: L. Z. Leiter, Erskine M. Phelps, Samuel W. Allerton, George H. Wheeler, James C. King, D. K. Pearsons, William B. Walker.

The Frankfort Electric Light Company, Frankfort, N. Y. President, F. C. Eaton; vice-president, S. S. Richards; secretary and treasurer, J. L. Seger; directors, S. S. Richards, G. N. Lehr, J. L. Seger, W. D. Allen and F C. Eaton.

COMMERCIAL PARAGRAPHS.

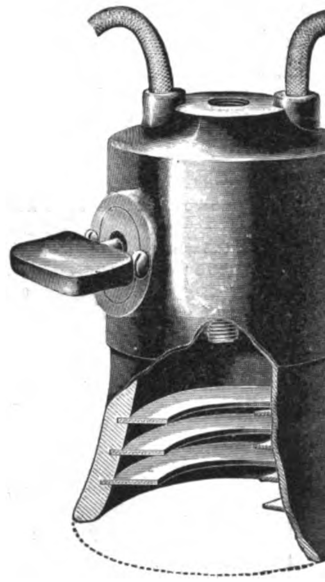
The Detroit Electric Motor Company, through their Chicago office, have closed a contract with the Calumet Railway Company to furnish fourteen 40-horse power equipments and ten 100 k. w. generators.

The National Electric Company of Eau Claire, Wis., report the sale of a complete electric equipment, including a 500-light alternating dynamo, to the Beacon Electric Company, for a new electric light station in Fenton, Mich. The company also expect to start four of their 500-light machines in the Cook County Hospital within a week.

Cutter's Mine Socket.

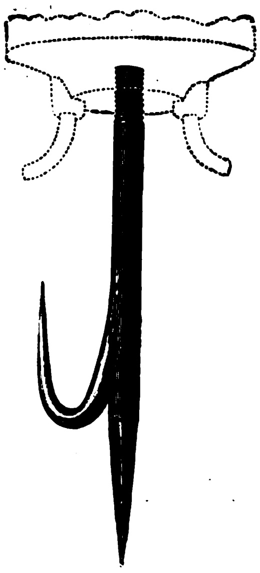
Those who have used incandescent lamps in places where water is apt to run over them know how the so-called water-proof sockets fall short of the mark. They apparently shield the works of the socket from the dripping water, but do not prevent the moisture from creeping up on the lamp and short-circuiting the cap. The result is that the fuses are blown much too often, thus leaving the men in darkness unless they have other lamps on hand.

These defects in the ordinary rubber, glass or porcelain sockets have been considered by George Cutter in developing the socket shown in the cut. This has a well built interior (with porcelain insulations) protected by a casing of polished hard rubber. The leading-in wires are cemented into the shell, while the handle or key passes through a bushing which is made watertight by soft rubber washers.



Cutter Water-Proof Socket.

These prevent any moisture from entering the shell at the sides, so that the only danger would be from the creeping of the water along the bulb of the lamp. To avoid this, the shell has a series of soft rubber rings which press against the bulb of the lamp when screwed into place and prevent any moisture from reaching the lamp base. It is evident that such a socket can be used with safety in places where there is a steady dripping of water, and it is claimed that it can be entirely immersed without any danger from short-circuit. When used in mines it is furnished with a prong, as shown in the cut, so that it can be hooked into any convenient position. The socket is made either with or without a key and is being exploited by George Cutter, of Chicago.



Cutter Lamp Hook.

Business is Good.

Riehle Bros.' Testing Machine Company report the following orders:

Taylor Iron and Steel Company. High Bridge, N. J., one 200,000 lb. vertical screw power testing machine.

Booth, Garrett & Blair, Philadelphia, for their new physical laboratory, one Riehle 100,000 lb. vertical screw power testing machine.

Atlas Engine Company, Indianapolis, Ind., one 50,000 lb. screw power testing machine.

Logan Iron and Steel Company, Burnham, Pa., one 300,000 lb. horizontal testing machine for car couplers, car links, pins, and chains, adjusted to British Lloyd Register.

Chicago Tire and Spring Company, Chicago, Ill., one 200,000 lb. car coupler.

Boston Belting Company, Boston, Mass., one special testing machine for testing rubber springs.

Pickel Marble and Stone Company, St. Louis, Mo., one 8 ft. bed marble machine.

Pullman Iron and Steel Company, Pullman, Ill., one 100.000 lb. vertical screw power testing machine.

F. P. Bagley and Company, Chicago, Ill., one 8 ft. bed marble machine, with quarter circle, surface molder, and countersinking tools; one sanding machine; one round hole borer.

Rutland Marble Manufacturing Company, Rutland, Vt., one 6 ft. bed marble machine, complete with all appliances.

Howard-Harrison Iron Company, Bessemer, Ala., one hay and straw rope twister.

Thomson-Houston Electric Company, Lynn, Mass., one 85 ton hydraulic press.

Baltimore Manual Training School, Baltimore, Md., one 50,000 lb. vertical screw power testing machine.

Pennsylvania Steel Casting Company, Chester, Pa., one 100.000 vertical screw power testing machine.

Canadian Government, five 2,000 lb. cement testing machines.

Johnson Company, Johnstown, Pa., one Riehle-Yale Extensometer; one Riehle-Vernier.

Pennsylvania Railroad, Altoona, Pa., one Riehle-Vernier beam for their Riehle testing machine.

This concern also announces orders received for Riehle-Roble patented screwjacks from the following:

United States Government, Columbian Exposition. Columbia Iron Company, Columbia. Pa. Slatington Foundry, Machinery and Boiler Works, Slatington. J. P. & J. M. Cornell, New York City. S. Tompkins, Engineer, Charlottesville, Va. United States Government. Boston Navy Yard. Terre Haute and Indiana Railroad, Terre Haute, Ind. Tippitt & Wood, Phillipsburg, N. J. Bryden Horse Shoe Company, Catasauqua, Pa. Allentown Rolling Mill Company, Allentown, Pa. Lukens Iron and Steel Company, Coatesville, Pa. Bethlehem Electric Light Company, Bethlehem, Pa.

INCORPORATIONS.

The Columbus Electric Company, of Columbus, Kan. Capital stock, $10,000. Directors: B. F. Hogg, E. M. Tracewell, H. R. Crowell, A. H. Crowell and F. D. Crowell, of Columbus.

The North Arkansas Railway Company, Mammoth Spring, Ark. Capital stock, $100,000. President, P. Arlund; vice-president and general manager, R. D. Welsh; secretary, G. C. Buford; treasurer, H. G. King. The company proposes to build and operate a railway, build water works, electric light plants, etc.

Electric Dice Game Company, Chicago. Capital stock, $5,000. Incorporators: John H. Brown, Walter R. Vaughan and Edmund D. Dubois.

A company has been formed to build an electric railway from Everett to Snohomish, Wash., eight miles. The incorporators are M. Swartout, Thomas Dwyer, R. M. Mitchell, John E. McManus and W. DeF. Edwards. Among the trustees are ex-Governor Merriam, of Minnesota; A. F. McClaine and O. N. Nelson.

Another electric street railway company has been formed in Newton, Mass. Capital stock, $100,000. Directors: H. B. Parker, George W. Morse, Frederic Johnson, W. F. Hammett, Austin R. Mitchell and James W. French. The route of the proposed road is from a point near the centre of the town of Wellesley, through Newton Lower Falls and Auburndale to West Newton, to connect with the line of the Newton and Waltham Company, which in turn is to connect with another line running to Oak Square.

The Commercial Light and Power Company, Duluth, Minn. Capital stock, $500,000. Incorporators: Morgan Brooks, of St. Paul; Franklin Paine and G. A. Leland, of Duluth. The company proposes to furnish electricity for light and power purposes.

The New Castle Electric Railway Company, New Castle, Del. The capital stock is placed at $100,000, divided into 10,000 shares at $10 each, with power to increase to a sum not exceeding $500,000. The commissioners named in the bill of incorporation presented to the Legislature are Mayor Frank E. Herbert, Howard Ogle, James B. Toman, Dr. Peter Cooper, Evan G. Boyd, City Auditor Henry H. Billany and Peter L. Cooper, Jr. The company was formed to establish an electric plant in New Castle to generate electricity for lighting public and private property, etc.

The Alton Electric Street Railway Company, Alton, Ill. Capital stock, $25,000. Incorporators: Manning Mayfield, Henry G. McPike and John F. McGinnis.

The Calumet Electric Manufacturing and Engineering Company, Chicago. Capital stock, $10,000. Incorporators: Lucius Alvin Hine, George Edenson Lorman and E. M. Ashcraft.

The Belt Line Electric Company, of Superior, Wis. Capital stock, $600,000. Incorporators: R. C. Pope, G. R. Smith and W. B. Perry.

The Metropolitan Development Company, Norfolk, Va. Capital stock, $100,000. The company's purpose is the construction or repair of works of internal improvement in the United States and Territories, and to operate water, gas, pneumatic power and electric works.

The Freeport Telegraph and Telephone Company, Freeport, Sacramento County, Cal. Capital stock, $40,000. Directors: D. T. Lufkins, H. T. Lufkins, F. Kunsting, Geo. Lawlor, J. G. Hite and H. T. Huggins. The company will construct, maintain and operate a telephone and telegraph line from Sacramento to Freeport and thence down the Sacramento River to Richland and to other points.

The Metropolitan Gas and Electric Light Company, Omaha, Neb. Capital stock, $200,000. Incorporators: J. H. McMurthy, K. K. Hayden, E. Finney, of Lincoln; Thomas J. Ross, of Chicago, and A. M. Coffman, of Boston.

Flatbush District Telegraph Company, Flatbush, N. Y. Capital stock, $10,000. Directors: William L. Lynan, Henry Hesterberg, Isaac Davis John Maguire and James Ryan, of Flatbush, and William H. Piarson, of Brooklyn. It is proposed to construct and operate lines of telegraph and telephone from the city of Brooklyn to the patent line dividing the city from the town of Flatbush, and from said patent line through Flatbush and the towns of Flatlands and Gravesend.

Conestoga Valley Railway Company, Lancaster, Pa. Capital stock, $600,000. The company proposes to build an electric car line from the city of Lancaster to the city of Reading, a distance of thirty miles. The road will traverse a thickly populated section of country.

A number of Webb City, Mo., capitalists have procured a certificate of incorporation, the object being to construct and operate an electric motor line from Webb City to Carthage, a distance of twelve miles. The same company intend to construct a belt line connecting Webb City, Carterville, Johnstown, Prosperity and the principal mines.

The McKeesport Telephone Company, McKeesport, Pa. Capital stock, $50,000.

Columbian Manufacturing Company, of Binghamton, N. Y. Capital stock, $20,000. Directors: Eli S. Meeker, R. W. Meeker, S. H. Sharpsteen, of Binghamton, and others. To own and operate a machine and repair shop, and to manufacture and sell water and electric motors.

The Central and South American Telegraph Company has filed with the Secretary of State at Albany, N. Y., a certificate showing that its capital stock had been increased from $6,500,000 to $8,000,000. The amount of capital actually paid in is $6,088,000.

Municipal Electric Company, Decatur, Ill. Capital stock, $25,000. Incorporators: John N. Culver, James M. Willard and Elmer E. Gibson.

The Kankakee Telephone and Electric Company, Kankakee, Ill. Capital stock, $35,000. Incorporators: Milford Hatch, Frederick C. Ehrich and Irvan W. Powell.

ELECTRICAL PATENT RECORD.

Letters Patent Issued January 24, 1893.

ELECTRIC RAILWAYS AND APPLIANCES.

490,297. Electric-Railway Conductor. Howard A. Miner, New York, N. Y. Filed June 2, 1892.

490,806. Closed Conduit for Electric Railways. Russell Parker and Benjamin F. Sutton, Brooklyn, N. Y. Filed Jan. 9, 1892.

490,807. Electric Locomotive. Alexander Philipsborn and Max Schiemann, Berlin, Germany, assignor to Siemens & Halske, same place. Filed April 14, 1892.

490,597. Conductor System for Electric Railways. Raphel Hayden, Fairmont, W. Va. Filed April 13, 1892.

DYNAMOS AND MOTORS.

490,290. Electric Motor. Julius W. Hansen, St. Paul, Minn., assignor of one-half to William H. Elmers, same place. Filed Sept. 25, 1891.

490,376. Armature for Dynamo-Electric Machines or Motors. Elihu Thomson, Swampscott, Mass., assignor to the Thomson-Houston Electric Company of Connecticut. Filed July 10, 1892.

490,449. Dynamo-Electric Machine. Robert Lundell, Brooklyn, N. Y., assignor of two-thirds to Edward H. Johnson, New York, N. Y. Filed June 21, 1892.

490,460. Dynamo-Electric Machine. Charles Wachtel, Newark, N. J. Filed June 13, 1892.

ELECTRIC LIGHTS AND APPLIANCES.

490,605. Electric Lamp Socket and Tap. Alexander F. Vetter, New York, N. Y., assignor to J. C. Vetter & Co., same place. Filed May 20, 1892.

TELEPHONE AND TELEGRAPH APPARATUS.

490,534. Support for Telegraph Cables. Frederick Le B. Bedwell, London, England. Filed Sept. 26, 1892.

MISCELLANEOUS.

490,279. Electric Meter. Oscar Frolich, Berlin, Germany, assignor to Siemens & Halske, same place. Filed Nov. 16, 1892.

490,292. Cut-Out for Electric Circuits. Michael Leavy, Pittsfield, Mass. Filed June 16, 1892.

490,302. Insulator. Louis McCarthy, Boston, Mass. Filed July 8, 1892.

490,327. Electric Annunciator System. Henry Van Hoevenbergh, New York, N. Y. Filed March 24, 1892.

490,353. Electric Mat. William G. James, Harlem, Ill. Filed Sept. 29, 1892.

490,358. Electrical Musical Instrument. Anacleto Montanelli, Portland Ore. Filed May 31, 1892.

490,363. Electric Switch. Albert L. Lohrer, Lynn, Mass., assignor to the Thomson-Houston Electric Company of Connecticut. Filed March 17, 1892.

490,477. Electrical Connecting Device. Joseph Hutchinson, New York, N. Y. Filed Sept. 16, 1892.

490,479. Electric Show-Case Alarm. Rudolph C. Kruschke, Duluth, Minn. Filed July 9, 1892.

490,545. Elevated-Railway System. Charles Drill and Henry J. Schmitt, St. Louis, Mo., said Schmitt assignor to said Drill. Filed Feb. 18, 1892.

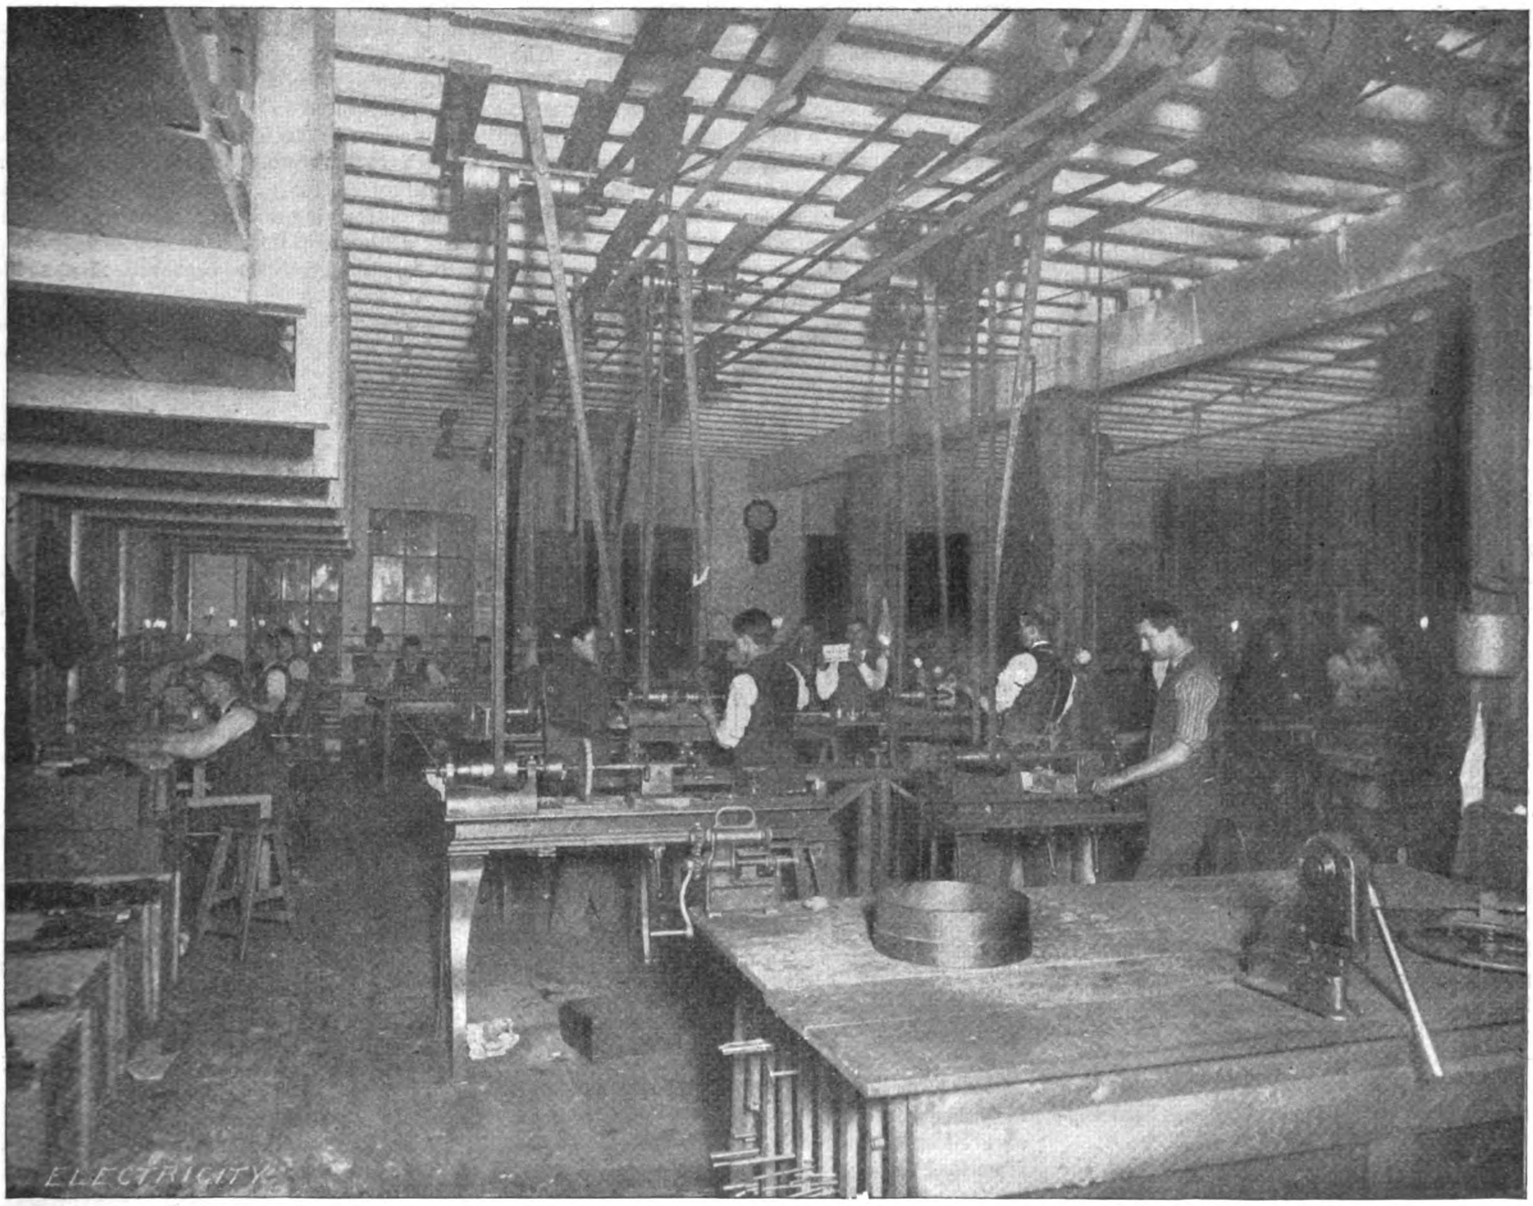
490,560. Insulator. Auguste J. Hauty, Saltsburg, Pa., assignor of one-third to John Burke, same place. Filed Aug. 29, 1892.

490,626. Railway Signal. Ira L. Green, Kittanning, assignor, by direct and mesne assignments, of five-sixths to James M. Patterson, Sharpsburg; George M. Fox, Wythington Reynolds and Christopher C. Shadle, Kittanning, and Marcus D. Wayman, Ford City, Pa. Filed Jan. 9, 1892.

490,630. Electric Conduit. Ernest L. Ransome, Oakland, Cal. Filed April 5, 1892.

ELECTRICITY.

VOL. IV. NEW YORK. FEBRUARY 8, 1893. CHICAGO. No. 4



MACHINE SHOP.—ELECTRIC GAS LIGHTING COMPANY'S FACTORY, BOSTON. (SEE PAGE 38.)

A Boston Enterprise.

A Scrap of Electric Gas Lighting History.

Largely owing to the fact that the two most important and best known departments of electrical science—lighting and railroading—have each made phenomenal progress during the last decade, the amount of capital invested at the present time in the business footing up to well nigh the substantial sum represented by $1,000,000,000, many persons have arrived at the conclusion that these two departments include about everything of importance or consideration in the electrical field. Such is not the case by any means, for the electric current has become quite ubiquitous. It may be said to have conquered the world, and if we may be pardoned for using the simile, this subtle force, like Alexander the Great, is awaiting the discovery of "other worlds to conquer."

COL. L. W. BURNHAM.

It is hard, indeed, to find many forms of human service to which electricity is not adapted. No man of progressive ideas, and for the matter of that, woman either, thinks of building a house or business premises without the now all necessary electrical equipment, every section or branch of which ensures the sweetening of human tempers, together with the lengthening of human life. The feminine section of the community nowadays insists on the family sewing machine, the baby's cradle, the ventilation of the house, and many other domestic duties being relegated to the never complaining care of the electric current through the medium of fans, motors and other handy and efficient devices.

And what is true in the foregoing allusions is doubly true when we include in our estimate the inconveniences of darkness, to say nothing of its dangers, a perfect horror of which all women naturally entertain. To overcome that dread in the feminine mind, as well as to add to "all the comforts of home," various inventors, backed by capitalists, went to work in the early days of applied electricity, and were not long ere they produced something which supplied what, in hackneyed phraseology is termed "a long felt want." This "something" was an electric gas-lighting device, the early pioneers in the exploiting of which, after several futile attempts had been made and failed, were men whose names and acts we propose to enumerate, in the belief that our readers will be interested in learning something of what has been attempted and by whom accomplished in making electricity a very important factor in the domestic life of this and other countries, while building up a business that any-one ought to be proud of.

It was in August, 1880, at Bath, Me., that the initial step was taken in the direction of organizing the National Electric Gas Lighting Company, and in that city the movement was consummated by the incorporation of a company under the above title with a capital of $500,000. A board of directors was at once elected and one of Boston's most popular ex-Mayors was made president. At first, and for some little time, the enterprise "made haste slowly" through lack of means and owing to poor management, until September, 1881, when Mr. Louis W. Burnham was induced to accept the dual position of president and manager, several personal friends at once entering the board of directors and furnishing capital sufficient to begin business on a practical scale.

A number of very valuable patents were purchased, and parties who were known to have been infringing these patents speedily received attention and were brought to terms. The new president-manager soon realized that the company had not been satisfactorily handled, while its methods were somewhat irregular. In view of this condition of affairs a new company was organized under the title of "The Electric Gas Lighting Company," with a capital of $250,000. The incorporation was made at Portland, Me., in April, 1882. All the property and franchises of the old company were purchased and new directors elected.

The board included Mr. John N. Barbour, Dr. W. C. Cutler, Mr. Alvan A. Sweet, Mr. John Hopewell, Jr., Mr. W. H. Dyer and Mr. Louis W. Burnham, the last named also being elected president and Mr. Barbour treasurer.

At once contracts were made with a manufacturing company in Connecticut for the construction of a regular line of electric gas-lighting apparatus. Under these contracts goods unsuitable for the trade were made after over a year's delay, when a change was deemed necessary. The Western Electric Company then undertook to manufacture the goods—this was in February, 1885—continuing to do so until the following July, when that company removed its Boston business to New York City.

The Electric Gas Lighting Company thereupon determined to manufacture its own goods. In November of that year, factory rooms, machinery and power were leased from the New England Manufacturing Company, in Hamilton street, Boston, and operations were begun with about a dozen men. It was but a short time before these facilities were outgrown, and a new factory was secured and leased at 173 Devonshire street and from that time on the business has constantly grown.

In May, 1885, Mr. Joseph S. Fay, Mr. E. G. Byam and Mr. Jacob M. Haskell, of Boston, and Mr. Francis C. Foster, of Cambridge, all well-known business men, were chosen as the company's directory in place of Mr. Dyer and Dr. Cutler, resigned. New funds were added to the enterprise, and Mr. Fay was elected president in December, 1885, Mr. Louis W. Burnham becoming vice-president and continuing general manager.

This proved to be the real starting point from which the company's success dates. From a business aggregating sales valued at $15,000 in 1885, it expanded until at the close of last year, 1892, it had done a business of $150,000 in that single year.

During the first five years of its existence this company evidently had an uninterrupted hill to climb. Having been organized to engage in a strictly electric gas-lighting business, its patents were constantly being infringed and its business interrupted by unscrupulous firms, until it found itself, for its own protection and well being, compelled to abandon the original idea of making and selling electric gas-lighting apparatus exclusively. So in 1886 the company branched out into a general domestic electrical business, and at the present time is entitled to rank as one of the leading and most extensive companies of its kind in the country.

The more clearly to convey some idea of what it is doing to-day, we publish herewith a series of cuts illustrative of the new factory which has been leased for a term of years, being 240 Dover street, Boston, where its multitudinous devices and specialties are manufactured by a large corps of expert electricians and mechanics who are kept constantly employed by virtue of their skill and the high class work they can turn out.

The factory building is of brick, six stories high, well lighted on both sides, having a spacious entrance, with freight elevator almost large enough to accommodate a freight trolley and pair of horses.

The cut forming our Frontispiece shows the interior of the main floor which is largely covered with machinery of the best and most modern types, including screw machines, die presses, stamping machines, lathes, drills, shears, punches, magnet winding machines, emery wheels, polishers, buffing wheels, indeed every kind of tool necessary for turning out large quantities of all kinds of metal work. As will be noted, there is little spare room on this floor which is occupied by nearly forty artificers.

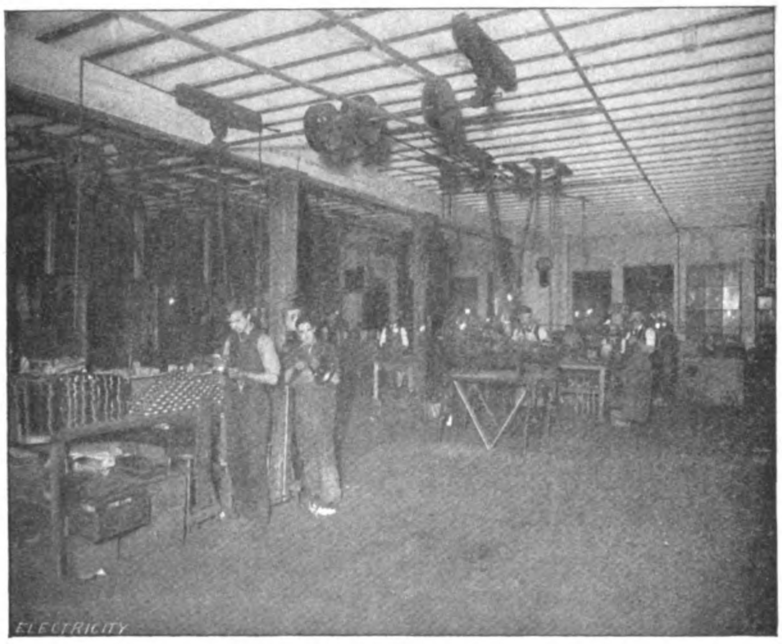


FIG. 1.

The second cut shows the department where magnet winding is in progress and the assembling of the various devices from the many parts large and small made in the other part of the factory is going on, in other words, where the articles are put together.

The third cut is another view of the factory where raw material is being rapidly transformed into almost every conceivable shape and size requisite for completing one or another of this company's special line of goods.

The fourth cut shows a view of the extensive stock room wherein is kept constantly on hand a large and valuable stock of material, including iron, brass, steel, copper, platinum, mother of pearl, bronze, wires of all sizes and qualities, covered and bare, etc., etc.

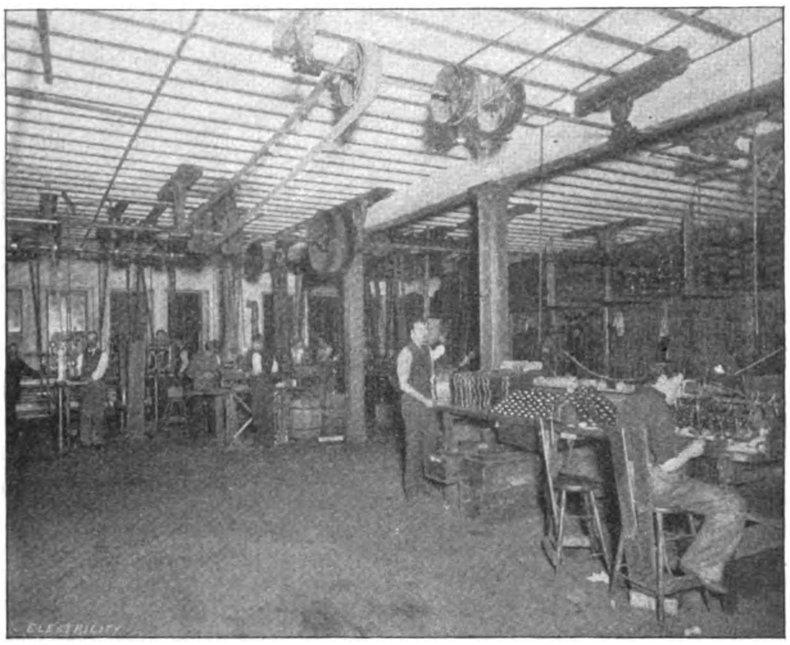

FIG. 2.

The factory office is shown in this cut. In addition to the factory as shown there is a separate room devoted to the exclusive purpose of manufacturing the zincs for the famous "Samson" battery, on which a special corps of men is kept constantly at work, the output of this specialty alone amounting to nearly nine thousand monthly. Then there is the electroplating room, where, with the aid of a complete and extensive plant, every kind of gold, silver, copper, bronze, nickel and other plating is done under the supervision of one of the leading experts in this department of business.

Adjoining the plating room is the polishing room, where, with the aid of several buffing and polishing machines, the finest work is done by first-class men only.

Not only is the floor of this large factory fully utilized, but even the space overhead along each side of the factory from front to back has had to be utilized for the storing of polished wood and fibre goods, such as cases, frames, etc., for annunciators, bells, push buttons, alarms and other appliances.

So complete and efficient is the staff of men employed that little has to be done outside. From the handling of crude brass, copper, iron, steel or platinum, to the finishing in paint, gold or varnish, men are employed to do it all.

It need hardly be stated that for the regular and orderly administration of the manufacturing business of this company every department is controlled and operated in a most precise and methodical manner. Waste, extravagance, irregularity of any kind is impossible. Superintendent Lane and Foreman Galbraith, both men of wide experience and fine ability, take care that everything shall run smoothly, and the interests of the company and its employees are alike carefully watched and secured. It may incidentally be stated here that the special tools used in the business are made by men specially employed for that purpose.

As will be perceived, the foregoing is a description of the factory only; the sales, shipping and clerical departments of this prosperous company being on Devonshire and Arch streets, where an immense and complete stock of electrical goods is carried and where, cosily ensconced when he is not on the road somewhere between the beginning of creation and the day of judgment, hustling after business, may be found Mr. Louis W. Burnham, the genial and enterprising general manager, whose portrait, at the opening of this article, will be quickly recognized by his many friends in the electrical business.

Mr. Burnham enjoys so wide a circle of acquaintance and has achieved so marked a degree of success that we feel tempted to close this article with the briefest allusion to his life and its varied activities.

As he has informed the writer, young Burnham was born at Canterbury, Conn., in 1831, where he remained with his parents until he was nearly eighteen years of age. Up to that time he had busied himself in many ways, working at various employments when he was not adding to his fund of knowledge at school.

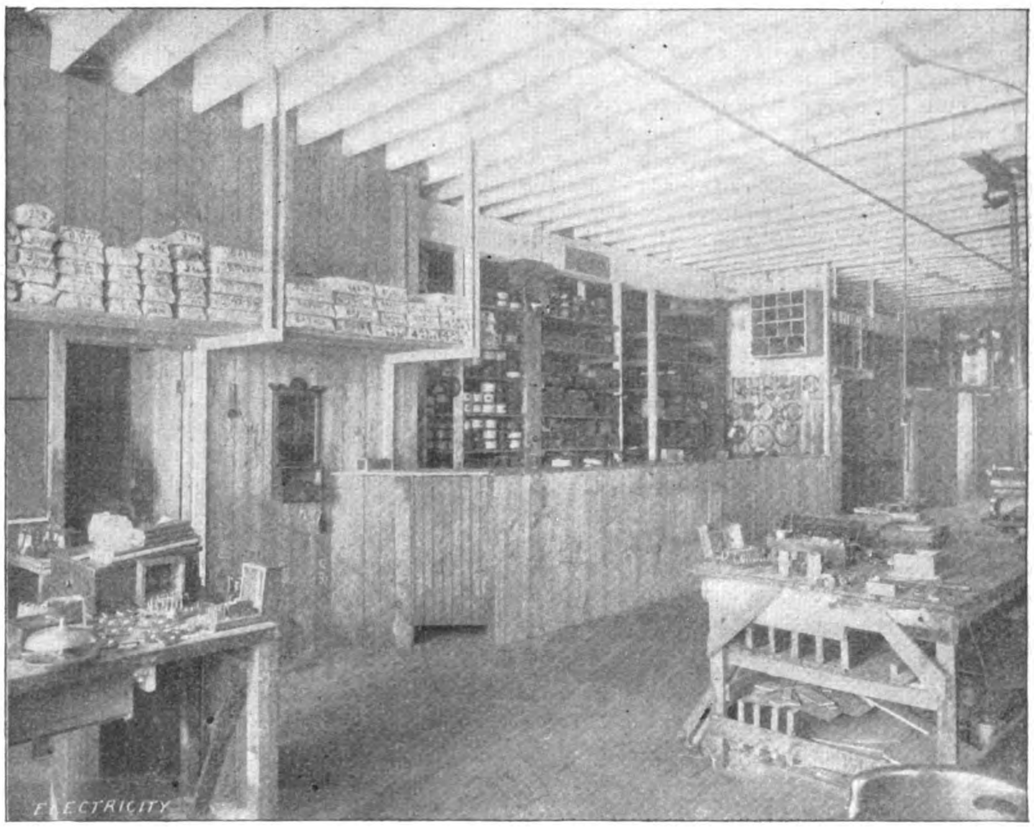

FIG. 3.

His earliest experience in commercial pursuits was gained at West Brookfield, Mass.

As an expert penman he travelled through the Eastern and Middle States conducting classes in writing with great success.

He subsequently held appointments in leading seminaries and academies, at some of which he taught large numbers of pupils. For a time he studied law; went West in 1855, engaged in Commercial College work, and became a prominent citizen and city clerk of Rockford, Ill., during the years 1856-57. The West not suiting the health of his family, he returned East in 1863, and established a very successful business college at Springfield, Mass. But the arduous labors attending the management of a successful institution of this kind undermined his health, and he had to abandon what was otherwise a most congenial and profitable enterprise. After recuperating for some time, Mr. Burnham assumed management of the New England department of a New York Life Insurance Company, which under his enterprising care expanded rapidly. He assumed this position in the spring of 1868, and continued in it until 1881, when he was appointed president and manager of the company with which he is still identified, a company whose phenomenal growth under his sagacious management we have endeavored to outline in the early part of the present article.

The Steam Equipment of Modern Central Stations.

BY ALFRED A. HUNTING, M.E.*

The first consideration in arranging a central station is location. It should be near the centre of distribution of powers. Calculations should be made of the probable growth of business in all directions, so that it shall be centrally located for as long a period as possible. If several stations are to be used jointly to supply a large district, they should be so located with reference to each other that each section will be amply provided for, and that in case a station should become disabled the others can supply the deficiency without disarranging the general service if at any time a heavy demand is made in any one section or by the whole district.

In choosing a site for a station, accessibility for delivery of fuel and disposing of ashes with the smallest amount of manual labor possible is of the greatest importance. The saving that can be made by careful planning at first will decide whether the station will be a success financially or not. The storage for coal should be so arranged that it will not have to be handled at all after it is landed from the car or ship. A receiving bin should be arranged, if coal is to be received by cars or boat, where the coal can be dumped, and from which a mechanical conveyor shall carry it to bins situated higher than the boilers. Each bin should have its own scale, and all coal weighed. A shute to land the coal in front of each boiler if they are stoked by hand, and to deliver to the mechanical stoker if the stoking is done mechanically. The weight of the coal should be recorded when each bin is filled, and each draught for a boiler should be charged to the boiler served; this not only checks the weight of the coal, but also shows just what each boiler is using, and will help to quickly determine at any time the duty each boiler is performing.

---

*Read before the Thomson Scientific Club, Lynn, Mass. Thursday, January 26, 1893.

If the ashes cannot be dropped so as to be delivered to cars by gravity, they should all be dropped to a central bin, or bins, and from there be carried by mechanical conveyors to cars. The saving in manual labor will be the interest on a large investment. The power to be used should be carefully estimated, not only what the first demand will be but what the development of the future will call for. Accurately lay out and measure for the whole plant, and build the building to accommodate the machinery, and not first build the building and then make the machinery adapt itself to the building. The building should be set on heavy foundations, and as near fireproof as it is possible to make it, with plenty of light and air. In arranging for foundations where piling has to be done be sure and cut the piles well below high water mark. There is constant change of water level where the land is back from the immediate water front. This was shown plainly to the writer about one year ago. The foundations of a building in Boston that had been built some years began to settle, cracking the walls and piers. The attention of the owners was called to the matter, as was the building inspectors. An investigation was made by digging down around the walls and piers. It was found that the water had changed its level, and that the caps of all the piles was about five (5) feet above high water. The piles were oak and of good size, but because of the water not getting to them properly dry rot had set in causing them to be so bad that pulling them apart with the fingers was an easy matter. What caused the water to change its level?

First, there have been large sewers put in the neighborhood.

Second, buildings that have been built since have had their foundation walls carried down deeper, which kept the water back; and since the foundations of the old buildings were changed the water level has changed again to about one (1) or two (2) feet lower. This was caused by a large building being put upon the side the pressure came from. The result is, the old building must come down in the near future. Quicksand is bad to put foundations on, but there are worse things than that to contend with. A large section of land in the vicinity of the Boston Post Office is a quicksand at a level where foundations should begin. There has been a constant settling of the Boston Post Office ever since it was started. A building on an opposite corner from the Post Office was built on very bad quicksand. The earth was excavated until the "*live*" sand became too bad to handle. Concrete was made of broken stone and French cement, to the thickness of about six (6) feet. This cement hardens to a consistency of stone. Here was a floating foundation. It has always remained plumb and has never settled. Screw piles have done good service in quicksand. Every situation where the substrata are not known should be bored in numbers of places to be sure of just the conditions to be met. Even rock foundations must be carefully examined, as in places where there is considerable dip to the rock, and there is water between the earth and rock foundations, they are apt to slide, especially where there is much vibration. In such cases anchors should be put in, by cutting deep into the solid rock, building into them with heavy masonry strong enough to stand any thrust that may be put upon them.

The machinery should be so arranged that those in charge will not have to go up and down more than is absolutely necessary to get at the different working parts. Arrange so that hoisting apparatus and travelling cranes will be available at every point for facility in handling material in cases of inspection or for repairs. Also remember to arrange that the different machinery can be taken down if occasion requires, and with as small expense as possible. This matter is often never even thought of.

The chimney should be carefully studied; the height and area must all be calculated with accuracy. If the chimney is to be of great height, it is a matter of the greatest importance that the foundations shall be of the best possible construction. Time and money spent in foundations pay. The shape is a feature of more than passing importance, as wind and weather are constantly deteriorating the material. There are few tall chimneys that are plumb.

The best form is the round chimney and one with but little ornamentation at the top. All projecting parts are simply levers for the wind to act upon.

The force of wind at

50	miles per hour is	12.300	lbs. per sqr. foot.
60	" " "	17.712	" " " "
70	" " "	24.103	" " " "
80	" " "	31.488	" " " "
100	" " "	49.200	" " " "

This gives a chance for racking and straining that does not appear at the first thoughts given to chimney construction. The draught of the chimney is of great importance. When the temperature and density of the air inside the chimney is equal to that of the outside air there will be no tendency to produce motion, the air inside the chimney being heated, consequently becoming of less density than the outside air, the excess of pressure exerted by the outside air will force the column of air inside the chimney upwards; this pressure of draught is equal to difference in weight of the two columns of air. The volume of atmospheric air is increased in the ratio of one (1) to one and three hundred and sixty-five thousandths (1.365) in rise in temperature from 32 degrees to 212 degrees F. under constant pressure; and where the volume is constant the pressure is increased in the ratio of 1. to 1.3665. The expansion under constant pressure is uniform and is at the rate of $\frac{1}{493.2}$ part of 32 degrees F. for each degree of rise of temperature, say the fraction $\frac{1}{493.2}$. At this rate of contraction the absolute zero of the Fahrenheit scale, or point of no heat, is $(493-32) = 461$ F., or 461 degrees below zero on the scale. This is the coefficient of expansion of gases on the Fahrenheit scale.

It has been found in practice that the best results in the draught are obtained when the density of external atmosphere is to the density of the gases in the shaft as two (2) to one (1), or when the temperature of the escaping gas is about 580 degrees Fahrenheit. Above this there is no practical gain in the draught and a great waste of fuel takes place. It is also very injurious to the bricks and mortar. It is also found that with a lower exhaustion than one-half inch of water pressure it is difficult to keep a good fire without constant stirring, which is waste of fuel and produces smoke. Syphon water gauges are commonly used to take draft off chimneys, the exhaustion being given in inches of water. A cubic foot of water at 60 F. weighs 62.5 lbs., therefore the density of air is $\frac{1}{817}$ that of water. If W equals the theoretical draught of shaft in inches of water pressure, H the height and V the velocity, then

$$W = \frac{H \times 12}{817} \text{ and}$$

$$V = 66\sqrt{W}.$$

In building a chimney an allowance of say 25 per cent in the power of the chimney should be made for future additions. It is next to impossible to determine the actual velocity of the gases in a given chimney, as the conditions affecting the draft vary from day to day; the direction of wind, barometer, coal and care in firing each have a share in the actual results.

The boiler should be selected with great care. Much care should be given to all details in locating. Accessibility to all parts must be had for repairs and inspection. Give plenty of head room, and make the boiler room as light and airy as possible. Comfort for the firemen should never be omitted. They can do much more work, their health be better, and everything more satisfactory where these points are looked after. All foundations and settings should be done in the best manner; so much is hidden that much poor work can be done and not show if inspection is not carefully carried on at all times in construction. High pressure and high evaporation duties are what will accomplish the results that engineers are looking for. The Committee of Judges of the Centennial Exhibition to whom the trials of computing boilers at that Exhibition were intrusted adopted the unit—thirty (30) pounds of water evaporated into dry steam per hour, from feed water at 100 degrees F. and under a pressure of seventy (70) pounds per square inch above the atmosphere, these conditions being considered to represent fairly average practice. The quantity of heat demanded to evaporate a pound of water under these conditions is 1110.2 British thermal units, or 1.1496 units of evaporation. The unit of power proposed is thus equivalent to the development of 33.305 heat units per hour, or 34.488 units of evaporation. The unit of evaporation is taken as a certain weight, preferably unit of water evaporated "from and at" the boiling point under atmospheric pressure. The now accepted unity of boiler power in the code constructed for the American Society of Mechanical Engineers is the equivalent of the Centennial standard, and in all standard trials the commercial horse power is taken as an evaporation of thirty (30) pounds of water per hour from a feed water temperature of 100 degrees F. into steam at seventy (70) pounds gauge pressure, which is equal to thirty-four and one half ($34\frac{1}{2}$) pounds of water evaporated from a feed water temperature of 212 degrees F. into steam at the same temperature. This standard is taken as the equivalent of 33.305 thermal units per hour. A boiler rated at any stated horse power should be capable of developing that same power with easy firing, moderate draught and ordinary fuel while exhibiting good economy; and the boiler should be capable of developing one-half ($\frac{1}{2}$) or one-third ($\frac{1}{3}$) more than its rated power to meet emergencies at times when maximum economy is not the most important object to be attained. Boilers in regular duty are evaporating ten (10) lbs. of water per pound of coal. If the feed water could be heated to 212 degrees F., this would be better than twelve (12) pounds of water evaporated per pound of coal. As more attention is paid to the boiler the higher will be the efficiency until we get nearly to theoretical evaporation.

The temperature of the gases should be closely watched, and not allowed to go to waste at over four hundred (400) degrees F. The difference in cost of generating steam at a pressure of eighty (80) pounds and of steam at one hundred and sixty-five (165) pounds is 2.25 per cent. in expenditure of coal, and again of over 100 per cent. in power. With a properly constructed boiler, there is no more danger in carrying one hundred and sixty-five (165) or two hundred (200) pounds of pressure than there is in carrying sixty (60) or eighty pounds in the ordinary boiler. I well remember when it was thought to be a remarkable thing to see a gauge record one hundred and five (105) or one hundred and ten (110) pounds pressure on locomotive and marine boilers; now it is an exception to find a modern locomotive or a marine boiler that carries less than one hundred and fifty (150) pounds, and some as high as two hundred (200) pounds. It is practicable to carry such pressures on locomotives and marine boilers. They are subjected to heavy strains and vibrations that stationary boilers never are or can be subjected to. There is hardly a limit to pressure that can be carried by a well constructed boiler. Pressure means heat, and heat pressure. By high pressure the latent heat is absorbed, and the theoretical power comes nearer to being realized. The engines must be selected with a view of carrying the economy to its fullest extent. When compound engines were first introduced they were not received with favor. A simple engine used condensing was good enough. The fact that long voyages by steamship were not profitable led John Elder to study into the matter. He built triple expansion engines and boilers to carry high pressure. The result enabled steamships to be built of enormous proportions and of great speed, and they *pay*. Why? Because of the great saving in coal consumption, which enables steamers to carry so much more paying freight. There is much difference between the consumption of one pound of coal per horse power per hour and the consumption of five pounds per horse power per hour. There are still engineers that scoff at new-fangled ideas of multiple cylinder engines, notwithstanding the consumption of coal per horse power per hour is lessened every year by more science being put into the construction of engines. In selecting engines, there are several things to consider. First, economy in consumption of steam. Second, strength of all parts, good workmanship and regulation. By all means avoid an engine that will run away when relieved of load. Third, simplicity, that they may have few parts, be of long life and the cost of repairs a minimum. Do not adopt an engine because it is fashionable but because of merit. If there are heavy constant loads, divide the power into as large units as possible with triple or quadruple expansion engines. In street-railroad work, the triple expansion engine is better than the ordinary compound. Speed is more uniform; it is more elastic, adapting itself to the inequalities of load with greatest ease and without shock.

There are places where condensing would be very expensive, because of the cost of water. But within two or three years even this has been overcome by pumping the circulation water to shallow tanks on the roof, the water falling from one tank to the other, until the temperature is reduced sufficiently for a cooling medium.

There have been several successful ways devised to do condensing even where water is almost prohibitory. Wherever you can, use condensing engines. When you cannot condense, compound them. For small engines, say of fifty (50) to seventy-five (75) H. P., it would not pay to put in a condenser for a single engine, but where several small engines are used, by tying them all to one condenser a large saving can be made. There is no fixed rule to go by in steam engineering; what may be admirably adapted for one case would not do as well in another. Keep well posted, and be able to judge what will be the most advantageous scheme to adopt at each station. Make careful drawings of everything, in plan and elevation; if all cannot be shown properly without, make sectional views. Every detail should be worked out. The drawings should be so carefully made that any serious defect will at once appear. It is much cheaper to remedy a mistake on a drawing than after the plant is partly erected. Too much care cannot be given to the drawings. It used to be said of John Ericsson that he scarcely ever went to look at machinery from his designs, he was so sure of his drawings that he knew the machinery would work.

In piping, avoid all abrupt turns. Put in large radius curves of bent wrought iron pipes. If the run is long, the flanges should be of steel bent on as large radius as possible, riveted to the pipes and the flanges riveted together. The expansion and contraction will be cared for by the curves in the flanges on the principle of an accordion. This avoids all slip joints and expansion joints, which should always be given a wide berth.

Where valves and fittings have to be made into the pipes, the flanges should be tongued and grooved, with heavy bodies, and ribbed. Separators should always be put in close to the engine, and after the pipe passes the separator it should be enlarged to form a receiver of a capacity of about five (5) times the fill of the high pressure cylinder. This always ensures constant pressure and saves shocks and pulsation in the steam pipe. It also saves the strain on the flanges, and the pipes will be free from leaks. The separator gives dry steam and catches any water that may accumulate in the pipes and keep it from going to the engine. It is practically a filter. There is no power exerted by the water in passing through the engine other than to do damage. Whatever per cent. of water is in the steam is so much power taken from the steam and wasted, and the pressure of water in the steam acts as a condenser, which makes the per cent. of water grow larger in long pipes. All steam pipes should be covered with the best non-conductor possible. It keeps the pipes of nearly a uniform temperature, avoiding condensing of steam, reduces the expansion and contraction of the pipe due to cold draughts and other causes. All piping to be in duplicate, so that if by chance any part of it gets disabled the engines will not have to be stopped. There should be good broad walks running beside each run of piping, accessible by easy means; where, as in many places, the pipes are high up, a small, quick running elevator would prove of great service not only to be used to get up quick but to carry up any needed tools or materials. Everything should be easy to get at. It may be of inestimable value some time when least expected.

The pipes between condensers and engines should be of ample size, for the place the vacuum is needed is in engine cylinder not in the condenser. Ample condenser, ample pipe, with as few bends as possible, give best results. I have seen twenty-six (26) inches of vacuum on gauge at the condenser, and only two inches vacuum in the engine cylinder. Cause, small piping. A heater should be put in between the engine and the condenser; it will give all the heat due to vacuum carried. After passing through the first heater, an auxiliary heater should be put in, steam from pumps passing through that. The result will be water at about 207 or 208. This helps largely in economy of fuel. The drips of the engine should all be connected with the condenser. By so doing, a quick start can be made at any time. Simply open drips; the condenser takes the cold air out and steam being admitted to the cylinder the waiting to slowly warm up is avoided. After engine comes to speed, shut drip and you are all right.

There are few uses that an engine can be put to that the load will be so uneven as in street-railway service, especially if there are heavy grades. Consequently the engines must be built purposely for such work, and should be much heavier than for ordinary service. These engines must be ready at all times for service, as a call for extra power may come at any moment. Extra engines should be put in so that the maximum load can be carried at all times.

All jack shafts must be large, with bearings long and close together, the foundations for the bearings so placed that vibration shall be reduced to a minimum. Bending and vibration of a jack shaft causes friction, which is so much taken from the power. When a jack shaft and friction clutches are to be used, a quill relieves both shaft and friction clutch. The shaft runs in its own bearings, the quill has bearings of its own. There is no heavy weight of pulleys and clutch sagging the parts running dry and heating. A friction clutch should be of as few parts and simple as possible, the running balance true. This will save vibration and add to the security and life of the plant.

There should be a log kept, showing just what each man does, giving in detail everything that happens, amount of all material used of whatever kind, time of coming and going of every man connected with the engineering department. By this you will be surprised to see how quickly faults and causes of accidents can be located. Each man will have an interest to do well. You will soon find the personal of the employees to be high. Each man will have a personal responsibility and know that his record can be seen by all the others at any time. Avoid complication, simplicity is the great success of engineering. In drawing specifications, do not use ambiguous terms or ask for impossible things. Be sure what can be done; ask for, and see that it is.

Manufacturers of steam engines and boilers who are up with the times know what will give best results as to detail and construction. Put the responsibility on them. Do not try to outdo some one else in fertility of invention, then, by robbing the machinery of its symmetry, smoothness in working and efficiency. If you have a rea invention, try it first where it can do no harm it does not work at the first trial. Few engineer are asked or paid to invent. They are paid assemble the best ideas of others and put them in shape to obtain best results for their clients.

ELECTRICAL COMPANY ELECTIONS.

Missouri and Kansas Telephone Company, Kansas City, Mo. President, John R. Mulvane; secretary, W. W. Smith; treasurer, N. R. Ferguson; directors, John R. Mulvane. T. B. Sweet and Edward Wilder of Topeka; C. E. Yost and A. Burt of Omaha; A. G. Fuller of Chicago, J. E. Hudson of Boston, S. A. Walker of St. Joseph and J. S. Chick of Kansas City.

Boulder Electric Light Company, Denver, Col. Dr. I. L. Bond, president; J. H. Nicholson, secretary; George M. McClure, treasurer; directors, Dr. I. L. Bond, J. H. Nicholson, George M. McClure, B. M. Williams and Dr. Renel Bartlett.

Jersey City Electric Light Company, Jersey City, N. J. President, Horace H. Farrier; vice-president, George B. Wilson; secretary and treasurer, Geo. H. Farrier; superintendent, W. W. Titzell; directors, Horace H. Farrier, Geo. B. Wilson, H. C. Adams, C. T. Friend, C. G Foye, G. V. Bartlett, Hiram Wallace.

The Cedar Rapids Electric Light and Power Company, Cedar Rapids, Iowa. President, John E. Hamilton; vice-president and manager, W. J. Greene; secretary and treasurer, Isaac B. Smith; directors, James L. Bever, John T. Hamilton, W. J. Greene, James Morton and P. C. Frick.

ELECTRICITY IS PUBLISHED ON WEDNESDAY OF EACH WEEK

Our columns are open for the discussion of any question in which the interests of the Electrical Industry are at stake. News notes, descriptions of new devices with drawings or photographs, are at all times desired.

SUBSCRIPTION RATES:

UNITED STATES, - - - - -	$2.50
IN CLUBS OF FIVE OR MORE, - - - -	$2.00
FOREIGN COUNTRIES, - - - - - -	$4.50

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

"Electricity," under its present ownership, has never solicited the advertising patronage of the General Electric Company.

The Goebel Lamp.

During the past week the unusual interest attaching to the strong defense submitted by the Beacon Company in the injunction suit brought by the General Electric Company has been raised to the highest pitch by the seemingly incontrovertible evidence adduced by the defendants to establish the fact of the priority of invention of the incandescent lamp by Heinrich Goebel and thus invalidate the claims of the Edison incandescent lamp patent.

The character of the evidence submitted at the first hearing of the case was such as to arouse the deepest interest of the electrical profession and to turn the tide of popular opinion in favor of the newly discovered inventor, and the additional evidence introduced during the past week has been more than sufficient to confirm this opinion in the minds of the laity.

At the present writing the question appears to resolve itself into one of scientific import, as the number of the defendants' witnesses, amounting to fifty or more, practically precludes the possibility of error or fraud in regard to the time when Goebel's work in this field was prosecuted. Aside from the question of priority, however, the defendants' case presents a formidable array of testimony as to the practicability of Goebel's lamps; and the exhibits offered in evidence conform to the commercial type of lamps in use today far more closely than does the lamp for which Mr. Edison took out his patent now in litigation.

This similarity will be manifest to the least technical observer, and reference to the diagram of the Goebel exhibit, page 43, will serve to confirm its remarkable conformity to electric lamps of present manufacture.

The filamentary bamboo carbon, platinum inleading wires, glass chamber and vacuum are all in evidence, and are authenticated by the testimony of numerous witnesses; but beyond this similarity, the methods of manufacture adopted by Goebel appear to have anticipated many supposed recent inventions, and point unerringly to the careful study which Mr. Goebel must have given to the subject in order to attain the successful results which he achieved at that early date.

That his scientific researches were carefully conducted is evidenced by the fact that at this late day his assertion concerning the different effects produced upon copper by pure and impure mercury could only be verified by the experiments of an expert.

The accurate scientific knowledge, and the habits of minute observation of Mr. Goebel, combined with his manual dexterity, make his case the more probable, and it is noteworthy that all who have come in contact with him have been impressed by his simple straightforward manner.

It must be remembered, however, that the establishment of Goebel's claims would not necessarily detract from the originality or value of Mr. Edison's work in this line; and as new facts are brought to light in the course of this litigation, it becomes more and more apparent that the invention of the incandescent lamp was rather in the nature of a gradual evolution than the result of an entirely novel conception. The patent records of England show that this method of illumination was the subject of a patent granted to Augustus King in 1845. J. W. Starr and Dr. W. H. Draper were also known to have experimented with incandescent lamps at about the same date. An illustration of one of these lamps shows an arrangement analagous to the present lamps except that the globe, instead of being sealed, was constructed at the top of a barometer tube. However, as the inventor mentions the use of these lamps for fishing at night by lowering them into the ocean, it is evident that such lamps must have been sealed. The adaptation of these lamps to commercial purposes constitutes the real invention, and in this respect the evidence of Mr. Goebel presents the validity of his claim in the strongest light.

* * *

A Patent Suggestion.

There have appeared from time to time a number of criticisms concerning our patent laws, and the pertinence of these complaints is emphasized at present with special force by the litigation both in this country and in England which has involved several of the most important electrical patents in use, and which in several notable instances has only been concluded within a few months of the expiration of the patents. The cases of the Brush storage-battery, the Hopkinson three-wire system in England, and the Edison lamp patents have been called prominently before the public during the past few months and clearly illustrate this point, as well as the fact that the same conditions prevail in other countries. The *Electrical Review* of London in a recent editorial ascribes this condition to the delay which has characterized the efforts of a large number of patentees to establish their claims and to proceed against alleged infringers.

In default of such proceedings, the purchasers of infringing apparatus are naturally led to the conclusion that the failure of the patentee to take any action against the infringer implies a tacit acknowledgment of the latter's right to manufacture the article in question, and in this way large interests have been built up, continued unmolested for years, involving in some cases enormous investments, which eventually may prove worthless when contested by the patentee.

An obvious remedy for this abuse is suggested by our contemporary, viz., "Let the validity of the patentee's claims be settled at the outset of the career of the patent"—an effective remedy, but one probably difficult to apply. It appears equitable that a reasonable limitation should be prescribed by law, however, during which any action either to uphold or invalidate the patent must be commenced, and after which any laches must resolve against the delinquent party.

Another abuse of the patent right which is entirely foreign to the spirit of the law is the purchase and suppression of a patent by those whose interests would be opposed by its use.

This abandonment of patented inventions is largely in vogue, particularly in the electrical field, and should constitute the ground for annulling a patent if continued beyond a reasonable limit.

It has always been the policy of the United States Government to interpret the rights of patentees in the most liberal spirit possible, and to construe every doubtful point in their favor. It is only justice that inventors should be enabled to reap the full reward which inures from a patent, but it seems equally fair that it should not be used solely to obstruct the science to which it appertains.

The fundamental idea in granting patents is to *advance the progress of science and the mechanical arts*, and to this end a limited monopoly is secured to inventors to stimulate work in this direction. A patent being in the nature of a contract between the Government and the patentee, ought to imply some obligation as to the use of the article, for if it be an important one and contains fundamental claims, failure to prosecute deceives the public, while suppressing its manufacture impedes rather than advances the progress of the art to which it relates.

* * *

THE charge made by Mr. Frederick P. Fish, that the entire defence made by Messrs. Witter & Kenyon for their clients, the Beacon Company, was fraudulently manufactured, is amusing to the public, but we doubt if it was regarded in this light by Judge Colt.

Mr. Fish should remember that Mr. Witter was a reputable and respected counsellor when he (Fish) was wearing knickerbockers and playing marbles—and cheating, doubtless, whenever he got the chance.

A Mechanical Theory of Magnetism.

Mr. Leon J. le Pontios, of the Westinghouse Company, gave a lecture before the Pittsburg Electric Club on January 14 in which he discussed the theory of magnetism and the possibility of the direct conversion of heat energy into electric energy. He predicts the possibility of utilizing the vibratory molecular motion called heat to generate and destroy instantaneously magnetic properties of a body, the heat being absorbed in the mechanical work of magnetization and demagnetization; and after prosecuting numerous researches in this direction he concludes that the great analogy existing between these phenomena implies that they should be submitted to similar bases of calculation. The theory of magnetism and electricity enunciated by the lecturer is as follows:

Instead of considering magnetic and electric phenomena as different modes of vibration of the intangible and mysterious fluid known as ether, which is supposed to be diffused throughout all space, these phenomena may have a much more material origin and simply be caused by modifications of the vibratory cadence which is supposed to constitute the permanent state of matter.

These perturbations may be caused by the presence or contact of bodies whose atomic conditions are so different that the equilibrium resulting from the universal atomic vibration is practically destroyed. The atoms strike each other until certain of them are destroyed, and this atomic battle may be called chemical reaction. A new state of equilibrium is formed out of which arises heat or electricity.

In other cases heat or electricity may be generated by a mechanical destruction of movement, like a shock, or by friction between certain bodies. The lecturer demonstrated mathematically that our world, under existing conditions, causes universal vibration as a necessary consequence.

He believes that what we call the state of rest is constituted by a certain movement of matter, and that every atom of a body which does not seem to move goes to and fro striking the next atom, thus limiting its motion and regulating the atomic distance, that is to say, the volume, of the body.

It seems paradoxical at first to reconcile rest and motion, but we must consider that the atoms are infinitely small, while the amplitude of their vibration is so extremely short itself that the vibrations in each direction take place practically in the same moment for us, whose existence is comparatively long, while our sensations in proportion to our longevity are unable to analyze these phenomena, so instantaneous is the going and return of these atomic vibrations. It could not be the same for a microbe, and he establishes this principle, that a being is not able to notice a vibratory movement if its duration is not in a certain proportion to his longevity. As an illustration of this idea, suppose an express going from Pittsburg to New York and coming back—the movement of the train would be a vibratory movement for the conductor, because he could distinctly appreciate the two phases of the vibration, while for a being whose longevity should reach a million years, the motions would be of such short duration that he could not perceive them. This real vibration would be for him a state of rest.

Under certain circumstances the movement takes a regular cadence, and according to the rhythm of this cadence heat, electricity or light is generated.

The lecturer distinguishes between the atomic vibrations, which are limited by the atoms constituting the body having the same mass and same velocity in striking each other. The undulatory movement characterizes the phenomena—acoustic, caloric, electric and magnetic waves. In this kind of movement an excess of speed imparted to an atom of the body is successively transmitted by the vibratory movement to all the atoms constituting the body. These peculiar vibrations create the phenomena in which the two phases differ from each other by a change of mass, or by a change of speed, simultaneously imparted to the atoms going in the same direction.

A bell vibrates—the medium surrounding its vibration, solid, liquid, or gaseous, undulates. The sun vibrates—the intersidereal matter undulates. A magnet vibrates—the medium placed in the proximity of its pole undulates more or less according to its atomic constitution. A conductor charged with static electricity vibrates—a battery in closed circuit undulates. The field magnets of a dynamo vibrate—the conductor cutting the lines of force at right angles undulates.

The lecturer in analyzing attraction and repulsion claimed that if they have for their origin a peculiar vibration of atoms constituting the magnet, this vibration must be such that one of the phases of the vibration differs by an excess of speed from the other phase.

He also claims that with such conditions the result of this peculiar movement tends to cause a rupture of equilibrium between the magnetic bodies.

Analyzing the ordinary battery, Mr. le Pontois shows the atoms of the liquid, two superposed atoms of oxygen and hydrogen in a state of perfect equilibrium.

The zinc plate is introduced and immediately a great disturbance occurs—the harmony is destroyed, water is decomposed on account of the great difference of the atomic interval and weight of the atom. The two superposed atoms of hydrogen and oxygen cannot vibrate in harmony with an atom of zinc: a battle occurs in which they are divided, the atom of oxygen going to the zinc, hydrogen to the carbon. A new vibration takes place in which an atom of zinc superposed on an atom of oxygen vibrates against an atom of H_2O. In the shock an excess of speed is given the H_2O, and an undulation starting from the zinc and going to the carbon takes place in the battery; and if the conductor connects the electrodes, the undulation affects successively the atoms of the conductor, and this undulatory movement is nothing but the electric current.

Then, considering a wire surrounding a soft iron, the lecturer analyzed the forces involved, and demonstrated mathematically that if an undulatory movement of said electric current flows through the wire, the undulation has the effect of disturbing the atomic vibration in the iron and to establish a new mode of vibration, in which one of the phases differs from the other by a difference in speed.

M. le Pontois briefly applied his theory to the dynamo, and explained that in like manner an undulatory movement takes place in a conductor moving in a magnetic field. In the case of the thermo-electric battery he says: When two metals under different atomic conditions, such as antimony and bismuth, for instance, are soldered together, if the soldered point receives a vibratory caloric movement this vibratory movement creates an undulation in the metals, and if they

are connected by a conductor an undulatory movement known as electric current takes place in the conductor.

The electromotive force, that is to say, the speed of the undulatory movement, is equal to the difference between the coefficients expressing the variations of the conductivity of the metals multiplied by the difference of temperature between the soldered point and the coolest point of the circuit.

He also showed how the Thomson and Pelletier effects can be explained by the atomic theory, and in conclusion gave a general outline of his thermo-electric generator.

In this he heats and cools simultaneously two neighboring points of the circuit, softening one of them and hardening the other, and an electric current takes place in the circuit, going from the softest point to the hardest point through the external circuit.

This principle is applied in practice in the following manner: A gas turbine is mounted on the same shaft with a blower supplying cold air, the outlets for the heated gases resulting from the combustion and the cold air furnished by the blower are placed in alternate positions on the circumference of a cylinder, and this apparatus revolves at a very high speed inside a cylindrical cavity made by a succession of laminated rings separated by a space of $\frac{1}{32}''$ and insulated each from the other. These rings themselves are divided in sectors, having a suitable coating to absorb the heat and at the same time to prevent oxidation.

The different points of each sector may be simultaneously affected by the discharge of hot air and cool air escaping from the nozzles, and the sectors are made of such shape that the currents generated circulate around an iron core placed inside each series of sectors; the iron cores, made of laminated sheets, are coiled at their extremities. The undulatory movement generated in the sectors changes the atomic vibration of the core and magnetizes or demagnetizes it. Hence are induced currents in the coils which may be connected in order to obtain the required voltage.

The principle advantage of this disposition of the parts lies in the fact that a large metallic surface is exposed in a very short time to a great variation of temperature, and the inventor demonstrated mathematically that the greater part of the energy furnished by the heat is utilized in the work of magnetization and demagnetization.

The experiments already made by Mr. le Pontois have given very encouraging results, and seem to indicate that the efficient conversion of heat into electricity is not impossible, and the practical results he has obtained are attributed by him to the application of his mechanical theory of magnetism.

Discussion of the Paper on Micanite Read Before the American Institute of Electrical Engineers.

(Continued.)

Prof. W. A. Anthony—I am very much interested indeed in this material, and the company for which I have been working for the last few years has been making some use of it in the construction of machines, and has found it a very excellent material in a great many places. I agree with Mr. Steinmetz that the measurement of the insulating power of the material is no test of its value in the machine. The effect of this high insulation, of course, is good. But the important fact is, that it will stand a great deal of mechanical wear and tear and a very high temperature without breaking down in insulation; and you may even have something of a short circuit without burning through it, while almost any of the other insulating materials are at once burnt out and destroyed by any short-circuiting.

Prof. Francis B. Crocker—I think that what Mr. Steinmetz said about tests of insulation at different voltages is the keynote of the problem. But I think he went a little too far in saying that the usual test of insulation showed nothing or showed next to nothing. It seems to me that although a test of insulation resistance is not conclusive I would much prefer to run a dynamo or a system of conductors, or any other electrical apparatus or system, when it showed 100 megohms insulation than when it showed 100,000 ohms insulation. In fact if it showed 100,000 ohms insulation I should be afraid to start up. If it showed 100 megohms I should have considerable confidence that it would run all right. It seems to me that the best way to do is to test the insulation at the voltage at which you intend to work. That covers both points. You test the insulation, which has been the customary thing to do for some decades now, and you also subject it to a potential, or power to break down, which Mr. Steinmetz rightly considers very important. There is no objection to it except the practical difficulty of getting a potential of whatever is necessary—one or two thousand volts, or whatever it may be. But Mr. Williams showed us at the last meeting an electrostatic method of doing that, and for some months past I have been making tests of insulating materials at several thousand volts with a direct current dynamo machine without any difficulty whatever. We pass the current from the dynamo machine through the given insulation and the galvanometer according to the ordinary direct deflection method well known to all of us, and observe the insulation resistance—the old-fashioned insulation resistance which Mr. Steinmetz thinks amounts to nothing—and at the same time we test the power to withstand disruptive discharge. It seems to me that that kills two birds with one stone. We get a quantitative result and also a test of the power to withstand the stress, and that stress of a potential which is applied to actually break down an insulator is very similar to a mechanical stress. It is a good deal the same kind of a stress as a point would exert resting on the centre of a pane of glass—at a certain pressure it will break through. That, of course, is simply an analogy, but it is quite close.

In testing the disruptive resistance or the breaking, Mr. Steinmetz said very truly that we ought to put it on the same basis as all other engineering problems, and that is to make an actual breaking strain test. In mechanical or civil engineering we simply take a test piece and subject it to a breaking test. Now, we can do the same in electrical engineering, and I think it should be the custom—I know it has been in the practical work that I have been engaged in—to subject machines intended for 500 volts to 1,500 volts test pressure. That is no more than is proper. It is simply a factor of safety of 3. If you raise the factor of safety to 5, so much the better. Electrical engineers should have their factor of safety and should consider it part of their work just as much as civil or mechanical engineers.

A dynamo machine or electrostatic machine can easily be obtained which will give any reasonable voltage from one to five thousand. I have a small machine that gives 5,500 and will run all day long at 5,000 volts. Such machines can easily be obtained. Why not subject any insulation to such a test, and at the same time pass the current through some galvanometer or other device to show quantitavely the insulation resistance at the same time that we test its power to withstand the potential? In regard to the galvanometer, I will point out one difficulty due to electrostatic disturbance, that is, the needle of a galvanometer connected to a dynamo or electrostatic machine giving 5,000 volts, or anything approximating that, will be acted upon just the same as a pith ball in the vicinity of an electrostatic machine—it will fly around and you will get a false deflection. That is quite confusing sometimes and very difficult to eliminate. The proper way to overcome this seems to be either to ground the terminal of the source connected to the galvanometer so as to reduce the potential to zero or else to make the potential of the coils equal to that of the needle by connecting the needle to the coils by a little wire passing down into a bath of sulphuric acid, or something of that sort. The electrostatic disturbance will be much greater than the current effects in a great many cases. Mr. Williams uses purely electrostatic means—an electrometer—and observes how long it takes to discharge at a given charge. But it seems to me that purely electrostatic strain is not so severe on a given insulator as the current from a dynamo machine. I think that 5,000 volts applied from a dynamo machine is a more severe test than 5,000 volts applied from an electrostatic source. There is some power behind in one case, and nothing behind in the other. That sounds a little absurd. But I think there is something there that we are not quite familiar with. So far as my experience goes, a potential applied with the backing of a dynamo machine, so to speak, is a more severe test than a simple electrostatic potential without any dynamo.

The Chairman—It seems to me that the remarks of Professor Crocker upon backing up the insulation tests with the current from the dynamo, and the remarks which Mr. Kennelly made relative to the using of this material and its advantage over mica and other expensive substances, *i. e.*, that it can be not only formed but that it has the great advantage of being considerably less in cost, are very pertinent; and I think from the remarks of Professor Anthony and of others here, and from statements made to me by the gentlemen who presented these samples to-night, that this material is not in an altogether experimental stage, that it has been worked commercially and on a considerable scale for a number of years. I would like to ask Mr. Thompson if he can give us a little information as to the relative cost of this material, taking any particular size or sizes, as compared with mica.

Mr. Thompson—Mr. Brooks or Mr. Kingsley, I think, would be better able to give figures on that. They are posted on the business points better than I am.

Mr. Lewis W. Kingsley—I would state that on sizes, say six by eight, the cost would be one-half that of mica. In very small sizes it costs more than small mica, but with large sizes it costs one-half, and you can get, of course, any size much larger than you can obtain it from the mine.

Mr. Steinmetz—I do not want to be misunderstood with regard to my opinion about insulating resistance. I do not mean to say that insulating resistance is of no value whatever. It has some value. It shows whether everything may be all right or whether something may be wrong. We are all familiar with the insulating resistance of materials, and know what resistance we have to expect, and where we find exceedingly low insulating resistance we must suspect something is wrong. Very often we find that the insulating resistance becomes all right by a couple of hours' sojourn in the steam box, especially where fibre or asbestos paper was used. Hence the low insulating resistance is a good hint to look things up and see whether everything is all right. But it is no reliable test of the safety of the machine.

Then with regard to exposing all the materials to a breakdown test, that is what we have done for several years and found it very reliable. But if we want to combine it with the resistance tests, then the only safe way would be to make the tests at a potential considerably higher than the normal, because as long as we have inductances in our circuit we cannot avoid occasionally a sudden rise of potential beyond the normal value, as in breaking circuits, etc., and we have to take this in account because this insulating resistance, especially of air, does not vary as a continuous function of the potential, but is infinite up to a certain point, and then suddenly drops to zero, practically. So we have to make the insulating tests considerably above the normal potential.

I am glad to see Professor Crocker propose the same factor of safety as we have used a long time, testing 500 volt machinery by 2,000 volts.

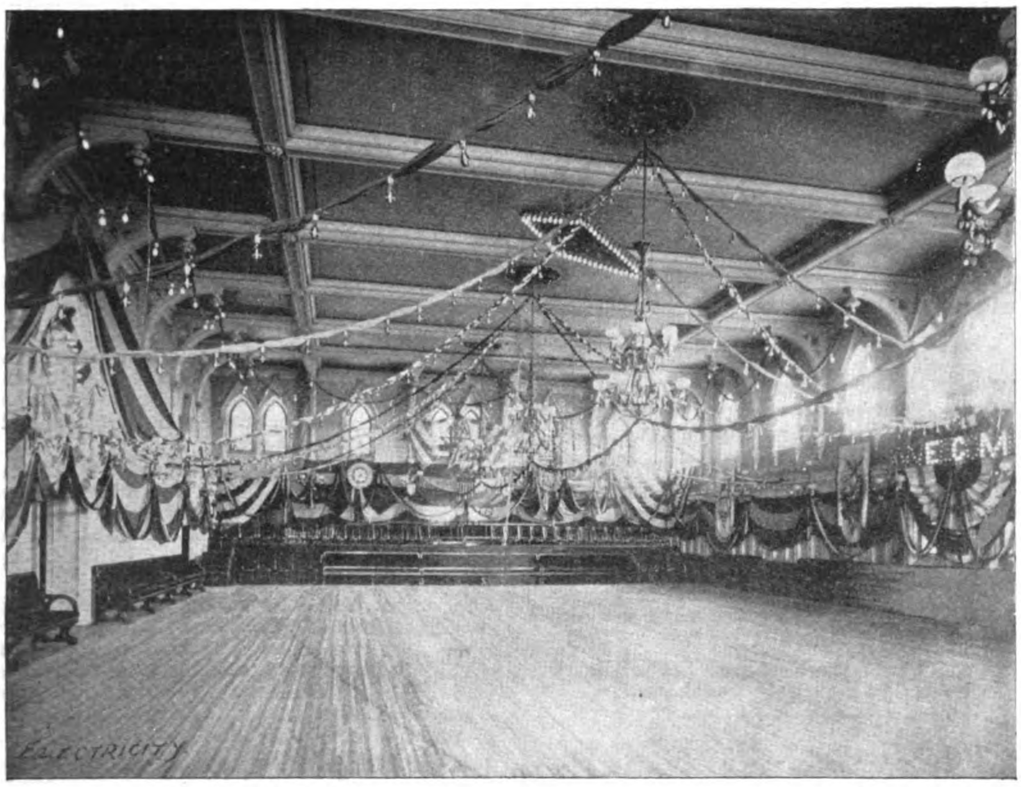
But with regard to the source of these testing potentials, I do not think we need to bother much about continuous current dynamos. For what purpose do we have the alternating current transformer? From ordinary 50 volt mains we can obtain any potential difference, of 2,000 volts just as well as of 3,000 volts, and I even think the alternating potential test is more reliable, because alternating stress is more severe than continuous electrostatic stress. Lately I looked up the literature for tests about disruptive discharges through the air and found quite a disagreement of that kind, so that I am almost inclined to believe that the disruptive strength of air is less with alternating potentials and decreases with increasing frequency. So if we use a frequency of 150 periods and 2,000 volts, we are sure the insulation will break down if it is liable to break down. *Power* indeed must be behind the *potential.*

With regard to micanite I can only say that I found it very reliable—superior to all the other insulating materials except genuine mica, but it is not absolutely fireproof, so that I prefer to keep it away from the arc.

A Brilliant Gathering.

Third Annual Ball of the Massachusetts Electrical Engineers and Mechanics' Association.

Rarely if ever since the introduction of electricity to commercial use has there been assembled so large and brilliant a gathering as that which filled Odd Fellows' Hall, Tremont street, Boston, Monday evening, January 30, the occasion being the third annual ball of the Massachusetts Electrical Engineers' and Mechanics' Association. This organization dates from a small meeting held in the dynamo room of the Boston Post Office in the spring of 1890, which meeting was adjourned to the press room of the Boston *Herald*, where, on April 1, it was determined to organize an association of electrical workers for mutual benefit, instruction and assistance, which it was felt could be best attained by such an association. Before that meeting adjourned officers were chosen and an executive staff appointed.



A Brilliant Gathering.—Electrical Decorations.

From that time forward the Association has grown in interest, importance and numbers until at the present time there are nearly two hundred enrolled members, having new and elegantly-appointed quarters, where meetings are regularly held, in the William Parkman Hall, Boylston Place.

One attractive feature of this prosperous Association from its inception has been the annual ball held in the large and handsome white marble building known as Odd Fellows' Hall. The first of these successful balls was held on January 26, 1891, the third a week ago Monday.

To say that each succeeding ball has eclipsed its predecessors is to put it mildly, for probably the third annual gathering, of which we now write, surpassed in the uniqueness and brilliancy of its illuminations anything previously attempted in any ball-room.

In describing these illuminations, which form the subject of accompanying cut, it may be stated that the entire exterior of the seven-story block was illuminated by a number of arc lights, the globes of which were of differently tinted glass, on the roof being placed two powerful search-lights, the flashing rays of which, combined with the rainbow hues of the arc lights, produced a *tout ensemble* that was striking and admirable.

In the hall itself were arranged nearly two thousand vari-colored incandescent lamps, ranged in groups along the sides of the large ball-room or hung along the sinuous length of streamers reaching out from the centre of the ceiling at various angles to the side or end walls, corners or windows. Prominent at the middle of the ends and sides of the room were designs most artistically wrought out in these colored lamps, the various tints being so blended or placed in such juxtaposition that many beautiful chromatropic effects could be readily produced through the aid of an elaborate switchboard that was made expressly for the occasion.

As will be noted from a glance at the accompanying illustration, over the platform occupied by the orchestra were two stars having five rays each, each ray being composed of incandescent lamps of a certain tint, but no two rays being alike in color. These stars were so attached to an electric motor that they were kept revolving the entire evening in different directions, the gyratory motions producing optical effects. Opposite the main entrance was the word "Welcome," composed of colored lamps and surrounded with a border of gayly-colored bunting.

At the opposite end of the hall from the orchestra were a huge crescent and star, the lamps composing which shed their effulgent rays through the entire length of the room. Over the entrance the large clock was encircled with an electric halo of lamps artistically arranged.

Pendent from the centre of the ceiling, as will be noted, were the bright outlines of a huge kite—typical of Benjamin Franklin's discovery—the kite itself being outlined in frosted white lamps, while the tail was composed of ruby lamps.

Close by the entrance to the hall room, or the landing, was shown a complete model plant, consisting of a small Edison dynamo connected in circuit with about a dozen miniature lamps brilliantly shining, the intention being to give the visitors a complete idea of the Edison underground system of lighting.

The festivities opened with a grand concert by a large orchestra at eight o'clock, the grand march taking place at nine. From that hour on until four o'clock Tuesday morning dancing was continued with an intermission at midnight for supper, which was quite a *recherché* repast. During the progress of the terpsichorean exercises the operator in charge of the switchboard caused great diversion, consternation and admiration by suddenly cutting out all the lamps of a certain color, thereby completely transforming the entire color of the room and its gayly-dressed occupants from a normal tint to a deep ruby, a green, blue, yellow, amber, white, mauve, gold—indeed, about any color desired. These sudden, startling and weird changes were closely akin to the weirdness of Henry Irving's "Walpurgis Night" or the scene of the Brocken in the opera of "Faust."

Of course, evergreens, gayly-colored bunting, and the stars-and-stripes added gayety to the scene.

But the most noteworthy attractions were the many pretty young ladies with their handsome toilettes, accompanied by their good-looking electric beaus, the entire assembly numbering nearly sixteen hundred persons.

That every feature of this celebration should be *en suite*, even the dance orders were artistically got up in true electrical style, every dance in the ball room and every tempting viand on the supper table being essentially electrical.

The souvenir was a handsome volume, the covers being printed in colors, the design including three medallion portraits—of Mr. Edison, Prof. Thomson and Prof. Bell—while Benjamin Franklin in the picturesque attire of the eighteenth century was shown flying his now historic kite, the antics of which revealed to the famous philosopher the presence of electricity in the atmosphere.

It is a noteworthy fact that every part of this elaborate installation even down to the minutest detail was worked out with mathematical precision before the first step was taken in the work. Plans, drawings and specifications were prepared, and every man engaged in the undertaking made use of the blue-print working drawings. Nor was outside help sought. So bent on achieving success were the members that each one assumed his share of responsibility and work, and all did their part in the most praiseworthy manner. The carrying out of the entire celebration was assigned to various committees, and where all did their very best and achieved such unquestioned success, it would be difficult to make a single invidious distinction.

During the evening many distinguished electricians and city officials took part in the festivities, thereby manifesting their deep interest in and encouraging by their presence the praiseworthy efforts of the officials and members of the Association.

It was an occasion that will long be remembered by all who had the good fortune to be present.

Prof. Bell.

The following description of Prof. Bell as he is is from a late number of the Boston *Advertiser*: "A large, strongly built man, who looks as though he enjoys life, is Prof. Bell, of telephone fame, who was at the Parker House last evening. He has a most contagious smile. The long, curly hair which clusters around the massive head is gray, and that shade predominates in the heavy beard, but his figure is as erect and his step as firm as those of many men twenty years younger. He merely stopped in Boston en route from his farm in Nova Scotia to his home in Washington."

A notable incident connected with the opening of the Liverpool Electric Railway line was the starting of the engines by Lord Salisbury, who subsequently entered a train, accompanied by the Earl of Latham and Lord Kelvin, the Mayor of Liverpool, and the directors of the road, and enjoyed the ride. The train ran smoothly at the rate of twenty-two miles an hour. Crowds of spectators thronged the route.

Canadian Electrical Association.

The second annual meeting of this association was held on Wednesday and Thursday, January 25-26, at which a number of papers were read and discussed. The reports of the officers and committees showed the growth and prosperity of the association to have made material increase during the past year. In calling the meeting to order President Wright said that since addressing the former meeting of the society several changes of importance have taken place in the aspect of this industry, and new departures have been made that will have considerable influence on the future of electrical business in Canada. The adoption of electricity as a motive power on suburban railroads and the conversion of horse tramways has developed in a manner that for rapidity is without a parallel in the history of modern civilization. While this is the case, and it is undoubtedly a fact that solid and substantial progress has been made by conservative management of electrical enterprise, a word of caution may not be out of place to investors in securities based upon electrical speculation. There is a danger that the fact of this solid progress may be made the means of ultimate injury to the concerns identified with it. It has caused a growth of schemes having electricity as a basis to spring up as thick and fast as mushrooms.

The inevitable failure of many of these will discredit, to a certain extent, legitimate enterprise and profitable business.

After acting on the various committee reports the convention listened to the various papers which had been prepared, among which were "The Incandescent Lamp," by R. G. Black; "Underground Construction," by W. A. Tower; "Probabilities as to the Success of Distribution of Power at Considerable Distances by High Tension Currents of Electricity," by E. Carl Breithaupt; "Free Wiring," by J. M. Campbell," and "Electrical Measurements," by Geo. Black.

Boston Notes.

The impromptu talk given by Mr. A. A. Hunting, M. E., on "The Steam Equipment of Modern Central Stations," a full report of which we publish in another column, before the members of the Thomson Scientific Club on Thursday evening, was a great success. Mr. E. Wilbur Rice, Jr., Superintendent of the General Electric Company's factories, presided, and the large room and adjoining corridors were crowded with members and friends.

The Edison Illuminating Company and the Boston Electric Light Company behaved most generously in connection with the third annual ball of the Massachusetts Electrical Engineers and Mechanics' Association. The former loaned all the wires, lamps, fixtures, etc., for the interior decorations, while the latter loaned and installed the arc and search lights that illumined the exterior of the building. Nor was the General Electric Company lacking in interest, for from its stores were loaned the switches, cut outs, etc., used on the unique switchboard built specially for the occasion.

When Mr. Fish, the accomplished and energetic counsel for the General Electric Company, appeared in court Wednesday to meet Judge Colt, who was to receive certain briefs and additional affidavits in the now famous lamp case, he made an appeal which might almost be characterized as "pathetic" for the issuance of an injunction, but his characterization of the new and startling evidence did not have the much-desired effect, hence all must await the Judge's decision.

His Honor Mayor Matthews' message or report on the subject of city lighting, which was sent to the City Council on Tuesday, was a most exhaustive document, and has been pretty well discussed by the daily press. His Honor has much to say on the high prices paid for gas and electricity, and strongly favors the City Fathers' going to the State Legislature for authority to build a municipal lighting plant as the only equitable way of solving the problem which has been agitating the public mind for years. The report is a most business-like document and is not likely to be quietly shelved. Public opinion is strongly in favor of some decided action being taken, and it may be the city will take advantage of the Municipal Lighting Act which became law about two years ago and under which more than one town in Massachusetts has erected its own plant.

The Ninth Annual Banquet of the Electric Foremen's Association, which is composed of gentlemen connected with the General Electric and allied companies, took place in the Revere House, Boston, last Saturday evening and was a most enjoyable occasion. There were nearly one hundred present, consisting of members and invited guests. Mr. A. L. Rohrer, the genial and popular president, who now resides in Schenectady, N. Y., presided on this festive occasion, his presence proving to be a pleasant reunion for the time being between that gentleman and his many old and tried friends. A splendid repast was partaken of, after which Mr. Rohrer, in his usual facetious manner, introduced the various postprandial speakers, each of whom contributed his quota to "the feast of reason and flow of soul." Professor Elihu Thomson, Mr. E. Wilbur Rice, Jr., and Mr. I. F. Baker were among the invited guests. The various impromptu addresses were characteristic of the occasion, including jest and story intermingled with startling facts bearing on the continued growth and expansion of the electrical business. Everyone present greatly enjoyed the occasion, which also included the election of officers for the coming year, these being W. H. Knight, president; J. P. B. Fiske, vice-president; A. C. Day, secretary and treasurer; J. T. Broderick, historian; W. P. Hill and E. H. Howe, executive committee. Special cars leaving Boston at 1:15 A. M. conveyed the party back to Lynn at the close of the proceedings.

Chicago Personals.

W. A. Kriedler, editor and publisher of the *Western Electrician*, was married last week to Miss Nettie A. Preston, of Chicago.

P. C. Ackerman, of the American Electrical Works, called on his many customers in Chicago last week.

G. W. Baumhauf, of St. Louis, was doing some purchasing for the Lindel Electric Road among the Chicago supply houses.

J. R. Chapman, of Grand Rapids, was also a Chicago visitor.

J. F. Barry, of the New York firm of Barry & McTighe, was in the city last week.

General News.

What is Going on in the Electrical World.

New Orleans.—The Carrollton electric railroad is completed and the cars are in successful operation.

Plattsburg, N. Y.—Investigations are being made as to the construction of an electric railway in this city.

New Milford, Conn.—An electric railroad from New Milford to Waramaug Lake, a pretty summer resort, is proposed.

Wichita Falls, Tex.—L. R. Morrison and associates have been granted a franchise to put in an electric light system.

Ashbourne, Pa.—Surveys are being made for an electric railway to connect Ashbourne with Cheltenham and other villages.

Mobile, Ala.—The Mobile Street Railway Company have received from council permission to use electricity on their lines.

Grand Rapids, Mich.—The franchise of the Reed's Lake Electric Railway Company has been annulled by a decree of the Supreme Court.

Boso, Japan.—The street car companies of Boso recently decided to construct an electric trolley line to replace the present horse car system.

Roanoke, Va.—The city council has awarded to the Roanoke Electric Light and Power Company a contract for lighting the streets of the city with electricity.

Des Moines, Iowa.—The Capital City Electric Company are said to be negotiating for the purchase of the entire plant of the Water Power Electric Company.

Carthage, Mo.—The Bartlett Company has obtained the franchise for building an electric railway in this town. The franchise calls for first-class equipments.

Cleveland, Ohio.—The Cleveland City Cable Company has received the permission of council to equip the St. Clair line and any other line which they control with electricity.

Charleston, W. Va.—An ordinance providing for the ownership of water, gas and electric light works by the city is to be voted on by the citizens at the next municipal election.

Fonda, N. Y.—The Fonda and Fultonville Electric Railroad Company has been organized at Fonda. Electric cars are to be run from Gloversville to Fultonville and connect with the West Shore road.

Chambersburg, Pa.—The council are considering plans for the erection of an incandescent light plant, as the right of the borough to manufacture electricity for commercial purposes has been affirmed by the court.

Peoria, Ill.—The proposed route of the Peoria and Pekin Electric Railway's new road between the two cities will be under ten miles, but the company expect to build six miles of track in Pekin itself if they obtain the franchise.

Woodbury, Conn.—Prominent citizens of Woodbury, in Litchfield County, have declared their intention of applying to the Legislature for a charter to build an electric railway line from Woodbury to Pomperaug Station on the New York and New England road.

Little Rock, Ark.—The Atlantic Trust Company of New York and the United Electrical Securities Company of Massachusetts have joined with the Thomson-Houston Electric Company in the application for a receivership for the City Electric Street Railway.

Mauch Chunk, Pa.—The work on the power house of the proposed electric railway, suspended because of the extreme cold weather, will be resumed at once, and as soon as the weather permits the construction of the railway through the Mauch Chunks will begin.

Wilmington, Del.—Capt. Chas. H. Smith, late superintendent of the Wilmington City Electric Railway Company, who is about to leave the city for his new field of labor at Scranton, Pa., was treated to a jolly farewell dinner by the George Washington Fishing Club.

St. Louis, Mo.—At a recent meeting of the stockholders of the Southern Railway Company it was decided to change the name of the line to "The Southern Electric Railroad." Hon. Thomas L. Johnson will continue as the company's president and Edward Lovejoy as its secretary. It is proposed to extend the line.

Canandaigua, N. Y.—The president of the Canandaigua Electric Light Company, M. D. Munger, has purchased water-power rights at Littleville, with the intention of constructing an electric light station at that place and ultimately transferring the local plant to Littleville. Power for the street railroad will be supplied from the new station.

Beverly, Mass.—The legal voters of the city at a recent election to decide the question whether the citizens were in favor of allowing the trolley system to be introduced have deposited 706 ballots for to 182 against the proposition. "The victory for the electrics," says a local paper, "was received with demonstrations of joy all over the town."

Buffalo, N. Y.—A new electric road is proposed that will connect Blasdell, Woodlawn Beach, Bay View, Windom and the Lake Shore, as well as the village of Hamburg and the vicinity of the Erie County Fair Grounds, with Limestone Hill and the city of Buffalo. Daniel W. Allen is at the head of the syndicate that is interested in the project.

Chicago.—Mr. Edison has been granted a concession by the ways and means committee of the Exposition to place 150 kinetographs at points he may select in the Fair Grounds. The kinetograph is an instrument which photographs the gestures of a speaker while at the same time his words are recorded by the phonograph. It is Mr. Edison's latest invention.

Cornish, Me.—Walter P. Perkins, John F. Jameson and others have presented a petition to the Legislature asking for a charter for an electric road to run from Cornish depot in Baldwin through Cornish village and Parsonfield to the Little Ossipee River. The road is to be equipped for transporting freight and passengers and the company also ask permit to furnish power, light and heat.

Pittsburg, Pa.—The Mt. Washington Electric and Cable Traction Company has decided to commence laying the tracks, stringing the wires and erecting the poles at an early date. The route will include Grandview, Boggs and Southern avenues and Sycamore street. The power on the hill streets will be electricity, while on the steep grade to the foot of Sycamore street the cable will be used.

West Chester, Pa.—The *News* says: "We have it from what seems reliable authority that a grand and final effort will be made to build the Unionville Electric Railway to West Chester next summer." — The Philadelphia and Delaware County Electric Railway Company, which has been granted charters to run its lines in Delaware County between Chester, Media and the limits of Philadelphia, will at once proceed to build its line.

San Francisco.—The Highland Park road is being converted into an electric line.—The electric light companies of the city have formed a "combine" and raised their rates nearly 100 per cent.—The Central Electric Railway system of Sacramento City has, it is reported, been sold to Albert Gallatin and H. P. Livermore, owning the controlling interest in the Folsom Water Power Company and in Sacramento Light and Power Company, which holds franchises recently granted for the building of new electric lines in San Francisco.

Minneapolis, Minn.—The Minneapolis Loan and Trust Company, as trustee, has filed with the register of deeds one thousand $1,000 bonds, given by the Minnesota Brush Electric Company, the Consolidated Brush Electric Company and the West Side Power Company, each bond bearing 6 per cent. interest. The companies together are known as the Consolidated Company, and the Loan and Trust Company acts as trustee for certain Eastern parties who are making the loan. The intentions are to extend the plant and enlarge the field of operation. The bonds are all signed by each company individually.

Newark, N. J.—A deal in electric lighting stock is reported by which about $500,000 of the stock of the Newark Electric Light and Power Company has passed into the hands of a syndicate which comprises a number of well-known capitalists. Among these are mentioned B. M. Shanley, of Newark; William C. Whitney, John N. Waterbury and John D. Crimmins, of New York, and Messrs. Elkins, Clarke and Blake, of Philadelphia. It is understood that the plant purchased will be used, among other things, in the operation of trolley cars on the Newark and Jersey City line and on some lines in Newark.

New York.—The furniture and fixtures of the Electric Club, at 17 East Twenty-second street, were sold at auction on the 31st ult. under the foreclosure of the bondholders' mortgage of $25,000. The articles sold brought very low prices, even the beautiful chandeliers and wall lamps being bid off at less than a fifth of their cost.—The Edison Electric Illuminating Company have adopted the marine or multiple expansion engine, similar to those on the swift ocean steamers, for use in their power stations because of the great saving in space occupied by that type of engine as compared with the ordinary land engine, and for other reasons.

Hartford, Conn.—A bill regulating electric railways has been introduced in the House. The bill provides that no street railroad operated by electricity shall be begun until there is a subscription of $3,000 per mile and the assent is secured of the property owners along two-thirds of the length of the road. This is also to apply to extension of roads. Bonds shall not be issued in excess of one-half the cost of construction. No extension shall be made of any road beyond the limits of a city or borough unless the Railroad Commissioners find that there is a public necessity. The bill places all electric roads in the State under the control of the Railroad Commissioners, who are to employ an electrical engineer to act with the board.

Albany, N. Y.—A bill has been introduced in the Senate by Gen. McMahon to create a State Telephone Commission. Among the provisions of the bill are the following: The Governor is to appoint three Commissioners (one Democrat, one Republican and one other), and one of the trio is to be an electrician, but no member shall be in any way interested in telephone corporations. The Commission is given full power to investigate as to complaints, prices, etc. Refusal to obey is a misdemeanor. When complaints as to cost of service are made, the Commission must within three months declare the proper price to be charged for the rental of telephones, either public or private. The rate they establish shall apply to all telephone service in the city or place for which it is made. The most approved appliances only are to be furnished by telephone companies to their subscribers. For disobeying the Commission a telephone company may be deprived of the use of a thoroughfare for its wires. The companies are to pay all the expenses of the Commission, just as the railroads do for the Railroad Commissioners.—In the Assembly Mr. Morris introduced a bill to permit villages to make a ten years' contract for their gas and electricity.—Mr. Hobbie, in the Assembly, on the 3d inst., introduced a bill to allow any electric light and power company to construct and operate a street surface railroad, and also to hold 2,000 acres of land and improve and sell the same and erect buildings thereon.

Philadelphia.—The Supreme Court rendered a decision last week of importance in connection with electric railways. The decision reverses the judgment of the lower court giving damages to Robert Winter, the owner of a team of horses that were injured by an electric car. On a dark evening in April last, Winter drew up his team in front of a business house in Pittsburg, to unload a safe. His horses were across a track on which electric cars ran on a descending grade. A car came down this grade, the gripman was unable to stop his car in time, and the team was injured. Winter sued the company and recovered a verdict. In his decision Judge McCollum, of the Supreme Court, says: "Now that rapid transit is recognized and demanded as essential to the prosperity of and the transaction of business in our large cities, the use of streets for individual convenience is necessarily qualified so as to make that transit possible, and to minimize its dangers. The substitution of cable and electric cars for the horse car and the omnibus is a change which renders impracticable and dangerous certain uses of the streets which once were permissible and comparatively safe. It introduces new conditions, the non-observance of which constitutes negligence."—The Ridge Railway Company have asked for the authorization of Councils to use the trolley electrical system on their line.

Electrical Display Advertising.

A unique invention in connection with display electrical advertising in street cars operated by electricity has been made by H. T. Richards, advertising manager of the *Electrical Review*, New York.

In the space usually devoted to advertising in street cars this new electrical invention is to be operated. Mounted along this space, on both sides of the car, will be placed in neat frames glass of any shade, ground on one side, cut in the usual size of the street car advertising panel.

Concealed behind this glass will be placed one or more incandescent electric lamps. Behind these lamps, in some cases, will be placed reflectors of suitable material.

The advertising copy to be used with this invention will consist of sheetiron, tin, cardboard or any opaque substance. That which corresponds to type, trade-marks or designs in the present street car advertising sign will be letters, trade-marks or designs cut out of sheetiron, tin or cardboard, which will admit the rays of the electric lamps to shine through, thereby forming the advertisement. If the advertiser chooses to use such copy as is at present used in street cars, viz., copy composed of colored letters, etc., he can do so, as lamps placed behind said copy, the red letters will show red and the blue letters will show blue. These panels or advertisements will be placed behind and against the ground glass in the said frames by nice adjustment, and will not take up any more room in the car than the present cardboard signs.

The strongest feature of this invention, from the advertisers' standpoint, is the fact that only one advertisement is illuminated at a time.

Fig. I.

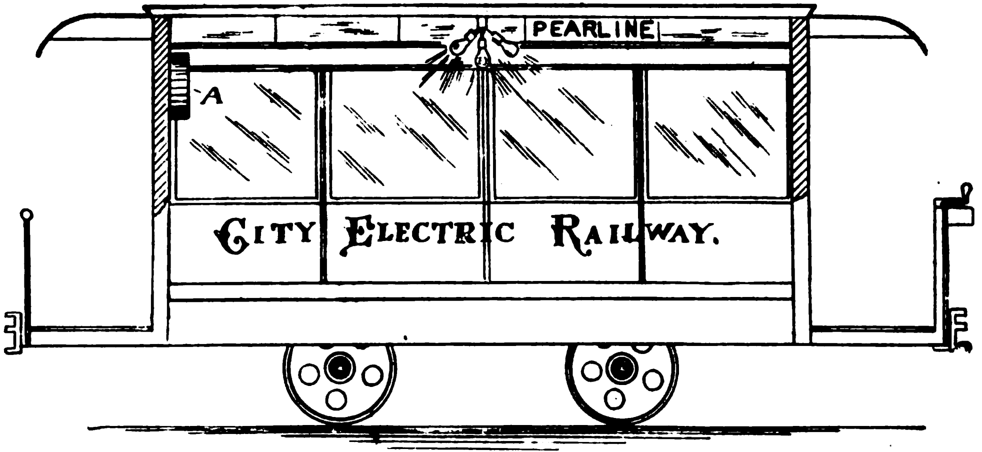


Fig. 2.

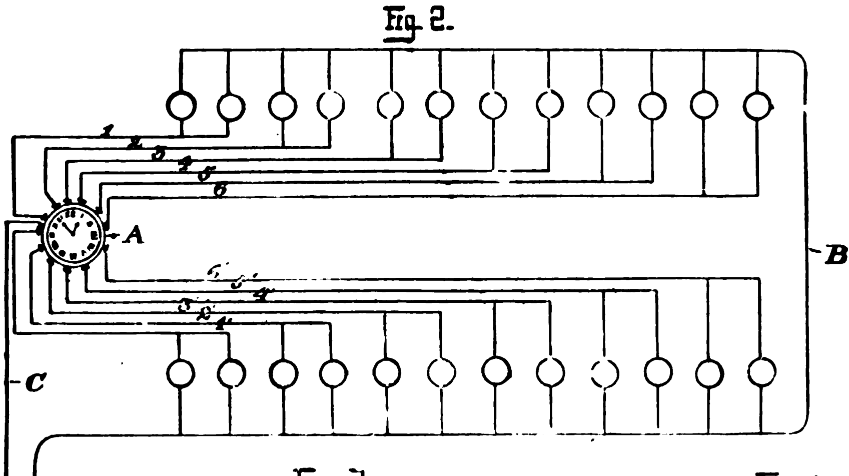

Fig. 3.

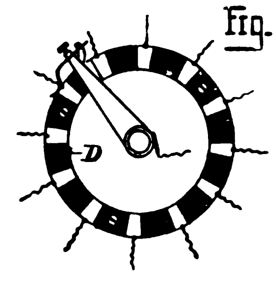

Fig. 4.

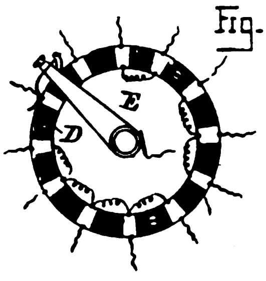


COMMERCIAL PARAGRAPHS.

The Chicago Electrical Manufacturing Company owing to an increase in their business have been obliged to seek larger quarters. Their new address is No. 41 South Jefferson street.

The railway department of the Electrical Supply Company report the sale of supplies for 150 miles of overhead railway for the extension of a new electric road.

George Cutter is sending out a blotter on which his smiling countenance greets his friends. He also informs the public that a catalogue of his electrical specialties is in the press.

Queen's Portable Photometer.

Queen & Company, Incorporated, Philadelphia, report a steady demand for their portable photometer, which instrument accurately measures the candle power of incandescent lamps, and can be used wherever desired.

It is very important from an economical standpoint for a central station manager to use lamps that give the greatest illumination for energy consumed. and this convenient apparatus enables comparisons of different types to be quickly made. When a customer complains of poor light, an impartial test will settle the dispute much more quickly than words, and there is no appeal.

The makers issue descriptive circular No. 295, which gives further particulars. Interested parties should ask them for a copy.

The Diamond Transformer.

A carefully compiled pamphlet has just been issued by the Taylor, Goodhue & Ames Company of Chicago, descriptive of the Diamond Transformer manufactured by them. In designing these machines it is assumed that the best transformer is not necessarily the one which has the lowest leakage or magnetizing current, nor the one which regulates most closely, nor yet again that which is the lightest and most easily handled, but is that transformer which combines as much of each of these desirable properties as is practicable with the best service.

In comparing various types of transformers it is therefore claimed necessary to begin with a realizing sense of the fact that the same laws govern all types as to design and performance, and that extraordinary excellence in one respect is necessarily obtained at a sacrifice in others.

The Diamond Transformers are designed so that the two objectionable losses of energy, viz., iron and copper losses, are reduced to the very smallest possible quantity.

The average efficiency between no load and full load is proportional to the watts output and the watts supplied to the primary coils, and this ratio is increased in the Diamond Transformer by the adoption of a low induction. Insulation is also among the points of greatest importance, and the materials available for this purpose are limited in number since they must be substances not readily affected by heat or cold and at the same time must present the maximum possible resistance to high voltage and lightning discharges. In the Diamond Transformer such insulations as mica, porcelain and asbestos are used, together with a special insulating varnish that does not deteriorate with age. The insulation resistance is not only very high but is permanent

Besides this, the questions of repairs, ventilation, fuses, and other important points are carefully considered, and the change of the secondary pressure from 50 to 100 volts is readily made by only one change in the connections.

The pamphlet also gives a simple formula, which will be found useful in calculating wiring for distributing leads:

$$\text{C. M.} = \frac{21.21 \times \text{C} \times \text{D}}{\text{E}}$$

C. M. = Area of wire in circular mils.
21.21 = Constant for two mil feet of copper wire.
C = Current in amperes.
D = Distance in feet to lamps.
E = Volts loss in conductor.

This company offers the following guarantee for its transformers: "We will guarantee the Diamond Transformer for the period of one year against damage by lightning, or electrical disablement of any kind not directly due to fire or carelessness and mismanagement on the part of the user, and will replace any that are so damaged free of charge, F. O. B. cars at our factory, upon receipt of the disabled transformer at factory with freight charges prepaid. Should the primary coil be burned out, we will express a new coil without charge, which may be inserted by the central station without delay or expense."

The Iron Nancy Hanks.

The Empire State Express is the Nancy Hanks of the rails. On Thursday she left Rochester for Buffalo and for ten miles kept up a speed of ninety-five miles an hour. This was done under unfavorable conditions, the road having at that part the heaviest grade on the whole Central system. The entire distance from Rochester to Buffalo, sixty-nine miles, was made in seventy-one minutes.—*Troy Budget.*

INCORPORATIONS.

Philadelphia and Delaware Street Railway Company, Chester, Pa. Capital. $150,000. Directors: Joseph H. Hinkson, G. P. Denis, Dennis Howarth, Ward R. Bliss, Chester; John J. Ryan, South Chester. The road will be twenty-five miles long and will be operated by electricity. It will begin at a point in the Island road where the road crosses Bow creek in Tinicum township, and extend to Chester.

The Reed Re-Cut File Company, Waterbury, Conn. Capital stock $2,500. Incorporators: H. W. Reed, R. L. Andrews and George Robbins, all of Waterbury. The object is to recut files and taps by an electric current.

A certificate of incorporation of the Enamel Electric Manufacturing Company has been recorded in the office of the County Clerk at Newark. Edwin A. Jeffrey and William H. Fancher, of Jersey City, and Thomas Erving, Jr., of Yonkers, are the incorporators The capital stock is $10,000. East Orange. N. J., is to be the place of business, and the company proposes to manufacture all kinds of electrical machinery, apparatus and appliances.

The Florence Rapid Transit and Power Company, Florence, Col. Capital stock, $100,000. Directors, J. A. McCandless, H. C. Topping, J. M. Hanks, J. F. Collins, J. W. Work and J. M. Aurner, of Florence; J. D. Phillips and J. H. Gillen, of Rockvale; E. S. Easton and George Wilson, of Coal Creek, and William McNeil and A. P. Easton, of Williamsburg. The purpose is to build and operate an electric motor line from Florence to Williamsburg, Rockvale and Coal Creek.

Straight Line Meter Company, Syracuse, N. Y. Capital stock, $40,000. Directors: Charles M. Warner, James M. Ellis, Duncan W. Peck, William D. Hawley and Henry C. Allen. The meter is intended for water, electricity and kindred uses.

A bill has been introduced in the Alabama Legislature to incorporate the Wetumpka Falls Electric Power and Manufacturing Company. M. B. Houghton, F. M. Billing, H. L. Williams, Peter A. Buyck and John H. Parker are the incorporators. The capital stock is put at $100,000 and may be increased to $1,000,000. The company is be empowered to build at or near Wetumpka an electric power and light plant and to supply any person, corporation, village, town or city in Alabama with electric light or power.

Fond du Lac Light, Power and Railway Company, Fond du Lac, Wis. Capital stock, $100,000. Incorporators: Elihu Colman, Joseph W. Hiner and Louis Marion, the present superintendent. Directors: H. A. Odell, Frank F. Reed and E. R. Gillman, Chicago; R. S. Munger and O. H. Simmons, Duluth, and W. G. De Celle and H. S. Cole, St. Paul.

The Electric Railway and Development Company of Staten Island has been incorporated under the laws of the State of New Jersey, capitalized at $200,000. The company will immediately build and equip with electrical apparatus nine miles of railroad from Lenollanville to Port Richmond, Staten Island. The officers of the company are Percy Thompson, 80 Broadway, president; Joshua Brown, 18 Wall street, vice-president; T. T. Greene, secretary, and F. A. Ware, treasurer. The principal offices of the company are located at 80 Broadway, New York.

Lakeside Street Railway Company, Shenandoah, Pa. Capital stock, $50,000. Incorporators: John F. Finney, president; O. A. Keim, secretary; S. W. Yost, treasurer; John Grant, R. J. Yost and H. C. Boyer, all of Shenandoah. The company has been organized to connect the several towns in Schuylkill. Luzerne and Carbon Counties with the popular summer resort Lakeside.

The Electrical Supply Company of Ansonia, Conn., has been granted permission by the Supreme Court to change its name to Ansonia Electric Company.

George R. Bradford, Loring Grimes, H. N. Woods, Eben G. Abbott, John Tufts, F. Scripture, Zeno A. Appleton, Nathaniel Richardson, James P. Merriden, Amos Rowe, William R. Parker, Edwin Turney, J. L. Woodfall, C. S. Rogers, Edgar Knowlton, T. T. Harwood and others have petitioned the Massachusetts Legislature to be incorporated as the Rockport Electric Street Railway Company, with capital stock not less than $25,000 or more than $50,000.

The State Department at Harrisburg, Pa., has granted a charter to the Montgomery County Passenger Railway Company, the line to run from Bridgeport to Conshohocken. Capital stock, $50,000. Incorporators: Cornelius Gallagher, New York; Edward S. Perot, Yonkers; John M. Dettre, Norristown; Daniel A. Holland, Daniel Stewart, Jr., James A. McGrath and Phillip J. Crimean, Conshohocken.

The Phœnix Power and Illuminating Company, Phœnix, Ariz., is preparing articles of incorporation. The capital stock of the company is put at $100,000, and the following are said to be among the incorporators: F. G. King and L. C. Kilham, of Rochester, N. Y.; D. D. Mallory, of Baltimore, Md.; J. H. Tracy, St. Louis, Mo.; E. C. Root, Denver, Colo., and E. H. Miller and Will Pilcher, of Phœnix. The object is to supply Phœnix with electric light, etc.

The Scranton, Northumberland and Bloomsburg Railway Company, composed of Hazleton, Shenandoah and Danville, Pa., capitalists, have applied for a charter. Capital stock, $500,000. The officers named are J. R. Coyle, president: H. O. Rogers and L. O. Emmerick, vice-presidents; T. H. Hutchinson, treasurer; A. T. McAllister, secretary; George A. Wilkinson, general manager. The proposed electric railroad will be built from Scranton to Northumberland, 80 miles, with branches to neighboring towns.

A charter has been granted to the Union Electric Street Railway Company to construct a line from Drifton through Freeland to Upper Lehigh, Pa. The directors are Harry E. Sweeney, Drifton, president; Horace E. Hand, Fred W. Bleckley, W. H. Jessup, Jr., and E. D. Wightman, Scranton.

The St. Louis, Kirkwood and Meramec River Railroad Company, St. Louis, Mo., have applied for a franchise. Capital stock, $500,000. Directors: Thomas Howard, James Daniels, Thomas M. Gallagher and Alexander B. Shaw, of St. Louis, and Matthew C. Orton of Chicago.

The Electric Gas Machine and Light Company, Springfield, Ill. Capital stock, $1,000,000. Incorporators: H. Clay Wilson, John G. Friedmeyer and Benjamin Knudson. The company is formed to manufacture and sell gas machines and appliances, and to acquire and deal in patent rights for the same, etc.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JANUARY 31, 1893.

ELECTRIC RAILWAYS AND APPLIANCES.

490,690. Railway-Yoke. Morris S. Towson, Cleveland, Ohio, assignor to the Love Electric Traction Company, Chicago, Ill. Filed Oct. 10, 1892.
490,975. Electric Railway. Edward W. Mitchell, Covington, Ky., assignor to the Mitchell-Thompson Underground Electric Conductor Company, of West Virginia. Filed June 23, 1892.
491,014. Trolley-Wheel. John J. Goetz, Covington, and John A. Smith, Dayton, Ky., assignors to themselves, and Harvey M. Littell, Cincinnati, Ohio. Filed May 20, 1892.

DYNAMOS AND MOTORS.

490,809. Dynamo-Electric Machine. Robert Lundell, Brooklyn, assignor of two-thirds to Edward H. Johnson, New York, N. Y. Filed April 22, 1892.
490,810. Dynamo-Electric Machine or Electric Motor. Robert Lundell, Brooklyn, assignor of two-thirds to Edward H. Johnson, New York, N. Y. Filed April 22, 1892.
490,959. Coupling of Dynamo-Electric Machines in Parallel. Albert Gay, London, England. Filed Jan. 11, 1892.

ELECTRIC LIGHTS AND APPLIANCES.

490,903. Combined Gas and Electric Light Fixture. Francis X. Garland, Philadelphia, Pa. Filed Jan. 23, 1892.
490,954. Manufacture of Carbon Filaments for Electric Lamps. Thomas A. Edison, Llewellyn Park, N. J. Filed Nov. 6, 1886.
490,992. Electric-Arc Lamp. James Sugden and Wallace J. L. Sandy, London, England, assignors to Charles Henry Freedman, Frank West Suter and Harrington Wyman, same place. Filed July 13, 1892.

BATTERIES.

490,753. Secondary-Battery Electrode. Harry G. Osburn, Chicago, Ill. Filed Nov. 21, 1891.

MISCELLANEOUS.

490,663. Electric Block-Signal System. John La Burt, New York, assignor to the Agricola La Burt Manufacturing Company, Brooklyn, N. Y. Filed Dec. 14, 1891.
490,678. Apparatus for Electrically Treating the Eyes. William A. Price, Iowa Falls, Iowa. Filed Sept. 24, 1892.
490,679. Apparatus for Electrically Treating the Ear. William A. Price, Iowa Falls, Iowa. Filed Sept. 29, 1892.
490,684. Automatic Alarm Device. George W. Schilling and John G. Haslam, Philadelphia, Pa. Filed June 18, 1892.
490,698. Electrical Time-Indicating Apparatus. Edward Weston, Newark, N. J. Filed June 16, 1891.
490,699. Recording-Ammeter. Edward Weston, Newark, N. J. Filed March 18, 1892.
490,700. Electrical Measuring-Instrument. Edward Weston, Newark, N. J. Filed March 29, 1892.
490,725. Electrical Pressure Indicator for Steam Gauges. Edward G. Smith, San Jose, Cal. Filed July 6, 1892.
490,744. Electric Time System. William F. Gardner, Washington, D. C. Original application filed Dec. 13, 1883. Divided and this application filed Sept. 4, 1891.
490,746. Electric Switch. Jacob S. Gibbs, Hartford Conn., assignor to the Perkins Electric Switch and Manufacturing Company, same place. Filed Nov. 1, 1892.
490,755. Connector for Electrical Conductors. George L. Russell, Middletown, Conn., assignor to the Schuyler Electric Company of Connecticut. Filed Aug. 12, 1892.
490,760. Electrical Measuring Instrument. Edward Weston, Newark, N. J. Filed Oct. 3, 1892.
490,761. Electric Signaling System. Adoniram J. Wilson, Port Chester, N. Y., and Wilmer W. Salmon, Chicago, Ill., assignors to the Hall Signal Company of Maine. Filed Sept 14, 1892.
490,762. Electric Circuit Breaker. Edward M. Bentley, Boston, Mass., assignor to the General Electric Company of New York. Filed Nov. 19, 1892.
490,841. Process of Electroplating Aluminum. George Wegner, Berlin, Germany. Filed May 5, 1892.
490,870. Electric Burglar Alarm. Warren H. Carr, Bath, Me., assignor to himself and James W. Wakefield, same place. Filed Sept. 22, 1892.
490,882. Telethermometer. Howard B. Payne, Chicago, Ill., assignor of one-half to David B. Van Slyke, same place. Filed May 20, 1892.
490,883. Telethermometer. Howard B. Payne, Chicago, Ill., assignor of one-half to David B. Van Slyke, same place. Filed Sept. 22, 1892.
490,891. Electric Warming-Bottle. Thomas Ahearn, Ottawa, Canada. Filed Sept. 8, 1892.
490,917. Switch and Safety Fuse. Elmer P. Morris, Boston, Mass., assignor to the Thomson-Houston Electric Company of Connecticut. Filed Feb. 11, 1892.
490,948. Electric Belt. John W. Cummings, Gold Hill, Nev. Filed July 27, 1892.
490,953. Art of Generating Electricity. Thomas A. Edison, Menlo Park, N. J. Filed Nov. 1, 1883.
491,004. Electric Stop-Motion for Knitting Machines. Winslow M. Bell, Milton, N. Y. Filed Dec. 18, 1890.

SUPPLEMENT.

ELECTRICITY.

VOL. IV. NEW YORK. FEBRUARY 8, 1893. CHICAGO. NO. 4

NEW EVIDENCE.

THE BEACON VACUUM PUMP & ELECTRICAL COMPANY STRENGTHEN THEIR CASE.

Summary of the New Affidavits.

On Wednesday, February 1, the matter of the Edison Electric Light Company vs. The Beacon Vacuum Pump and Electrical Company came up in the United States Circuit Court, Boston, before Judge Colt.

This was the day set by the Court at the close of the previous hearing for the final filing of the printed arguments, etc., by both sides.

Messrs. Witter & Kenyon, for the defense, asked the privilege of putting in as evidence a large number of new affidavits which they had been able to get together since the previous hearing. Mr. Frederick P. Fish, for the plaintiffs, objected to this in a somewhat impassioned address of fifteen minutes' duration.

Defendants' counsel explained that in their original application for time in which to prepare their evidence, on January 18, they had asked for 30 days; that since that time they had been working night and day, and had prepared their evidence as rapidly as possible; that the affidavits which they now offered were essential evidence in the case, and could not have been submitted earlier.

Mr. Fish contended that the evidence had all been manufactured in the past six months; that the lamp alleged to have been made 30 years ago had also been made in the last 6 months; that the entire defense was one of the greatest frauds ever perpetrated upon a court. Plaintiffs had not seen the new affidavits and had no opportunity of answering them. Plaintiffs also had a great number of new affidavits but they did not desire to offer them as it would merely prolong the case.

Looking over defendants' affidavits hurriedly, Mr. Fish remarked that it was just as he had expected: all the holes made by plaintiffs in defendants' case had been filled up.

Defendants' counsel remarked that the holes were not new to his side, but that it had been a physical impossibility to offer all these affidavits at the previous hearing.

Judge Colt stated that he would accept the new affidavits of both sides unless positive protest was made by Mr. Fish, who finally consented.

Judge Colt took the papers, saying that he would take the affidavits and if he could decide the case on the evidence offered on January 25 he would do so. If the new matter was indispensable in reaching a decision, he would then reopen the whole case, giving both sides an opportunity to offer additional affidavits and answers, and would hear new arguments throughout.

Following are new affidavits offered by defendants, those of Messrs. Pope, Henry Goebel, and Vandegrift in full, the rest being condensed.

Affidavit of Henry Goebel.

From the time when, in the early fifties, I succeeded in securing an incandescent light substantially like those represented by Exhibits Goebel Lamp 1, 2 and 3, until the date, say the year 1879, I acquired constantly increasing skill in preparing each one of the various features of the lamps, as well as in connecting them together; that is to say, in the making of the carbons, in the attachment of the leading-in wires themselves, and the manner of their introduction through the glass walls, and in the general finnished appearance of the completed lamp. Before 1872, that is, before I left Monroe street, I had arrived at definite conclusions as to the best materials for the various parts of the lamps. I had settled upon bamboo as the best material from which to make the carbons, and for some time before and for all the time after that date of 1892, I never made filaments of any other material than of carbonized bamboo, except in rare cases where other things were treated chiefly for purposes of comparison. I had found and settled, prior to 1872, that the bamboo filament was tougher, less fragile, would give a better light and a more durable light; that is to say, in all these respects taken together I had. prior to that date, settled upon the bamboo filament as superior. I had prior to that date, 1872, a set of mechanical devices, consisting of four in number, for the purpose of producing a very fine and a very uniform thread of hair of bamboo for use in these lamps. On the 26th day of January, 1893, one of these devices was found in one of my tool boxes, and I have given it to Messrs. Witter & Kenyon. It is marked Goble No. 6. This or other similar mechanical devices I used for the purpose of producing a hair like piece of bamboo from before 1872 for a good many years. In or about 1886 I sold to Mr. Perkins three of my tools for making carbons for incandescent lamps. Two of these tools have been handed to me to-day, January 31, 1893, by Mr. Perkins, and I recognize them as the tools I sold Mr. Perkins as above stated. I have marked them respectively Goebel No. 7 and Goebel No. 8. The tool marked Goebel No. 6 is the first tool I used for making the strips for the burners. I made it in the early sixties, when I was living at 271½ Monroe street. It consists of a plate which I screwed to my work table. In this I had embedded a knife, the projection of which I could regulate by a screw. I hinged another plate to the same, which bore a roller engaging and pressing on the bamboo and facilitating the passage of the same between the former and the knife. This hinged plate was drawn down by foot or by hand, and returned to its position after the pulling through of one piece of bamboo by the action of a spring, and was then ready for the next operation. I had a screw on the same by which its descent could be regulated. This tool I made for the express purpose of preparing the bamboo strips for the burners of my lamps. It was used pretty constantly by me from that time down to about the time I stopped making lamps, a few years ago. It has never been used for any other purpose; it could not be. When I made carbons for the American Company, in 1881, I made use of this tool. The tool was constructed by me so as to enable me to make the strips smaller and more even than it was possible to make them by hand. The tool marked Goebel No. 7 was made by me before 1870, and I think as early as 1865. The first tool did not plane the strips as small or as even as I wanted, so I made this second tool to cut the strips smaller and more accurately. This tool has been changed in three respects since I sold it to Mr. Perkins. When I sold it it had a different knife in it, although it was one of substantially the same shape. It had flat springs under the hinged plate instead of round springs; a new spring or catch has also been put in to catch in the cogged wheel at the top of the regulating screw. The old spring or catch was substantially the same in form as the one now in it.

The tool marked Goebel No. 6 is the third one I made. It is finer in its adjustments than the others. It is just as it was when sold to Mr. Perkins. About the same time I made a fourth tool. It was for planing the sides of the fibre to have them all one width as well as one thickness.

I pulled the bamboo strips through all of these planes by taking them at one end by a pair of pinchers and pulling them through.

These tools were all used constantly by me in making my filaments.

About 1886 Mr. Perkins asked me whether I would let him have some of my tools, and I then gave him the tools marked Nos. 7 and 8, and the fourth tool, which I understand Mr. Perkins still has in his possession. Before I left Monroe street, in 1872, I had for a long time gas in my house, and had made for myself glass blowing apparatus much superior to that which I had used in producing the glass part of the Goebel lamps Nos. 1, 2, and 3. Moreover, I had been practising the art of glass blowing in other glass work, not merely in connection with these lamps, but in other matters, including hundreds of barometers and thermometers, Geissler tubes, etc., to such an extent that I had acquired quite a high degree of skill in the use of the blow pipe.

In making the connection between the leading-in wires and the carbon I very early arrived at the conclusion that, all things considered, stove polish was the best material for effecting the puncture, and from before 1872 that was the material which I uniformly used for that purpose. Prior to this date also I had settled upon the use of platinum leading-in wires for the reason that when I used iron or copper the glass part of the lamps would sometimes crack and thus impair the vacuum. I should have used platinum in every one of my lamps, except that platinum wires were more expensive and not so easily accessible as iron or copper wire. The greater proportion of the lamps made with platinum leading-in wires made a better incandescent lamp and light than those used with iron or copper. After I had settled fully in my mind upon the superiority of the platinum leading-in wires, almost all of the lamps that I made from long prior to 1872 onward in both my places in Grand street were made with platinum leading-in wires. I had as late as 1890 in my possession a number of such lamps of an earlier date than 1872 that were made with platinum leading-in wires. One of these lamps with platinum leading-in wires, I sent to the counsel connected with this case at about the time I gave them Goebel lamps Nos. 1, 2 and 3, and I told them at that time that this lamp had been in my possession from before 1872; that is, with others like it, was made prior to 1872. This lamp is marked Goebel No. 4. Lamp marked Goebel No. 4 I have had in my possession ever since before moving from Monroe street to Grand street in 1872. I made it and burned it a good many times both before and after I left Monroe street; it burned well and gave a good light. I took especial pains with the glass part of this particular lamp, and it was because the glass part was so well done, giving the lamp such a beautiful and finished appearance, that I always kept it, bringing it out from time to time to light up or to exhibit. I kept it in my possession until I sent it to the defendants' counsel in the case. The lamp and all its parts are the same as they were when I made it prior to 1872, in material and in all other respects, except such changes as may have occurred from my use of it, handling it and mere lapse of time. If it does not burn to-day it is because it has been in some way injured by handling or lapse of time.

When, in about the year 1881, the people came to me from the American Company, I instructed one of their glass blowers to introduce the platinum wire from opposite sides of the glass globe. He said they couldn't do it, or that it couldn't be done; and to convince him that it could I explained how I did it, and showed him this identical lamp, Goebel No. 4, as proof that it could be done. Thenceforward, at least for a time, the American Electric Light Company adopted that plan, and I produce a lamp marked Goebel No. 5 which is an old American Electric Company lamp with the leading-in wires sealed by that method.

I have recently been informed that an expert for the defendants, Mr. Pope, has given a reason or reasons why he did not think this lamp, Goebel No. 4, was made by the Torricellian process of producing a vacuum, namely, that there would in such case be, in his opinion, a deposit of mercury upon the surface of the copper wire, and he discovered no such appearance. But I told him that he was mistaken in so thinking, provided that distilled mercury was used in producing the vacuum, and I understand he has been conducting experiments to ascertain the facts in this connection. The mercury that I used in producing the vacuum in these lamps was carefully distilled, sometimes three or four times, before it was used, and I took particular pains to perform the process always in a very dry atmosphere, and used other safeguards, such as heating it very slightly, tending to insure a high vacuum and the absence of injurious deposits or gases.

Prior to 1872 I had employed for the purpose of producing a vacuum a mercury pump, in the use of which no mercury was present in the glass part of the lamp at all, but it was a pump having stopcocks, which made it difficult and not always sure of manipulation, so that as a rule I succeeded in obtaining as good if not a better vacuum by the Torricellian process than I did with this early mercury pump. This pump which I now speak of must not be confounded with the pumps mentioned in my former affidavits.

These lamps with the platinum leading-in wires, and some of the lamps with the leading-in wires of other material, when connected with my batteries gave a uniform, steady and continuous light, equal approximately, I should say, to an ordinary gas jet, and they were used for a number of just such uses as incandescent lamps are used to-day, and were so used prior to 1879 and from time to time from the early fifties onward.

I know no reason why these lamps were not suitable for commercial use. These lamps were ready for commerce and commercial use, but commerce was not ready for these lamps, and the reason was that there was no available source of cheap electricity, and the introduction of these lamps to a wide commercial use involved, even with an adequate source of electricity, the expenditure of vast sums of money. As compared with incandescent lamps of to-day, these early lamps of mine gave a fairly good light; an entirely practical light. They burned fairly well, and with the addition of such improvements as have been added to the modern lamp (some of which I am familiar with), they would give in my opinion just as good a light and just as durable a light as the Edison lamp of to-day. Each one of my lamps that turned out to be successful burned with a candle power equal to that of an ordinary gas jet, and maintained that power with some few exceptions of accident until the battery power gave out, or until it had obtained a length of life very comparable with that of the incandescent lamp of 1880.

By the expression "that turned out to be successful" I mean that sometimes the carbon was not perfect, sometimes the glass was not perfect, sometimes the junction of the various parts was not perfect, and in such cases the lamp was not what I considered a successful lamp. But that has always been true in the manufacture of incandescent lamps, and is true even to-day notwithstanding improvements that have been added to the lamps and the process of making the lamps.

The Goebel lamps Nos. 1, 2, 3, 4 and 5 show for themselves partially the advance in nicety of workmanship which I acquired from time to time in the manufacture of these lamps, though not as fully as such advance would be shown provided I were able to produce a larger number of lamps identified as belonging to later and later periods of time.

I never put any devices on my electric lamp to conduct heat away. I never used any thermal regulators on my lamps. There was no need for such appliances; the wires that ran into my incandescent lamps would not get warm, nor would the base of the lamp become heated. The wires that I used, running from the battery to the lamps, were of the ordinary size used in batteries of the size and kind I employed. They were not very thick, but were like ordinary copper wire. In using my lamps with electric batteries I usually connected only one lamp with a sufficient set of battery cells. Sometimes, however, I connected two or even three lamps to the same set of battery cells. In this case I would use more cells.

One of the very earliest of my efforts to make an incandescent lamp was by using a platinum wire or hair as the illuminating part. It was two or three inches long, and was very fine; about as fine as No. 80 or 100 cotton thread. I used a vacuum with this platinum lamp, and used copper leading-in wires sealed in the glass. The fine platinum wire heated up and became incandescent, and gave a good light, but in a few minutes it got too hot and melted and fell onto the glass and the glass broke. I did not try platinum again, but turned to vegetable carbons. I knew from the arc light I had made first that carbons would not melt, and I thought that in a vacuum where there was no oxygen it would not be consumed and would last; and I discovered that it did last.

I have not received any money nor anything of value for the affidavits I have given in this suit, or for anything I have done for the defendants herein, and I have not received any promise from anyone of money or anything of value, and I do not desire or expect to receive any. I have given my evidence in this case reluctantly and only after considerable urging. I have no interest in the result of this case. I bear Mr. Edison no enmity and do not desire to injure him in any way. I do not own any stock of the defendant corporation, or in any electric lighting company, and have no interest of any kind in that business, and not only have no interest whatever in the defendant company, but I do not even know any of the officers or anyone connected with it.

After the American Company sent a dynamo to my shop at 468 Grand street, in about 1882, I used it to light up my shop for a sort of exhibition, and in that lighting I used old tube lamps that I had had on hand for a number of years. There were eight in number, as I remember, of these lamps so exhibited; whatever the number was, they all had platinum leading-in wires. I do not remember whether Goebel lamp No. 4 was one of them or not. A partial garbled notice of this display of my lamps was printed in the New York *World* of May 1, 1882, reading as follows:

> Mr. Henry Goebel gave an exhibition of his electric light last night in a room back of his store at No. 468 Grand street. Mr. Goebel claims that he has been at work on electric lights for 31 years, and that 29 years ago he arranged one on the top of his house at No. 271½ Monroe street. The lights were seen from the Essex Market bell tower, and an alarm of fire was given which brought out a number of engines. He himself was arrested, but Judge George Woods released him. When he returned home he found that his neighbors had demolished all his instruments and apparatus. The light exhibited last night was clear and steady, and one could see to read by it with great comfort and ease. It is about eight inches long and about as thick as a candle. The vacuum is obtained by a pump similar in principle to the Geissler pump, and can be operated by unskilled hands. The carbon points used are made of reeds which are heated in a retort by electricity. The lamps cost twenty-five cents apiece, and Mr. Goebel claims that he can furnish light as cheap, if not cheaper, than gas.

I had nothing to do with the preparation of any notice or with putting it in the newspaper.

Affidavit of Franklin L. Pope.

I have heretofore made an affidavit in this case. At the time of making my former affidavit I felt doubtful whether the date of the lamp marked Goebel No. 4 could have been as early as Mr. Goebel and his son Henry always asserted it to be. They have both asserted from the beginning of my acquaintance with them, about two weeks ago, that this lamp was made before they removed from Monroe street in 1872. My doubts in the matter have arisen from the circumstance that the joint between the carbon and the copper wire appears to have been made in part by electroplating, and my own experience in such matters led me to entertain the opinion that if the lamp had been first filled with mercury, and then exhausted by inverting the tube, in one of the ways which Mr. Goebel says he practised, the mercury would have united with the surface of deposited copper and some traces of it would probably have remained; and as no such trace appeared to be visible in this lamp, I was led to believe that it must have been exhausted upon a vacuum pump and not in the manner before referred to. I was instructed by defendants' counsel to investigate the matter from the scientific point of view most exhaustively, and to make any necessary experiment for that purpose, which I have done. Upon my first questioning Mr. Henry Goebel on this matter, he at once told me that he used heated chemically pure mercury in his work, and that he took care that the exhaustion was performed in dry weather and not in moist weather, and he also stated that when chemically pure mercury was used it would not unite with the copper. In order to test the truth of this statement I at once procured some chemically pure mercury from Hegeman & Company and electroplated two pieces of copper wire in a saturated solution of sulphate of copper acidulated with sulphuric acid. This was on January 26, 1893. After a sufficient coating of fresh metallic copper had been deposited upon the wires, I immersed one of them in the chemically pure mercury, and the other for half an inch in depth in some ordinary commercial mercury which I had on hand and which contained, as is frequently the case with ordinary commercial mercury, traces of sulphuric acid. The result was that the chemically pure mercury did not adhere to the copper, thus absolutely confirming what Mr. Goebel had said, whereas the impure mercury formed an amalgam with the copper on the surface, leaving an evident and discoverable trace of its presence. I submit herewith the two samples of wire with which the test was made, marked with my name and date of their affidavit. This conclusively disproved and explained the only doubt that had arisen in my mind from my most careful scientific and practical examination of the lamp, and conclusively demonstrated that the lamp Goebel No. 4 might have been exhausted by the Torricellian process of filling the same with mercury and then inverting and emptying it, without necessarily leaving any traces of mercury or mercury amalgam on the copper interior parts. The result of this experiment removed the only reason for doubt which had previously existed in my mind as to the probable date of this exhibit. I reported the final results of my examination to defendants' counsel on January 27, 1893. Of course if the lamp No. 4 had been exhausted by means of a mercury pump, not involving the presence of mercury in contact with the interior parts of the lamp, my objection would have had no force. There is nothing inherently improbable in the doing of glass work of the kind and character exhibited in the lamp Goebel No. 4. In 1872, and for several years before that date, I remember that at least as early as 1868 Geissler vacuum tubes were made and sold in considerable numbers in Boston by Ritchie, and that they had been imported from Europe and publicly exhibited in this country several years earlier than 1868. Some of these Geissler tubes had platinum wires sealed into the side of the exhausted glass tube in the same manner as the wires are sealed into the Goebel lamp No. 4. I have tested this lamp for its resistance. I can get no current through it, which shows that the current is somewhere broken. I have carefully examined the carbon filament with a microscope, and also the joint or connection of the carbon filament with the supporting copper wires, and can discover no visible sign or indication of a break. I am of opinion that the break is not in the carbon, but is somewhere along the length of one or other of the two interior copper conductors or of the two platinum leading-in conductors that should continue the copper ones, or in one or other of the joints between the copper and the platinum. I estimate that the luminosity of the lamp Goebel No. 4, if this break did not exist, would be approximately 10 candle power with the proper current. Such a current was readily obtainable in 1872 and long before that time, and by means of the appliances and in the way described by Mr. Goebel as possessed and used by him in 1872 and before. The Goebel lamp No. 4, with the hidden break repaired, would be entirely capable of practical use, exactly as incandescent lamps are used to-day, and the same thing is of course true ef the lamps said by Mr. Goebel to have been made and used by him in 1872 and before and after exactly like the Exhibit No. 4. Barring accidents, which occur now and then with all styles and grades of work in this art because the structures are so delicate and fragile, I am of opinion that the length of life of lamps made exactly like Goebel Exhibit No. 4 in all details of construction and of workmanship, and made exactly in the way and with the tools and appliances referred to by Mr. Goebel as used by him in his Monroe street house in making these lamps prior to 1872, would on the average be not less than 150 to 200 hours, and perhaps more. And I mean by that with the ordinary rough usage that lamps meet with in commerce and burning with the sustained brilliancy and power of a modern incandescent lamp of ten candle power. An incandescent lamp of that candle power is entirely commercial to-day, and are sold and used both in this country and in Europe. The lamp Goebel No. 4 was shown me in connection with Exhibits 1, 2 and 3 at the time I made my former affidavit; and upon such examination as I then had time to make, and my opinion was based on the assumption that the lamps had all four been exhausted by the simple Torricellian process, I entertained the doubt above stated and reported the same to defendants' counsel. I was not before aware, and did not suspect until Mr. Goebel informed me, that if the mercury were distilled, that is, were chemically pure, no trace of the same would be left upon the surface of the copper wires, especially if care were taken to perform the operation in a dry state of the atmosphere, which Mr. Goebel said he was always very careful to do. Returning to the lamp Goebel No. 4, and after the most careful investigation of every part and detail within and without—carbon joints of carbon to copper, copper to platinum, platinum leading-in wires and their sealing, the glass work generally, the glass, the mounting of the whole—I am clearly of the opinion that there is no reason discoverable in the lamp itself, or in the account of how it was made, why that particular lamp and lamps in all respects like that lamp might not have been made by Mr. Goebel as early as before 1872 and long prior to 1879. The lamp No. 4 represents an advance in the care and skill of making and putting together the various parts of the lamp, and especially in respect to the workmanship and finish of the enclosing chamber, just such as I should naturally expect a man of Mr. Goebel's ingenuity and delicacy of manipulation would make. I am familiar with the appearance and construction of the lamp marked Goebel No. 4. It has an arch-shaped or hair-pin filament of rectangular cross-section made of a thin strip of carbonized indigenous wood which I believe to be bambo, and its cross-section, as near as I can judge is about .006 by .012 inches. The luminous part is about 2.5 inches long. The leading-in wires are thin and flat and are of platinum. Between the platinum and the carbon a piece of copper wire is interposed and the joint between the copper and the carbon appears to have been electroplated with copper, as there is a superficial deposit of copper upon the wires. I can see no traces of mercury within the lamp. The circuit through the lamp is now broken but the oxydized appearance of the filament indicates that it has been kept for some time at incandescence. I can observe no indication of hydro-carbon treatment upon the filament. I have had the lamp tested by an induction coil and find it still maintains a vacuum.

The workmanship of the lamp shows a considerable degree of skill, especially the mounting of the carbon. The seal is more than a quarter of an inch in length and similar to that used in the early forms of vacuum tubes, such for instance as those shown in the fifth edition of Du Moneel's work on the Ruhmkorff induction coil, published in Paris in 1867, particularly in Figures 44 and 45 on page 123; in Figures 71 and 72 on page 210, and Figures 74, 75 and 76 on pages 221 and 222. With a fairly good vacuum I have no doubt that this lamp might burn several hundred hours—three or four hundred at least. Goebel lamp No. 5, made for the American Electric Light Company in 1881, as I understand, I have most carefully examined. This lamp is substantially the same as those now in general use. It has a pear-shaped globe 2¾ inches in diameter at its largest point and 6 inches long. The filament is of carbonized indigenous wood, of rectangular cross section, and is very similar to the filament of lamp No. 4, except that it is thicker. I estimate the filament to be about .012 by. 025 and its light-giving portion 4½ inches long. It is secured to copper wires which are twisted into coils at the ends, into which the ends of the filament are thrust, and the joints are covered with a cement which looks like an alloy of mercury and gold. The leading-in wires are of platinum and round, and are sealed into the sides of the glass chamber in the same way as in the Goebel lamp No. 4. The glass work of this lamp is of the same style as No. 3, but the finish is better. The resistance of this filament cold is 133 ohms and would be about 66 ohms when hot. It does not appear to have been treated by hydro-carbon process, but looks as if it had been burned. It is a good commercial lamp—I think as good as any that were made in 1881, and could have been made at that time, as Goebel states in his affidavit. Comparing the construction and workmanship of Goebel lamps 1, 2 and 3 with Goebel lamp No. 4, and that with Goebel lamp No. 5, I find a steady progress shown in matters of detail of construction and workmanship. This is particularly the case with the glass work, which in the early lamps is crude and unskilful, showing a lack of familiarity with the material and with the management of the flame. The carrying of the wires through the end of the lamp with a thick mass of glass formed around them increases the liability to leakage and fracture. Nos. 1, 2 and 3 are all crude in workmanship; No. 4 is very much better, being, in fact, nearly or quite as good in every respect as the commercial lamps in general use in 1881 and 1882. The filament is uniform in thickness, having apparently been shaped by a machine. Copper wires with a cross bridge of glass are placed between the filament and the platinum wires, as in modern lamps; the seal is elongated and thereby made more secure, and the leading-in wires are made of platinum, very thin, and carried through the side walls of the chamber, thus largely reducing the liability of leakage and fracture. These improvements are just such as would naturally result from increased experience and skill gained by continuous practice of the art.

In my opinion, Goebel lamp No. 4 and the lamps made like it in 1872 and before and after embody the invention of the second claim of the Edison patent in suit, as the same has been construed in the prior adjustications, having all the elements of that claim combined and operating as there set forth. Referring to the question of iron leading-in wires and the practicability of sealing them in glass so as for a longer or a shorter time to make and maintain an air-tight joint suitable for the purpose of an incandescent electric lamp, it is a fact that iron of all the metals is the one which stands nearer to platinum in the matter of the approximation of its coefficient of expansion and contraction to that of glass, so that its use for that purpose is the next best thing to the use of platinum. It is also a fact that glass of one quality differs from another in its liability to fracture. It is again the fact that the thinner the wire in either case the less is the danger. In my opinion, while platinum is superior for the purpose, and so superior that in manufacturing on a commercial scale where the percentage or average of failures is required to be very low, platinum has heretofore had to be used. Still, I believe it to be possible to make perfectly operative lamps, capable of practical use, with iron leading-in wires. It would require more care in the sealing in than is required where platinum is used and there would be more lamps fail in every dozen made, but the lamps that would not fail at once would, some of them, burn as well and as long as would be required in a commercial lamp for some purposes. Again, the use of platinum leading-in wires fused in the glass was not only known generally in the art prior to October, 1879, and prior to January, 1880, but it was known in the art of electric lighting and all its advantages. To the best of my knowledge and belief, the art of sealing platinum wires into the walls of an exhausted glass chamber for the purpose of conveying electricity through the said walls was known as early as 1860. I have tested the lamp Goebel No. 4 for vacuum by charging it with high tension electricity from an induction coil in a dark room. It has a fairly good vacuum, enough in my judgment to keep it running two or three hundred hours. The color af the luminosity indicates that there is no oxygen in the lamp and hence that no leakage of air into the lamp has occurred since it was made.

Affidavit of Charles R. Cross.

I have to-day for the first time been requested to examine critically two incandescent lamps marked "Goebel Hairpin Lamp, H. Goebel No. 4," and "Goebel No. 5." I have been asked to compare them with the incandescent lamp set forth in the second claim of U. S. patent No. 223,898, issued to Thomas A. Edison. Both of these lamps contain a filament of carbon enclosed in an all glass globe. The filaments of both the lamps from their appearance seem to have been kept in a state of incandescence for a certain time, from which it follows that there must have been a vacuum within the glass vessels in which the filaments are enclosed.

In my opinion both of these Goebel lamps resemble the invention set forth in the second claim of the Edison patents referred to as that claim has been construed by the Circuit Court of Appeals. So far as I can judge from their appearance both of these lamps are capable of being practically operated to give light for purposes of illumination.

The leading Goebel lamps Nos. 1, 2 and 3 possess iron or copper in wires. Lamps Nos. 4 and 5 possess platinum leadings in wires. That platinum is much the best material for any purpose in which a conducting wire has to be sealed into glass was pointed out half a century ago or more by Faraday.

The introduction of leading-in wires at the sides of a glass vessel instead of through a heavy piece of glass at its base, was a well known process in the art prior to the date of the Edison patents in suit.

So far as the structure of any and all the various Goebel lamps is concerned, I see nothing in the construction of any part of the apparatus which would make it improbable that it was constructed prior to the date of the Edison patent in suit, or at the date assigned by Goebel. There is no detail in the process of manufacture as described, or in the furnished product so far as I can observe, which would forbid its having been employed at the time at which Goebel asserts his lamps to have been made.

There are at least two manifest advantages of construction in which the Goebel lamp is superior to the lamps specifically described in the Edison patent in suit.

In the first place the Goebel filament is made of the carbonized fibre of bamboo, a material which the Edison Company has itself employed as the best material available, and which is far superior to the tar, putty and other filaments specifically set forth in the patent.

In the second place, the filament specifically described in the Edison patent is carbonized with the supporting wires in place, the intention being that the filament shall thereby remain adherent to these during and after the act of carbonization. In my opinion there would be a great liability to a defect in the joint between the supporting wires and the filament in consequence of this mode of production unless some further process of uniting the two, not set forth in the patent, were introduced. The Goebel lamps, as I understand it, were not made in this way, but the carbonized fibre was attached to the supporting wires subsequent to its carbonization.

Affidavit of James A. Vandegrift.

James A. Vandegrift, being duly sworn, deposes and says as follows:

I have been handed by W. H. Kenyon, Esq., an incandescent lamp marked "Goebel No. 4," and requested to make certain tests and report upon the results of them. I have made the tests desired, and have arrived at the following results and conclusions: There is a fair vacuum in the lamp, sufficient to enable the carbon to last between one hundred and two hundred hours when burning at normal temperature. An average life of between one hundred and two hundred hours was a good length of life for a commercial lamp in the year 1880. I find that the filament has been made from a piece of coarse bamboo, its structure when compared with a piece of fine bamboo differing from it only in degree but not in nature. The filament has been carbonized. It shows evidence of having been burned for some time, and seems to be slightly oxidized upon its surface, but it is not so far as I can see materially injured. The indication of the oxidation of the surface of the carbon filament is not peculiar to this lamp or unusual.

I have noticed it in respect to modern commercial lamps containing untreated filaments. This effect is shown by a long and continued use with a good vacuum, or by a shorter use with a lower vacuum. There is a broken circuit through this lamp, but I have not been able to discover that the break occurs in the carbon. This would seem to locate the break at the junction of the wires. The leading-in wires are of platinum. The supporting wires connecting with them and with the filament are of copper. I see no reason why this lamp could not have been made as early as 1872, or earlier.

The glass work in some respects seems to be an adaptation of a mode of sealing which I understand to have been practised earlier than that date, for example in the Geissler tubes. The platinum and copper wires are fully large enough to carry the current when the lamp filament is heated to incandescence, judging from the size of the latter. I find no indication from examination of this lamp that hydro-carbon treatment has been applied to the filament, and my best judgment is that it has not. In respect to the quality and appearance of the carbon and the quality of the glass work, and the workmanship of the lamp generally, this lamp, in my opinion, would have as good a commercial life as the lamp described in the Edison patent here sued upon, the only question determining the number of hours of its life being the degree of vacuum.

Affidavit of Detlief Christian Voss.

The Goebel lamps referred to by me in my previous affidavit, and which I saw frequently, burned at from 8 to 13 c. p. A great deal depended upon the battery. Some of the meat-saw lamps burned at about 8 or 10 c. p. Some of the hair pinlamps burned at a higher c. p.—I should say 12 to 13 c. p. I have seen Goebel's store lighted with three electric lamps alone when the gas was turned off, and the light in the store was a nice brilliant light of, I should say, from 8 to 10 c. p. to the lamp.

I remember the Edison lamps put upon the market about 1881. Some of these lamps were in the factory of the American Electric Light Company for the purpose of testing them. We found some of these lamps of not more than 12 to 14 c. p. The light given by the best Goebel lamps compared favorably with these.

Affidavit of David A. Hall.

Mr. David A. Hall, a manufacsuring jeweller, who sold Goebel jewelry about 1872, testifies that from 1872 to 1886 he was in the habit of calling on Goebel at the latter's store. Saw lamps frequently during the entire period in Goebel's store. Some of them had a straight carbon burner like Exhibits 1, 2 and 3, and others had the burner in the shape of a hairpin as in exhibit No. 4. I am positive that I saw them prior to May, 1873, because Mr. Goebel gave me a lamp just like Goebel hairpin lamp No. 4 as a present or keepsake ; I took this lamp home and remember showing it to my father, who then lived next door to my house. I remember his wondering what it was. My father died in May, 1873. I have a number of times, I should think as many as a dozen times, seen Goebel's store lighted entirely by these lamps. These lamps gave a very good light, brighter than a gas jet. In fact I used to think it too bright a light, and I have told Mr. Goebel that I thought it was too strong. The light was very steady.

I have often called on Mr. Goebel socially. Sometimes these electric lights of his would burn all the time I was there. Some of them would burn continuously for hours at a time.

I was very well acquainted with Mr. Goebel for many years. He was and is a man of the highest reputation for honesty and veracity. I would place the utmost confidence in any statements he might make.

I remember noticing that the wires that went through the glass of Mr. Goebel's lamps were white metal, and of asking Mr. Goebel what the wires were made of, thinking they might perhaps be silver. He told me they were made of platinum, and gave me a reason at that time for using platinum instead of some other metal, which I do not fully remember, except that the platinum and glass were affected alike by the heat and the glass would not crack ; they expanded alike.

Affidavit of Edward E. Cary.

Edward E. Cary, being sworn, deposes and says : I am twenty-seven years of age, reside in Boston, Mass., and am superintendent of the defendant company. I have been engaged since 1885 in the commercial manufacture of incandescent lamps with the United States, Westinghouse and the defendant company since July 1, 1891. I am thoroughly skilled in the manufacture of incandescent electric lamps.

I have been asked to consider a report on the statement of Prof. Thomson and two others in this case that lamps with in-leading wires of iron or copper are for that reason incapable of any practical use. I have been aware from my own experience for several years that it was quite possible to make entirely practical and operative incandescent lamps with iron in leading wires sealed in the glass—lamps fully capable of practical and long-continued use.

To test this matter practically I present two incandescent lamps made by me within the last two days with iron leading-in wires. These lamps have been used as in ordinary commercial use as long as I have had time to use them since making them.

Affidavit of Mr. A. D. Kenyon.

Mr. Alan D. Kenyon, of counsel for defendant, testified that Goebel's hairpin lamp No. 4 came into possession of his firm a short time before January 16 last; that it was not offered in evidence at the hearing on that date because Mr. Franklin L. Pope, the expert for defendants, had expressed a doubt after examination as to whether the lamp was made at the early date given by Mr. Goebel. This doubt was based on the absence of any appearance of mercury on the copper surfaces inside the glass tubes, such as appears on the copper surfaces of the lamps marked Goebel lamps Nos. 1, 2 and 3. They did not wish to present to the court any lamp as to which there was a doubt.

(This matter is fully gone over in the affidavit of Mr. Pope.—Ed.)

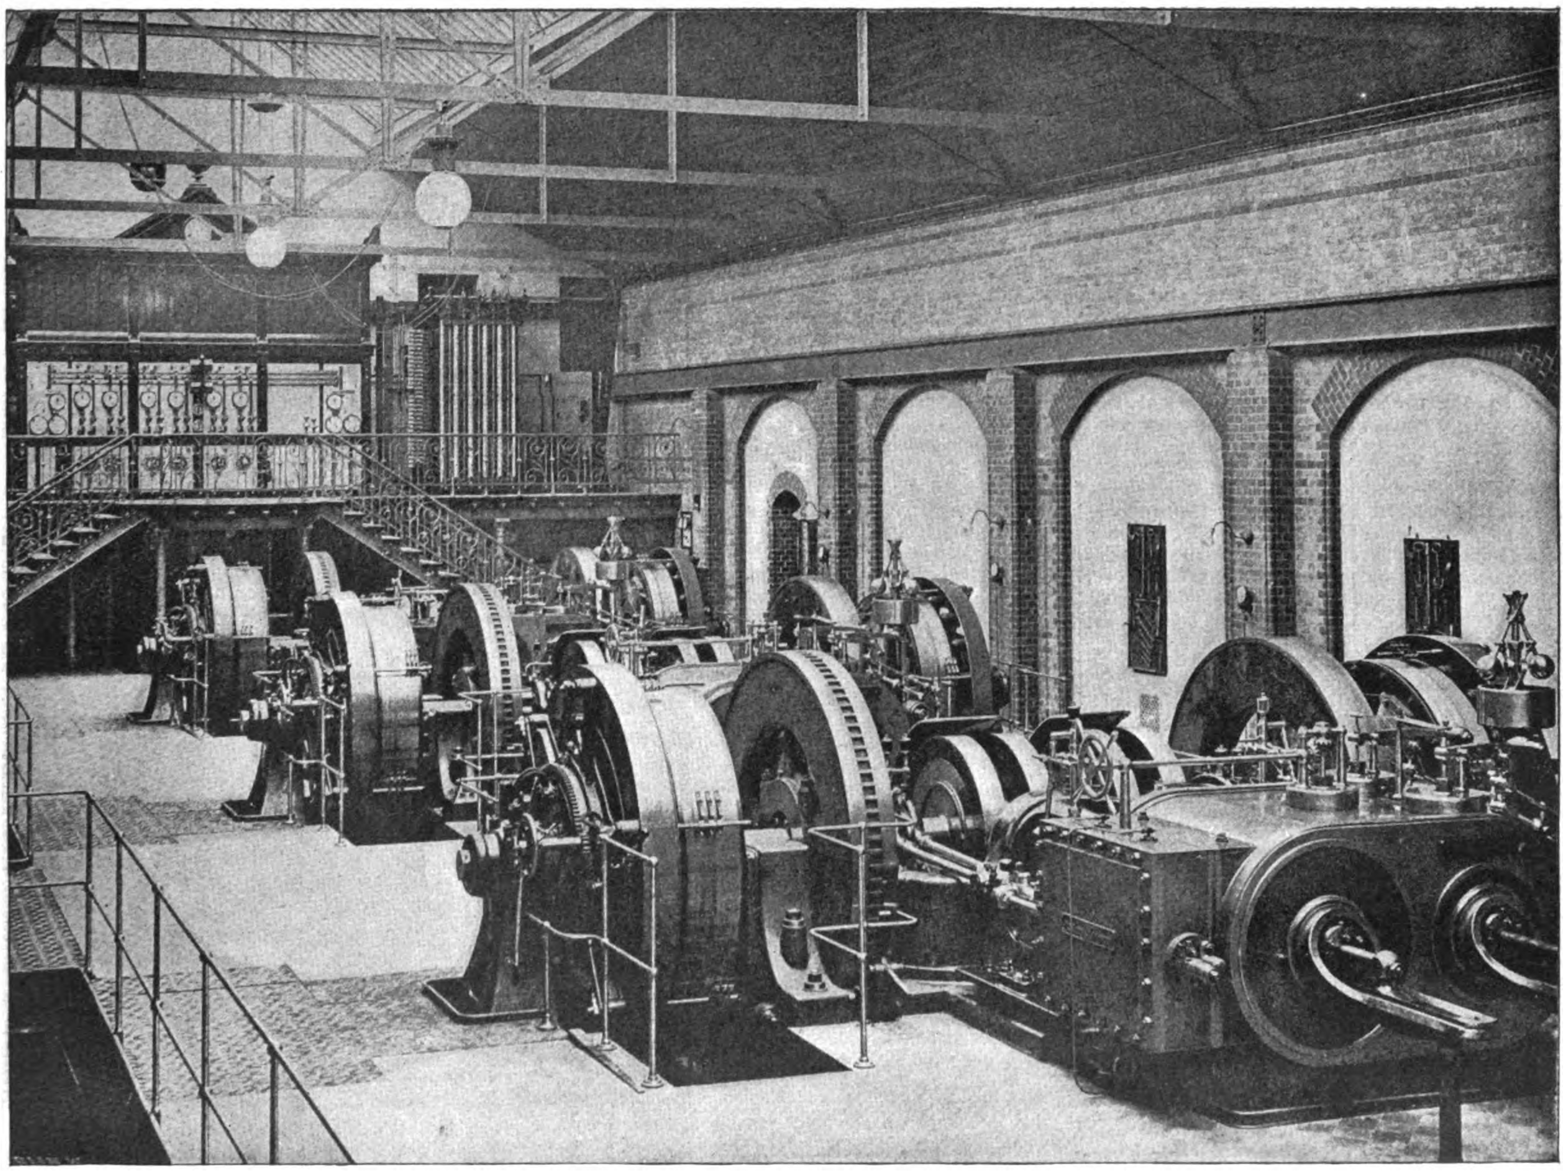
Henry Goebel, Jr., testified in his affidavit that the majority of the lamps made by his father in Monroe street were made with platinum wires running through the glass; those with iron and copper leading-in wires were the earliest lamps made. Goebel, Sr., became satisfied quite early that with platinum leading-in wires more of his lamps were good lamps. Almost all the lamps from Monroe street time down had platinum leading-in wires.

Additional affidavit, of the following named persons were submitted. They were in their nature corroborative of the others, many of them bearing upon the high reputation borne by Mr. Goebel for the past 40 years as a man of veracity and irreproachable character :

Thomas Conroy, Henry Crawley, Peter Schelleus, Edward J. Kenny, Peter H. Fox, Anna Mary Huebsch, Louisa F. Stark, George Paboch, Johanna Paboch, Benj. F. Chambers, Wm. H. Williams, Edward J. Hogan, Wm. Newman, R. H. W. Baker, Charles Forschner, A. T. Cross, Theodore S. Copeland, Henry Grinnell, Charles G. Perkins, Edward E. Mulligan.

ELECTRICITY.

VOL. IV. NEW YORK. FEBRUARY 15, 1893. CHICAGO. No. 5



A SIEMENS & HALSKE CENTRAL STATION.—BRESLAU, GERMANY. (SEE PAGE 54.)

The Breslau Municipal Station.

In May, 1889, the city government of Breslau, Germany, having decided to install a municipal plant gave an order for the same to Siemens & Halske, of Berlin, who completed the installation in July of the year following. Our Frontispiece represents the dynamo and engine-room of this plant. The current is distributed on the three-wire system, the pressure on each side being 110 volts. Continuous current machines are employed.

The steam plant consists of three boilers of the Heine type, which work at 150 pounds pressure, manufactured by A. Börsig, Berlin.

There are three horizontal engines, each of a capacity of 250 H. P. running at 150 revolutions per minute, and each drives two direct coupled dynamos. The engines were manufactured at Görlitzer Machine Works and Iron Foundry. The engines are run with condensers.

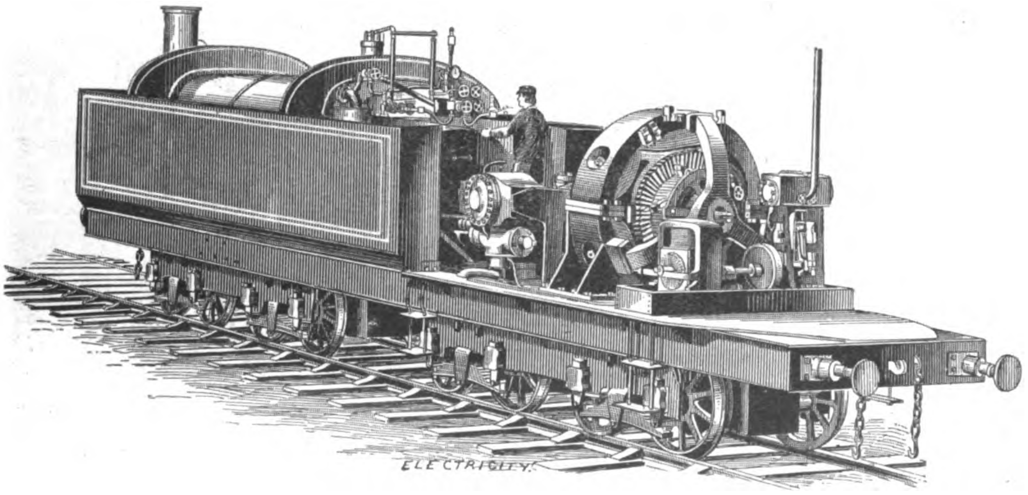
The dynamos, manufactured by Siemens & Halske, are six in number, and are connected directly to the engine shafts. These machines have a capacity of 605 amperes at 130 volts. In parallel with the dynamos is placed a battery of accumulators of the Tudor system. These have a maximum discharge of 304 amperes and a capacity of 220 H. P.

The total capacity of the station using the engines and batteries together is equal to 970 H. P., and was designed to run about 8,500 16 C. P. lamps.

An Electric Locomotive.

In a recent number of *L'Illustration* there appears an account of a new electric locomotive invented by Mr. J. J. Heilmann, and which is about to be tested by the French Government with a view to its adoption on the Government roads.

The accompanying illustrations give a general view of the locomotive and also the disposition of the machinery on the car. The novelty in this case lies in the fact that the current is generated on the car instead of being obtained from stations along the route. The boiler and steam engine, of the Brown type, are placed on the rear of the car, the engine being directly coupled to the dynamo, which is a separately excited machine. The current is led to four motors, each of the axles of the locomotive being driven by a separate motor.



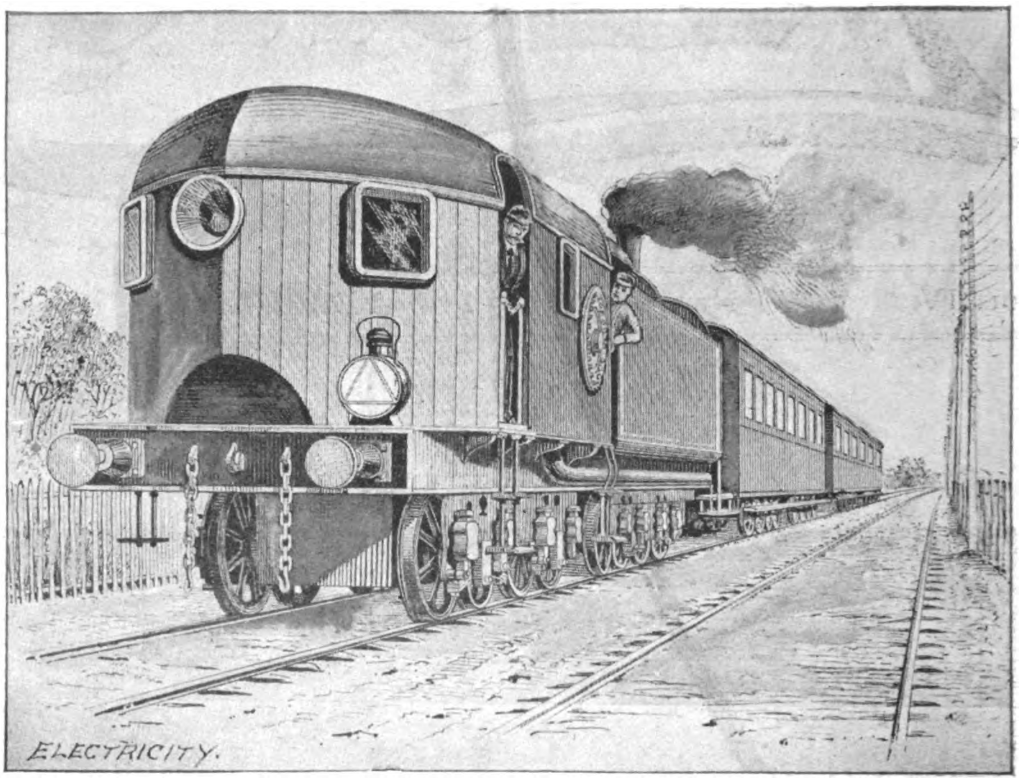
Heilmann Electric Locomotive.

The advantages claimed by the inventor for the use of a dynamo and motors instead of driving with a steam engine direct are the absence of reciprocating motion, which will permit much higher speeds to be attained, and the automatic regulation of the motors, which permits the heat spent in the furnace to be more efficiently utilized than when the steam is applied directly to the locomotive pistons.

The experimental machine illustrated is not yet definitely arranged as to details, which will be largely determined by the trials to which it is to be subjected, and which will be watched with the greatest interest.

World's Fair Notes.

The Engineering Department has started a large corps of men at work drawing the electric light cables in the conduits. These circuits will be known as the patrol circuits, and will convey current to the double carbon arc lamps which are to burn all night.



Heilmann Electric Locomotive.

The Director of Works has issued specifications and calls for bids for furnishing the necessary motors for operating the machinery in the Mines and Mining Building.

The Westinghouse Electric Company have placed eighty of their new stopper lamps in the Building of Arts. The lamps were put in position not so much as a test as to show their effect in lighting up the space to be occupied by the pictures and other works of art.

Although very few of the exhibits for the Electrical Department have arrived at the park, a good beginning has been made by a number of the largest electrical manufacturing concerns in the country. The new cranes in Machinery Hall are in daily use unloading electrical apparatus.

The heavy rains during the past week have caused considerable damage to several of the Exposition buildings. The large amount of snow which had gathered on the roofs of the Manufacturers' and Liberal Arts and the Machinery Hall buildings absorbed the rain to such an extent that the extra weight broke through in small sections of the annexes. The roof of the Electricity Building escaped any damage on account of the slant given to the arches.

The large number of hotels being erected in the vicinity of the World's Fair grounds has created a good demand for electric lighting apparatus. In nearly all of the fifty or sixty new hotels in the course of erection the contracts specify for a complete electric light plant. The promotors of the hotels make a special point in their advertising matter of calling the attention of their prospective customers to the fact of their hostelries being lighted by electric light.

The method of illuminating the largest of the World's Fair buildings—the Manufacturers' and Liberal Arts—has at last been definitely decided upon. The problem was a serious one and required considerable thought on the part of the electrical engineering department. The arrangement to be adopted is to have a large electrolier, seventy-five feet in diameter, occupy the central portion of the dome, on which will be mounted over one hundred arc lights of 2,000 C. P. each. The electrolier will consist of a large platform from which the curved lamp posts will rise and extend over the side. The electrolier will be suspended one hundred and forty feet above the floor of the building, and will be reached by a spiral iron stairway. Besides the large electrolier there will be four smaller ones to illuminate different portions of the building.

The Western Union and the Postal Telegraph Companies are making great preparations to supply their customers with a means of rapid communication from the Exposition grounds to almost every large city in the country. The Western Union will have at least forty wires and the Postal will supply about thirty more.

The Postal Telegraph Company will have sub-offices located in the Machinery Hall, the Casino, Mines and Mining Building, Manufacturers' and Liberal Arts, the Electricity, the Illinois and the New York State buildings. The Western Union will occupy positions in nearly all of the other buildings. It will also furnish the time for between 200 or 300 self-winding clocks.

Master in Chancery L. W. Winchester reported his decision in the case of the Babcock & Wilcox Company vs. the World Columbian. The bill sustains the Babcock & Wilcox Company, and orders the Exposition authorities to allow the company to carry out its contract by placing its boilers in the unoccupied space of the main boiler house.

Dr. Allen Hornsby, assistant chief of the Department of Electricity, gave a lecture last Tuesday evening before a large audience assembled in the Baptist Church on Oakwood Boulevard. His subject was How to Study the Exhibits in the Electrical Department of the World's Fair.

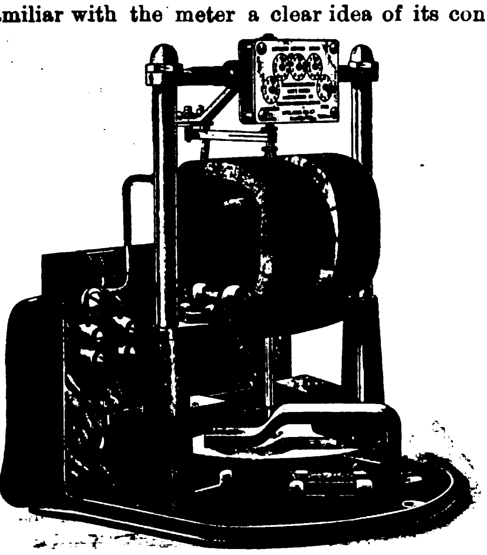
One of the largest tower clocks that have ever been erected in the West will be placed in the centre of the Manufacturers' Building. Electricity is to be used both in regulating the clock and in ringing a number of chime bells.

A concession has been granted to Thomas A. Edison to install 150 of his kinetographs in the different buildings of the Exposition.

The Thomson Recording Wattmeter.

BY P. J. M'FADDEN.*

In this paper on the Thomson Recording Wattmeter I have endeavored to give briefly a description of its physical characteristics and the electrical principles underlying its design, and have avoided any discussion of its abstract mathematical equations, as my instructions from your Literary Committee were to prepare a paper that would not take long in its reading and yet would give those of you who are not familiar with the meter a clear idea of its construction and application in commercial practice.



Thomson Recording Wattmeter.

In designing this meter several essentials had to be strictly observed: First, the meter must be theoretically correct in principle. Second, it must be of the simplest possible construction. Third, it must be easy to install and to maintain in operation. Fourth, it must be accurate throughout its range. Fifth, it must be automatic. In addition to these requisites it was the aim of the inventor that the meter operate with equal facility and accuracy on circuits of either direct or alternating currents, and it was his opinion that such a meter should be a motor meter; that is to say, it should be actuated by the same energy which it measures, avoiding, for instance, the necessity, as in clock meters, of winding up the mechanism at stated intervals.

Briefly, then, this meter consists merely of a simple skeleton motor having no iron either in armature or field. The fields, which consist of two coils, one on either side of the armature, are connected in series with the lamps or motor whose absorption of energy they are to measure, all the current in use passing through these field coils. The armature, which is of the Siemens drum type, is hollow and is made of a fibre cylinder over which the coils are wound. On the end of the shaft of the armature is a silver commutator, on which rest flexible bronze brushes provided with silver contact pieces. The armature is shunted across the circuit in the manner of a lamp, and to cut down its current a high resistance of fine wire is connected in series with it, the whole forming a pressure coil whose current varies with the voltage of the system.

It will readily be seen, therefore, that as the field varies with the current, and the armature with the pressure, the speed of the motor will vary directly with the energy or watts in use, which is of course the ideal method of measurement.

Friction would, however, seriously affect the accuracy of those results were it not compensated for. This is accomplished by taking off the armature circuit beyond the fields. Thus there is a slight constant field, independent of that created by the current flowing to the lamps, caused by the flow of the armature current through the field coils. On very low loads, where friction is a strong factor, this "shunt," or constant field, forms a comparatively considerable percentage of the total field and torque. thus nicely balancing the meter against friction, whilst on medium and high loads both friction and the shunt field become so insignificant a percentage of the total load and torque that their influence cannot be detected and may be neglected.

Another essential feature of the meter deserves description, namely, the slowing mechanism or means for loading the meter. The necessity for this retarding mechanism is too apparent to need explanation, and has been fully appreciated by all makers of recording motor meters. In the Thomson meter this is accomplished in the most simple and satisfactory manner by placing on the shaft a thin disc of copper, some little distance below the armature. This disc rotates between the poles of three permanent magnets, as shown here.

The fields of these magnets generate Foucault or eddy currents in the disc, thus forming a considerable drag or load on the motor, which is constant and proportionate in its action. Thus it will be seen that, neglecting friction, which, as we have noted, is compensated for, the meter is proportionate throughout, for torque is directly proportionate to the product of current in armature and fields, which equals amperes × volts—that is, torque is directly proportionate to power or watts passing the meter. Speed is directly proportionate to torque, and the retarding effect or generation of current in disc is directly proportionate to speed. Therefore, the theory of the instrument is consistent and correct throughout.

Another good feature of the meter exists in that the drag or load is considerable, hence friction, which is the only varying quantity, forms, even on light loads, but a small proportion of total retarding effect.

The indications of the meter are shown in watt hours on the dial, the first wheel of whose train engages with a worm on the shaft, thus connecting it with the revolutions of the armature. The five dials of the whole train will record up to 10,000,000 watt hours, that is to say, approximately 200,000 lamp hours, and it is only then that the dials all come back to zero. This for the smaller sized meters without constants. The largest sizes will register as high as 360,000,000 watt hours before reaching zero again.

By an examination of this dial it will at once be apparent that the friction absorbed in actuating the recording mechanism is so small as to be negligible, as the power required is so slight that it is scarcely possible to move with the finger the first gear which engages with the worm on the shaft so slowly as not to see the first dial hand move, and yet when the meter is running at full load this motion of the dial hand is not discernible. Here then is one of the two possible chances for friction reduced practically to zero.

It is essential that a motor meter have a slow rate of revolution so that no possible resistance can be introduced by reason of friction of the gears of the train or on the lower and only bearing. To accomplish this and still to use the same recording mechanism on all meters, the larger size meters are made of such electrical dimensions that their rate of revolution will be one-half, one-third, one-sixth, etc., slower than their normal, thus keeping the revolutions of all meters down to about sixty revolutions per minute at full load, and consequently lengthening the life of the meter. In such cases the corresponding constants of 2, 3, 6, etc., are marked on the dial and by which the readings are to be multiplied. These constants are uniform throughout any given sized meter.

The only other point in which friction might appear is at the bearing on which the lower end of the vertical armature shaft rests. This again is reduced practically to zero by having the shaft's point hardened, very carefully ground and highly polished, and in having the bearing made of sapphire. This jewel is inserted in the end of a brass screw which passes through the bed plate of the meter.

If the jewel should, by reason of a continual vibrating or pounding of the shaft upon it, become cracked, the point of the shaft would become worn and the meter run slow. To prevent the occurrence of this, the jewel setting is mounted on a small spiral spring contained in the hollow screw, and this permits of the bearings following every motion of the shaft and presents no rigid surface upon which the vibrating shaft can deliver a sufficient blow to do any damage. The calibration of the meter is readily and effectively accomplished by moving the poles of the permanent magnets towards or away from the periphery or centre of the disc, thus increasing or decreasing its speed until it become synchronous with the standard instrument.

We have seen by the description just given that the theory of the Thomson Recording Wattmeter is necessarily mathematically correct, save from that slight error which is induced by friction on the lower loads. We have also seen that this error is reduced to an almost negligible quantity by connecting the armature into the circuit in such a manner that the current passing to the armature passes first through the field coils, thus giving a certain initial torque which is present at all times and which on low loads forms a considerable portion of the total torque, this initial torque being so proportioned as to almost absolutely balance friction, the meter being in fact poised when entirely free from load.

It may have occurred to some that as the size of the meter increases so would the number of turns in the field decrease, and therefore a meter of 100-lights capacity would not have the same amount of initial field due to the armature current passing through the series coils as would a meter of small capacity. Strictly speaking, and were no provision made for it, this would be quite true, but in cases of this kind the initial torque is maintained by the insertion of what is termed the shunt field coil, wound inside of one or even in some cases of both the series field coils. In cases of this kind the current passing through the shunt field, acting in unison with and in the same direction as the series fields, and then through the armature, maintaining approximately the same number of initial armature field turns and the same initial torque to counterbalance friction.

---

* Paper read before the Chicago Electric Club.

It is this nicety of construction which enables the Thomson Recording Wattmeter, even in sizes as large as 100 amperes, actually to give a registration on loads as small as one lamp.

No difficulty is experienced in adapting the Thomson Recording Wattmeter to all purposes. Its theory and its construction is good alike for use in all connections. Thus, there being no iron whatever in the frame, in the armature, in the field or cover of the meter, its accuracy remains unchanged with the same calibration whether it be installed on alternating or direct current, and this being true it is, of course, obvious that no variation in frequency can in any way affect the accuracy of the meter.

It may be well here to say a few words as to the watt hour as a unit of measurement. In the watt hour we have what may be very honestly termed a universal unit. No matter what variation of voltage the meter may be subjected to, no matter whether operating upon power or upon light, whether being used to measure the output from a station or to measure the total input of electrical energy into a house having but three lamps, the watt hour means the same thing.

It has been customary with many manufacturers to adopt the ampere hour as the unit of measurement, but the ampere hour, while a very good thing for ampere meters, is in reality no measurement whatever of the energy used except at one fixed potential. It is a recognized fact that a recording ampere meter, except at the potential for which it is calibrated, does not accurately record the power passing through it; and so an ampere as a unit designates only half of the question. It indicates how much current has been used, but to obtain results as to the amount of power used it is necessary to assume or determine the voltage and multiply the result.

By a fortunate coincidence the basis of charge dependent upon 1,000 watt hours found a parallel in the familar basis of charge for gas. That is to say, experiment has shown that 1,000 cubic feet of gas will give about ten times the illumination of an incandescent lamp consuming 1,000 watt hours, and if a customer has been paying $2.00 for 1,000 cubic feet of gas, he would, if he were to be charged at the same rate for his illumination, pay twenty cents per 1,000 watt hours for his consumption of electricity.

The Thomson Recording Wattmeter is made for lighting or power circuits of all commercial voltages, and for primary circuits of alternating current stations for measuring the total output from an alternating machine, and for measuring the output of direct current of light or power stations in sizes from 10 ampere to an instrument as high as 600 ampere capacity, one meter thus being capable of measuring the output of some of the largest generators now made.

These meters are also made to record on a single dial the summation of energy from both sides of an Edison three-wire system, and to measure the power consumed by an electric car, to check the wastefulness or economy of the motorman; in fact, they are made in about fifty-five different forms, varying in voltage, amperage and in construction according to the uses for which they are intended.

I trust that these brief notes have sufficed to convey to you an idea of the main features of this meter, and perhaps to have suggested to your minds some other points which, in the limited space afforded me, I have not been able to touch upon, in which case I will be pleased to answer any question I may be able to touching the subject.

Mr. Wirt—Mr. Chairman, I did not have time to prepare a paper for this evening, but I will make a few remarks upon the meter question. I have brought with me an Aron meter. I had a little experience with this meter in the laboratory at one time, and was very much interested in it. It is familiar to most of you, and the mechanism is very simple. It consists simply of two pendulum clocks, each being run by a spring, capable of running thirty days at one winding. Each clock has a pendulum of the same effective length, giving synchronous vibrations. The pendulum of the left hand clock is weighted with an ordinary brass bob. The pendulum of the right hand clock has a permanent magnet for a bob. Those two clocks are geared on the counter differently, so that when they are running properly and in synchronism the counter stands still. Any difference in the rate of the two clocks is registered on the counter. The electrical part of the meter is merely a pair of coils. In a meter for a two-wire system there is only one coil, and the bob is single instead of double as in this sample. Those coils are close underneath the permanent magnet bob and carry the main current. The current is so put through the coil as to magnetize the permanent magnet in the same sense in which it is originally magnetdized. There is no tendency to reverse or decrease the strength of the permanent magnet. The principle of operation is simply that the attraction of the coil for the magnet acts exactly as an increase of gravity and increases the rate of vibration; so the magnetic pendulum runs faster than the other, and the difference in rate is registered on the counter. That difference in rate is proportioned to the current passing; and one of the beautiful things about this meter is that it is capable of an infinitely fine rate of registration. It does not register down to one per cent. only, but it will register down to any per cent., no matter how small, of the total current.

The extremely small difference in the rate of the two pendulums on which the reading of the meter depends is rather surprising; at full load the difference in the rate is only about 0.1 of one per cent. It follows that an error in either clock work of 0.1 of one per cent. would suffice to wipe out the largest record that the meter might make. The meter working at one per cent. of the full load would give a variation in rate of only one part in 100,000.

When I took that meter to test it some years ago, the first thing I wanted to find out was if the effect of the current would not be to increase the magnetism in the magnet so as to give a rate different from the rate required theoretically. I found that the actual magnetic effect of the current was so small, and the strength of the magnets and their hardness was such, that the effect was not appreciable. The meter can be taken as strictly proportional to itself throughout its range. That makes it valuable to test other meters by. After having determined the rate of the meter it can be depended upon for a time to agree with itself, and to give readings that are proportional to the true value.

The next thing I wanted to find out was whether a short circuit or disturbance in the main circuit would not so affect the magnets as to permanently alter their value, and so cause false reading. I tried short circuits and did not succeed in making any permanent change in the magnet, but I did find that by *reversing* the current and putting it through the meter in the reverse direction, and then making a short circuit, the magnets had been permanently changed and the constant of the meter altered.

The constant of the meter which is sent out should be taken with several large sized grains of salt, and should be redetermined for each meter before it is put into use.

The mechanical part of this meter has been very well worked out. The clock work is admirable; it is not large, having very little work to do, much less work in fact than an ordinary eight-day clock has to do in moving the hands. But the design of the case and some of the other details of the meter are rather too clumsy to suit the American taste.

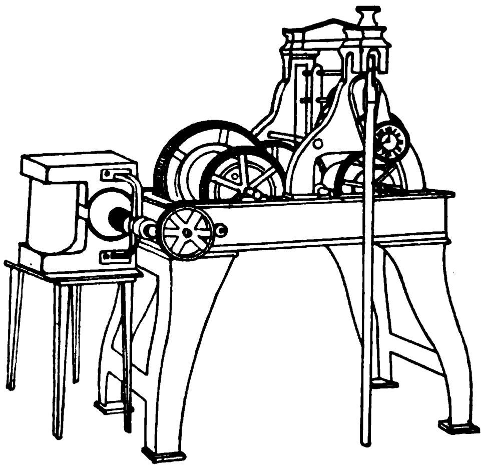
I have not had any extended experience with this meter, and I do not know to a certainty whether the magnets retain their permanency over long periods of time. The meter has never come into use in this country, probably owing to the fact that we have had good meters and that no one has seen fit to undertake the manufacture of this one here. They are largely used in Germany, and I understand with gratifying success.

I know one central station that put in an electrolytic meter, having first tested this meter and made very careful calculation as to the cost of operating both, and concluded that the cost of the Aron meter at the then ruling price would more than offset the gain in operating expense, and they put in the electrolytic meter.

Clock Winding by Electricity.

The extent to which the electric motor is being applied as a labor-saving device apparently has no limit. It has entered the home to run the sewing machine, the dental parlors to turn engines, and in the stores to run the coffee mill. Wherever manual labor is required in turning light machinery, the electric motor finds a new field for operation.

One of its latest invasions is found in the field of chronometry. Although it has been applied on a limited scale in winding ordinary clocks, the illustration given probably represents the first machine in which a large motor has been utilized for winding a tower clock.



Electric Clock-Winding Machine.

Mr. J. R. Young, of Madison, Wis., has designed and applied the motor herewith described and illustrated.

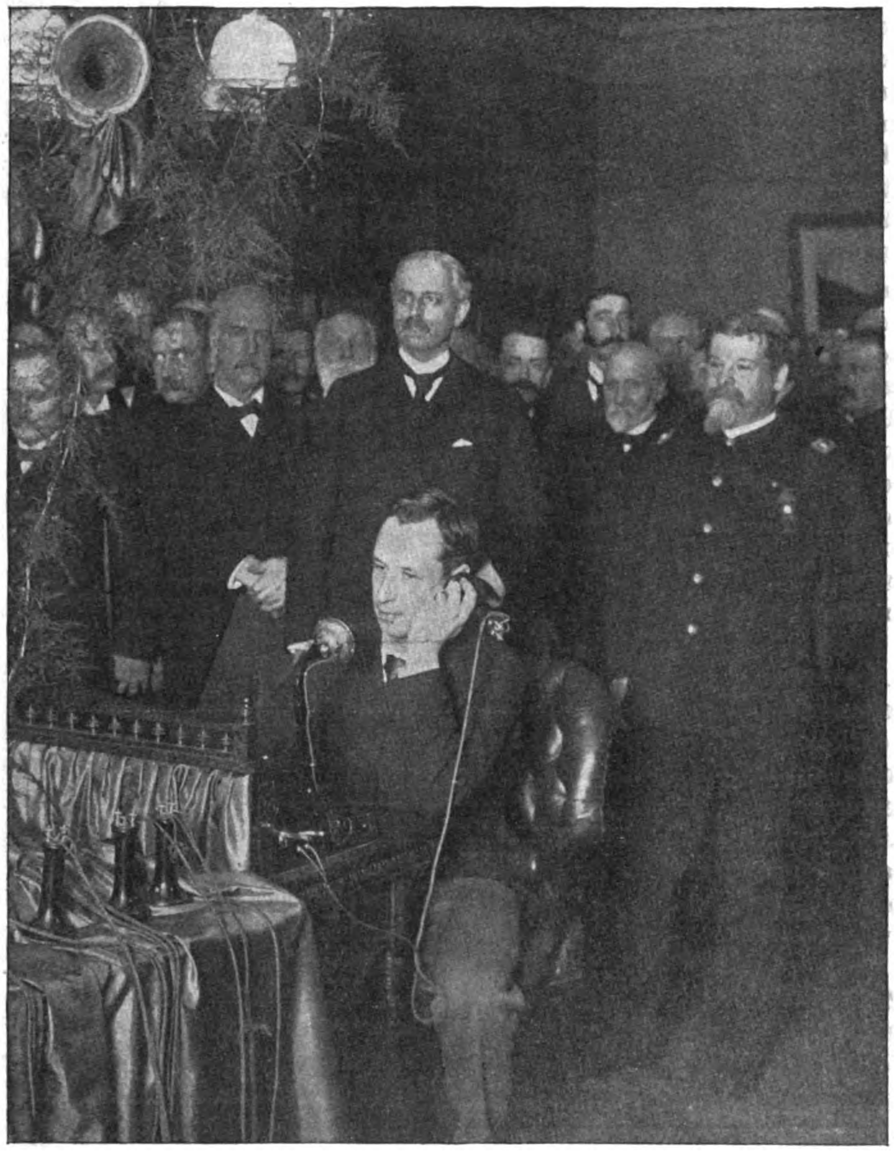
The square stem on which ordinarily the key is placed to wind the clock carries one of a series of cog wheels which are used to reduce the speed of the armature and increase winding power. The last cog wheel is mounted on the armature shaft. The motor used is an ordinary one-half horse power machine. Current is supplied from the electric light plant located in a portion of the University machine shop, 500 feet distant from the library tower in which the clock is mounted. The switches are so arranged that after the current is turned on it will be automatically cut off as soon as the winding is completed. Before this novel method was adopted it usually required the united efforts of two men for an hour to wind the clock. With the electric motor an attendant can do the same work by simply turning on a switch in the dynamo room and allowing the motor to run for ten minutes.

Linked at Last.

A Notable Event.

Boston and Chicago United by a Strand of Copper 1,200 Miles Long.

Transformed as if by magic into a tropical garden, where were growing scores of elegant and graceful palms, acacias, pampas and pines, the main rooms of the American Telephone and Telegraph Company's headquarters on the ground floor of the handsome Telephone Building in Liberty Square, Boston, presented a magnificent appearance last Tuesday afternoon on the occasion of the opening of the long-distance telephone line between Boston and Chicago. Not only is the comparative adjective "long distance" entitled to be used in this connection, but the superlative "longest" ought also to be used, for this line is undoubtedly the longest telephone line in the world; hence the event was in every sense a notable one. The tropical display lent beauty to the occasion, but the practical adjuncts necessary included elegant sound-proof telephone booths fully equipped, a switchboard for manipulating the new line that was to be opened, making connections and giving instructions to the gentlemen at the Chicago end of the line.



A Notable Event.

In the centre of the room stood a long-distance telephone set, while adjoining it was a table draped in old gold satin, from the graceful folds of which extended no less than forty wires, to the ends of which were attached as many receivers, all connected with the Chicago line. Snugly ensconced in a bower of green foliage which almost hid an electrolier overhead, was placed the trumpet-shaped long-distance receivers, likewise connected in circuit. The cards of invitation announced the opening exercises for four o'clock, and at that time many of Boston's representative men began to arrive, followed shortly afterwards by His Excellency Governor Russell, Lieut.-Governor Wolcott, Brigadier-General Dalton, chief of the Governor's staff, with other State and city dignitaries. As the Governor entered the room that fact was flashed to Chicago, and instantly a cornetist in the Chicago office struck up the popular air "Hail to the Chief," which came over the line as distinctly and loudly as if the performer had been stationed in the adjoining room. This astounding performance was received with loud applause by the two hundred or more gentlemen present.

Then the Governor took his seat at the telephone and gave the usual "Hello, Chicago!" which was instantly responded to from Chicago with "Hello, Boston!" And then having got the ear of the Chicagoan the Governor extended his congratulations as follows:

> "The Governor of Massachusetts extends his hearty congratulations, and those of the State, on the completion of this new line of communication between the two cities. Boston considers this a most important event in its history, and I feel it an honor to enjoy the privilege of conveying to you this expression of kindly feeling from the people of Massachusetts. This line will undoubtedly be the means of uniting the two cities more closely together."

At the close of this brief but successful conversation a flash light photograph of the ceremony was taken, then President Hudson, of the American Telephone and Telegraph Company, called attention to the following interesting facts anent this important achievement. He stated that the line just opened extended from that room by the most direct highway routes across Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, Ohio, Indiana, terminating in the office of the company, Nos. 105-107 Quincy street in the city of Chicago. The principal points on the main line are Providence, New York City, Newark, N. J., Harrisburg and Pittsburg, Pa., Cleveland and Toledo, Ohio, and South Bend, Indiana. In the Eastern States connecting lines reach all important points from Portland, Me., on the east to Buffalo north and Washington south. In the West branches are completed from Chicago to Milwaukee, Wis., and from Toledo to Detroit, Mich. Through these branches and connecting lines all important points to Ohio, Indiana, Illinois, Michigan and Wisconsin will soon be reached.

The Boston-Chicago line is 1,200 miles in length and is constructed in the most substantial manner.

During the proceedings the Chicago cornetist played the following selection of popular airs: "Star Spangled Banner," "Maggie Murphy's Home," "Annie Laurie," "Red, White and Blue," "Ta-ra-ra-boom-de-ay," Military Bugle Calls, and "Yankee Doodle," the assembled crowd receiving each piece with rounds of applause. Between the musical selections Mr. Wendell Baker, special agent of the Telephone Company in Chicago, kept up a facetious conversation with the forty Bostonians who held the 'phones to their ears in turn.

After the actual opening of the line by the Governor the visitors were escorted in parties to an elegantly appointed room on the second floor, where, embowered in foliage and plants, was stationed an orchestra which enlivened the time while all partook of a petite lunch which was daintily set in this room.

Then a tour of the entire building was made, the exchange or operating room of the telephone company, with its gigantic switchboard that accommodates some 4,000 subscribers and is manipulated by over ninety girls, receiving a great deal of attention.

Among the distinguished men present we noticed Professor A. E. Dolbear, Tufts College; Professor Charles R. Cross, Massachusetts Institute of Technology, and Professor Elihu Thomson, of the General Electric Company.

The entire arrangements for this interesting event were carried out by Mr. William A. Hovey, Special Agent of the American Telephone and Telegraph Company, and that gentleman was unremitting in his efforts to make it a success worthy of the occasion.

In our illustration Gov. Wm. E. Russell is seated at the telephone; at his right stands Lieut.-Gov. Roger Wolcott, and at his left Adjt.-Gen. Samuel Dalton.

St. Louis Notes.

The *Republic* states that the first electric light plant in St. Louis was installed in the famous restaurant of Tony Faust in 1878, having been imported from Paris, and that it was this plant which gave Heisler his first inspiration to engage in the business.

The *Post-Despatch* says: "The most prominent topic to come before the electricians will be the incandescent lamp question. The recent decision upholding the validity of the Edison patents strikes the interests of nearly every one in the electrical business, either favorably or unfavorably. But since every one is allied by interest with either one side or the other, a condition of intense partisanship exists and it may be prudent to rule the subject out of the convention altogether. This President Ayer will probably do. But it is certain that the matter will be the most talked-of of any that will engage the attention of the members of the convention."

The St. Louis entertainment committee proposes to raise a fund of $6,000 for the entertainment of the visitors.

"Electricity," under its present ownership, has never solicited the advertising patronage of the General Electric Company.

"Attitude of the General Electric Company."

Mr. S.D. Greene has announced over his own signature that the world is all in error as to the policy of the company of which he is the Assistant General Manager.

Mr. Greene has had some experience, and has lived probably thirty-five years. He has held an honorable though not arduous (nor dangerous) position in the navy of his country. He is a popular member of several clubs, and is, perhaps without exception, the most amiable gentleman in the service of the General Electric Company.

But Mr. Greene would have used better judgment if he had declined to assume the rôle of apologist for the insolent and infamous documents which have been mailed in thousands at the direction of his superiors.

Mr. Greene is a representative, in the tenth generation, of the ancient and honorable family of Rhode Island Greenes—a family which has contributed much to the greatness of New England and the United States. And if Mr. Greene will turn to page 36 of the "History of Warwick and Coventry," he will learn something in regard to the character of Dr. John Greene, founder of the American family, who first landed in Boston. He never sold himself to the highest bidder. His strongest characteristic was an intense and abiding hatred of hypocrisy and cant. And when he came to a realizing sense ot the humbug and injustice of the ruling powers of the early Puritan settlement, he withdrew, at great loss of money and all the comforts of life, to the then wilderness of Rhode Island, where he could at least maintain his self-respect.

We fear that the example of Dr. John Greene, the hero, has been lost on Mr. S. D. Greene, the time-serving quibbler.

* * *

THE *Electrical Engineer* is just now engaged in a perilous feat. It is attempting to run along on top of the fence where it sat for so many months, until the spikes became too sharp. By running alongside the band-wagon (in which ELECTRICITY holds the foremost seat and the reins), it no doubt hopes to create the impression that it is actually in the procession. This attempt will be a failure, and the *Engineer* would better get down immediately. There is room in the band wagon. And there is danger ahead in its present course. No man can serve two masters. The world has more respect for a journal which is honestly and courageously on the wrong side than for the one which is on neither side. It is only the museum-freak which can look two ways at once.

* * *

As an item of news we are pleased to report that one of the large supply houses in this city bought and received 1,500 lamps from the General Electric Company during the past week. Also that the same company have sold lamps for use on various new installations of machines not their own, which all goes to show that the Electric Trust has a pain in the back.

Fundamental Electric Railway Patents.

The inspired newspaper report which we noted two weeks ago, concerning the purchase of the Green trolley patents, has been verified as to the fact of the purchase. The report erred, however, in implying that upwards of $500,000 had been paid therefor, as ELECTRICITY is able to state with certainty that the price paid by the General Electric Company was $25,000 cash down, and a prospective $25,000 extra in case the courts sustain the patents. The proviso appears to point to the advent of an era of electric railway litigation for which ample rival claims exist to form the basis of a struggle not second to the incandescent lamp cases.

The list of patentees and early users of various indispensable appliances on electric railways is a formidable one, and includes the names of Van Depoele, Sprague, Edison, Daft, Adams, Finney, Henry, and numerous others whose patents have been granted during the time intervening between the application and the issue of the Green patents.

* * *

The End is Not Yet.

Pending the outcome of the litigation over the Edison patent in Boston, there are some facts which should not be lost sight of. *The General Electric Company is only in the beginning of its campaign of extinction*, whatever the result of its suit against the Beacon Company. The loss of that suit by the General Company would be a serious blów, but not a death blow.

Their *possibilities* for injury and disturbance to the trade would not be exhausted with the setting aside of the Edison lamp patent.

Their *intent* to capture *all* the business of this country may be denied in plausibly worded statements which no one but a man in his dotage can fail to estimate properly. They may, for the time being, sell a few lamps to supply houses and competing plants. But the cloven hoof cannot be hidden by so thin a covering.

"We are going to do this business; you may as well fold your tents and get out!" comes straight from the lips of Mr. Charles A. Coffin, who is a much higher authority than Lieut. Greene.

The conflict is in truth an irrepressible one, and will not end short of the breaking up and reorganization of the General Company—or else in the control of all the business by that company. This is obvious. They need *all* the business to earn interest on their watered stock; and if interest cannot be earned, the whole machine is broken up.

The lamp case is an important one, but not all important. Other patents are in reserve.

Whatever the merits of the Green trolley patents, the fact that the Electric Trust will upset and demoralize the entire electric street-railway industry during the next two years is not doubted except by fools.

And in the lighting field there will be patent suits almost without end. Suits are now being prepared claiming fundamental patents on sockets, fuses, the three-wire system, and feeder distribution. The compound winding of machines is also claimed, and we understand will be the first matter to be pushed to a finish.

Smaller manufacturers cannot stand a long campaign of litigation when attacked singly. There is a thousandfold more trouble ahead than has yet been met. And the man who cannot see this belongs in a lunatic asylum and not in business.

And what is the redress?

Mr. E. B. Weeks's paper, read at the Montreal meeting, outlines an effective method of redress for the Central Station men—a co-operative manufacturing plant.

But manufacturers and supply men have a much better one, and this is simply *a combination for mutual defense in unjust patent suits.*

The Central Station men ask for one thing, and only one—*an open market in which to buy their supplies.* With this assured they will be content.

Will the independent manufacturing and supply interests stand together for a successful fight, or will petty jealousies keep them apart, rendering them easy victims for the Trust which has aimed at their annihilation?—a Trust without principle, without any sense of honor, and with (for the present) unlimited financial resources.

* * *

To THE lamp manufacturers who have been compelled to shut down, ELECTRICITY sends greeting. They will be on deck again in a few weeks, meantime ELECTRICITY will continue to fight the battle of fair competition against monopoly. The preliminary skirmish has been won by monopoly, but the end is not yet. And when the Trust is beaten and discredited, as it is sure to be, it will not be forgotten that ELECTRICITY was the only paper to take up the fight, and to maintain first, last, and all the time that the Trust was *wrong*, and that the independent concerns were *right*.

* * *

EDISON lamps are being sold in Chicago for 42 cents, on Staten Island for 55 cents, and at points in Michigan for 75 cents.

* * *

A FEW years hence, when you wish to refresh your memory as to what caused the ruin and collapse of the Electric Trust, what paper will give you so much information as ELECTRICITY?

* * *

THE *Western Electrician* has long enjoyed an enviable popularity as an ably conducted journal. Mr. Kreidler is a gentleman whose friends in the field are only limited by the number of his acquaintances. His paper has heretofore been a highly creditable exponent of public sentiment in the West. And now that the next Convention of the National Association is to be held in his bailiwick, the visitors to that Convention will naturally look to the *Western Electrician* for an expression of the general sentiment in the West on the subject of the Electrical Trust and its treatment of its competitors and Central Stations. The crisis demands that personal considerations be laid aside, and that every honest journal do its honest duty. The eyes of the East are on you, William.

Highly Complimentary.

Uriah Heep Forgets His Humility.

The Pioneer Sneak and Hypocrite Pays Its Respects to Some of Its Constituents.

(*From the Electrical World, Feb. 4.*)

Most, if not all, of the alleged infringers of the Edison patent have contracts ahead which they feel bound and are anxious to fill; many of them also have considerable stocks on hand, and among these stocks are comprised large numbers of lamps which were made before the plan of blowing the lamps into molds was adopted. Such lamps, while equal in other respects to those blown into molds, lack the uniformity in size and shape, and for this reason have been considered somewhat off color and not readily salable. THOSE COMPANIES WHICH HAVE ALREADY BEEN ENJOINED, OR AGAINST WHOM RESTRAINING ORDERS HAVE BEEN GRANTED, NO LONGER ABLE TO FULFIL THEIR STANDING ORDERS, ARE TURNING THE SAME OVER TO THE OTHER COMPANIES AGAINST WHOM ACTION HAS NOT BEEN BROUGHT, AND THE LATTER ARE FILLING THE SAME NOT ONLY WITH THE ACCUMULATED STOCKS OF THEIR FORMER COMPETITORS, BUT ALSO WITH LAMPS OF THEIR OWN MANUFACTURE, AND WITH SUCH AS BEFORE HAD BUT LITTLE MARKET VALUE. It seems probable that no decision can be reached for some weeks to come, and in the meantime the alleged infringers will have ample opportunity of unloading their accumulated stocks and, it is feared, to the injury of the lamp business.

Such customers of the Beacon, Buckeye, Packard, Germania and Pennsylvania Lamp Companies as are readers of the *Electrical World* are thus advised precisely what kind of goods to expect.

A more disgraceful statement than this has never appeared in any trade journal in this country.

In the first place it is a lie from start to finish, and such a dastardly attempt to ruin the business of a large number of representative electrical manufacturers by maliciously impugning their business integrity serves merely to defeat its own ends and to reveal the fawning servility of this satellite of the Trust.

Not less contemptible is the imputation of incredible ignorance to purchasers of incandescent lamps, who, we are asked to believe, are unconsciously accepting unmarketable goods or makes other than those ordered by them. The different manufactures of lamps are purposely made to exhibit some characteristic feature, and no great difficulty would obtain in distinguishing them, even by the laity, and certainly not in the case of supply dealers and central station men. The section, length and specific resistance of the filaments, the method of joining them to the leading-in wires, the shape of the glass base and the sizes of the bulbs are all distinctive features which are either apparent or readily determined.

And more than all this, it is beyond dispute that the independent companies still in operation are making and selling to-day, as they have made and sold previously, lamps which are thoroughly up to the standard, and as a rule of a higher grade than the General Electric Company's lamps.

These manufacturers are not playing their last card; their reputations are still at stake; they are not going out of business whatever the outcome of present litigation; not one of them would sell lamps that were not a credit to their makers. They are selling not only good lamps, but *first-class* lamps.

The possible injury worked by this false statement cannot be estimated. But how long will this sort of thing be allowed to continue? The independent manufacturers mentioned, *and their friends*, can furnish a speedy answer to this question.

The *Electrical World* can no longer sail under false colors.

That poltroon, that sneak, that cowardly assassin, stands before all men in its true garb.

It is not on the fence.

It is conducted absolutely and solely in the interests of the Electric Trust, and is controlled by no motive except personal gain.

Secure in a handsome competency, leeched and wheedled out of the trade under false pretenses, the monumental humbug and hypocrite still extends one begging hand for support while carrying in the other a knife to stab any and all opponents of its friend and patron the Electric Trust.

It is high time that independent concerns learned to recognize the power of the press both for *good* and for EVIL.

Trust Methods.

Notes and Comments from Various Sources.

Madison, Wis., Secures Redress.

Attention was called in these columns some time ago to the shady methods adopted by the Trust in "bottling up" the town of Madison, Wis. The gas company was included in the deal. Frozen-out stockholders of the old company, it will be remembered, at once organized a new company, the Capital City, and secured a franchise. The city contract has just been awarded. There were three bidders ostensibly, but really only two: the gas company and the Four Lakes Company working of course in harmony, and the Capital City acting independently. The latter secured the contract for five years, at a saving to the city of about $2,000 a year.

The moral of this is obvious, and Central Station stockholders now considering consolidations in various cities will do well to take heed. No city will submit to be robbed.

To the organizers of the Capital City Electric Company, to the courageous press of Madison, and to the taxpayers of that town, ELECTRICITY says, Well done!

A Storm Gathering in Philadelphia.

Says the *Philadelphia Inquirer*:

"There is likely to be some forcible language used in the forthcoming annual message of Mayor Stuart to City Councils and in the reports of the heads of departments, Directors Windrim and Beitier, with regard to some of the present evils of municipal government and particularly in reference, among other things, to the operations of the Electrical Trust. The report of Chief Walker, of the electrical branch, will be of striking character.

"It is said to be the most elaborate document yet submitted by the chief, filling fifty-three closely-written pages of foolscap, and a large part of it is devoted to the proposed acquirement by the city of its own electrical plant. The recommendations in favor of such legislation by Councils are even more strongly presented than in former years, and as in the past the views therein expresssed are believed to meet with the approval in every respect of his Honor the Mayor.

"Tables are given showing the profits now derived by the companies which furnish the city with electric light, and how great would be the saving to the municipal government once they had installed their own system. The department now has its own conduits and cables, and could quickly secure the dynamos, engines and lamps necessary to conduct the all-important work.

"Chief Walker does not hesitate to point out the many evils arising from the dangerous overhead wires, but at the same time repeats his recommendation of last year that the city own, erect and maintain all the poles necessary for electric lighting, for the use of which the city would derive a revenue, while at the same time it would place it within the power of the department to *remove all wires and fixtures of those who are unsuccessful in obtaining a renewal of their contract.*"

The Mayor of Wyandotte, Mich., Has Something to Say.

There has been for some time a Fort Wayne plant in Wyandotte, under the name of the Wyandotte Electric Light Company. In August of last year the question of bonding the city for the purchase of a municipal plant was submitted to popular vote, and resulted in 709 votes in favor of the plan with only 80 against it. The resolution was adopted by Council.

Mayor Campau says:

"The committee on public lighting, out of courtesy, then waited upon the Wyandotte Electric Light Company, asking them to submit a proposition for future lighting. This the company refused to do until after the unanimous adoption of a resolution to advertise for bids for a plant to be owned by the city. To the surprise of everybody, the company then submitted a proposition to light the city for a period of five years at a cost of $80 per light per year. This was a reduction of $10 per light over the contract which it held for three years previous. The most surprising thing was to notice that many of the aldermen who had previously favored the owning of a plant by the city then turned around and advocated giving the contract to the Wyandotte company. Only the fact that I was firm in ruling the motion out of order prevented it going through. The whole matter was then referred to the Committee on Public Lighting.

"Chairman Wm. Spears, of the public lighting committee, finally submitted his report, signed only by himself, Ald. Clark and Walcott refusing to join him. The report stated that the entire question of letting the contract to private parties was illegal, and not according to the will of the citizens as shown at the elections. The report recommended that the bids submitted by other companies be opened and acted upon. The report was laid on the table. The bids of the companies, then in possession of the clerk, were ordered opened and read. The General Electric Company and the Western Electric Company were the only ones which submitted bids. The General Electric Company's was $14,785, that of the Western $13,765.

"On account of a great deal of effort on the part of State Agent W. F. Davidson, of the General Electric Company, both verbal and written, the committee was led to believe that on account of the superiority of their apparatus, the great danger of infringements upon their patents, and their resources for defending all lawsuits on account of their enormous wealth—being capitalized for $50,000,000—it would be to the city's interest to award the contract to that company.

"The report was adopted, and the contract awarded to the General Electric Company.

"To my great surprise, I received a communication from John J. Martin, of Chicago, manager of the Chicago office, and W. F. Davidson, State agent, to meet them at the Hotel Cadillac here in Detroit, which I did, and was there informed by them that their company refused to carry out the contract, as the matter had been represented to the president of the General Electric Company, Mr. Coffin, that Wyandotte was an immediate suburb of Detroit, and the selling to our city of a plant by that company would establish a bad precedent right at home, and in view of the agitation going on in Detroit by Mayor Pingree and others, it would jeopardize their large investment here in Detroit, which amounted to $400,000, and for that reason they refused to carry out the contract. They said, however, that they would use their influence with Mr. Coffin to disabuse his mind of this; but in this they failed, as a short time afterward I received a brief letter from Mr. Martin, of Chicago, declining to carry out the contract.

"At a subsequent meeting, I submitted his report from the company, which report was accepted, and in so doing the General Electric Company forfeited $500, which was deposited as a guarantee for the fulfilment of their contract. At this same meeting there was a resolution offered by a member of the Council, submitting a proposition from the local company at present lighting the city. At this same meeting there was a petition of citizens sent in, signed by quite a number of taxpayers, asking the Council to award a contract to the present company. Nine-tenths of the signers were among those who had petitioned the Council previously to submit the question to the electors for the purpose of owning their own plant, and in connection with this petition a proposition was tendered by the local company, offering to light the city at $60 per light per year, giving mercantile arc lighting, first lamp $6 per month, all after that, $4 per month; incandescent mercantle lighting at 65 cents per month, private lighting 20 cents apiece per month for 10 lights or over. The proposition from the company was laid on the table.

"Chairman Spears, of the Electric Lighting Committee, presented a resolution setting forth that as the General Electric Company had declined to carry out their contract to erect a plant for the city of Wyandotte, therefore, be it resolved, as the bid of the Western Electric Light Company was not rejected, that it be accepted as modified, the price to be $11,937, and that the Mayor and clerk be instructed to enter into a contract with said company for the purchase of the same. The vote on this resolution stood 4 and 4, and I broke it by voting for the resolution, which was accordingly carried. Next morning I went to Chicago and secured the signature and seal of the Western Electric Company to the contract.

"In the face of all the foregoing proceedings, the present local company, and no doubt backed up by the General Electric Company, have become desperate, none but themselves knowing the means by which they have secured (as they claim) a sufficient number of members of the Council to override the law of our State and the will of the people, and involve the city in lawsuits and damages, the apparatus of the Western Electric Company being now on the way to Wyandotte.

"This action on the part of the Council is surprising, in view of the action already taken by the people, and in view of the fact that the bonds have been issued and sold and the money is now in the hands of the treasurer with which to pay for this lighting plant.

"In the face of the foregoing, it behooves the citizens of Detroit to see to it that the General Electric Company's grasp gets no tighter upon them than it is at present."

We will state for the information of Mayor Campau, that the Western Electric Company is a much stronger concern financially than the Electric Trust, and is abundantly capable of carrying out its undertakings.

If the councilmen of Wyandotte, or any of them, are thieves, having taken bribes of any nature to influence their action in this matter, they should be sent to jail.

Mayor Pingree Aroused.

"Electricity's" Influence is Apparent.

(*From the Detroit Tribune.*)

Mayor Pingree was aghast yesterday when he learned that the electric light companies had invaded Lansing with a powerful lobby for the purpose of killing the bill authorizing Detroit to do its own municipal lighting. The Mayor yesterday stirred up a number of people to send telegrams of protestation to the legislators and in addition issued the following proclamation:

"One of the head men of the Detroit Electric Light and Power Company, which at present has the contract for lighting the streets of the city, is reported to have said that 'if Pingree got that bill through the Legislature he would have to have more money than we have.'

"From this it would seem that the leading men in the Electric Light and Power Company, above alluded to, consider the question merely one of boodle. The bill introduced by Mr. Moore, himself a representative business man in this community, was asked for by a large number of the leading business men of this city, by most of the heavy taxpayers, and is known to be approved of by the masses. The House of Representatives at Lansing yesterday indicated by a large vote in committee of the whole that it was ready to pass such a bill, breaking the shackles by which the hands and feet of the municipality of Detroit are now held by the local branch of the Electric Trust.

"The bill, if it becomes a law, simply empowers the city of Detroit to provide for lighting its streets, either by contract with an electric light or gas company or by the purchase or building of a plant, as it may deem wise and expedient. It does not in any way commit the city to the plan of doing its own lighting, or to the abandonment of the present lighting contract. It simply enables the people of the city of Detroit to exercise their judgment as to how their streets shall be lighted.

"How long will our people stand this sort of thing?

"Perhaps they will wait until this electric company has allied itself with the gas companies, the Standard Oil Company and all the other great corporations and trusts, which are slowly but surely ossifying the blood of the body politic and have made the people a stone and the Legislature a puppet.

"The last man who was discovered in an open and barefaced attempt to corrupt the Legislature of Michigan is now a fugitive from justice and a wanderer upon the face of the earth. Will others be warned in time that they may be saved from a similar fate?"

Startling Claim for the Edison Patent.

An Illinois Editor on the Situation.

(*From the Peoria Transcript.*)

The first effect of the legal action referred to is that the Edison Company has caused a heavy advance in prices. The globes have in the recent past been selling at 50 and 55 cents each, but the advance is one of 20 cents on each lamp.

Machines can be purchased elsewhere, but not so with the lamps. Edison has the advantage in that he holds a patent on the shape of the globe.

A vacuum has to be round or oval, and it is this that Edison has full possession of.

We have always placed a high estimate on Mr. Edison's achievements, but manifestly not high enough. If he has fundamental patents on a "round vacuum" or an "oval vacuum," it is time for all other inventors to retire.

We think, however, that the editor of our Illinois contemporary has been visiting one of the distilleries for which his town is famous, and that he has as a consequence been in a trance, during which arc-lights, pear-shaped globes, the whiskers on the moon, and the patent situation became badly mixed.

Washington Bridge.

One of the most beautiful structures of its kind in the world is the Washington Bridge.

This engineering marvel of bronze, steel and stone is one of the sights of the metropolis.

It spans the picturesque Harlem River and the tracks of the New York Central and Hudson River Railroad at 181st street, New York.

The length of the bridge is 2,375 feet, height 133.5 feet above the river. It has two steel arches, each with a span of 510 feet, supported by three stone piers and two stone abutments. The piers are 98 feet long and 40 feet thick, of solid concrete, faced with dressed granite. The abutments are semi-circular arches of masonry, each having a span of 60 feet. There are a 50-foot driveway and two footways, each 15 feet wide. It cost $2,700,000.

A photogravure etching of the famous view of Washington Bridge, taken by Mr. W. H. Jackson, the noted landscape photographer of Denver, Colorado, has just been issued by the Passenger Department of the New York Central. The *Journal* has received a copy. It is a splendid piece of work, the finest example of this style of art produced in recent years. It is the work of the New York Photogravure Company, which fact alone is a guarantee of its excellence.

A copy of this beautiful etching, 17x22 inches, on fine plate paper, 24x32, can be obtained at the New York Central ticket offices, No. 413 Broadway, No. 942 Broadway, or at Grand Central Station, New York; No. 333 Washington street, Brooklyn, or of Frank J. Wolfe, General Agent, Albany Station, Albany; W. E. Brown, City Passenger Agent, No. 127 Washington street, Syracuse; J. C. Kalbfleisch, City Passenger Agent, No. 11 East Main street, Rochester; Edson J. Weeks, General Agent, No. 1 Exchange street, Buffalo; W. B. Jerome, General Western Agent, No. 97 Clark street, Chicago; or of Carleton C. Crane, Pacific Coast Agent, No. 10 Montgomery street, San Francisco, for 50 cents; or it will be sent free, postpaid, to any address, on receipt of 75 cents in stamps or money order, by George H. Daniels, General Passenger Agent, Grand Central Station, New York.—*Albany Evening Journal.*

Overhead Electric Tramways in England.

BY F. W. N. KING.

On Saturday, December 31, 1892, the first section of overhead electric tram system was opened to public service. The line now open goes through South Staffordshire, connecting the important Black Country towns of Bloxwich, Dudley Darlaston, Walsall, Wednesbury, West Bromwich and Handsworth, and serves a population of nearly 300,000. The portion of the system which has been electrically equipped comprises about eight miles. The cars up to now have been propelled by steam locomotives of the Wilkinson type, but the permission to use steam expired at the end of last year. The directors of the company, of which Mr. Alfred Dickinson is engineer, had various methods of electric traction to consider—namely, the accumulator, the conduit and the overhead wire. Of the two former there was little to be said, as neither has, as yet, been practically demonstrated to be perfectly satisfactory, so the latter was finally adopted.

The generating station is a substantial building which does not boast of much ornamentation and comprises an engine-house, boiler-house, stores, etc. It is situated on the Walsall road at the Pleck, which is about the centre of the lines. A canal runs close beside the works, and an arm has been cut alongside the boiler-house, so that if necessary fuel can be unloaded from boats right into the coal vaults. In the boiler-house are three boilers, each being 30 feet long and 7 feet diameter. They are tested by hydraulic pressure up to 200 lbs. per square inch, and are run at a pressure of 120 lbs. The engine-house contains three compound condensing engines, each of 125 I. H. P. at 100 lbs. pressure and 100 revolutions per minute. The high pressure cylinder is 16½ inches diameter, and the low pressure 20 inches, and they have a stroke of 30 inches. Each engine is fitted with a surface condenser and a 4½-inch diameter air pump with a 30-inch stroke, the same as the engine. Canal water is used for condensing. Each condenser is supplied by a centrifugal pump, driven by belting off the main shaft of each engine. The driving pulleys upon the engines are 10 feet diameter, and are each proved to carry nine 1¼ inch diameter ropes; these in turn drive the 2-feet pulleys upon dynamos. This system of driving was adopted in preference to belting owing to the increased factors of safety obtained, as it is possible to continue working with several of the ropes broken. There are three dynamos of the Elwell-Parker type. They are shunt wound and have drum armatures, and each gives at 450 revolutions 250 amperes at a pressure of 350 volts. The switchboard is placed at the end of the engine-house nearest to the road, and upon it are placed an ammeter, voltmeter and resistance coils, and an automatic magnet cut-out switch for each dynamo. The switch is so arranged that when there is a flow of current in excess of the capacity of the installation it is automatically thrown out, thus breaking the circuit and reducing the risk of damage to the dynamo to a minimum. The whole of the buildings are lighted by means of incandescent lamps. A feeder-cable is laid out from the switchboard at the generating station underground to the roadway, whence it is run along the outside edge of the channeling, some 15 inches below the surface of the roadway, so as to feed into the trolley wire near to the points of heaviest load upon the road, connections being made to the trolley wire every half-mile by means of branch distribution boxes. From these boxes two other cables are carried up the inside of the pole and along the arm which supports the trolley wire, and are connected to the line-breakers, which divide the trolley wire up into half-mile sections. Between the cable which comes off the main feeder into the fuse box and those which run up the pole there are two fuses. These are so arranged that in case of any short circuit or ground being made on any section of the trolley wire, as would probably be the case if the wire broke, the fuse burns out and disconnects the section of the line. The trolley wire is solid hard drawn copper of 8 B. W. G. It is fastened by means of copper clips to insulators which are suspended from the arms of the poles. Every pole is composed of two tubes, a cylindrical and a tapered one, the latter being shrunk into the former. They are 30 feet long over all, a buckled steel brass plate, 2 feet square, bolted to the base of each, which rests upon the concrete foundation extending 6 feet into the ground. There are three different sizes of poles, those for ordinary single lines being 6 inches outside diameter at the base and tapering to 3¾ inches at the top, and having arms varying from 2 feet 6 inches to 6 feet 6 inches in length. In most cases these poles are fixed in positions originally occupied by lamp columns at the junctions of the roads, and these have been fitted with lamps and gas fittings to replace those removed. Sixteen cars have been specially built for this electric line; they are of a 3 feet 6 inch gauge; and have fixed wheel-bases of 6 feet, the wheels being 34 inches in diameter and specially made with rolled steel tires upon cast steel centres. These conveyances carry forty passengers—twenty-two inside and thirteen outside.

There are two pairs of carbon brushes on each motor, and they are accessible from the inside of the cars by means of traps in the floor. Each car is fitted with an ordinary quick-action brake, and also with an entirely independent emergency brake, both of which are operated from either platform of the car, thus giving the conductor an equal chance with the driver of stopping the vehicle in case of danger. The switch-boxes on the platforms of the cars each contain a lightning arrester, a controlling switch, a reversing switch and a motor switch—the latter being for the purpose of disconnecting either motor. The pressure used here is only 300 volts while in the United States it is 500.

Several hundred invited guests assembled at the generating station to witness Mrs. Carruthers-Wain, wife of the chairman for the South Staffordshire Tramways Company, switch on the current and afterward declare the line open for public service.

Death of Dr. Norvin Green.

Dr. Norvin Green, President of the Western Union Telegraph Company, died at Louisville, Ky., February 12. Dr. Green was born in New Albany, Ind., in 1818, but when only four years of age was taken by his parents to the then wilderness of Kentucky where his boyhood was spent.

In 1840 he graduated from the Medical School of the University of Louisville, but only continued in the practice of medicine for a short time, after which he served for several terms in the Kentucky Legislature. In 1853 he became interested in the Louisville and New Orleans Telegraph Company, with which business he has ever since been connected. When this company was absorbed by the Western Union, he was made Vice-President of the latter and afterwards was elected President.

Dr. Green was also President of the first Edison Company, organized in 1878, and was the first President of the American Institute of Electrical Engineers.

He combined a most genial personality with unusual executive ability, and to the latter qualification he himself attributed his success in the management of the extensive business of which he was the executive head.

The St. Louis Convention.

Transportation Arrangements.

An excursion rate of a fare and a third has been granted to St. Louis and return for delegates attending the Convention of the National Electric Light Association by all the Passenger Associations except the Western; negotiations are now pending with that body, and in all probability they also will grant this concession.

Arrangements have been perfected for a special train to carry the Eastern delegation, which will be vestibuled and electrically lighted and composed of dining, buffet, observation and sleeping cars, and will leave New York via Pennsylvania Railroad from stations foot of Cortlandt and Desbrosses streets, Sunday, February 26, at 12 o'clock noon; Philadelphia, 2:25 P.M.; Harrisburg, 4:25 P. M.; Pittsburg, 10:40 P. M. (central time); Columbus, 4:35 A. M.; Indianapolis, 10:30 A. M.; arriving at St. Louis at 5:30 P.M. Monday, February 27.

The rate for berths is $6 each; drawing-rooms, $22 each.

For the convenience of passengers taking this train from New York, arrangements have been made so that if they will remit to the undersigned the amount of railroad fare ($24.25) with the sleeping-car fare ($6.00) a receipt will be mailed them that will be honored by the railroad company for checking baggage, ferry passage, and passage through the gate at Jersey City, and exchangeable on the train for regular ticket and certificate.

The Boston Passenger Committee have declined to sell tickets at a reduced rate from Boston via New York; therefore the Eastern delegates who desire to take the Electrical Special will be compelled to come to New York, purchase tickets, and secure certificates from New York to St. Louis and return.

It is quite important that all the names of delegates who will be passengers on the Electrical Special should be known as soon as possible.

The following named gentlemen have charge of transportation matters in their various territories:

Morris W. Mead, Pittsburg, Pa.
Fred. W. Royce, Washington, D. C.
John Carroll, Montreal, Canada.
A. C. Shaw, Boston, Mass.
H. A. Cleverly, Philadelphia, Pa.
M. J. Hart, New Orleans, La.
John W. Flintham, Denver, Col.
J. Scribner, 173 Adams street, Chicago, Ill.
Louis Nahm, St. Louis, Mo.

To secure the benefit of the reduced fare returning, it will be necessary for those who do not go by the Electrical Special to be sure and state to the ticket agent, at the time they purchase the going ticket, that they purpose attending the meeting of the Association in St. Louis, and procure from him a certificate which will entitle them, when properly vised and countersigned, to return for one-third the regular fare. No reduction can be obtained without this certificate. Immediately upon arrival in St. Louis, these certificates should be left at the secretary's office, addressed to the undersigned, who will see that they receive proper attention and are returned to the owners.

C. O. BAKER, JR.,
Master of Transportation.
136 Liberty street, New York.

"Practical Electricity."

Mr. H. E. Swift, a gentleman well and favorably known in Boston, has assumed control of *Practical Electricity*, and will endeavor to give Boston and New England a local electrical paper of merit. We welcome Mr. Swift, and trust that he will follow the good example set by ELECTRICITY—*telling the truth* at all times. There is a good deal of *truth* to be picked up in Boston these days.

In connection with the International Electrical Exhibition to be held in Milan in 1894, the committee propose to offer a prize for the most important invention in electricity, more especially as relating to the transmitting of energy to distances and its transformation for industrial purposes.

Buffalo, N. Y.—It is said that Niagara Falls has offered the Stern Incandescent Lamp Company $50,000 in cash and 38 acres of valuable land if they will establish their factory there.

Real Merit Is Recognized.

(*From the "Popular Electrician," Lynn, Mass.*)

One bright and newsy Electrical Journal seems to flourish without the aid of the General Electric Company. We mean ELECTRICITY, and are glad to see one Electrical paper independent enough to stand on its own bottom. In the words of Rip Van Winkle, "May it live long and prosper."

How it Looks in Boston.

The Boston *Post* remarks:

"That General Electric is looked upon as a sale. That it is the belief that the suit now pending before Judge Colt, between the General Electric and the Beacon Lamp Company, will be decided in favor of the latter company, and that in this case the stock of the defeated company will see much lower quotations."

Legal Notes.

The mandamus proceedings begun by the Durand Land Company against Civil Justice Jeroloman, of the Eighth District Court, to compel him to entertain a dispossess proceeding against the Thomson-Houston Electric Company, came up on Friday last.

The question involved in the mandamus proceedings is whether an act of the present Legislature, passed January 24 last, applies retroactively to a proceeding begun by the Durand Land Company against the Thomson-Houston Company.

The first named company obtained judgment against the latter for $95,279 for rent, and the collection was stayed by an appeal. Meanwhile unpaid rent has accumulated until it amounts to $20,000, and the Durand Company cannot obtain judgment for this and subsequently accruing rent without waiving the forfeiture of the lease occasioned by previous failures to pay.

It was said yesterday by counsel that the act of the Legislature in question applies at present to no other case and that its passage was procured in the interest of the Thomson-Houston Company to meet a decision of the Common Pleas adverse to it. It is said that the effect of the act will be to enable tenants, by taking appeals from judgments for rent rendered against them where landlords sue for use and occupation, to occupy the premises without payment indefinitely, or at any rate as long as an appeal can be carried from one court to another. Meantime landlords can have neither their rent nor their premises. The expenses of appeals, however, will render this policy impracticable save where the rent is large.

Judge Bartlett, of the New York Supreme Court, has granted an attachment against the property in this State of the River and Rail Electric Light Company as a foreign corporation. William L. Bigley is suing the company to secure money owed him.

At Denver, Colo., Clement B. Smythe a few days ago purchased at sheriff's sale for $3,000 the stock of goods of the Midland Electric Company at 1,737 Champa street.

Boston Notes.

The Sawtell Company have removed their offices to the Shawmut Building, 146 Franklin street.

A good deal of excitement is being caused in Providence, R. I., by a report that has gained credence that the West End Railroad Company of Boston is trying to secure control of the Union Street Railroad. The latter company is capitalized at $2,000,000, and is said to have been paying 18 per cent. quarterly dividends. The par value of the shares is $100, and last week $240 was asked. The price has gone up since then to $260. President Whitney of the West End Company denies the rumors in toto. That the Boston company is trying to secure control of the Interstate Electric Railroad is admitted. Should the latter deal be consummated, the former would be pretty sure to follow, for the Interstate runs through from Attleboro, Mass., to Providence, R. I.

The Edison Illuminating Company of Boston is now supplying current for 75,000 incandescent and over 400 arc lights, and the demand for more is a matter of almost everyday occurrence. Their three large central stations are inadequate, and a fourth has become necessary.

An important and interesting patent case was tried in the United States Equity Court Wednesday, before Judge Carpenter. The litigants were the Electric Gas Lighting Company vs. the Holtzer-Cabot Electric Company, both of Boston. The device in dispute was an electric gas lighter, the patents on which have been owned for years by the Electric Gas Lighting Company, which owns about all fundamental patents on these devices, and has been doing an enormous business with them for years. It was claimed that the defendants have been infringing one of their patents. Samples of many different types of electric gas lighters were shown in court by both parties in interest, and the case was argued at length by Boston and New York counsel employed. After all the evidence had been submitted, the Judge took the subject under consideration and will give his decision shortly. As this case has most important bearings on this branch of the electrical business throughout the country, great interest is felt in the outcome of the suit.

The members of the Catholic Union of this city had a rare treat on Tuesday evening, February 7, when Mr. Peter A. Dowd, a well-known and accomplished electrical engineer, gave an interesting address on "The Electric Motor." The subject was discussed from a historical and commercial standpoint rather than in a technical manner, though a brief resume of the labors of Michael Faraday, Sir Humphry Davy, Dr. Galvani and other pioneers in the electrical field was presented in an appreciative manner by the speaker. His Eminence Archbishop Williams was present and was particularly interested in the subject.

The Nova Scotia Power Company of Halifax, N. S., has transferred all the street railway plant of that city over to the Old Colony Trust Company of Boston as security for the issue of $240,000 in bonds, the cash to be used in building an electric street railway through Halifax. The local electric lighting plant was included in the transfer.

A most interesting case is at present before Mr. Justice Morton in this city. Some three or four years ago the Citizens' Gas Light Company was organized in Wakefield, Mass., for the purpose of lighting that town and the adjoining town of Stoneham. A gas plant was established and subsequently an electric lighting plant was added and a combined business has been carried on. After the Municipal Lighting Act became law, in 1891, the purport of which law was to enable towns or cities to purchase or build their own lighting plants, the citizens very soon began to think they ought to avail themselves of this law and own their own plant. Public meetings were held; the movement met with popular favor, and funds were appropriated for the purpose. It was not thought best to purchase the local plants, but to contract for new ones. The Citizens' Company were prepared to sell theirs, and they are now seeking to induce the court to compel the town to purchase its plant. The court appears to take an opposite view, and the town authorities have determined to test the constitutionality of the Municipal Lighting Act as a whole rather than be compelled to do what they didn't want to.

There is at present under construction at the works of the General Electric Company in Lynn a 20 H. P motor that will weigh only 1,250 pounds. This will supersede the present type of 15 H. P. motor that weighs 2,000 pounds.

The incandescent lamp makers of Boston keep uncommonly busy filling orders which flow in with their usual volume. The decision in the lamp case which Judge Colt will give ere long is being looked forward to with intense interest by all electrical men, the general feeling being that the whole lamp case is in a fair way for being reopened. The additional evidence handed to Judge Colt a week ago has proved interesting reading, and the demand for the special supplement issued by ELECTRICITY was great, the supply being exhausted immediately on arrival.

A new device called an "Illuminable Revolvable Electric Sign and Signal Combined" has been invented by Dr. *A. T. Buswell, Boston*, and is placed upon the market with every appearance of being a success. It is for use on electric street cars at night to indicate to passengers the routes along which the cars run, also the places they run to. This will be accomplished by a colored lamp attached to the trolley arm, indicating the route, with a four sided revolving sign over the driver's head, illuminated by electric lamps inside, the glass sides of the sign having written on them names of streets, avenues or districts. It is a most ingenious device and will meet with speedy recognition.

General News.

What is Going on in the Electrical World.

Montreal, Can.—The late fire entirely destroyed the electric plant in the Ogilvie block.

Yuma, Ariz.—A San Francisco capitalist intends to build an electric street railway in this town.

Urichsville, Ohio.—An electric railroad is to be built between this place and New Philadelphia, the county seat.

Hyattsville, Md.—An electric railway from Washington to Hyattsville is no longer a matter of speculation. A portion of the line has already been surveyed.

Pittsburg, Pa.—McKee & Brothers' glass factory at Jeannette, it is stated, will soon begin the manufacture of incandescent electric light bulbs, shades and glass bells.

Rome, N. Y.—The work on the electric system is going ahead on all sides, and if the weather continues favorable the cars will soon be on the tracks. The power house is nearing completion.

Baltimore, Md.—The Baltimore Traction Company has determined to push the work of supplying with electrical equipment the subsidiary lines recently acquired by the company.

Albany, N. Y.—Assemblyman Plant has introduced a bill in the House creating a State Board of Telephone Commissioners, with power to fix the telephone rates throughout the State.

Indianapolis, Ind.—Judge Elliott has made a formal request to the Board of Works for a grant of the right of way for a new street railway line. The road will be an electric one and will be located chiefly on the South Side.

Laurel, Md.—The Electric Light Company of Laurel have erected part of their poles, and will have them all up and wired in a few days and in operation about the first of March. The power house has been erected and most of the machinery put in.

Seattle, Wash.—The Union Electric Company is fitting up a handsome library for the use of its employes at its office on Second street. It will be supplied with books on the subject of electrical engineering and all the current electrical periodicals.

Atlanta, Ga.—It is proposed to equip the Pryor street dummy line for electricity. The same change will be made on Georgia avenue from Pryor to Grant Park, and on Piedmont avenue north to the city limits there will be a line of electric cars.

Ishpeming, Mich.—The Cleveland Cliff and Lake Angeline Iron companies, two of the largest producers in the Lake Superior district, have signed contracts with the Thomson-Houston Company for complete underground electric traction plants, costing $50,000.

Alexandria, Va.—A new company has recently obtained a charter for an electric railroad from Alexandria to Washington, with branch lines to Arlington, the Theological Seminary, and to Falls Church. L. W. Spear is the chief promoter of the new enterprise.

Elkton, Md.—The Elkton Electric Light Company has been applied to by citizens of Chesapeake and North East for an estimate of the probable cost of furnishing current for electric lights for those towns from the Elkton plant. They are each about six miles from Elkton.

New Brunswick, N. J.—The proposed electric road will make a belt line around the city and will connect with the Raritan River Railroad station on Commercial avenue and thence run across town to French street. The charter is being considered by the Board of Aldermen.

Middletown, Ohio.—Several of our wealthy citizens have determined upon having an electric street railway in the city, and have applied for a charter. The capital stock is $100,000, and the incorporators are George Jacoby, Charles Goldman, Joseph Iseminger, W. O. Barnitz and Wm. P. Noble.

Gallitzin, Pa.—The borough council has granted a franchise for electric lighting, and a company has been organized with a capital stock of $12,000 to establish a plant in this town. Among those identified with the movement are Dr. Ferguson, M. Fitzharris, Thomas Bradley and J. L. Mitchell.

Findlay, Ohio.—In the suit brought by the Findlay Electric Light and Power Company attacking the franchise of the Hancock Electric Light and Power Company on the ground that it had never been submitted to the people, Judge Norris, in the Common Pleas Court, decided in favor of the Hancock Company.

Canandaigua, N. Y.—The Canandaigua Electric Light Company have purchased the Littleville flouring mill, about six miles from town, and will put in an electric plant there by which they propose to light the village and run the street cars. The water power at the old mill is to be utilized in generating electricity.

Waterford, N. Y.—An electric railway line is projected to run from Waterford to Mechanicsville and then follow the route of the present street railroad to Stillwater; thence along the Hudson to Schuylerville and Fort Edward, whence it will connect with the Fort Edward, Sandy Hill and Glens Falls street railway.

Detroit, Mich.—The contract for electric car motors has been awarded to the Detroit Electrical Works by the Citizens' Street Railway Company. Before awarding this contract the motors of several systems were tested, under various conditions, and the showing made by the Detroit motors was so satisfactory that the home company secured the contract.

Salt Lake, Utah.—The West Side Rapid Transit Company have electric cars now running on their line. As soon as the weather will permit the work of extending the line to Crescent Beach at the lake will be begun.—If the negotiations now pending are successfully carried through the Salt Lake Electric Light, Power and Heating Company and the Salt Lake Gas Company are soon to pass into the hands of an English syndicate.

Washington, D. C.—The Columbia Street Railway Company have made application to the Commissioners for permission to adopt electricity on their line, the system to be the underground conduit. Although more expensive than the trolley, it is said to possess advantages that make it preferable to that mode of propulsion. The underground conduit system selected has been successfully operated in Buda-Pesth.

San Angelo, Tex.—The dam in the South Concho River which was washed away about six months ago, entailing heavy losses to the electric light and power company, has been replaced by a stronger one about five miles south of the town, the water from which is conveyed in a canal to the power house of the company, a short distance out of the city, where a fifty foot fall supplies power sufficient to run the electric lights of the town, woolen mills, etc.

McKeesport, Pa.—The electric railway to connect McKeesport and Wilmerding will be built at an earlier date than expected. The land company working in connection with the railroad company has decided to arrange for a model town on its plan, which embraces almost 300 acres between McKeesport and Wilmerding. A big water works will also be erected in North Versailles township to supply the town and an electric plant to supply power for the road and light for the business houses and dwellings.

Philadelphia.—The *Inquirer* says: "A ride from Philadelphia to Washington by way of Baltimore in a trolley car is one of the possibilities of the future, and if legislation is favorable and the investing public continues to have faith in the Philadelphia Traction magnates, that future may not be far distant. The principals of the Traction syndicate, Messrs. Widener and Elkins, already have a firm footing in two of the cities mentioned; they are acquiring a foothold in the third; have projected a portion of the connecting line and are shaping legislation which will enable them to consummate the plan as above outlined."

Lynchburg, Va.—Application has been made to council for permission to build a new electric street railway, the route to be down Cabell street from a point where it intersects the corporation line to Sixth street, thence along said Sixth street across Sixth street bridge to Commerce street, thence along Commerce street to either Seventh or Eighth streets thence with said Seventh or Eighth street to Church street, thence along Church to Washington, thence along Washington to Grace, thence following Grace to a point near the Presbyterian cemetery. The Rivermont Electric Car Company is said to be sponsor for the scheme.

ELECTRICAL COMPANY ELECTIONS.

The Youngstown (Ohio) Gas Company, the Youngstown Electric Light Company and the Mahoning Electric Light Company, all under the same directory. Directors: C. H. Andrews, George Tod, John B. Smith, W. E. Taylor, Thomas E. Davey, Frank Hitchcock, John C. Wick.

Electric Light and Power Company, Centralia, Ill. President, O. V. Parkinson; secretary and treasurer, F. F. Noleman; superintendent, J. R. Young; directors, O. V. Parkinson, E. A. Hartman, A. H. Rainey, James Benson, F. F. Noleman, G. E. Els, M. C. Wetmore, R. J. Merkle and R. J. Young. The capital stock is to be increased from $10,000 to $20,000, and an arc system put in.

Flatbush District Telegraph Company, Flatbush, L. I., N. Y. President, Isaac Harris; vice-president, James Ryan; treasurer, W. G. Pearson; secretary, W. H. Pearson. These officers and Messrs. Henry Hesterberg, William M. Lynam and John Maguire comprise the directors.

East End Electric Light Company, Pittsburg, Pa. The old board of directors was re-elected, as follows: James H. Willock, E. H. Myers, H. C. Bughman, John S. Scully and George H. Blaxter.

Toledo Electric Light Company, Toledo, Ohio. President, J. J. Moore; vice-president, J. S. Rodgers; secretary, E. C. DeLong; treasurer, G. G. Hadley, Sr.; directors, J. J. Moore, E. W. Wilson, E. C. DeLong, J. S. Rodgers and G. G. Hadley, Sr.

A Progressive Concern.

Messrs. J. Jones & Son, of 39 Vesey street, New York, dealers in general electrical supplies, report an unusual demand for the well-known goods manufactured and handled by them, and Mr. Ernest A. Lowe, manager of the company, expresses great satisfaction at the outlook for business during 1893. They aim to include the entire field of electrical supplies and in addition to this carry a stock of specialties which have been well patronized. Among these may be mentioned the Varley Electric Time Call, Berlin Watch Demagnetizer, DeMott Electric Motors, Medical Appliances, etc. The company invites correspondence concerning any class of electrical goods and will furnish circulars, prices, etc., on application.

The Carpenter Enamel Rheostats.

The principle of the Rheostats manufactured by the Carpenter Enamel Rheostat Company of Bridgeport, Conn., is set forth at length in a neat pamphlet recently published by the company. Its operation consists in the conduction and dissipation of heat by holding a resistance wire in intimate mechanical contact with a supporting plate, so that the heat generated in the resistance wire, by the passage of a current, is rapidly conducted to the plate, which becomes the radiating surface. This is accomplished by the use of enamel, which attaches the wire to but insulates it from the radiating surface plate, and which also completely surrounds the wire and protects it from chemical action. In this way the capacity of a resistance wire for current is greatly increased. In practice it is found that a wire that will carry a certain current when exposed to the air will carry ten times that amount of current safely in this rheostat. On this principle, since the cross section of the conductor can be greatly reduced, it follows that its length can also be proportionately shortened for any required resistance, and no consideration of mechanical strength of the wires enters into this construction since it is so perfectly protected and supported on all sides.

For convenience in rapidly supplying the demands of concerns preferring to furnish their own regulating switches, Standard Plates for four sizes of motor starting rheostats are always carried in stock by the company. These plates have bosses or lugs at the corners for convenience in attaching to switch, and are provided with connecting bolts, insulators, etc., at the connecting points of the resistance.

The Carpenter Company manufacture their rheostats in several forms with a view to their adaptation to the various uses for which they are intended. Among the appliances they furnish are regulating switches, theatre dimmers, feeder equalizers, arc lamp resistances, etc. Chas. D. Shain, 136 Liberty street, New York, is the general selling agent of the company.

The Buckeye Lamp.

Both the New York and Chicago branches of the Buckeye Electric Company have sold during the past sixty days enormous quantities of their well known Buckeye lamps. They are now putting on the market a coiled filament lamp which has proved a favorite with the trade and is in large demand.

This enterprising concern are prepared to furnish lamps in any quantity on short notice, made to fit any standard sockets.

National Electric Manufacturing Company.

Attention is called by this company to the following tests of their transformers during which the temperature of the iron was raised to 90 degrees. These transformers are wound for 1,000 volts on the primary and 100 volts on the secondary coils:

TRANSFORMER NO. 9,880.

Primary load,	1.844	amperes.
Secondary load,	18.220	amperes.
Efficiency,	98.76	per cent.

TRANSFORMER NO. 9,882.

Primary load,	1.895	amperes.
Secondary load,	18.220	amperes.
Efficiency,	96.09	per cent.

TRANSFORMER NO. 9,921.

Primary load,	1.853	amperes.
Secondary load,	18.220	amperes.
Efficiency,	97.29	per cent.

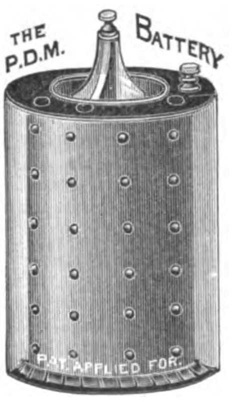
The Commonwealth Electric Company.

The office of the Commonwealth Electric Company in Philadelphia is now at No. 418 Market street, the removal to the new location being rendered necessary by the demands of increasing business. The company are now prepared to fill orders on the shortest possible notice, and guarantee their work in every particular.

Trade Note.

Mr. W. R. Mason, the General Manager of the Railway Equipment Company, Chicago, has just sent out a circula to the Eastern trade, calling attention to the unequaled facilities of the company for furnishing everything necessary for the complete equipment and maintenance of electric roads, and also calling particular attention to the merits of type "G" overhead material manufactured by his company. This material has been specified on a majority of the leading roads during the last season. He also informs the trade that he expects to be in New York the latter part of this month, and will call on the leading contractors and street roads in the East.

The Premier Batteries.



The Premier products have become so generally and favorably known among the users of electricity that it may appear intrusive to speak of them, but as improvements are being constantly made in these as in all other electrical appliances, it is within the province of an attentive journal to give them such notice as they deserve. Among the latest products of the maufacturer of the Premier appliances is a new form of Bluestone Battery, which as a motor battery for operating from 4 to 12 inch fans, or even larger, is considered a highly efficient contrivance, and is commended by the maker as superior to any in the market. The motors used with this battery have distinguishing features that will be appreciated by all who have occasion to employ such apparatus; they need not be specially wound, and resistance coils and short-circuiting devices are not necessary to keep the battery in working order when motors are not required. The commutator, if oil is used sparingly, will always remain clear and bright. No chisels nor scraping tools are necessary, an old cloth is all that is required to keep the zinc of this new cell clean: the coating never hardens on the zinc. These cells have run the No. 3 Premier Motor 200 hours continuously, at a cost of less than 50 cents. The zincs will last 1,500 hours, and are never taken out of solution. The best type of cell for running sewing machine motors, for large induction coils, electro-plating, experimental work, or where a powerful current is necessary, contains a surface of nearly 100 square inches of best quality oxidized carbon and 60 square inches of zinc. The zincs are made specially for this cell, and with a view to increase of electro-motive force and a decrease of internal resistance, hence increased efficiency and economy. The Premier Grenet Battery, the manufacturer claims is ahead of all other cells yet produced for amateurs and students in electricity. The carbons are of the same quality as those used in the Premier Battery. These cells have been very successful. Circulars containing full particulars may be obtained by applying to the sole manufacturer of the Premier Batteries, M. R. Rodrigues, Nos. 17 and 19 Whipple street, Brooklyn, N. Y.

INCORPORATIONS.

The Perry Electric Light Company of Perry, Wyoming County, N.Y. Capital, $25,000. Directors: Henry N. Page, William D. Page, M. H. Olin, George K. Page, Clarence M Smith, all of Perry.

A new electric railway company at Chattanooga, Tenn., represented by C. E. James, Willard Warner, Xen Wheeler and others, have made application for a charter. The rights of way to and through the suburbs east of the city have been granted.

The People's Traction Company, of Philadelphia, have applied for a charter to operate passenger railways by cable, electrical and other means. The capital of the company is $10,000,000, and $1,000,000, 10 per cent. of the capital stock, has been paid in cash to John Lowber Welsh, of Philadelphia, treasurer of the company. The directors are Wm. H. Shelmerdine, R. Nelson Buckley, John Lowber Welsh, Edward J. Matthews, Caleb F. Fox, Philadelphia.

An electric company is being organized in Athol, Mass. The capital stock of the company is $60,000, and among the local men interested are N. D. Lucy, C. A. Chapman and H. R. Barber.

The Harrison International Telephone Company, Chicago. Capital stock, $80,000,000. Directors: Dr. E. M. Harrison, Fort Smith, Ark.; L. E. Ingalls, Chicago; George R. Peck, Topeka, Kan.; Charles M. Ferree, Albert I. Stone, Major William Warner, John T. Blake, Howard M. Holden, Webster Davis, Kansas City; Richard C. Kerens, D. J. Young, St. Louis. The telephone will comprise what will be known as the long distance typewriter, a system of telegraphy which is calculated to abolish the dot and dash. The typewriter will be more or less of the ordinary character. Each word is spelled out and an exact fac simile produced on the machine with which it has been connected by electric wire. The cost, it is said, will be one-third less than telegraphy.

The St. Louis, Collinsville and Eastern Railroad Company, of East St. Louis, Mo. Capital stock, $250,000. Incorporators: Alexander Young, St. Louis; Walter Young, St. Joseph, Mo.; James Hannerty, Chicago; John S. P. Gordon, Collinsville, Ill.; and Perry A. Gordon, Glen Carbon, Ill. The object of the company is to build a railroad from East St. Louis to Collinsville, with a branch to Venice, Ill.

Universal Electric Launch Company of Nyack, N. Y. The purpose of this company is to manufacture, lease and sell boats propelled by electricity and of batteries, machinery and other supplies for the use of sail boats. Capital, $25,000. Directors: Stephen R. Bradley, Stephen R. Bradley, Jr., and Charles L. Seabury of New York City, and Andrew L. Riker and Thomas L. Proctor of Brooklyn.

The Varley Duplex Magnet Company, Englewood, N. J. Capital stock, $20,000. Incorporators: F. C. Jones, of New York; Richard Varley, Jr., Wm. Varley, and Treadwell Cleveland, Englewood. The company will manufacture duplex magnets, electrical appliances, machinery, etc.

A certificate of incorporation of the Bound Brook Electric Light, Heat and Power Company has been filed in the office of the Secretary of State at Trenton, N. J. The capital stock is $5,000. The incorporators are Charles P. Sebring, of Plainfield; Louis J. Auerbacher of Newark, and Frederick H. Cook, of Bound Brook.

The Patty Electric Burglar Alarm Company, Cooper, Iowa. Capital stock, $5,000. President, T. S. Patty; John Frame, treasurer; C. E. Miller, secretary. Mr. Patty has recently had patented a closed circuit burglar alarm, and it is the intention of the company to manufacture these machines.

Electric Supply Company, Port Huron, Mich. Capital stock, $5,000.

The Southern Electric Railway Company, of St. Louis. Capital stock, $1,500,000. Incorporators: Tom L. Johnson J. C. Richardson, E. S. Lovejoy and others.

The Manasquan (N. J.) Electric Light and Power Company. Capital stock, $25,000. Incorporators: George Lane, Wm. E. and E. G. Harrison, Asbury Park; M. Stanton Taylor, Spring Lake.

The Fonda and Fultonville Electric Railway Company, Fonda, N. Y. Directors: James Shanahan, Tribes Hill; Edward Wemple, William P. Myers, Charles Pickard, A. Z. Wemple, William Niles, Fultonville; J. Hess, Fonda; James P. Argersinger, John G. Ferris, James I. Younglove, Johnstown; G. Lever, A. J. Zimmer, P. C. Freuycar, James S. Burr, Gloversville. The company will operate a street railway from Fonda to Fultonville.

Electrical and Mechanical Engineering and Trading Company of New York City. Capital stock, $150,000. Directors: J. H. Vail, George F. Sandt, Westfield, N. J.; U. T. Factenthall, Brooklyn; J. H. Miller, Mount Vernon, and H. Wray Weller, Jamaica. To act as consulting, contracting and constructing engineers for electrical and mechanical construction and to deal in apparatus, materials, etc.

The Lewistown Electric Light and Power Company, Lewistown, Fergus County, Mont. Capital stock, $10,000. Incorporators. M. M. Erickson, Cyrus Styles and W. C. Waldo.

The Florida Telephone and Telegraph Company, Pensacola, Fla. Capital stock, $25,000. C. M. Baldwin, president and general manager; John C. Witt, secretary and treasurer. The company was organized to build and operate telephone lines in Pensacola and other Florida towns.

The Lancaster and Philadelphia Electric Railroad has been chartered with a capital of $1,500,000. The line, commencing in the city limits of Lancaster, will extend through Lancaster township, East Lampeter, Paradise Borough, Salisbury Borough, Landisville Borough, West Salisbury Township, over the Philadelphia and Lancaster Turnpike, to Coatesville Borough, then along the same road to Downingtown, to Radnor and Bryn Mawr, where it will connect with the electric road into Philadelphia.

The Ocean City Electric Railway Company has filed a certificate of incorporation in the County Clerk's office at Cape May, N. J. Directors: Ezra B. Lake, H. B. Adams, J. E. Lake, R. B. Stites, W. S. Lake, William Lake, of Ocean City, and Dr. Gilbert E. Palen, of Philadelphia.

The North Side Electric Street Railway Company, Chicago, Ill. Capital stock, $500,000. Incorporators: August Rieke, F. W. McNally and William Kilpatrick.

The Augusta Electric Light and Manufacturing Company, Augusta, Ill. Capital stock, $16,000. Incorporators: William Golm, B. B. Garm, D. P. Coffman, R. J. Grigson and O. L. Pitney.

COMMERCIAL PARAGRAPHS.

The Packard lamps are more in demand to-day than ever before, and the factory at Warren, O., is taxed to its full capacity.

The Consolidated Electric Manufacturing Company of Boston will soon be an active competitor in the field of arc-lighting apparatus.

The National Electric Manufacturing Company of Eau Claire, is carrying on a very active campaign and with gratifying success.

The Waddell-Entz Electric Company are installing several very fine plants just now. Their plant in the *Mail and Express* Building is worthy of examination by all intending purchasers of isolated plants.

"Gonda Batteries" long since passed the experimental stage, and the best exponents of their merits to-day are those who have used them the longest.

One of the most important features of a correct and efficient steam plant is a good packing material. The Gould Company, of East Cambridge, Mass., are among the oldest in this line. Central station requirements have received careful attention by this company.

The Briggs & Allen Manufacturing Company, of Lawrence, Mass., has contracted for a 350-light dynamo to light its mill. The machine will operate about 300 incandescent lamps and 3 or 4 arc lamps. The Rodney, Hunt Machine Company, of Orange, Mass., has also ordered a machine of the same size. From it 200 incandescent lights will be run and several arcs. Both machines are of the Mather type.

The firm of Swan & Lane, electrical engineers, 192 Summer street, Boston, will in future be continued at the old address by Mr. Fred Swan alone, his partner, Mr. Lane, having retired. Mr. Swan is one of the most talented engineers in the country and enjoys a fine reputation for theatre, ballroom and similar artistic illuminating undertakings. At the present time several good contracts are in hand.

Cumner, Craig & Company is the title of a new firm of electrical engineers having offices in the John Hancock Building, Boston, Mass. They do general construction work in addition to representing several leading firms. Though only recently organized, this new firm is handling motors, dynamos and batteries at a lively rate.

"Insullac," the new insulating medium, made solely by the Massachusetts Chemical Company, Boston, has captured the whole electrical fraternity throughout the country. It is being shipped everywhere.

The Detroit Electrical Works announce the appointment of Mr. E. L. Myers as District Manager for the company with offices in Nos. 917-918 Monadnock Building, Chicago. The company is to be congratulated on securing the services of Mr. Myers, whose business qualifications and popularity in the trade make him a valuable acquisition.

The Electric Light and Manufacturing Company of Richmond, Va., finds constant employment for several competent mechanics, and seems to be doing a satisfactorily profitable business.

The contract for forty-three additional electric motors was awarded last week by the Detroit Citizens' Street Railway Company to the Detroit Electrical Works, whose motors on the Jefferson and Woodward avenue lines have proved so satisfactory.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED FEBRUARY 7, 1893.

ELECTRIC RAILWAYS AND APPLIANCES.

491,132. Inclosed Conductors for Electric Railways. Frank C. Perkins, Dunkirk, N. Y. Filed May 27, 1892.

491,210. Trolley-Stand. Samuel Harris, Cleveland, Ohio, assignor to the Steel Motor Company, same place. Filed Nov. 14, 1892.

491,361. Electric-Railway Trolley. Benjamin Kochs and Albert Kochs, St. Louis. Mo. Filed July 25, 1892.

491,483. Switch for Electrical Tram-Cars. Noritz Immisch, London, England, assignor to the Immisch Electric Navigation and Power Company, of New Jersey. Filed Nov. 21, 1891.

DYNAMOS AND MOTORS.

491,106. Bipolar Electrical Machine. Thomas H. Hicks. Detroit, Mich., assignor of one-half to George F. Case, same place. Filed Feb. 8. 1892.

491,294. Dynamo-Electric Machine. Gabriel V. M. A. Parrot and Antoine C. Reignier, Paris, France. Filed August 3, 1892.

ELECTRIC LIGHTS AND APPLIANCES.

491,09[illegible]. Electric-Arc Lamp. Wallace E. Freeman, Long Island City, assignor to Lawrence M. Closs, New York, N. Y. Filed July 8, 1892.

491,124. Arc-Light Carbon. James McLaughlin, Chicago, Ill. Filed May 5, 1891.

491,251. Duplex Electric-Arc Lamp. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Oct. 20, 1890.

491,268. Lamp Socket. Edwin R. Elliott, Litchfield, Ill. Filed March 28, 1892.

491,412. Windlass for Lowering or Raising Street Electric Lamps. Charles R. Eddy, Springfield, Mo. Filed May 28, 1892.

TELEPHONE AND TELEGRAPH APPARATUS.

491,109. Telephone Cable. Silas W. Holman, Boston, Mass. Filed Nov. 5, 1892.

491,133. Printing Telegraph Receiver. Major D. Porter, Brooklyn, N. Y., assignor to the National Ticker Company, of West Virginia. Filed Dec. 10, 1891.

491,163. Vibratory Telegraphy. Stephen D. Field, Yonkers, N. Y. Filed Jan. 7, 1892.

491,275. Telephone Transmitter. Harry L. Tyler, Corning, N. Y. Filed May 13, 1892.

MISCELLANEOUS.

491,171. Retouching Device. Albert S. Harry, Steubenville, Ohio. Filed Nov. 15, 1892.

491,208. Insulator Clip. William H. Edmunds, New York, N. Y. Filed Aug. 9, 1892.

491,250. Testing Apparatus for Multiple Switchboard Systems. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Sept. 9, 1890.

491,252. Metallic Circuit for Multiple Switchboard Systems. John A. Seely, New York, N. Y., assignor to the Western Electric Company, Chicago, Ill. Filed Nov. 15, 1886.

491,311. Electrically Heated Soldering Iron. Samuel B. Jenkins, Boston, Mass., assignor, by mesne assignments, to the American Electric Heating Company, same place. Filed June 8. 1892.

491,312. Electrically Heated Smoothing-Iron. Samuel B. Jenkins, Boston, Mass., assignor, by mesne assignments, to the American Electric Heating Company, same place. Filed June 8, 1892.

491,313. Electric Curling-Iron Heater. Samuel B. Jenkins, Boston, Mass., assignor, by mesne assignments, to the American Electric Heating Company, same place. Filed June 8, 1892.

491,320. Electric Water Heater. Willis Mitchell, Malden, Mass., assignor, by mesne assignments, to the American Electric Heating Company, Boston, Mass. Filed June 8, 1892.

491,321. Electrically-Heated Vessel. Willis Mitchell, Malden, assignor, by mesne assignments, to the American Electric Heating Company, Boston, Mass. Filed June 8, 1892.

491,322. Electrically-Heated Gridiron. Willis Mitchell, Malden, assignor, by mesne assignments, to the American Electric Heating Company, Boston, Mass. Filed July 2. 1892.

491,339. Electric Clock. John H. Dyson, Belleville, Wis. Filed June 6, 1892.

491,346. Electro-Mechanical Movement. Elisha Gray, Highland Park, Ill. Filed Jan. 8, 1892.

491,347. Telautograph. Elisha Gray, Highland Park, Ill. Filed Sept. 21, 1892.

491,362. Insulator. Augustus R. Lane, New York. N. Y. Filed May 13, 1892.

491,369. Electric Lock. Oliver A. Moyer and Henry W. Rhodes, Ogden, Utah. Filed April 9, 1892.

491,387. Electric Circuit for Railway-Signalling. Louis Thaler, New York, N. Y. Filed Aug. 24, 1892.

491,394. Process of Electrically Reducing Aluminium and Forming Alloys thereof. Thomas L. Willson, Brooklyn, N. Y. Filed March 25, 1891.

491,426. Combined Electric Switch and Door-Lock. John H. L. Holcombe, U. S. Navy. Filed Oct. 24, 1892.

491,437. Electric Metal-Heating Device. Willis Mitchell, Malden, assignor to the American Electric Heating Company, Boston. Mass. Filed June 16, 1892.

491,438. Electrically-Heated Muffle. Willis Mitchell, Malden, assignor to the American Electric Heating Company, Boston, Mass. Filed July 5, 1892.

491,457. Electrical Measuring-Instrument. Elmer G. Willyoung, Philadelphia, Pa., assignor to Samuel L. Fox and Edward B. Fox, same place. Filed Aug. 11, 1892.

491,465. Electrical Transmission of Power. Charles S. Bradley, Avon, N. Y. Filed April 4, 1892.

491,484. Electrically-Heated Vessel. Samuel B. Jenkins, Boston, Mass., assignor to the Butterfield-Mitchell Electric Heating Company, same place. Filed June 9, 1892.

491,491. Insulated Magnetic Coil. Thomas E. Morford, Minneapolis, Minn., assignor, by direct and mesne assignments, of one-half to the Enamel Insulator Company, of Illinois. Filed Jan. 28, 1891.

RE-ISSUES.

11,303. Method of Insulating Electric Conductors. Thomas E. Morford, Chicago, Ill., assignor by direct and mesne assignments, to the Enamel Insulator Company, of Illinois. Filed June 3, 1892. Original No. 457,828, dated Aug. 18. 1891.

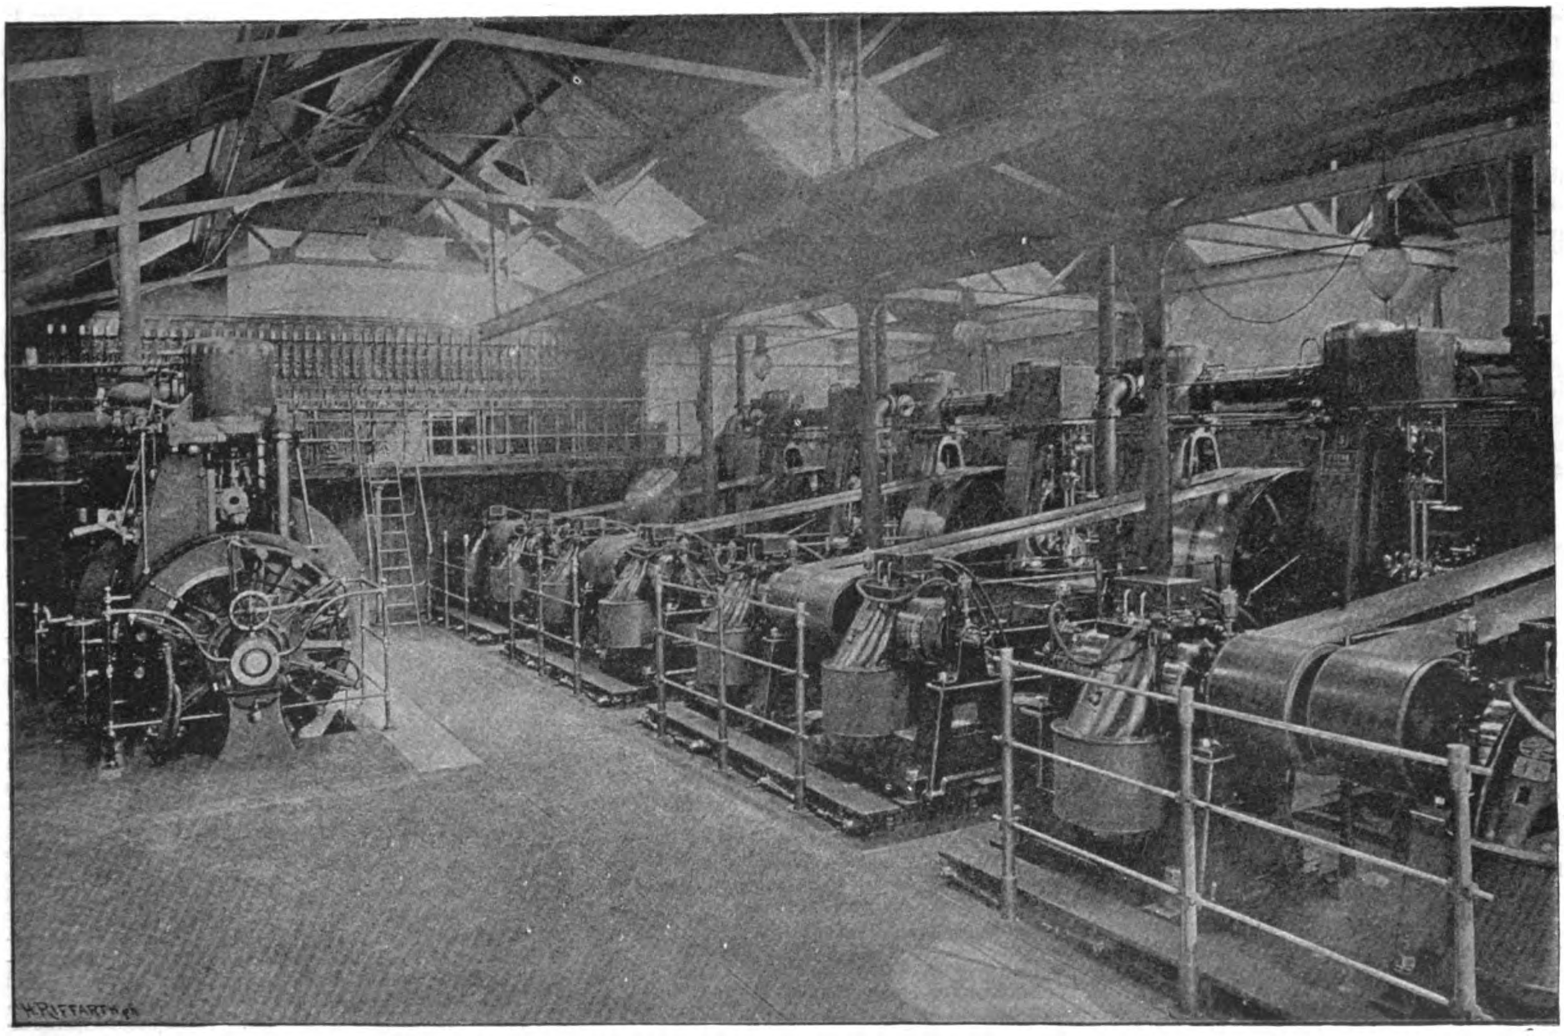
11,306. Multiple-Switchboard System. Charles E. Scribner, Chicago. Ill., assignor to the Western Electric Company, same place. Filed Nov. 6, 1891. Original No. 442,143, dated Dec. 9, 1890.

DESIGN.

22,207. Resistance-Box. Edward Weston, Newark, N. J. Filed Sept. 10, 1892. Term of patent 14 years.

ELECTRICITY.

VOL. IV. NEW YORK. FEBRUARY 22, 1893. CHICAGO. No. 6



DYNAMO ROOM—ELBERFELD MUNICIPAL STATION. (SEE PAGE 65.)

The Elberfeld Municipal Station.

This station, which was contracted for by the city of Elberfeld in 1887, was commenced in the summer and finished in November of the same year. The distribution is on the three-wire continuous current system.

There are three Cornwell boilers which carry 120 pounds pressure, and six separate compound engines which are run condensing. Four of these engines are from 100 to 170 effective horse power and run at 180 revolutions per minute, and each is connected by belts to two dynamos. The other two engines are rated at 350 H. P. at 160 revolutions and each is direct coupled to two dynamos.

The dynamos, of which there are twelve, were manufactured by Siemens & Halske. Eight of these machines are of the constant current type and generate 390 amperes each at 112 volts pressure and the four direct connected machines have a capacity of 900 amperes each. The total capacity of the plant is 1,400 H. P.

Fire Insurance Rules.

At the meeting of the Executive Committee of the Suburban Underwriters' Association held on February 7, Mr. Fremont Wilson was appointed as consulting electrician for said Association. Rules governing the equipment of electric light, heat and power installations have been recommended, and are the same as those recommended by the United Association of Underwriters' Inspectors, of which Mr. C. M. Goddard, of the New England Exchange, is Secretary.

Insurance companies and brokers throughout the district covered by said Association have been notified that electric light privileges will hereafter be only given to parties whose installations have been certified to by Mr. Wilson. Electric light and power companies and contractors will be furnished with printed rules and regulations and blank forms of application to be signed by all parties doing work in their districts. The territory at present under the jurisdiction of this Association is Queens, Suffolk, Westchester, Putnam and Rockland Counties. Richmond County is practically under the jurisdiction of the Association, and the same rules and regulations will undoubtedly be required there.

Any information which parties may desire will be furnished by Mr. H. E. Bowers, Secretary of the Association, 44 Pine street, New York City.

Mr. William McDevitt, Chief of the Electrical Department of the Philadelphia Fire Underwriters' Association, took passage for Europe on the North German-Lloyd steamship Lahn on February 21st. Many claims have been made by authorities in foreign countries of superior methods in the distribution and use of the electric light, especially as to "wiring" and its application to houses and for safety from fire. This subject Mr. McDevitt will particularly inquire into, and he will also examine the safeguards used for the protection of theatres.

It must be understood that Philadelphia has the largest number of electric lighting stations of any city in the United States. This class of risk has almost been refused insurance throughout the country owing to the number which have been burned down—yet Philadelphia has never even had a serious fire in a single station.

Mr. McDevitt will visit Berlin, London, Paris Vienna and Marseilles, and goes at the request of nearly all the electrical contractors, central stations and electrical engineers in the city of Philadelphia who are interested in this work and who believe that our methods are not very far behind.

The Philadelphia Fire Underwriters' Association has granted Mr. McDevitt a two months' leave of absence, and he carries with him letters from Hon. Edwin S. Stuart, Mayor of the city of Philadelphia, to the municipal authorities abroad, besides other letters which will give him the entree to all places he may wish to visit. A very full and interesting report is looked for, and one which cannot fail to be of great use to the electrical fraternity in general.

Edison's Lamp Patent Stands.

Judge Colt's Decision in the Beacon Company's Case.

Exhibit No. 4 Viewed With Suspicion.

On Saturday, February 18, Judge Colt, in the United States Circuit Court at Boston, handed down his decision in the case of the Edison Electric Light Company vs. the Beacon Vacuum Pump and Electrical Company, granting the injunction asked for by the plaintiffs.

Following is a summary of the decision:

In May, 1885, the plaintiff brought suit in the United States Circuit Court for the Southern District of New York against the United States Electric Lighting Company for infringement of the patent now in controversy, which was granted to Thomas A. Edison, January 27, 1880, for an improvement in electric lamps; and on July 23, 1891, a decree was entered, adjudging the validity of the patent and ordering an injunction and account. Upon appeal to the Circuit Court of Appeals for the Second Circuit, the decree was affirmed in October, 1892. Another suit was then brought in the same court against the Sawyer-Man Electric Company, and a preliminary injunction was granted *pro forma* until a decision could be had by the Circuit Court of Appeals, which on December 19, 1892, affirmed the order. and directed an injunction. Suits were then immediately brought against the Westinghouse Electric Company in Pennsylvania, the Perkins Electric Lamp Company and the Mather Electric Company in Connecticut, and preliminary injunctions obtained.

The present bill was filed January 10, 1893, and the plaintiff now moves for a preliminary injunction against the defendants, based upon the foregoing prior adjudications. This motion is resisted on the ground of newly discovered evidence bearing on the question of novelty in the Edison invention, which was not before the courts in the other cases. As to these other cases, it is said that there has been but one final adjudication upon the merits, which was in the suit against the United States Electric Lighting Company, that the defendants in the other prior suits were so connected with that company that they were in privity with it, and that therefore injunctions were granted as a matter of course.

The suit against the United States Company was thoroughly and obstinately contested, as is shown by the record, which covers about six thousand printed pages. The general rule is that where the validity of a patent has been sustained by prior adjudication, and especially after a long, arduous and expensive litigation, the only question open on motion for a preliminary injunction in a subsequent suit against another defendant is the question of infringement, the consideration of other defences being postponed until final hearing.

The only exception to this general rule seems to be where the new evidence is of such a conclusive character that if it had been introduced in the former case it probably would have led to a different conclusion. The burden is on the defendant to establish this, and every reasonable doubt must be resolved against him.

There is no denial of infringement in the present case under the construction given to the patent in prior adjudications. The contention of the defendants is, that this motion should be denied on the ground that they have recently discovered that Henry Goebel, a German watchmaker, living in New York, invented the Edison incandescent lamp as early as 1854, and that therefore the Edison patent is void for want of novelty, or at least must be limited to the coiled form of filament. This is the same line of attack upon the patent which was unsuccessfully made in the case against the United States Electric Company.

To subdivide the electric light and embody it in a cheap and durable domestic lamp, capable of successfully competing with gas, had for years baffled the science and skill of the most eminent electricians in this country and in Europe. The difficulty lay in the practical construction of a durable incandescent lamp rather than in a knowledge of the elements which should compose such a structure. Carbon burners, platinum wires, exhausted glass receivers were old and well known.

The arc lamp, was known as early as 1844, but its great light made it unfit for use in dwellings. The question was how to divide the electric light for domestic purposes. Many scientists considered the problem as hardly within the range of possibility. From the results of the experiments of Fontaine, the French scientist, published in 1877, it would seem that almost insurmountable obtacles, founded on the operation of natural laws, stood in the way of the successful division of the electric light. Mr. Preece, the electrician for the British General Post Office, pronounced early in 1879 that "the division of the electric light is an absolute *ignis fatuus*."

Those who dissented from this view were Mr. Edison in this country and Mr. Lane-Fox in England, who both reached the conclusion that the sub-division of the electric light could be accomplished provided the radiating surface of the burner of the lamp was reduced in extent so that only a moderate volume of light would be emitted while at the same time the resistance of the burner was increased so as to enable the employment of relatively small conductors for leading the electric current to the lamps; or, shortly stated, the burner should have a high ratio of resistance to radiating surface. Edison first embodied this discovery in his platinum lamp in 1879. but this lamp was unsatisfactory and the problem remained unsolved.

After the failure of the platinum lamp, it occurred to Edison to substitute a short filament of carbon in place of the long platinum burner, into the nearly perfect vacuum chamber. and it was found that such filament was stable at high temperature and free from disintegration and oxidation. It was thus made known that the disintegration of the carbon burner was not caused by the electric current, but was due to "air washing," or the attrition produced by the passage of the air over the highly-heated surface of the carbon.

As late as 1878, Mr. Sawyer, in a patent to Sawyer and Man, stated that no incandescent lamp had yet been devised which was practically operative, because of the defective methods employed for charging the lamp with artificial atmosphere which resulted in the disintegration of the carbon; second, because it was impossible under varying degrees of heat and pressure to maintain perfect joints; third, because unequal expansion of the carbon and its holder had resulted in fractures of the burner. But Edison overcame these obstacles and produced a practical lamp. When we review the literature which preceded this invention, the subtle force with which it had to deal, whose laws had to be intelligently investigated and understood, the well nigh perfect workmanship necessary in construction, and the slow steps by which the end was finally reached, it seems on its face almost incredible that the incandescent lamp of Edison was in fact invented and operated by Henry Goebel in New York forty years ago, and publicly exhibited before hundreds of people.

[Here follows a resume of the affidavits in the case, with which our readers are already familiar. —Ed.]

Upon consideration of the whole of the evidence on this motion I have reached the following conclusion:

It is extremely improbable that Henry Goebel constructed a practical incandescent lamp in 1854. This is manifest from the history of the art for the past fifty years, the electrical laws which since that time have been discovered applicable to the incandescent lamp, the imperfect means which then existed for obtaining a vacuum, the high degree of skill necessary in the construction of all its parts, and the crude instruments with which Goebel worked.

Whether Goebel made the fiddle-bow lamps 1, 2 and 3, it is not necessary to determine. The weight of evidence on this motion is in the direction that he made these lamps, or lamps similar in general appearance, though it is manifest that few, if any, of the many witnesses who saw the Goebel lamp could form an accurate judgment of the size of the filament or burner. But assuming they were made, they do not anticipate the invention of Edison. At most they were experimental toys used to advertise his telescope, or to flash a light upon his clock, or to attract customers to his shop. They were crudely constructed, and their life was brief. They could not be used for domestic purposes. They were in no proper sense the practical commercial lamp of Edison. The literature of the art is full of better lamps, all of which were held not to anticipate the Edison patent. The prior art demonstrates that to protect a carbon filament ten one-thousandths of an inch in diameter from speedy disintegration the lamp chamber must maintain a nearly perfect and stable vacuum, and every part of the structure must be composed of such materials and so put together as not to imperil this vital condition. Leaving out other defects, it is abundantly shown that the Goebel lamp did not possess this requirement, and could not by reason of the elements which entered into its composition and the mode in which it was constructed. Goebel says he made more than 100 lamps, and that a continual improvement took place in their construction, and yet the only three lamps produced at the hearing by his own confession were made as early as 1854, or before gas was introduced into his house. Where are the other lamps which show these improvements except Exhibit 4, which I will deal with presently? The evidence of Goebel and his witnesses point to the conclusion that work ceased on these lamps in the "fifties," and was not revived until Edison twenty years later startled the electric world with his invention. Goebel brought from Germany the ideas contained in the old lamp of Starr, with its carbon pencil enclosed in a Torricellian vacuum, and he probably constructed some lamps after that pattern. In doing this he was up and in line with the art as it existed at that early day, but to say that with a sudden bound he jumped from Starr to Edison passes the limits of credulity. The history of great inventions shows a gradual and labored progress. Each new investigator records some advance until it may be the desired discovery is almost within his grasp, but it is only after many attempts and many failures that some one appears who accomplishes the long sought for result. The discovery of the domestic incandescent lamp is no exception to this rule, as the record in the New York case bears witness. Speaking from the standpoint of the art of incandescent lighting in 1854 and in 1892 are two different things, and it is, therefore, quite easy for witnesses to think that Goebel did much more than there is any legitimate reason to suppose.

As for lamp No. 4, I cannot but view it with suspicion. It presents a new appearance. The reason given for not introducing it before the hearing is unsatisfactory. This lamp, to my mind, envelopes with a cloud of distrust the whole Goebel story. It is simply impossible under the circumstances to believe that a lamp so constructed could have been made by Goebel before 1872. Nothing in the evidence warrants such a supposition, and other things show it to be untrue. This lamp has a carbon filament, platinum leading-in wires, a good vacuum, and is well sealed and highly finished. It is said that this lamp shows no traces of mercury in the bulb because the mercury was distilled, but Goebel says nothing about distilled mercury in his first affidavit, and twice he speaks of the particles of mercury clinging to the inside of the chamber, and that for this reason he constructed a Geissler pump after he moved to 468 Grand street, which was in 1877. Again, if this lamp has been in his possession since before 1872, as he and his son swear, why was it not shown to Mr. Crosby, of the American Company, when he visited his shop in 1881 and was much interested in his lamps? Why was it not shown to Mr. Curtis, the leading counsel for the defendants in the New York cases, when he was asked to produce a lamp and promised to do so? Why did not his son take this lamp to Mr. Bull's office in 1892 when he took the old fiddle-bow lamps 1, 2 and 3? Why did not his son take this lamp to Mr. Eaton's office in 1882 when he tried to negotiate the sale of his father's inventions to the Edison Company? A lamp so constructed and made before 1872 was worth a large sum of money to those interested in defeating the Edison patent like the American Company, and Goebel was not a rich man. Both he and one of his sons were employed in 1881 by the American Company. Why did he not show this lamp to McMahon when he called in the interests of the American Company and talked over electrical matters? When Mr. Dreyer tried to organize a company in 1882, and procured an option from him of all his inventions relating to electric lighting, for which $925 was paid, and when an old lamp of this kind was of vital consequence and would have insured a fortune, why was it not forthcoming? Mr. Dreyer asked Goebel to produce an old lamp, and was especially anxious to find one pending his negotiations with the Edison Company for the sale of Goebel's inventions. Why did he not produce this lamp in his interviews with Bohm of the American Company, or Moses of the Edison Company, when it was for his interest so to do? The value of such anticipation of the Edison lamp was made known to him. He was desirous of realizing upon his inventions. He was proud of his incandescent lamps, and was pleased to talk about them with anybody who would listen. Is it conceivable, under all these circumstances, that he should have had this all-important lamp in his possession from 1872 to 1893 and yet no one have heard of it or seen it except his son? It cannot be said that ignorance of the English language offers an excuse. He knew English very well although Bohm conversed with him in German. His children spoke English. Neither his ignorance nor his simplicity prevented him from taking out three patents, the first in 1865 for a hemmer, and the last in 1882 for an improvement in incandescent lamps. If he made lamp No. 4 previous to 1872, why was it not also patented?

There are other circumstances which throw doubt on this alleged Goebel anticipation. The suit against the United States Electric Lighting Company was brought in the Southern District of New York in 1885. Large interests were at stake, and the main defence to the Edison patent was based upon prior inventions. This Goebel claim was then investigated by the leading counsel for the defence, Mr. Curtis. It was further inquired into in 1892, in the case against the Sawyer-Man Company. It was brought to the attention and considered by the Edison Company in 1882. It was at that time known to the American Company, who hoped by this means to defeat the monopoly under the Edison patent. Dreyer tried to organize a company for its purchase. Young Goebel tried to sell it. It must have been known to hundreds of people. And now when the Edison Company after years of litigation, leaving but a short time for the patent to run, have obtained a final adjudication establishing its validity, this claim is again resurrected to defeat the operation of the judgment so obtained. A Court of Equity should not look with favor on such a defence. Upon the evidence here presented, I agree with the first impressions of Mr. Curtis, and with the opinion of Mr. Dickerson that whatever Goebel did must be considered as an abandoned experiment.

It has often been laid down that a meritorious invention is not to be defeated by something which rests in speculation or experiment, or which is rudimentary or incomplete. The law requires not conjecture, but certainty. It is easy after an important invention has gone into public use for persons to come forward with claims that they invented the same thing years before, and to endeavor to establish this by the recollection of witnesses as to events long past. Such evidence is to be received with great caution, and the presumption of novelty arising from the grant of the patent is not to be overcome except upon the most clear and convincing proof.

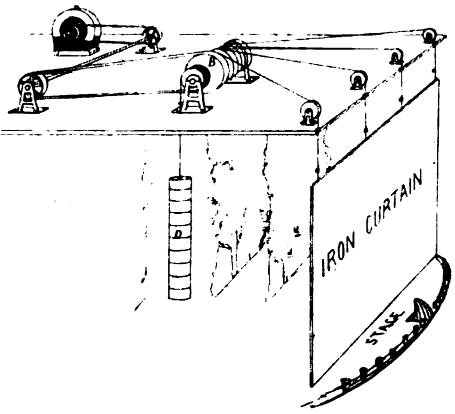
When the defendant company entered upon the manufacture of incandescent lamps in May, 1891, it well knew the consequences which must follow a favorable decision for the Edison Company in the New York case.

Owing to the large interests involved, I have carefully considered this motion, and I am satisfied upon the evidence, and the law applicable thereto, that it should be granted.

The Electric Curtain at the Comedie Français (Paris).

Since the burning of the Opera Comique at Paris, in 1887, it has been the effort of nearly all French theatrical managers to adopt a speedy means of lowering the iron curtain in an instant, and electricity has been found to supply the demands of both the managers and public for shutting off instantly any fire occurring on or about the stage from the audience.

The first theatre in Europe known so far to use the electric iron curtain is the Comédie Français at Paris. The *rideau électrique* was put up and arranged by the Edison Electric Light Company, M. Anton, chief machinist of this theatre, giving valuable aid in erecting the curtain, which commenced working a few weeks ago. The curtain is hung by four steel wire ropes which run over pulleys, the ropes then meeting at and going over a wooden drum B. This is driven from the pulley G by an electric motor F.



The counter-weight D is held by a cord to insure equilibrium at any instant required. The total weight of this curtain is about 400 kilogrammes, and is balanced by the counterweight D. The speed at which the wheels run is about 1,800 revolutions per minute, and the capacity of the motor which works the curtain is equal to two horse power. The curtain can be let down at the maximum rate of 1.5 meters per second, the minimum being 0.75 metre per second, the same speeds being available for lifting it. The electric current is supplied from the light circuit. This will undoubtedly come into use in most play houses, and would have been the means of saving many lives and considerable property in London, New York and Paris theatres had it been adopted before. There is an iron curtain in the Paris Opera House, and electricity will soon be applied for operating the safeguard.

A Correction.

Electric Cranes at the World's Fair.

There was a slight inaccuracy in our "World's Fair News" in the issue of February 1. Of the three electric cranes to be used, the Yale & Towne Mfg. Company, of Stamford, Conn., Messrs. Wm. Sellers & Co., of Philadelphia, and the Morgan Engineering Company, of Alliance, O., each furnished one.

Electric Meters.[*]

DISCUSSION.

Mr. Furgeson—Mr. Chairman, I would like to ask Mr. Weart if the Aron meter is designed to be used in connection with the alternating current?

Mr. Weart—I cannot answer that question. My impression is that the meter is all right for the alternating current, but I may be mistaken.

The Chairman—Mr. Gates, don't you know something about the Aron meter? Doesn't the Siemens & Halske Company use that meter?

Mr. Gates—I do not know anything about the Aron meter. The Siemens & Halske Company use that meter quite extensively on the other side, but not exclusively. At some other meeting of the Club I will bring one of our meters here and exhibit. I think the Aron meter is used for alternating current, but not to any great extent. There are very few alternating plants in Germany. They are mostly in Austria, Hungary and that part of the world.

Mr. Weart—Mr. Chairman, on second thought it is apparent that the alternating current will not affect the permanent magnet. The alternating current does not detract from the magnet as the direct current does.

The Chairman—I know that Aron meters have been used on some alternating systems satisfactorily.

Mr. McFadden—Mr. Chairman, in answer to Mr. Furgeson's question, I will say I am quite sure that it is used on the alternating current also, because the conditions mentioned by the French engineers in the competition for the prize were that the meter should be a wattmeter to run equally well on alternating or direct currents, and the prize was divided between Prof. Aron and Prof. Thomson.

Mr. Weart—They must have had a coil in the permanent magnet.

Mr. McFadden—I presume so.

Mr. Weart—But then it would not be a true Aron meter.

The Chairman—I would like to ask Mr. Weart a question: How about the constant of the Aron meter in relation to the value of gravity at different places? The pendulum of the clock, you know, runs faster or slower in accordance with the distance from the center of the earth, due to what we usually call gravitation. Now, supposing the meter is calibrated in Chicago, and would be taken to Helena, Montana.

Mr. Weart—Gravity would affect the two pendulums alike, and they would both increase at the same rate and the increment due to magnetic force would be practically in the same ratio as before.

But that brings up a point I meant to have spoken of but overlooked, and that is the extremely small margin the Aron meter works on. These pendulums run at the same rate when any current is passing through the coils, and you have got to spend less time to make them run at the same rate. I have heard of a device for making the pendulums synchronous when the variation is small. I have not seen that, but the total increase in rate of the magnetic pendulum with the full load on the meter is only one part in a thousand. That means, to get the reading of the meter you have got to differentiate the one-thousandth part; and that meter will do that down to another one part in a thousand, but it is apparent that a very slight change in the rate of either pendulum will give you somewhat serious error. Whether that becomes serious in actual practice I cannot say, for I have not had actual practice with the meter.

Mr. Grier—Mr. Chairman, in regard to the effect of heat upon those two pendulums: they are of different shapes and different material, and will their rate remain the same relatively in different temperatures?

Mr. Weart—The fact that they run at the same rate indicates that their centres of gravity are at the same point, and the rods being of the same material they ought to operate at the same rate.

Mr. McFadden—I would like to ask if the clockwork is the same for all sizes except the coils and pendulums?

Mr. Weart—I have not seen very many of

---

[*] Meeting of the Chicago Electric Club, June 16.

these meters, but I see no reason why a change in dials and pendulums should not be all that is required. I think that is one of the advantages of the meter.

Mr. McFadden—I notice in some that instead of a permanent magnet there is a single pendulum.

Mr. Weart—I remember when the Aron meter first came out, the description answered to the style you speak of. In that case the meter had hands, and the reading was gotten by the difference between the time of the meter and the true time. I think the fact of the variation being so small is sufficient to account for that form being dropped, because if you had to take the difference between your meter and the true time at the place where you happened to be, the little variations that would take place in your clockwork would wipe out the possibility of reading the meter correctly. It would evidently be of great advantage to have two sets of clockwork in the same case, made in the same way, which would be utilized together and would be liable to vary at the same rate, in order to avoid that difficulty.

Mr. Armstrong—Mr. Chairman, I have had experience with several different kinds of meters. I had some experience with the Thomson wattmeter in testing an electric elevator. I wanted to take some current readings on an electric elevator, and as you probably all know, the readings have to be taken very hurriedly. The current runs up to two or three hundred amperes and the voltage drops down from normal at the time the elevator cord is pulled, and very often readings have to be taken inside of fourteen, or fifteen, or twenty seconds; and I happened to want to find out about what it cost to operate an electric elevator, and I had about four days in which to do it. I got a Thomson wattmeter and put it on, and I found some quite surprising results which went to show that notwithstanding the fact that the load was thrown on very suddenly and thrown off again, and then on and off, that the meter read fairly accurately.

I found that the point which Mr. McFadden mentioned about the disc taking about so long to stop seems to be true; that what it loses perhaps in inertia in starting it gains in stopping, so that it seems to about balance, and, as near as I could tell, comparing it with readings with the watch and with the ampere meter and voltmeter, three or four reading at the same time, they were quite near together. I believe, take it all in all, that the wattmeter was more nearly correct than anything else, and am using it for both direct and alternating currents.

I like the meter from the commercial view, because the customer can see what he is getting. There is something about the mystery of a bottle and the very great certainty of the bill when it comes in which is appalling to the customer. With the Thomson wattmeter, or with any wattmeter where the indication is read off from a dial, the person can from time to time see how his bill is climbing up, and he is not quite so much astonished at the end of the month. I like that feature. While I have had no practical experience with the meter there shown, I do not believe I would care to have it. I think it is too delicate for anything like practical use. As Mr. Weart said, it might be a very good toy for laboratory use, but it would not be of any value whatever in the market as a meter. The intensely practical American people want something that is simple, that is not liable to get out of order, and something that can be understood by ordinary people, who, after all, make up the majority of those who are handling the practical apparatus. It is all right to place refinements in a station where they are to be handled by men of refinement, but I find in a great many cases that we make grave errors in putting too fine an apparatus into the hands of an ordinary dynamo tender. He does not appreciate it, and he uses it with considerably less skill than he would if he had something very much more ordinary, and we would get far better results with a cheaper, plainer apparatus.

Mr. Furgeson—Mr. Chairman, I would like to add something which I forgot to say and which is suggested by Mr. Armstrong's remarks, as to the customers reading their meters. They can see what the meter is registering, but whether that meter is registering right they do not all know unless they know how to test it. All Thomson wattmeters are made on the principle that one revolution of the disc corresponds to a watt hour. That is the basis of the whole thing. One revolution equals one watt hour. The time is constant. In other words, one watt takes one hour for one revolution, and any larger number of watts, 540 say, would take $\frac{1}{540}$ of an hour, or of 3,600 seconds, to make a revolution. He can time his disc and see how many seconds it takes to make a revolution. Or to do the same thing, use this formula: $W = \frac{r \times k \times 3{,}600}{s}$, in which W is watts, r is revolution, k is constant, 3,600 is time, and s the number of seconds observed.

Mr. Weart—Mr. Chairman, I am very much interested in the Thomson meter, and I fully appreciate the beauty of the constant. The old Edison meter had a very complicated constant, which did not make even figures, and it was quite difficult to hammer the constant into the head of the meter man. In the Edison meter the constant is quite as simple as in the Thomson meter, but it is this: one milligramme equals one ampere hour. So that if the customer wants to know how his meter stands, all he has got to do is to take his plates out and weigh them and get the milligrammes and commence reading right away. I think he would be as likely to go through the operation in one case as in the other. I think the importance of the customer knowing the state of his readings exists principally in a sentimental sense. It may be a satisfaction to know that he can read his meter and get the bulge on the company, but I don't believe that he will do it. The objection is always made against the Edison meter that it is blind, that the customer cannot read it and will not have faith in it. Well, it takes but very little time for them to acquire faith in it. They soon learn that their bills bear a proportion to the amount of service rendered.

There are one or two things about the electrolytic meter that I am inclined to give here, having had some practical experience with the meter, and being now in a position where I might be supposed to be free to speak. There are two or three things against it, and while I have somewhat of a sentimental feeling in favor of the electrolytic meter, I expect to see it go out of commercial use in the course of a few years. The worst thing about it is that if it does not go perfectly straight—and nothing ever does go perfectly straight—the electrolytic meter is going to work against the company. It is the total depravity of inanimate things that makes it come out so. And that is not all: it has a tendency to read slow, and reads slowest when the load is lightest. Consequently in the summer, when the company needs every cent they can get—when the customers are not using much current—they are receiving 10 or 20 per cent. less than they ought to receive, and they cannot use that as a constant. If they could they would, but they don't know how to figure it, and consequently they lose that. It is not even appreciated what real difficulty there is in applying the electrolytic method to a commercial meter. It is known that electrolysis is proportionate to the current that is passing, and the Patent Office is full of meters which are automatic in their action either by casting or a plate attached to a scale beam, or something of that kind. But we cannot apply the current direct to the electrolytic meter, as we have seen here. We have got to send the current through the shunt and take the whole potential on that shunt. The shunt has a fixed resistance and the bottle has a weight resistance, and the weight resistance has necessarily the same variable resistance. The metal chosen for the electrolytic style has the least variation of counter-electromotive force with the variation in the current of any commercial metal that it is possible to use. That makes it desirable for use in the electrolytic style. But steel varies with temperature, and we have been told how it is compensated for by a spool. That is easily accomplished, as the variation in the resistance liquid can be ascertained, but the contact resistance of the plate is somewhat variable, and it varies on the wrong side. In other words, the resistance of the steel in figuring the constant of the meter is taken at its normal value when the steel is fresh and the surface clean: when oxydized the resistance of the oxide cannot be allowed for. The oxide always increases the resistance, so that it reads slower and slower towards the end of the month. I do not want to be understood as saying that this is a frightfully serious matter, or we would not see the meter used; but as a matter of fact it does read slower at the end of the month, and the resistance is affected by the amount of current passing. A large current passing through the bottle tends to remove some of the oxide so that the meter reads a little faster on full load than it does on light load; consequently with the light load the reading is not what it should be. I have another objection against the wattmeter. It is not a real objection but a comparative objection. We hear a great deal said about the beauty of being able to read your current in watt hours. The fact is that current is distributed in these days, almost without exception, at constant pressure. Constant pressure theoretically amounts to constant pressure actually, but as we have seen here to-night, the pressure will vary occasionally, but the wattmeter does not average it properly. We are not buying watts on an incandescent circuit, but light. Nobody has pretended to give us a meter that will read in candle hours, but one that will read in watt hours. The result is that the pressure drops 5 per cent. The meter takes care of that; it measures the watts accurately, and we get that 5 per cent. taken off from our meter readings. But when our light has gone down 50 per cent. we are paying 45 per cent. more than we ought to. That is not very much comfort to us if our light goes down 50 per cent. that we get 5 per cent. rebate on the bill.

I can see in the case of electric railway service, where the pressure is extremely unsteady, that the wattmeter may be desirable and practical. In the case of electric light service I hardly think it is, and it is an injustice to the buyer.

The Chairman—Take one of the meters that simply measure currents, wouldn't the same objection hold good there?

Mr. Weart—That makes no pretence to be virtuous.

The Chairman—But the same objection would hold there, wouldn't it, if you simply measured a current and the voltage goes down the current decreases very little and the voltage comparatively little at the same time, and has the same effect on the light, and while you pay for virtually say five per cent. less current, you pay, as you say, for 50 per cent. less light?

Mr. Weart—Of course I do not claim that the Cooley meter really does measure light. It does not pretend to; but, by implication at least, it is held forth that the watt meter does give the customer a square deal, whereas it is more or less a pretence if the customer is buying light and paying for watts.

Mr. McFadden—I think the matter of paying for light, is a matter between the consumer and the station man who calls it a lamp hour or candle power hour. We furnish a meter that will measure it accurately in watts and give that to the station superintendent as such. He can sell it out to the customer as watt hours or lamp hours, just as he chooses. It is a matter of detail with him.

Mr. Weart—I would like to ask Mr. McFadden if the wattmeter is really accurate over wide variations in voltage.

Mr. McFadden—I have run, for instance, a hundred volts on two-wire 110 voltmeters—I have run them at 92, I don't know how much lower they would go, and as high as 125, and they were still accurate. I have done it in the shops but never in practice.

Mr. Grier—Mr. Chairman, that is a question that came up not long ago where one of the Thomson wattmeters was used. The voltage varied from 100 to 117, according to the load, at different portions of the building in which the station was located, and the meter read apparently, according to the measurements taken with a Mason lampmeter and a Mason voltmeter in circuit; it apparently measured accurately anywhere from 100 volts to 117. One peculiar thing was that while the customer was kicking very hard about his bill it was found that the meter read 5 per cent. too slow.

Mr. Gilchrist—I would like to say in answer to Mr. Wirt's remark in regard to the electrolytic meter running slow on a light load that the idea of the Chicago Edison people is to have a meter constructed in such a way that, where it is a very large meter that is liable at times to run with light load it will register on two small bottles, and then when a heavier load is thrown on it is shunted on to two heavier bottles. In that way we expect to get rid of that loss by the meter running slow on a very light load. We find that necessary in our South Side residence station. We have a great many residences there which are wired for a large number of lights, from 500 to 1,000, and where at all times in the year, especially in the summer months, the average load is very small indeed, as low as ten to twenty-five or fifty lamps.

Mr. Wirt—I would like to ask Mr. Gilchrist what is the gain with the light load from the change of bottles? Of course I don't understand the arrangement.

Mr. Gilchrist—Well, the gain is to get rid of any inaccuracy which may occur by running a very light load on a very large meter.

Mr. Wirt—On the same shunt?

Mr. Gilchrist—Using the same shunt, yes.

Mr. Wirt—You have the same difference of potential then in the larger sized bottles?

Mr. Gilchrist—Not the same bottle shunt, no. We use different bott e shunts. It is to be applied especially in these new meters. We have not used them yet, but there is one being made up for us now. But ordinarily the ratio of the large circuit to the shunt circuit will be as much as exists in the No. 1 meter; that is the smallest meter, which will read down to one milligramme in the bottle. In the cases of very heavy loads it will be thrown on to this highest resistance shunt so that eight amperes on this main circuit will only read one milligramme in the bottle. We also get rid of any difficulty with oxide, which Mr. Wirt knows better than I can explain.

Mr. McFadden—I do not remember whether in reading his paper Mr. Gilchrist spoke about the thermostat. I would like to ask if the lamp was burning all the time if your current goes through the bottles.

Mr. Gilchrist—No, I did not mention the thermostat at all. It is hardly worth mentioning, to tell the truth. We have 3,000 meters out, and the first year we started we sent on an advance order for a dozen thermostats. I think we have four of them out, and the other eight are still at the station. But the current of the lamp does not register on the meter. That is the producer's loss. But it is set in such a way that the lamp only burns over a small portion of the time. Of course if it was in a very cold place, or if the weather was always as cold as at present, the probabilities are that the lamp would burn about half the time.

One Use for the Telephone.*

BY F. S. MARSH.

The writer had experienced some difficulty on several occasions in signalling in the usual way by electricity to the engine-driver on the surface when anything had temporarily gone wrong with the underground endless-rope haulage, owing to the fact that on the signal to stop being given, one of the many workpeople along the level not knowing anything was wrong, and sometimes for mischief, rang the signal to start. This happened more than once, with unpleasant consequences. The engine-driver, not knowing who was ringing the bell, of course acted on the signals received, and in the case of the rope being out of the balance wheel, train off the road, or like mishaps, much damage was soon the result. No code of signals the writer could devise would deal with this difficulty, and as anyone along the level could give the signal to start, the engine-driver never knew who gave it, or if anyone was tampering with and making at such time a dangerous use of it.

The only satisfactory solution of the difficulty could be found in a system of signals whereby anyone along the level could signal "stop" in case of accident, but only one man could give the word to start. This, it will be readily seen, is met by the use of the telephone. An occasion arising for stopping the engine, the ordinary code signal "one" is given, followed immediately by a prearranged signal (which all working on the road should know), say ten strokes of the bell; on receiving this signal the engine-driver, who has stopped the engine, takes the telephone off its hook and listens for instructions from the only man who, carrying the transmitter, can give them; he is told what is wrong, and he now knows exactly what he is about, and what is of equal importance, the men below know that it is safe for them to do anything about either wheels, trams, ropes, or other gearing, no matter how they may be entangled. When all is right the engine-driver is acquainted with the fact and told he is about to have the signal to start; he then replaces the receiver on its hook and waits for the signal, after receiving which he goes on with his work, taking instructions by the authorized code. There is here no possibility of mistaking signals, and all work with a sense of security unknown when using code signals alone. There are reasons why an automatic switch is necessary. Were the telephones below ground connected to the signal wires while the battery is on circuit the magnet would be injured, and were it other than automatic the engine-driver might forget to turn the switch; directly the circuit is closed by removing the telephone from its hook no code signal can be given, so the annoyance of continuous ringing is effectually stopped. Replacing the instrument on its hook at once brings the ordinary signals into use again.

Another useful purpose served by the automatic switch is that on removing the telephone (when work for the day ceases), and letting it hang by its suspension cord (provided to preserve the insulated wires from injury), the electric circuit being closed, the battery power is saved. This can, of course, be equally well effected by taking out one of the battery zincs, and in other ways.

For some purposes it is convenient at times for several persons to carry with them a transmitter. Deputies, who in case of serious personal injury to workpeople, can telephone for the stretcher, thereby gaining in many cases, depending on distance, half an hour or more time in removing the injured and obtaining medical advice. Where rope splicing is being done, or ropes are being changed, it is often a gain in time when direct communication can be maintained with the surface or any intermediate point; for it must be remembered that two telephones may be hooked on to the ordinary naked wires at any point along the line of wires, the only additional arrangement necessary being predetermined parts of the road where the person using the instrument must listen, and the battery being off there can be no call bell used. Other uses, depending on local circumstances in any particular mine, may make the telephone a valuable adjunct.

The instrument selected by the writer, chiefly on account of its portability, is the "Watch receiver" (answering equally well as a transmitter), which is a modification of the Bell telephone. Fig. 1 shows a front view of the instrument, with cover and diaphragm removed, in which *a* is a horseshoe magnet, *b b* are the bobbins wound with silk-covered wire, *c* insulating material, *d* (Fig. 2) the diaphragm of thin ferrotype iron; *e* and *f* insulated wires from the two poles of the magnets secured by the binding screws, G G, and joining in a twin cable at the end of the suspending cord, *h*. The twin cable, 24 inches long, is provided with two brass hooks, *i j*, on the instrument for underground use. For connecting on to the ordinary signalling wires it is immaterial which hook goes on which wire. An arrangement of an automatic switch for use in the engine-house is shown in Fig. 4. The cable terminals are joined permanently to the ordinary signal wires at *k l* on the pit side of the switch, which is shown by dotted lines in closed circuit, *m*, and in open circuit at *n*—that is, when the weight of the telephone, adjusted to overcome the tension of the spring, S, brings the hook in electrical contact at *p*. The receiver for use below ground is best carried in a leather bag, large enough to hold the cable attached (24 inches), all of which will go in the waistcoat pocket, and as it weighs under half a pound it is no inconvenience.

The telephone, arranged as described, has now been in use at the Birch Coppice Colliery for several months on three separate roads, roughly, 1, 1¼, and 2 miles long respectively, and has answered very well. With long lines it might be necessary to use a microphone, but the "Watch" or "Ader" modifications of the "Bell" telephone, answer all ordinary requirements. Whilst not claiming this as the best system in all cases for signalling, it may be suggested as one use for the telephone.

---

* Paper read before the Chesterfield and Midland Counties (England) Institution of Engineers.

An Open Letter

To Mr. W. J. Jenks, Electrical Expert of the General Electric Company

And Inferentially to the Editors of the "Electrical Engineer."*

Most Learned and Erudite Seniors:

A "volt-ampere" does include the unit of time, because an ampere is defined as a "coulomb per second," the coulomb being the unit of quantity. A "volt-ampere" is then the rate of dissipation of energy when one ampere flows under a pressure of one volt, or ten amperes under a pressure of one-tenth of a volt, or one-tenth ampere under a pressure of ten volts; in other words, it is the rate—one "coulomb per second" under one volt, or ten "coulombs per second" under one-tenth of a volt.

To use a hydraulic analogy: Imagine the rate of flow of water denoted by one gallon per second to be called a "galpere"; then an ampere is equivalent to a galpere, and a volt-ampere is the same as a galpere under a pressure of, say, one inch of water, or an "inch galpere."

A kilowatt hour, or say a "watt hour," is then a "volt-ampere hour"; i. e., a "volt-coulomb-per-second hour," i. e., 3,600 "volt-coulombs," or 3,600 "joules"; in the hydraulic analogy it is an "inch-galpere hour"; i. e., 3,600 "inch-gallon-per-second" seconds, i. e., 3,600 "inch gallons." An "inch-gallon" means one gallon under one inch pressure or ten gallons under one-tenth of an inch, and has no relation to time; it may be the work done in a minute or a year.

"Foot pound" in the same way is not a rate, nor is "horse-power hour"; the latter does *not* "indicate work done at a definite rate per second and also for a definite time"; it represents work done at *any* arbitrary rate for such a time that the product of the rate by the time is equal to 33,000 × 60 foot lbs.

The statement that "amperes represent simply and only the number of volts expended in each ohm of resistance" is only partly true; it is purely a numerical relation depending on our system of units and by no means necessarily true; it is not even true with our units in case of a circuit with counter-electromotive force, e. g., an ordinary motor circuit. The amount of coal burned under a boiler is proportional to the "watt hours"; the size of the boiler is proportional to watts.

Mr. Jenks's error seems to arise from his confusion of the meaning of "ampere hour" or "watt hour"; he considers an "ampere hour" to be exactly one ampere flowing for one hour, and apparently has no conception of the fact that it may be made up by *any* rate and the corresponding time.

We recommend to Mr. Jenks and the editors of the *Electrical Engineer* a little book by Swinburne on electrical units.

A BEGINNER.

ELECTRICITY

The Popular Electrical Journal.

GEORGE R. METCALFE, - - - EDITOR.
R. H. WILLOUGHBY, - - ASSOCIATE EDITOR.

W. M. ALLISON, - - BUSINESS MANAGER.

B. E. GREENE, Publisher.

PUBLICATION OFFICES:
6 Park Place - New York

CHICAGO:
J. F. CONNOR, - - 823 Monadnock Building.

BOSTON:
W. S. KEY, - Room 34, 620 Atlantic Avenue.

ELECTRICITY IS PUBLISHED ON WEDNESDAY OF EACH WEEK

Our columns are open for the discussion of any question in which the interests of the Electrical Industry are at stake. News notes, descriptions of new devices with drawings or photographs, are at all times desired.

SUBSCRIPTION RATES:

UNITED STATES,	$2.50
IN CLUBS OF FIVE OR MORE,	$2.00
FOREIGN COUNTRIES,	$4.50

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

"Electricity," under its present ownership, has never solicited the advertising patronage of the General Electric Company.

Municipal Electric Light Stations.

One of the results of the recent large number of combinations among city lighting plants has been to revive the question of municipal ownership of the so-called "natural monopolies," and the adoption of this policy is warmly advocated by many who are otherwise opposed to the nationalistic idea of a Government industrial enterprise.

Natural monopolies may be broadly defined as those industries which are based upon franchises and thus practically excluded from competition. Corporations operating under these conditions enjoy special privileges the abuse of which in some cases has led to a demand for municipal plants that may in time seriously affect the electric lighting industry.

However effective such a remedy may prove in avoiding the extortionate prices of a corporation, the objections to municipal business enterprises are too apparent to be ignored, and, leaving aside for the present the economic principles involved, it may be reasonably questioned if municipal plants reduce the ultimate cost of lighting to the public.

A few statistics regarding the cost of municipal lights have been compiled and are largely quoted by the advocates of this policy in proof of the claim that municipal plants furnish lights at a figure far below that charged by private companies. To any one familiar with central station work, however, these figures will appear manifestly absurd, as it is obvious that in some cases the most important items of expense are not charged against the plants.

Some of these figures have recently been tabulated by a writer in the *Review of Reviews* who finds the average cost per lamp per year in twenty-three municipal stations is $53.04; to this the writer adds $33.60 per lamp to cover the interest on the investment and depreciation of the plant, making a total of $86.64 per lamp. In the same article the average price per lamp furnished by private companies is given as $106.01, and these figures, if verified, would prove a strong argument in favor of municipal proprietorship. The fallacy in this comparison lies not only in the small number of plants considered but in the total lack of accuracy in the data supplied, which becomes apparent when we consider a few of the cases noted.

Bay City, Mich., is quoted as furnishing lights during the year '89-'90 at $58.00 per year each, while the actual figure is $104.00 as it was ascertained by Mr. Francisco, who made a report on this subject to the National Electric Light Association in August, 1890, that the items of taxes, water rates, interest and depreciation were not included in the estimate, and this service was based upon the moonlight schedule. The taxes and water rates are properly included in the cost of municipal supply, as this income would be received by the city if the plant were operated by private parties.

The city of Bangor, Maine, is quoted as running municipal lights at $45 per year each, yet the facts are that the actual cost is a little over $100 each, and that too in a station that uses water power all but a few weeks during the year.

In Ypsilanti, Mich., the price per lamp is given at $23.60, which has been found to be underestimated by $48.40, as it costs this city $72 per lamp to run eighteen nights a month up to midnight only.

Topeka, Kan., and Lewiston, Maine, are reported with equal inaccuracy concerning the cost of their lights, and further, Mr. Francisco has found that even taking the figures furnished by the city officials on the cost of operating municipal plants, the average of fifty cities was $119.24 per lamp per year while the average charge of three hundred and sixty-five private concerns for lamps was $118; so, without considering the peculiar methods of municipal bookkeeping, of which the above figures are samples, municipal ownership does not appear to have proved the success that is claimed for it. Besides this, however, there are other objections which make it desirable to look in some other direction for the solution of the street lighting question.

* * *

"The Birds, the Beasts and the Bat."

The *Electrical Engineer*, which for several weeks has seemed to be in great doubt as to which side it will pay better to take, would do well to read and reflect over the old fable of "The Birds, the Beasts and the Bat." We print it here for the convenience of our wavering contemporary:

> "The Birds waged war with the Beasts, and each party were in turn the conquerors. A Bat, fearing the uncertain issues of the fight, always betook himself to that side which was the strongest. When peace was proclaimed his deceitful conduct was apparent to both the combatants; therefore being condemned by each for his treachery, he was driven forth from the light of day, and henceforth concealed himself in dark hiding places, flying always alone and at night."

Moral: Choose your side, and stick to it.

* * *

In the Right Direction.

The appointment of Mr. Fremont Wilson as consulting engineer to the Suburban Underwriters' Association, noted in another column, is a step in the right direction concerning the insurance regulations for buildings containing electrical equipments. As the fire risk on the buildings is conceded to be a safe one where the installation is *first class*, the establishment of suitable rules and the appointment of a competent man to see them enforced will be of benefit to both the underwriters and the owners in securing a high grade of work. A reduction in the rates now often demanded would naturally follow if this system were rigidly adhered to.

* * *

IT IS pertinent to ask, what have the *Electrical World* and the *Electrical Engineer* done to avert the disaster which has overtaken the independent interests in the trade?

* * *

NOTWITHSTANDING the splendid programme arranged for the St. Louis Convention, the meeting will be very like a funeral procession.

The Situation up to Date.

It has been our aim to present from week to week a fair and reasonable view of the situation as it was at the time. We have made few prophecies, but have stated a great many facts. Many of our statements of fact have been denied, or treated lightly, by those who either thought they knew better or were blinded by false hopes. But the man or newspaper that is RIGHT can afford to wait. Vindication follows doubt as surely as the night the day.

The statement of facts is sometimes an unpleasant duty. For our contemporaries it has proved an impossible task.

But even at the sacrifice of popularity, Electricity will continue to state the facts, as we believe them to be, after a careful and painstaking survey of the field and with *unequalled sources of information.*

The defeat of the Beacon Company is a blow to the independent manufacturing and selling interests which should not be underestimated. It has given a new lease of life to monopoly, and a new vigor to the campaign of extinction. The selling of a few lamps now and then to competing plants is simply a matter of policy, and no one should be fooled by it. The *intention* of the Trust to drive all others out of business cannot be doubted. Their *power* to do so is increased a hundredfold by the result of the Beacon suit.

The actual existence of supply men, builders of dynamos, wire manufacturers, contractors—in fact the whole range of outside interests—is in imminent danger. The contractors will be perhaps the first to suffer. The supply men in New York and Chicago, and some other large cities, have held that the Trust must maintain business relations with at least one house in each of these towns. This theory is utterly fallacious. The Electric Trust is not built upon such silly ideas. They want ALL the business, and will have absolutely no use for an intermediary supply house to divide profits. Central station men, if the Trust succeeds, will not be free agents. They will buy of their masters, not a part, but ALL of their supplies, and at the price which their masters make. The experience of the past six months has proved that the Central Station men will not yield their independence willingly; the experience of the next six months is very likely to prove that hundreds of them *must yield.*

The makers of dynamos will find few customers with nerve enough to buy their machines in the face of threatened patent suits and the probability that lamp orders will not be filled in six months.

But it is useless to go over the list of those who will find their occupation gone before the year is over, if the Trust is able to carry out its plans. The list of the interests which will not be crippled would be much shorter.

This is not an encouraging prospect for the independent concerns. But it is TRUTH.

Is there any hope, any means of averting the gradual paralysis of business?

The first and most welcome would be that the Trust should fall of its own weight. This is not impossible, but it is improbable for many months to come. The Trust will not go to pieces while it can raise money almost without limit to put into its business; meantime its obligations are piling up, and nothing less than a monopoly of all the business, with at least a doubled percentage of profits, will carry it through. The wreck of the Whiskey Trust, the Book Trust, and the Reading Combine, however, in the last few weeks, gives an entirely reasonable ground for hope that the Electric Trust will meet a like fate. The prospects of the Reading combination sixty days ago were considered by shrewd financiers as infinitely brighter than those of the Electric Trust.

There have been during the past week many unpleasant rumors in regard to the inability of some of the gentlemen high in the councils of the Trust to meet their financial obligations. And there is good reason for believing that the Electric Trust will sooner or later meet the fate of other iniquitous organizations built on the twin ideas of monopoly and extortion.

New lamps, which do not infringe the Edison patent, will come without question. But it may take many months. The new Westinghouse lamp affords a measure of relief, but cannot for some time be supplied rapidly enough. The closing of all other outside lamp factories will diminish the total output by 20,000 lamps a day.

This problem of a new lamp is engaging a great deal of the best thought of our scientific men, and must be solved.

One effective method would be a universal demand for an investigation of the Trust by a Congressional Committee. An investigation which would go back for a few years into the affairs of the Thomson-Houston Company would reveal much more than is generally known to the trade. Trust methods did not begin in 1892.

Every man in the trade can accomplish something in this direction. If you do not know your Congressman personally, you have friends who do. See to it that in some manner your Congressman learns the details of the situation. Let him understand that not only are the businesses of his constituents in danger, but that the people at large are confronted with an excessive and unwarranted charge for light, and that the whole organization of the Electric Trust is in defiance of the law.

Electricity has already suggested a combination for mutual defense in unjust patent suits. It is a suggestion which should be acted on.

Most effective of all methods of self-preservation is INDIVIDUAL HUSTLING, bearing in mind that the rivalries and jealousies of smaller concerns should all be buried in the face of the attack of a common enemy.

The first requisite for intelligent and well-directed effort is a realizing sense of the actual condition of affairs. Do not chase the delusive phantom of hope; do not listen to the palaver of the enemy who makes soft and honeyed statements in the public print while plotting your destruction in secret council. *Cultivate your memories.* Bear in mind the career of the Boston squeezers previous to the past year. Remember the reasons for and the methods of the absorption of the Brush, the Schuyler, the Fort Wayne, the Excelsior, the Van Depoele, the Jenney, the Bentley-Knight, and the Short Companies; the fate which has overtaken most of them, and the present opinions of the original stockholders.

When you have arrived at a full conception of the TRUTH—that the Trust means to drive you out of business, or to commit the equal offense of buying a controlling interest in your concern in order to lay you on the shelf—to rid itself of your competition—then you will be in fighting trim, and with the aid of Electricity will fight a winning battle.

* * *

It is the duty and pleasure of every fair-minded journal to print communications from its constituency whenever these communications are of common interest. It is also the duty and pleasure of every fair-minded editor to see to it that none of his contributors makes himself appear silly.

* * *

If the city of Detroit agrees to purchase the present lighting station in that city, owned by the Trust, the experiment of a municipal plant will be foredoomed to failure. Mr. McDonald is a sly and resourceful man; and the only way for Detroit to beat the Trust is to *leave them alone!*

* * *

The clergy of Central New York (round about Syracuse) who are investing church funds in electric securities would do well to take heed before it is too late. The voice of sound judgment should outweigh that of the plausible district agent.

* * *

The business man who does not know when his business is in jeopardy is an easy victim.

* * *

Scores of the smaller manufacturers and supply men will endeavor to wake up after their business is dead and buried.

* * *

It has been decided that the officers, committees, and Association members of different grades shall wear badges of various bright colors at the Convention, for convenience sake. Supply men and smaller manufacturers could with perfect propriety wear crape.

* * *

The backbone of all previous convention gatherings has been the supply and manufacturing interests. What can they accomplish by gathering at St. Louis next week? This question may be answered during the Convention, and we earnestly urge every independent concern, as well as every central station man who wishes to preserve an open market in which to purchase his supplies, to be on deck.

* * *

"Right forever on the scaffold,
Wrong forever on the throne;
Yet that scaffold guides the future,
And behind the great unknown
Standeth One within the shadow,
Keeping watch above His own."

He Seeks a Wider Field.

Plausible Excuse for Mr. Coffin's Expected Resignation.

This corporation (General Electric) is one of the industrials which interest Wall Street and speculators and investors elsewhere. A splendid money-making future was predicted for it, and yet only twelve months after its organization Mr. Coffin is tempted to go elsewhere. Of course he does it because he sees more money somewhere else.

The plan, as I understand it, is to create a great corporation with many millions of capital, which shall take advantage of the mighty development of electric railways which seems to be spreading throughout the country with a rapidity unequaled even by the development of steam railways or the telegraph in the early years of their establishment.

As I have heard the plan it looks something like that favorite corporation of Henry Villard's, known as the North American Company, which had so dismal an experience, and which was created as a sort of middle-man to aid railway companies in construction and in all sorts of development. This proposed new organization seeks to do the same thing for electric railways all over the United States.

Mr. Coffin must have faith in it, and so must that group of capitalists who are discussing this matter with him, and yet there are shrewd men here who are inclined to think that the various companies now engaged in this prodigious development of electric railways are most of them entirely able to take care of themselves without the aid of any middle-man. It is suspected that behind the apparent scheme is one which has for its object the ultimate consolidation of the electric railway systems of the country, just as the various telegraph companies were ultimately merged into one gigantic monopoly with $100,000.000 capital.

The organization, I understand, is not yet completed, but it must have been well developed to justify the report coming from good sources. as it does, that Mr. Coffin is to seek an even greater field than the one which he now controls.
—*Philadelphia Press*, February 11.

Mr. Barton's Backbone.

Mayor Pingree of Detroit has received the following letter in regard to the Wyandotte electric fight from the Western Electric Company of Chicago:

Dear Sir: Your telegram of this date, advising us not to "weaken on our contract with the Wyandotte," duly received.

Indirect effort has been made to have us default on our contract with the city of Wyandotte, the reason for which is not clear to us, unless it is thought that it may possibly influence the action of your city on the lighting question.

When we execute a contract we aim to carry it out to the letter, and we assuredly will not make any such exception in the case of Wyandotte.

Western Electric Company.

President Ayer has Changed his Mind.

He Will Not be Able to Keep Down Discussion of the Lamp Question.

[*From the St. Louis Post-Dispatch.*]

There is no doubt that the burning issue before the Association will be the incandescent lamp question. President Ayer at first thought that he might be able to keep it down, but it is understood that he has changed his mind. He has requested one of the best known electricians in the country to prepare a paper on the subject, covering the ground exhaustively as between the rival companies, and embracing also a consideration of the equities of the case and the moral rights of the public in the matter. This paper will alone make the session of the Association here historic.

The Electric Selector and Signal Company.

With the assent of ninety-nine per cent. of the stock and bond holders of the Electric Secret Service Company, all of the property, patents, business and good will of that company were sold by C. P. Mackie, receiver, on February 11, 1893, to the Electric Selector and Signal Company.

This new corporation has likewise acquired other important inventions relating to the general subject of electrical selections, and proposes to develop this especial business as applied to telegraphs, block signals, electric light and power and telephones in this country and abroad on a larger scale than the company which it succeeds. The change has been effected without interruption of the business of the Electric Secret Service Company, and upon terms which provide for a settlement of all that company's obligations in full in cash. The Electric Selector and Signal Company will, we understand, have the same technical management as the Electric Secret Service Company, although its Board of Directors will contain several new and influential names.

The Electric Selector and Signal Company will have an exhibit at the St. Louis Convention that should be peculiarly interesting to all electric light men. This exhibit will consist of the company's system of selective arc light and motor cut-outs. Some new devices have lately been added to the system which materially simplify the operation of the cut-outs; these will be shown for the first time to the electrical profession at the Convention.

The company will be represented at St. Louis by Messrs. C. P. Mackie, Robb Mackie, S. S. Bogart and Herbert Laws Webb.

Tests on the Budapest Electric Railway.

A German exchange gives the following figures concerning the reports of some tests made on the Budapest Railway:

	No. of Experiment.			
	1	2	3	4
Weight of car (tons)	4.13	4.13	4.13	4.13
Load (tons)	2.40	2.40	0.37	0.37
Total weight of car (tons)	6.53	6.53	4.50	4.50
No. of driven axles	2	1	2	2
Length of trip in yards	34.0	34.0	32.8	32.8
Incline	level	level	1 in 18.95	1 in 10.42
Time of trip in seconds	51	50	8	14
Speed, miles an hour	13.7	13.95	8.37	4.77
Revolutions per minute of motor.	549	560	337	192
Volts	282.5	285	266	260
Amperes	26.0	24.5	54 0	68.0
Watts	7,345	6,982	14,364	17,680
Elec. energy used, E. H. P	9.85	9.35	19.25	23.70
Tractive force, lbs. per ton.				
On the horizontal	33.6	33.6	33.6	33.6
On the inclines	......	......	118.2	215
Total tractive force lbs	33.6 x 6.53 =219.0	219.0	(33.6+118.2) x4.5=683.0	(33.6+215) x4.5=1120.0
Mechanical horse power	8.14	8.29	15.27	14.30
Efficiency: $\frac{\text{Mech. H. P.}}{\text{El. H. P.}} \times 100$	82.57 p. c.	88.62 p. c.	79.41 p. c.	60.37 p. c.
Losses by friction of gearing, etc., and conversion of energy	17.43 p. c.	11.38 p. c.	20.59 p. c.	39.63 p. c.

The report further states that one of the cases in which electric traction is applicable while horse power is out of the question is that in which steep inclines have to be surmounted; and another case is that in which high speeds are required. Owing to the comparatively great weight of the electric car and its machinery the adhesion of the wheels to the rails is greater and should enable considerable inclines to be easily surmounted. In order to experiment on this subject a trial line was constructed, with inclines of 1 in 10 and 1 in 19, on which trial runs were made, which proved that even inclines of 1 in 10.42 can be easily surmounted, so that in very steep lines the difficulty of the brake would be greater than that of climbing the grade.

All experiments were carried out at night, in order that the fluctuations of pressure due to the working of the line might be avoided. The car was always started outside the trial line proper. Every set of observations is the mean of a series. The car with which the experiments were conducted was an ordinary car of the Budapest Electric Tramway Company, with simple chain gearing of 11.31 from the motor to the axle. As the motor was not sufficiently strong to carry the fully loaded car up the steep inclines, the experiments on these parts of the road were done with a smaller load. The efficiency dropped while ascending the hill owing to the speed of the motor being so low.

These experiments go to show that the electric car is capable of working on lines where the steepness of the inclines would render horse traction out of the question.

Carbon Filaments.

An exchange gives the following process which is employed in the manufacture of incandescent lamp filaments by the Societé Anonyme des Lamps à Incandescence, Budapest:

A cotton or silk filament is used which is impregnated with the following mixture: Silicate of potass, 25 to 30 per cent.; Senegal gum, 10 to 15 per cent.; caustic soda, 12 to 13 per cent. The filament is compressed in the form of a sharp prism, the edges being found to radiate more than the facets. It is then carbonized and flashed; but instead of employing a carbide liquid or gas, the Budapest Company use a solid carbide, such as naphthaline or paraffin wax, which liquefies only in the vicinity of the filament, and assures a very regular layer of carbon. The filaments are prepared of any desired resistance before their introduction into the bulb.

ELECTRICAL COMPANY ELECTIONS.

The Sacramento Electric Power and Light Company, Sacramento, Cal. President, Albert Gallatin; treasurer and general manager, Horatio F. Livermore: secretary, Joshua Barker; directors, Albert Gallatin, A. J. Ralston, Horatio P. Livermore, Charles E. Livermore, Joshua Barker.

Central New York Telephone and Telegraph Company, Utica, N. Y. President, R. S. Williams; vice-president, L. H. Lawrence; secretary and treasurer, F. G. Wood; general manager, C. A. Nicholson; directors, Martin A. Knapp, Syracuse; David B. Parker, New York; A. Cadwell Belden, Syracuse; Charles A. Nicholson, Robert S. Williams, Lewis H. Lawrence and Francis G. Wood, Utica.

The Washington, Alexandria and Mt. Vernon Electric Railway Company, Alexandria, Va. President, G. E. Abbott; vice-president, F. A. Reed; secretary, H. K. Hipple; treasurer, D. C. Leech; superintendent, W.H. Cooper; directors, G. E. Abbott, F. A. Reed, H. K. Hipple, D. C. Leech, Park Agnew, J. S. Schwartz, and J. R. Caton.

Merchants' Co-Operative Electric Light Company, Kansas City, Mo. President, Charles H. Simms; treasurer, C. S. Squires; secretary, John C. Conkey.

The following have been elected directors of the Bell Telephone Company: Henry Altman, Philo D. Beard, Benjamin E. Chase, Daniel H. Cowles, Edward J. Hall, John E. Hudson, Harlow C. Palmer, David B. Parker, Thomas T. Ramsdell, Sherman S. Rogers, Samuel S. Spaulding, Henry M. Watson, William H. Watson, George Weldon, John L. Williams.

Holmes Electric Protection Company, Toronto, Can. President, Thos. G. Blackstock; vice-president, J. R. Wood; secretary-treasurer, A. S. Wigmore; directors, W. B. McMurrich, L. K. Cameron, F. A. Ritchie, B. Jennings and A. S. Wigmore.

Waynesboro Electric Light and Power Company, Waynesboro, Pa. Treasurer, W. T. Omwake; directors, John J. Miller, F. Forthman, Daniel Hoover, E. W. Washabaugh, J. F. Zullinger, E. Elden, W. H. Brown.

Legal Notes.

In the suit of the Thomson-Houston Electric Company vs. the Little Rock (Ark.) City Electric Street Railway, on the application for a receiver for the latter company, the railway company has filed its answer in the Chancellor's Court at Little Rock denying its insolvency and asking for judgment for $50,000 alleged to be due it by the Thomson-Houston Company. The St. Louis Trust Company, holders of $300,000 first mortgage bonds of the railway company, have withdrawn their intervention, and the National Bank of Commerce of St. Louis was made a party defendant. The legality of $200,000 income bonds of the railway, now held by the First National Bank, is security for moneys due. The bank's claim will be bitterly fought by the Thomson-Houston people, and evidence will be introduced to show that the road is fully worth a million dollars and is not responsible for $170,000 indebtedness alleged to be held by the Thomson-Houston Company in notes signed by the railway company payable to and indorsed by H. G. Allis and Geo. R. Brown.

On the 14th inst., after Judge McClure had finished his argument against the appointment of a receiver, Judge Rose, of counsel for plaintiff, asked the Chancellor to grant him until Thursday to prepare his reply. While granting the request, the court at the same time issued an order restraining the Thomson-Houston Company from negotiating any of the notes held by that company signed by the City Electric Street Railroad Company and indorsed by H. G. Allis president, and George R. Brown secretary.

The Robinson Radial Car Truck Company have entered suit in the United States Circuit Court at Boston against the West End Street Railway Company for infringement of their patent covering trucks now in general use by electric street railway companies. While the West End Company has been using fifty or more of the Robinson trucks for several years, having purchased them from the manufacturers, it is claimed by the plaintiffs that the West End Company has, without license or authority, built and put in operation within a few months about 100 trucks differing from the "Robinson Radial" in only a few minor details. The plaintiffs state that in November last the West End Company applied to the Robinson Company for a license to cover the alleged infringement, but their proposition was refused.

A legal question involving the rights of a telegraph line to trespass on private land, at Huntingdon, Pa., a few days ago, was decided by Judge Furst against the private property holders. The Postal Telegraph Company ran their line through the farm of Porter Skinner, in Dublin township. Viewers appointed by the court fixed the damages at $87 and costs. The telegraph company excepted to the report, alleging irregularities, and appealed from the assessment of damages. The whole proceedings were set aside by Judge Furst, requiring Skinner to pay costs. It was shown that the material damage was so slight as not to warrant action at law, as the use of the highway and the private land was not interfered with. A large number of similar cases in the county against the telegraph company have been abandoned.

Important Decision in England.

Ex-Congressman John S. Wise and O. T. Crosby, who were called to London some weeks ago as experts in the suit of the National Telephone Company of Great Britain vs. the Leeds Tramway Company, have arrived in this city, the Tramway Company, in whose interest these gentlemen testified, having won the suit.

The question at issue was whether the Tramway Company, whose wires worked injury to the wires of the Telephone Company, should not be restrained.

The English counsel had collected a mass of evidence showing that the tramway wires did not seriously injure those of the Telephone Company. Mr. Wise advised that all this testimony was irrelevant, and that the proper position to take was to admit the serious injury, but to claim equal rights to the earth with the Telephone Company. His advice was taken, and the court, Mr. Justice Kekewick, sustained Mr. Wise's contention.

Two Large Contracts

Which the Trust Did not Get.

The Traction Company of Philadelphia have closed a contract for the electrical equipment of the various lines in that city with the Westinghouse Company. The first shipment will include 300 car equipments and six 500 H. P. generators.

The contract for the Lindell road in St. Louis has also gone to the Westinghouse Company. Three 700 H. P. generators and 100 car equipments will be the first instalment.

A Municipal Plant.

The city of Marshall, Michigan, has purchased the splendid water power at that point and is installing an electric lighting plant which is to be of the most improved construction and will be used for public lighting purposes. Power will be rented to manufacturers for use during the day. This will prove an economical arrangement both for the city and those seeking cheap and reliable power.

Electrolytic Bleaching.

The purification of starch of an inferior quality by an electric process has been found so effective that the starch so treated is superior to that formerly known as the first quality and is sold for a higher price than the latter. The manufacturers of starch who adopted this process are quoted as saying that in the first year of its operation the plant paid about three times its value by the saving in expense of operation over the old method.

World's Fair Notes.

The first consignment of storage-batteries for the Electric Launch and Navigation Company arrived on last Tuesday and consisted of two car loads, containing 1,800 cells of Julien batteries. The fifty boats of the company are practically completed and will be shipped to the Fair grounds within a few days. As soon as the sheds back of the Agriculture Building are completed the work of placing the batteries in the boats will be commenced. All the interior wiring was done as the boats were being built and the motors will be placed in them before they are shipped.

Part of the iron frame work for the Westinghouse 10,000 light machines, consisting of six car loads, has arrived on the grounds and is ready to be unloaded in the Machinery Hall. These machines are to be used not only for exhibiting purposes but are also to take part in the lighting of a large number of the buildings. The carpenters and structural iron workers have already begun the erection of the switchboard frame which is to compose part of the Westinghouse exhibit. The switchboard is to be one of the finest and largest that have ever been erected in this country.

The Standard Electric Company of Chicago have also shipped ten of their large arc light machines to Machinery Hall, where sheds are being erected for their protection till such time as they can safely be placed in position.

The firm of Agnew & Company, contractors, are just completing the erection of a number of thatforms, raised a few inches above the floor, for ple use of exhibitors in the Electricity Building.

The first machines to be placed on the floor of the Electricity Building for exhibition purposes were five arc light dynamos of the Thomson-Houston make and were shipped direct from the company's factory at Lynn.

The Western Electric Company were the next to follow with a number of their machines, both of the arc and incandescent type. These will be placed in position as soon as the company's booth, which is now being built, is finished.

The Eddy Electric Manufacturing Company have placed two of their 10 H. P. motors in the Electricity Building to operate two freight elevators which are to be used in carrying up the exhibits to the balcony.

General News.

What is Going on in the Electrical World.

Flandreau, Mont.—There is a demand here for an electric light plant.

Knoxville, Tenn.—The West End Street Car line is soon to dispense with its mules and adopt electricity.

Buffalo, N. Y.—The Buffalo and Tonawanda Electric Road has been purchased by a New York syndicate.

Wilson, N. C.—An electric light plant, costing $15,000, with a capacity of 500 lights, has just been installed here.

Columbia, S. C.—The electric railway is nearly completed, and the trolley cars will soon be speeding through the streets.

Jacksonville, Fla.—The Jacksonville Street Railroad Company has determined to equip its road with electricity without delay.

Baltimore.—The Edmonson Avenue street railway is to be converted into an electric line and will be extended to Powhatan.

Portsmouth, N. H.—A bill has been introduced in the Legislature granting a charter for an electric road from Portsmouth to York Beach.

Denton, Tex.—At a recent election, ordered by the city council, the vote in favor of introducing electric lights as against was overwhelming.

Oakland, Cal.—The Gas, Light and Heat Company has applied to the city trustees for a franchise to furnish electricity for light and power.

Waco, Tex.—The Waco Electric Light and Power Company has been legally authorized to dam the Brazos River at Waco for water power purposes.

Hartford.—H. T. Paiste of Philadelphia has entered suit against Messrs. Hart & Hegeman of this city for alleged infringement in the manufacture of switches.

New York.—Frank A. Delbentz has filed an application with the Attorney-General asking for the annulment of the charter of the Magnetic Telegraph Company of this city.

Saratoga, Cal.—A franchise has been granted Warren Olney, of San Francisco, for an electric road to connect Saratoga and San Jose. Work on the road will begin July 1.

Montgomery, Ala.—It is rumored that the Cloverdale Company is to be consolidated with the Terminal and that the road is to be equipped with electricity at an early date.

Red Bank, N. J.—George M. Lane and William E. Harrison have arranged for the purchase of the plant and real estate of the Red Bank Electrical Illuminating Company.

Altoona, Pa.—The east end people are taking measures to secure an extension of the electric railway to Pottsgrove Reservoir and thence to Juniata by way of the Red Bridge.

Frederick, Md.—An electric railway from Frederick to Middletown and thence to Boonsboro and Hagerstown is strongly advocated by the people living along the proposed line.

Toledo, Ohio—An effort is being made to have the Walbridge suburban electric road run from Maumee across to Perrysburg and return on the east side to Toledo, thus making a belt road.

Baton Rouge, La.—The electric street railway belt line is nearing completion, and it is predicted by the president of the company that the cars will be running before the 10th of March.

Poughkeepsie, N. Y.—The South Avenue Railroad Company has been granted a franchise for an electric railway in the town, and also one to build a similar road from here to New Hamburg.

Indianapolis, Ind.—R. I. McDonald, of Ft. Wayne, is to receive an answer on March 1 to his proposition to pay $500,000 for the franchise to the streets of the city now held by the Citizens' Company.

Portland, Ore.—There is talk of the city's disposing of the East Side electric light plant; it costs the city some $4,000 a year more than it would to have the lighting done by an electric company.

Worcester, Mass.—The Worcester Traction Company will soon petition the Board of Aldermen for a franchise for a new electric loop line to be operated in connection with the Chandler Street line.

Fort Collins, Col.—There is talk of utilizing the water power of the Cache la Poudre, at the Big and Little Narrows, to generate electricity for the use of Fort Collins, Loveland, Greeley and Berthoud.

Ellenville, N. Y.—The village trustees have applied to the Legislature to be empowered to raise money by bonding in sufficient amount to secure or erect a lighting plant in order to own and control its lights.

Wheeling, W. Va.—There is a movement on foot here looking to the establishment of an electric plant to be owned and operated by the city, and a petition is to be sent to the Legislature for its permission.

Dallas, Tex.—An electrical department has been added to the Texas Survey and Rating Bureau, and Henry Garrett, of Dallas, an engineer of reputation and experience, has been placed in charge as chief.

Pittsburg, Pa.—The Commercial Telegraphers' Association convention, held here last week, was an occasion of considerable interest, and will probably result beneficially for the numerous body immediately concerned.

Mansfield, Ohio.—The Citizens' Electric Street Railway Company has secured the right of way over several streets in the western part of the city, and will within a few weeks begin work on an extension of their track.

Hightstown, N. J.—The council has passed an ordinance granting to Lane & Harrison, of Asbury Park, the right to form an electric light company in Hightstown, and giving them the necessary franchise for a plant.

Englewood, N. J.—A company has been formed by Mr. A. G. Fischer to start an electric light plant here. They contemplate supplying light for Harrington Park, Norwood, Closter, Cleveland on the Hill and Tenafly.

Valley Stream, L. I., N. Y.—A petition will be presented to the Hempstead Town Board at its next meeting asking that Valley Stream be made a street lighting district and the illumination be by means of electric lights.

Providence, R. I.—The Union Street Railroad Company will soon be reorganized, as a majority of the stock has been purchased by a syndicate who intend to equip the system with electricity. The old board of directors will resign.

Eugene, Ore.—An electric road across the steel bridge at Springfield is the object of a petition now in circulation here. If the franchise is granted, it is thought the proposed electric line from Eugene to Springfield will be built at once.

Camden, N. J.—The proposed electric railway between Camden and Woodbury is almost certain to be built, as the projectors are receiving much encouragement from property owners and are making progress in securing the right of way.

Woonsocket, R. I.—The result of the recent purchase of the Woonsocket Street Railroad will be a large increase of the capital stock, the extension of lines to Blackstone, Millville and Uxbridge and the equipment of the lines with electricity.

Elgin, Ill.—The Dundee Rapid Transit Company has secured the right of way for the railway line between Dundee and Carpenter. The line to Elgin will enter on Logan avenue and connect with either the Douglas or Dundee avenue line.

Gainesville, Tex.—Messrs. Griffin, Leonard and Briscoe have been appointed by the city council as a committee to ascertain to what extent an electric light plant would be patronized by private parties, and to derive ways and means to build the plant.

Scottdale, Pa.—President Miles of the company that proposes to build an electric railroad from this town to Bradford and Connellsville, has interested some Cleveland capitalists in the project, and it is now probable that the scheme will be pushed.

Jersey City, N. J.—A company to be known as the Central Electric Railroad Company is being organized for the purpose of building and operating an electric railroad in Jersey City to connect lower Jersey City with Greenville and Jersey City Heights.

Fort Lee, N. J.—The Ridgefield Township Committee has granted the extension of the right of way through the township to the Fort Lee Electric Railway Company. The company has been negotiating for the purchase of a large tract of land in the township.

Amherst, Mass.—Citizens of Amherst, Hadley, Belchertown and other towns in the county are signing a petition asking the Legislature to grant the petition of the Northampton Street Railway Company for authority to extend its lines from Northampton to Hadley and Amherst.

Wausau, Wis.—A franchise has been granted J. D. Ross, Walt Alexander, B. E. Jones and H. Dunfield to build an electrical railway through the principal streets of this city, work to begin on or before June 1. The territory embraced in the construction is about four miles.

Americus, Ga.—The Thomson-Houston Company, having become the owners of the street railroad, have offered to undertake to refit and operate the road if the citizens will undertake to secure certain privileges heretofore granted and give the road a certain guaranteed amount of patronage.

Montclair, N. J.—An electric railroad from Main street, Orange, to Montclair, with a branch running from West Orange to Eagle Rock, is to be built as soon as the weather will permit the work to be done. The terminus at Montclair will be at the Delaware, Lackawanna and Western Railroad station.

Leavenworth, Kan.—Arrangements have been completed for an electric railway between Fort Leavenworth and the Soldiers' Home.—The old "dummy" line is to be equipped with electricity, and for this purpose two carloads of electric railway material have been ordered from the Westinghouse Company at Pittsburg.

Brooklyn, N. Y.—The capital stock of the Traction Company has been increased from $3,000,000 to $9,000,000.—New electric lines will have the effect of reducing the rates to Coney Island, and it is thought probable that 15-cent round trips between Brooklyn and that popular pleasure resort will be made next summer.

Minneapolis, Minn.—Measures are being taken to consolidate the Water Power and Mill Company, the Water Works Company, the Electric Light Company and the Street Railway Company. The capital stock will be about $500,000. The Thomson-Houston Company will own the stock and control the consolidated concern.

Albany, N. Y.—A bill has been presented in the Legislature authorizing Sherman Petrie, of Kings County, to use the Erie Canal to experiment with the trolley electric system as a motive power for canal boats. The experiments are to be made at Mr. Petrie's expense, under the supervision of the State Superintendent of Public Works.

Spokane, Wash.—It is understood that the War Department has granted the Cœur d'Alene Electric Railway Company permission to cross the Fort Sherman land. This was the only obstacle to the building of the road, and operations will commence as soon as the snow goes. The motive power is to be obtained from the Spokane River and Post Falls.

Kansas City, Mo.—The city engineer has recently been at work on the specifications for the city's electric lighting plant. On the completion of his work of outlining the circuits and locating the lamps everything will be ready to receive bids.—The Merchants' Co-operative Electric Light Company have in view the building of a first-class electric light plant in Armourdale.

Marietta, Ohio.—The electric light plant owned by the city is advertised for sale. It cost $18,000 and has been in use three years. A syndicate has offered $15,000 for the plant for the purpose of establishing it at Devol's Dam on the Muskingam River, where there is abundance of water power for an electric plant of large capacity.—T. F. Davis, D. S. Milne, John Mills and W. J. Crane have asked permission of council to erect poles and string wires for electric lighting.

Newark, N. J.—The fortieth anniversary of Judge Gottfried Krueger's arrival in this country was celebrated on the 13th inst. by substituting electricity for horses on the South Orange street car line of which Judge Krueger is one of the largest stockholders. The first car that was sent over the line under the new system was named the "Judge Krueger," and it is said to be the handsomest and most costly street car in existence.

Norfolk, Va.—The people of this city are making a loud demand for electricity in the street-car service. The *Landmark* says: "It costs less to use electricity; it retires the poor animals from a killing service; it increases travel; it enhances safety and increases speed. All this necessarily adds to the profits of the business, and to the attractions of the locality in which the improved service is given. Give us electricity in our street cars, and do it quickly."

Detroit, Mich.—Frank A. Kirby, Neil McMillan and Fred A. Ballin, of the Detroit Dry Dock Engine Works, have formed a company called the Detroit and Belle Isle Electric Navigation Company. They intend to run a system of electric launches from the bridge approach on the American side, through the south canal to the Casino, and thence through the canals on the south side of the island to the upper end, around to the American shore, and back to the starting point.—Mayor Pingree, having been favorably impressed by the new Westinghouse lamp, will introduce the lamps into his factory, where he has an electric light plant sufficient for 1,000 lamps.

Philadelphia.—Chief Walker of the Electrical Bureau is in favor of the city owning and operating its electric light plant. The average cost of the electric lights at present is 44 cents for each lamp.—The *Record* says that "although the telephone patent issued to Alexander Bell in 1876 will expire on March 23, the Bell Telephone Company of Philadelphia does not expect to find any competitors in the field for ten and most probably seventeen years to come. The fact that Attorney-General Miller has filed a complaint in the United States Circuit Court at Boston against the American Bell Telephone Company and Emile Berliner has hardly disturbed the placid tranquillity of the local capitalists interested."

Boston Notes.

If one was to attempt to chronicle a tithe of the rumors current on Boston steeets day by day, having reference to the present and future prospects and the final destiny of the General Electric Company, this column would be unusually interesting reading. The briefest and most convincing summary of the situation is found in the daily stock market reports and the price for which General Electric can be bought to day as compared with the prices of three weeks ago. To the uninitiated even, the fact is patent that this stock, in the aggregate, is to-day less by several millions of dollars in value than a few months ago.

The sudden demand for the new Westinghouse lamp throughout New England is taxing the resources of the Boston office to the utmost, and nothing like even pace can be kept up with the incoming orders.

A corporation known as the Electric Brake Company, having its headquarters in Salem, Mass., has recently appointed its officers and will at once proceed to place on the market a device invented by Mr. W. Y. Ober, of Lynn, which it is claimed will perform the same service as the Westinghouse Air Brake on trains, Ober's device, however, being operated by electricity.

Electricity is to play a prominent part in future in the manufacture of bleaching powders. The Chemical Association of Rumford Falls, Me., which manufactures such powder on a large scale, has ordered a large generator for the purpose from the General Electric Company. It would be of 200 H. P., 140 volts and 1,400 amperes. This voltage it is estimated will be just sufficient to overcome the resistance where current flows while the amperage is such as to give heat sufficient to decompose common salt, from which chlorine is obtained.

Many large contracts are being booked by Boston electrical firms, both for installations in the city and in the surrounding towns. The Mather Electric Company is particularly fortunate in securing many of these contracts, so that it is enjoying a veritable boom. The company has never before done such a volume of business.

Quite a number of Boston gentlemen engaged in the electrical business are laying out their plans for a trip to the forthcoming Convention of the National Electric Light Association at St. Louis. The journey is a long one, but the Hubites don't consider distance when they are going to see friends or going for business. There will be quite a Boston contingent, so that it goes without saying that the approaching Convention will not be lacking in those characteristics of intellectual refinement and "culchar" which are sure to be around when men of "light and leading" from the modern Athens are on deck.

Beginning with the present issue of our journal there will be found in our advertising columns something interesting about new devices that will be of value in the electrical field which have had their birth in Boston.

The New England Street Railway Company has just been incorporated under the laws of New Jersey, to acquire, improve, operate and sell street railway properties. The capital stock will be $5,000,000. This company practically owns already nearly all the electric street railways in New England outside a few of the largest cities.

Mr. L. S. Dumoulin, the widely known and accomplished electrical superintendent of the West End Railroad Company, Boston, has resigned his place to accept other lucrative appointments of a more private character, but will continue to act as consulting electrical engineer of the West End Railroad Company.

Mr. F. S. Pearson, chief-engineer of the West End Railroad Company, Boston, has resigned his responsible position, but will be retained as consulting engineer for the company. Mr. Pearson is the prime mover in the gigantic project for the purchase of the Nova Scotia coal fields.

The Riehle Bros. Testing Machine Company announce that, beginning April 1, Mr. J. R. Matlack, Jr., will act as its representative at the World's Columbian Exposition, Chicago, and can be found, previous to the opening of the Exposition, at the office of R. W. Hunt & Company, Rookery, Chicago.

Walker & Kepler.

Messrs. Walker & Kepler, who formerly represented the Edison Company in Philadelphia, have taken the agency for the Siemens & Halske Company, their territory embracing the eastern part of Pennsylvania and the State of Delaware. This firm has a great many friends in the trade, and we predict a large success for them in their enlarged field.

W. S. Chesley & Company.

The above firm, located at 24 Morris street, Jersey City, make the following announcement: "We make a specialty of repairing Street Railway Apparatus, also large Dynamos, Lamps, Motors and Converters. Armatures of any make rewound, new Commutators, &c. We have sixty horse power for testing purposes and facilities for turning out work promptly and at lower prices than the manufacturer.

"We buy and sell all kinds of apparatus. We are manufacturers' agents and can furnish new machines. Our second-hand machines are thoroughly overhauled, supplied with new wearing parts and are guaranteed to be as good as new. Complete plants erected. Prices low. *Write for anything wanted.*"

New England Enterprise.

Foremost among the electrical supply houses of New England stands the Pettingell-Andrews Company, whose extensive establishment occupies the Estes Block, 192-202 Summer street, Boston. Here in extensive warerooms is carried a large, varied, indeed complete, line of all conceivable electric light, power and railway supplies. Incorporated less than four years ago, the company has steadily grown and expanded until at the present time it does by far the largest business of its kind in New England.

Under the direct personal management of the four principal stockholders, Messrs. C. H. Price, president; C. B. Price, secretary; D. A. Andrews, treasurer, and D. A. Andrews, Jr., vice-president, an extensive business with a far-reaching connection has been built up, its capacious stores occupying the whole of two floors in the block aforementioned. Here nearly $50.000 worth of stock is carried right along, including the well-known high-grade specialties made by the following and other companies, whose sole New England agents they are: The Okonite Company, Siemens & Halske Electric Company, Interior Conduit and Insulation Company, Boston Electric Wire Company, Bryant Electric Company, and many other well-known firms.

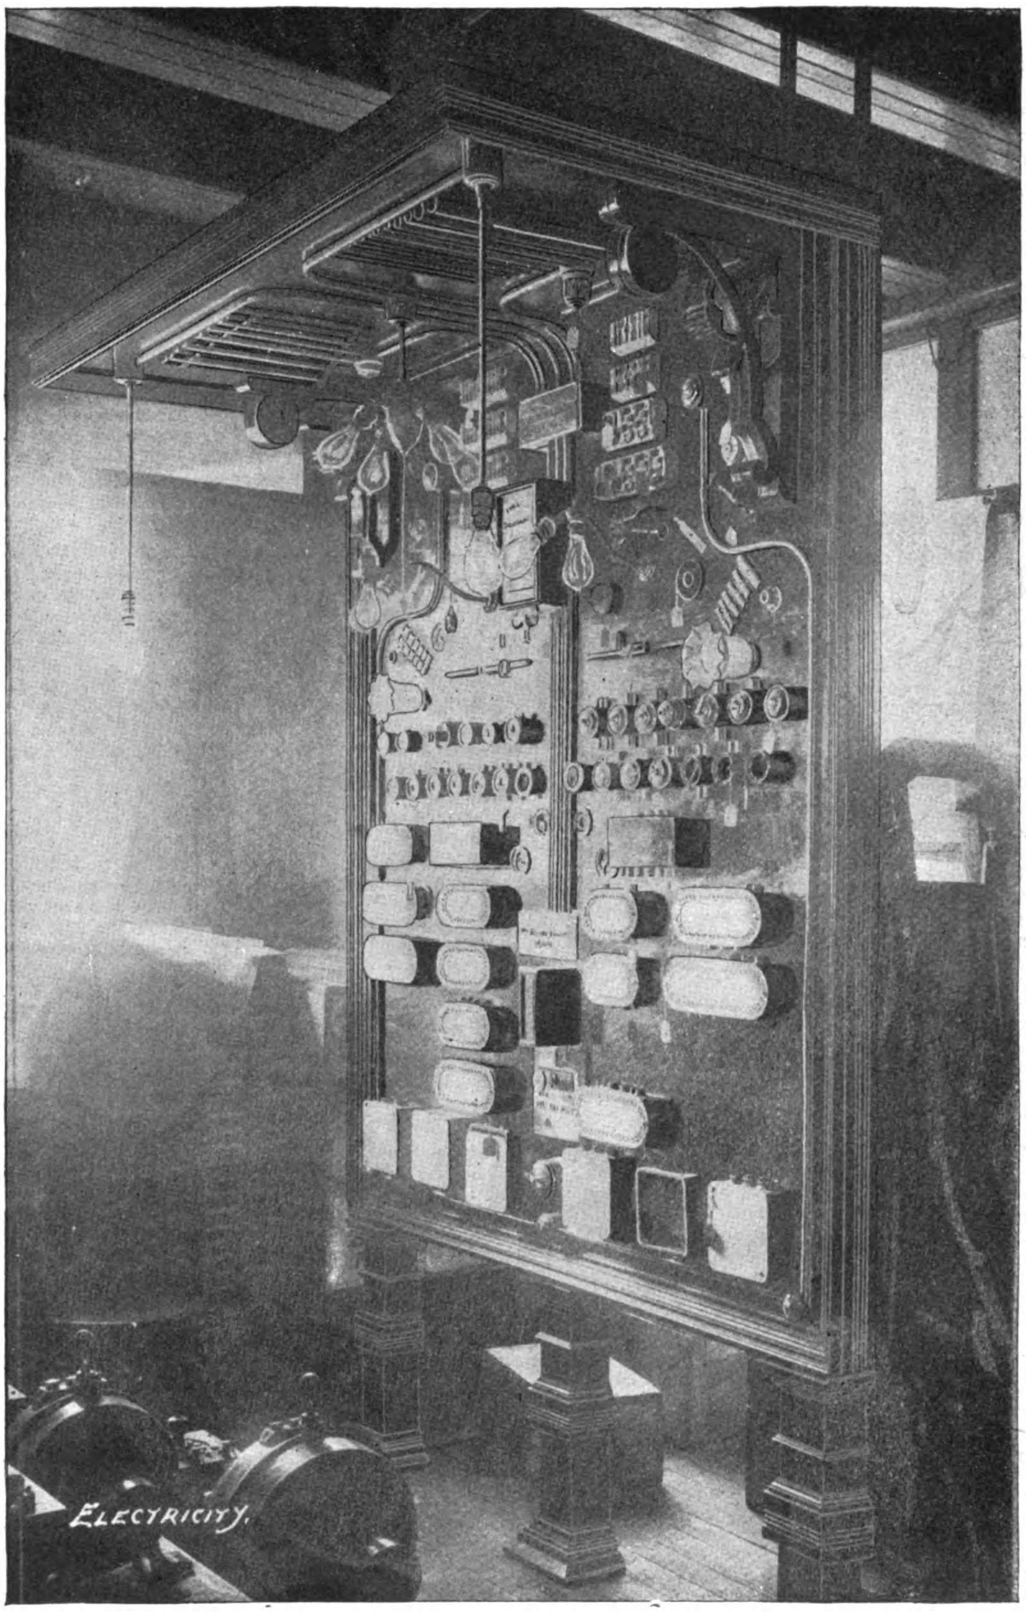

EXHIBIT BOARD, PETTINGELL-ANDREWS SUPPLY HOUSE, BOSTON.

The Pettingell-Andrews Company also handle large quantities of useful specialties of their own. Included on their list of patrons are the names of every light and power company throughout New England, while heavy shipments of goods are regularly made to distant parts of the country.

The accompanying cut shows an exhibit board in this mammoth establishment, on which are displayed every conceivable specialty manufactured by the Interior Conduit and Insulation Company of New York. There are various sizes of junction boxes, sections of the well-known interior conduit, with a notable variety of switches and cut-outs, all got up in different tints and colors to match the rest of the appointments in any room, hall, office or store. The entire board is wired up, having lamps connected in circuit so that quite a variety of illuminating effects can be produced, showing the merits of their manifold devices. The display is one of the most imposing and attractive that have been made by any manufacturing firm or supply house, and is quite a unique object in every respect.

But the Pettingell-Andrews Company does not simply handle supplies successfully. It has shown much enterprise in other directions, and its latest undertaking is to secure a franchise and contract to construct a new electric railway complete from Bellows Falls, the great paper-making centre, and Saxon's River, Vt. The track will be between five and six miles long, and equipped for both passenger and freight service, the entire electrical equipment to be of the Siemens-Halske type and make—overhead trolley system. This road will be not only the first electric railway in the State of Vermont, but will be the first Siemens-Halske road in New England, and the undertaking will be watched with great interest by the entire electrical fraternity. Construction will begin directly the frost is out of the ground. The company has several similar undertakings in view.

The Card Motor and Dynamo Company.

Some years ago an electrical manufacturing plant was started in the Queen City, and organized under the laws of Kentucky as the Card Electric Motor and Dynamo Company. Its progress was so apparent that a number of

Cincinnati's best known citizens purchased the same, and in January, 1892, incorporated it under the laws of Ohio, making the company a full fledged Ohio concern and entitled to encouragement as such.

The officers of the company are: J. W. Wilshire, president; George Bullock, vice-president and secretary; Otto W. Jantz, superintendent and electrician. Their mammoth factory is located at the southeast corner of Second and Plum, while the general offices are at 59 West Fourth street. The company consists of men of indomitable will power, who are peculiarly adapted to make a success of their undertaking. At the time of this their mammoth undertaking electricity was in its infancy in Cincinnati. They have, by absolute determination and straightforward business methods, so greatly increased the business of the company that they find their present quarters inadequate to carry on the business and have purchased grounds and commenced the erection of a three-story brick building, 175 feet on Hunt street by 86 feet on Broadway.

This company has on file in their office testimonials from every machine they have installed, either for the purpose of motor power or electric light, substantiating their claim to superiority.—*Cincinnati Post.*

The Lundell Motor.

The fact that the small as well as the larger sized Lundell Power Motors manufactured by the Interior Conduit and Insulation Company of New York have been and can be adapted to many useful purposes, is again exemplified in the new Beach Emery Grinder which this company has just standardized. The accompanying cut illustrates this neat little machine, which will at once commend itself to machinists and others interested in the grinding of small tools, such as twist drills, lathe tools, graving tools, knives, scissors, etc., etc. All shops that have adopted the electric illumination can most conveniently use this device. The Emery Grinder illustrated is 12 inches high, weighs 18 pounds, operates at a speed of 2,500 revolutions maximum and has in its base a regulating device for two lower speeds. It is of 1-6 H. P. capacity, 115 volts, and swings a 2 inch emery wheel. Larger and smaller wheels driven by motors of higher or lower powers are also furnished by the Interior Conduit and Insulation Company.

INCORPORATIONS.

The People's Electric Heat and Light Company, Springfield, Ill. Incorporators: F. W. Tracy, J. Henry Schuck, Frank Reisch, Chas. F. Herman, Frank Hoblit, of Lincoln; William L Gross and Edgar L. Gross.

The South Peoria Street Railway Company, at Peoria, Ill. Capital stock, $100,000. Incorporators: Charles A. North, Isaac M. Hornbacker and John W. Culbertson. To construct and operate horse, dummy and electric railways in Peoria County.

Articles of incorporation have been filed by a syndicate composed of twenty-six citizens of Newburg, N. Y., forming the Newburg, New Windsor and Balmville Street Railroad Company, with a capital stock of $100,000. The contemplated railway will be an electric system.

The Michigan Electric Company has been incorporated with a capital stock of $60,000, all paid in. The incorporators are John E. Moore, E. F. Sweet, A. C. Sekell, of Grand Rapids; C. Jesse Church, of Greenville, and Dr. O. C. McDonnell and Charles A. Church, of Lowell. The company will, as soon as the weather will permit, proceed to improve the water power of Flat River and to erect electric works to supply Grand Rapids with power and light by a system of long distance transmission.

The Butte (Mont.) General Electric Company has filed amended articles of incorporation. Under the new articles the capital stock is placed at $850,000, and the limit to the indebtedness is fixed at $1,000,000.

Kennett Electric Light, Heat and Power Company, of Kennett Square, Pa. Capital stock, $20,000. Directors: W. W. Gawthrop, J. M. Palmer, H. H. Gawthrop, D. W. Hutchinson, J. E. Worrell, Henry C. White, John C. Yeatman and Theodore Penrock.

Articles of incorporation have been drawn up for an electric railway in Wauwatosa, Wis. The incorporators are August Richter, Joseph P. Schubert and A. C. Dick, and the capital stock is put at $25,000.

The Alton Electric Street Railway Company, Alton, Ill. Capital stock, $250,000. President, A. M. Farnum; vice-president, J. H. Porter; secretary and treasurer, G. H. Walbridge; directors, J. G. White, J. H. Porter, E. C. Harrison, G. H. Walbridge and A. M. Farnum, all of New York City.

A charter has been granted to Senator John J. Patterson, and R. B. Focht, H. E. Gutelius, E. N. Tool, Silas Patterson and H. M. Nolf, directors, for an electric railway to extend from Lewisburg, Pa., to Middleburg, via Mifflinburg and New Berlin, with extensions to Laurelton and Cowan. It is understood that a portion of the road will be constructed during the coming summer.

The Crescent Electric Light, Heat and Power Company, Chicago. Capital stock, $100,000. Incorporators: Joseph R. Bickerdike, Tracey D. Hull and Burton Johnson.

The W. E. Irish Thermal Arc Light Company, Chicago. Capital stock, $250,000. Incorporators: W. E. Irish, F. B. S. Morgan and J. S. Morgan.

Beers Electric Fan and Motor Company, Newark, N. J. Capital stock, $100,000. Incorporators: Erastus Hayes and A. R. Bradley, of New York; William M. Tallman, of North Plainfield, and Franklin H. and William P. Beers, of Newark.

United Traction and Electric Company. Capital stock, $8,000,000. Incorporators: Henry W. Calhoun, of New York; Adrain H. Larkine, of Nutley, and Thorwall Stallknecht, of Orange. The concern will have offices in New York, Jersey City, Connecticut, Massachusetts, Rhode Island and in the District of Columbia. Its objects are the making and forming of contracts or sub-contracts for the purpose of building and equipping railroads, whether operated by horse or electric power.

The Arapahoe Railway Company, Denver, Col. Capital stock, $25,000. The company intends to build an electric railway through the eastern and southern environs of Denver. Among the principal backers of the project are the Arapahoe Investment Company, the Fairmount Cemetery Company and B. H. Du Bois.

The New York Traction Company. Capital stock, $5,500. Directors: John A. McCall, F. K. Hain, T. D. Jordan, W. H. McIntyre, George V. Turner, New York; Charles A. Johnson, Raymond C. Johnson, Charles H. Russell, Charles Curie, Brooklyn; James A. Morrissee, F. C. Van Dyke, Paterson, N. J. The purpose of the company is the construction of railroads and furnishing power for railroads in New York City.

Articles of incorporation of the Jersey City, Hoboken and Rutherford Railway Company have been filed. Among the New York and New Jersey capitalists interested in the project are H. B. Hyde, president of the Equitable Life Assurance Company of New York; John A. McCall, president of the New York Life; Thomas D. Jordan, controller of the Equitable; Charles A. Johnson, president of the United States Fireworks Company; ex-Senator Russell of Brooklyn, Gen. Louis Fitzgerald, James A. Morrissee and James R. Lee of Paterson, and Charles Curie of Brooklyn. The capital stock is $525,000, and it is all subscribed for.

A number of well known men of Lancaster, Bethlehem, Littleton and other New Hampshire towns, and also of Portland, Me., have organized the Coos and Grafton Electric Light, Heat and Power Company. The intention of this company is to locate on the Connecticut River, near the town of Dalton, on a valuable water power already secured, a large and fully equipped electric light and power plant, with a capacity of at least 4,000 16-candle power lights, or between 300 and 400 horse power. Their purpose is to run wires to Lancaster, Littleton, Bethlehem, St. Johnsbury, and to any neighboring town where sufficient power and lights can be sold to make it an object.

The New England Street Railway Company; certificate of incorporation filed at Trenton, N. J. Capital stock, $5,000,000, which may be increased to $50,000,000. Directors: John R. Bullard, president of the Dedham National Bank; James C. Elmo, president of the Shoe and Leather National Bank of Boston; Col. John H. Cunningham, president of the Winnisimmet National Bank of Chelsea, Mass., W. B. Ferguson, president of the Gloucester Street Railway Company; William H. Leonard, vice-president of the North National Bank of Boston; Dr. A. F. Mason, Major A. C. Pond, president of the New Haven and West Haven Street Railway Company; A. K. Mitchell, vice-president of the New England Trust Company of Boston; Thomas T. Robinson, treasurer of the West Leicester and Spencer Street Railway Company of Boston, and James B. Dill of Dill, Chandler & Seymour, of New York, counsel of the company. The company proposes to acquire as many street railroads as possible in New England and operate them by electricity. Its charter gives it the power to acquire and operate by electricity street railways in any part of the United States and in the City of Mexico. The Corporation Trust Company of New Jersey is its trustee in New Jersey, and the New England Trust Company in Boston.

The Power City Illuminating Company of Niagara Falls has been incorporated at Albany with $5,000 capital, to generate electricity for light, heat and power. The directors are H. L. Brewster, H. C. Brewster, A. Erickson Perkins, Haywood Hawkes, Peter A. Porter and Lewis A. Boore.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED FEBRUARY 14, 1893.

ELECTRIC RAILWAYS AND APPLIANCES.

491,666. Electric Locomotive. Sidney H. Short, Cleveland, Ohio, assignor to the Short Electric Railway Company, same place. Filed Jan. 16, 1891.

491,667. Directly-Connected Motor for Cars. Sidney H. Short, Cleveland, Ohio, assignor to the Short Electric Railway Company, same place. Filed March 30, 1891.

491,691. Series System for Railways. George L. Thomas, Brooklyn, N. Y. Filed June 16, 1892.

491,857. Electric Locomotive. Frank B. Rae, Detroit, Mich., assignor to the Detroit Electrical Works, same place. Filed April 11, 1891.

DYNAMOS AND MOTORS.

491,567. Conductor for Armatures. Emil Kolben, Schenectady, assignor to the Edison General Electric Company, New York, N. Y. Filed Feb. 8, 1892.

491,568. Armature and Means for Supporting the same. Emil Kolben, Schenectady, assignor to the Edison General Electric Company, New York, N. Y. Filed Feb. 8, 1892.

491,695. Alternating-Current Dynamo-Electric Machine. James J. Wood, Brooklyn, N. Y. Filed Oct. 30, 1890.

491,708. Electric Motor and Dynamo Mica Insulator. Charles W. Jefferson, Schenectady, N. Y., assignor to Eugene Munsell & Company, New York, N. Y., and Elizabeth, N. J. Filed June 1, 1892.

491,829. Electric-Motor Regulator. Joseph A. Williams, Canal Dover, Ohio. Filed Feb. 11, 1892.

491,970. Electric Motor. Alexander W. Meston, St. Louis, Mo. Filed June 15, 1891.

ELECTRIC LIGHTS AND APPLIANCES.

491,548. Electric-Arc Lamp. Frederick D'A. Goold, Schenectady, assignor to the Edison General Electric Company, New York, N. Y. Filed April 15, 1892.

491,561. Incandescent Lamp-Socket. Joseph Hutchinson, New York, N. Y., assignor to the Edison General Electric Company, same place. Filed June 11, 1891.

491,596. Electric-Lamp Fixture or Bracket. James T. Robb, Mount Vernon, assignor to the Edison General Electric Company, New York, N. Y. Filed Aug. 31, 1891.

491,603. Duplex Electric-Arc Lamp. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Oct. 27, 1890.

491,604. Electric-Arc Lamp. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Oct. 30, 1890.

491,605. Cut-Out for Arc Lamps. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 1, 1890.

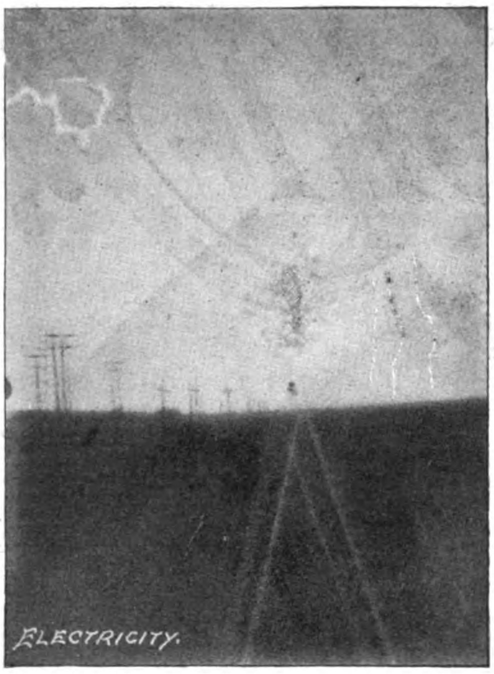
Lightning Photography.

From an Express Train.

BY W. N. JENNINGS.

When a school boy, I remember watching with much interest the professor turning the handle of an electrical machine, and still recall the thrill of delight I experienced when I saw for the first time a bright spark flash across the three-inch space between the prime conductors with the "crack" of a toy pistol.



LIGHTNING PHOTOGRAPHY. (FIG. 2.)
(Taken from moving train. Showing multiple images of telegraph poles.)

A needle was then placed upon one of the brass knobs of the machine, the handle rapidly turned, but no spark would pass, the electricity passing from the point of the needle in the form of a luminous brush as fast as it was generated. The experiment was varied by allowing one of the boys to revolve the glass cylinder after the professor had removed the needle, followed by numerous sparks in quick succession. Holding the needle in his fingers, the professor brought its point near one of the conductors, when the spark stream ceased and a silent brush of light blue tint swept over the brass knob, appearing to come from the professor's body.

So much for electrical dissipation. A number of condensers were next connected with the machine, and while the handle was being turned we were told that these acted as reservoirs where the electric fluid was stored until it had gained energy enough to bridge the eight-inch gap between the prime conductors, which it presently did with a brilliant flash and the report of a rifle.

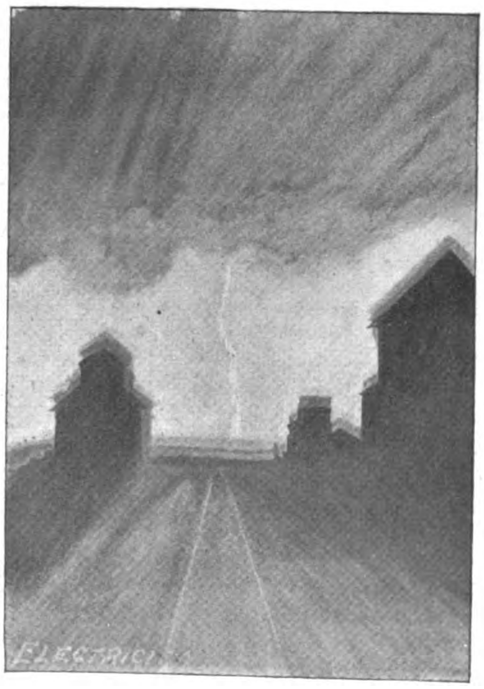
Then it was when I got my first conception of the service of the lightning rod—not to carry away the electric fluid, but to throw out from its point a stream of electricity of the opposite kind with which the sky is charged and thus neutralize the effect of the storm. Thunderstorms are usually preceded by a heavy downpour of rain, and in built-up cities every church spire and a thousand pointed gables send up peace offerings to Jove, and thus avert great destruction.

But out in the Western prairies of the great American Continent a thunderstorm is seen at its best—or worst. These stretches of land serve as enormous condensers, with the poles of Nature's electrical machine many miles apart. I had often wished to have the privilege of watching a Western storm, and last summer my yearning was satisfied to its fullest extent.

We had reached the middle of the prairie of North Dakota. The day had been very sultry, and as an old railroader said thunder was in the air, I loaded my camera and waited anxiously for Jove's pyrotechnics. At midnight I was startled from my sleep by a strange rumbling sound, quite unlike that of the train, and a peculiar glare filled the car, not shed by the oil-lamps overhead. I rolled up the window shade, and for the first time in my life saw lightning. Seizing my camera I made my way to the rear platform of the train, from which point I had a clear view of the storm. The sight was terribly grand: a quivering banner of light as broad as a house, threw its flaming folds far out into the night; flying hailstones became scintillating stars, the railroad track a blazing sunbeam, and the prairie a surging sea of molten silver, while the thunder boomed continually like the sound of great breakers rolling in upon the seashore.

As a streak of lightning shot out from the horizon the train flashed past a telegraph pole, which stood out against the sky in quadruple. The same thing happened in the case of a water tank, which showed six outlines in front of a single line of light. The glass eye of my camera corroborated the vision of my own; and my travelling companion, Mr. F. E. Ives, of color-photography fame, indorsed my views, he too having noted the phenomenon from the car window.

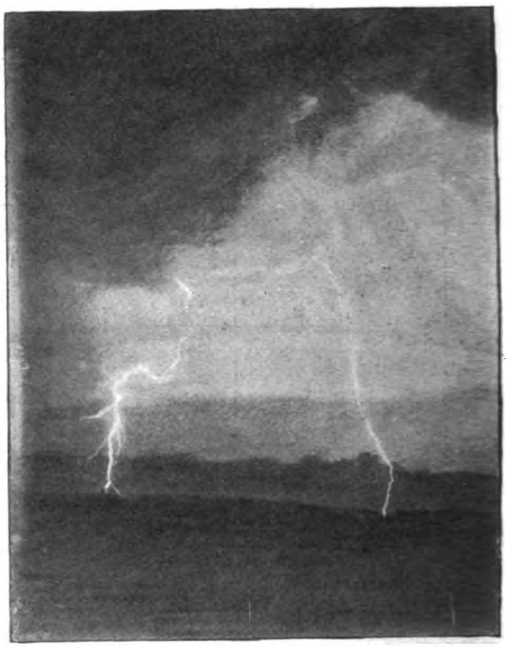
Many years ago, while passing my hand before my face during a thunderstorm, I noticed multiple images of the fingers, and have since noted the flight of bats between a lightning discharge and the eye which gave a number of instantaneous images of the bat, showing clear-cut images with different wing movements, with a space between each. This led me to conclude that when lightning has once opened up a path in space, that line being a conducting one, electric energy oscillates to and fro along it, until a balance between the two points is maintained or the electric area is drained or neutralized. If during the progress of such a discharge the camera is passed quickly across it, the resulting photograph will be likely to show a number of images having the same general outline.



LIGHTNING PHOTOGRAPHY. (FIG. 3.)
(Taken from moving train. Showing multiple images of buildings.)

In the case of the large photograph illustrating this article the discharge was a single one, which is proven by the fact that the train was running at a high rate of speed, and yet the railroad ties quite close to the camera are clear cut, which image I have failed to secure during the daytime under the same conditions with the most rapid instantaneous shutter at command.

Another peculiar feature of this storm was shown by great bands of light shooting up out of the prairie, quite close to the camera, and after reaching the clouds recoiling and striking the earth again. One such flash I succeeded in capturing, and it is here reproduced.



LIGHTNING PHOTOGRAPHY. (FIG. 4.)
(Taken from moving train.)

The Administration of the Royal Saxon State Railways has decided on the construction of an electric central station to supply all the Dresden railway stations with light and power. From the various schemes submitted, that of Messrs. Siemens & Halske, slightly altered by Mr. Ulbricht, of Dresden, was adopted. This scheme proposed the use of the "drehstrom." On completion of the station, the output is to be 1,300 H. P. The installation will consist of five boilers, four engines, and the same number of "drehstrom" machines of 330 H. P., each running at a speed of 100 revolutions per minute. The station pressure of 120 volts is raised by transformers to 3,000 volts, and reduced again for use at the lamps and motors. The network stretches to places four miles distant, and feeds 600 arc lamps and over 3,000 glow lamps. The work has been divided between Messrs. Siemens & Halske and the Helios Company of Cologne, the former firm being responsible for the station, the motors, and the station transformers, while the latter company provide the mains and the lighting arrangements. This station will be the largest in existence working on the "drehstrom" principle.—*London Electrician.*

Modern Invocations Not Wanted.

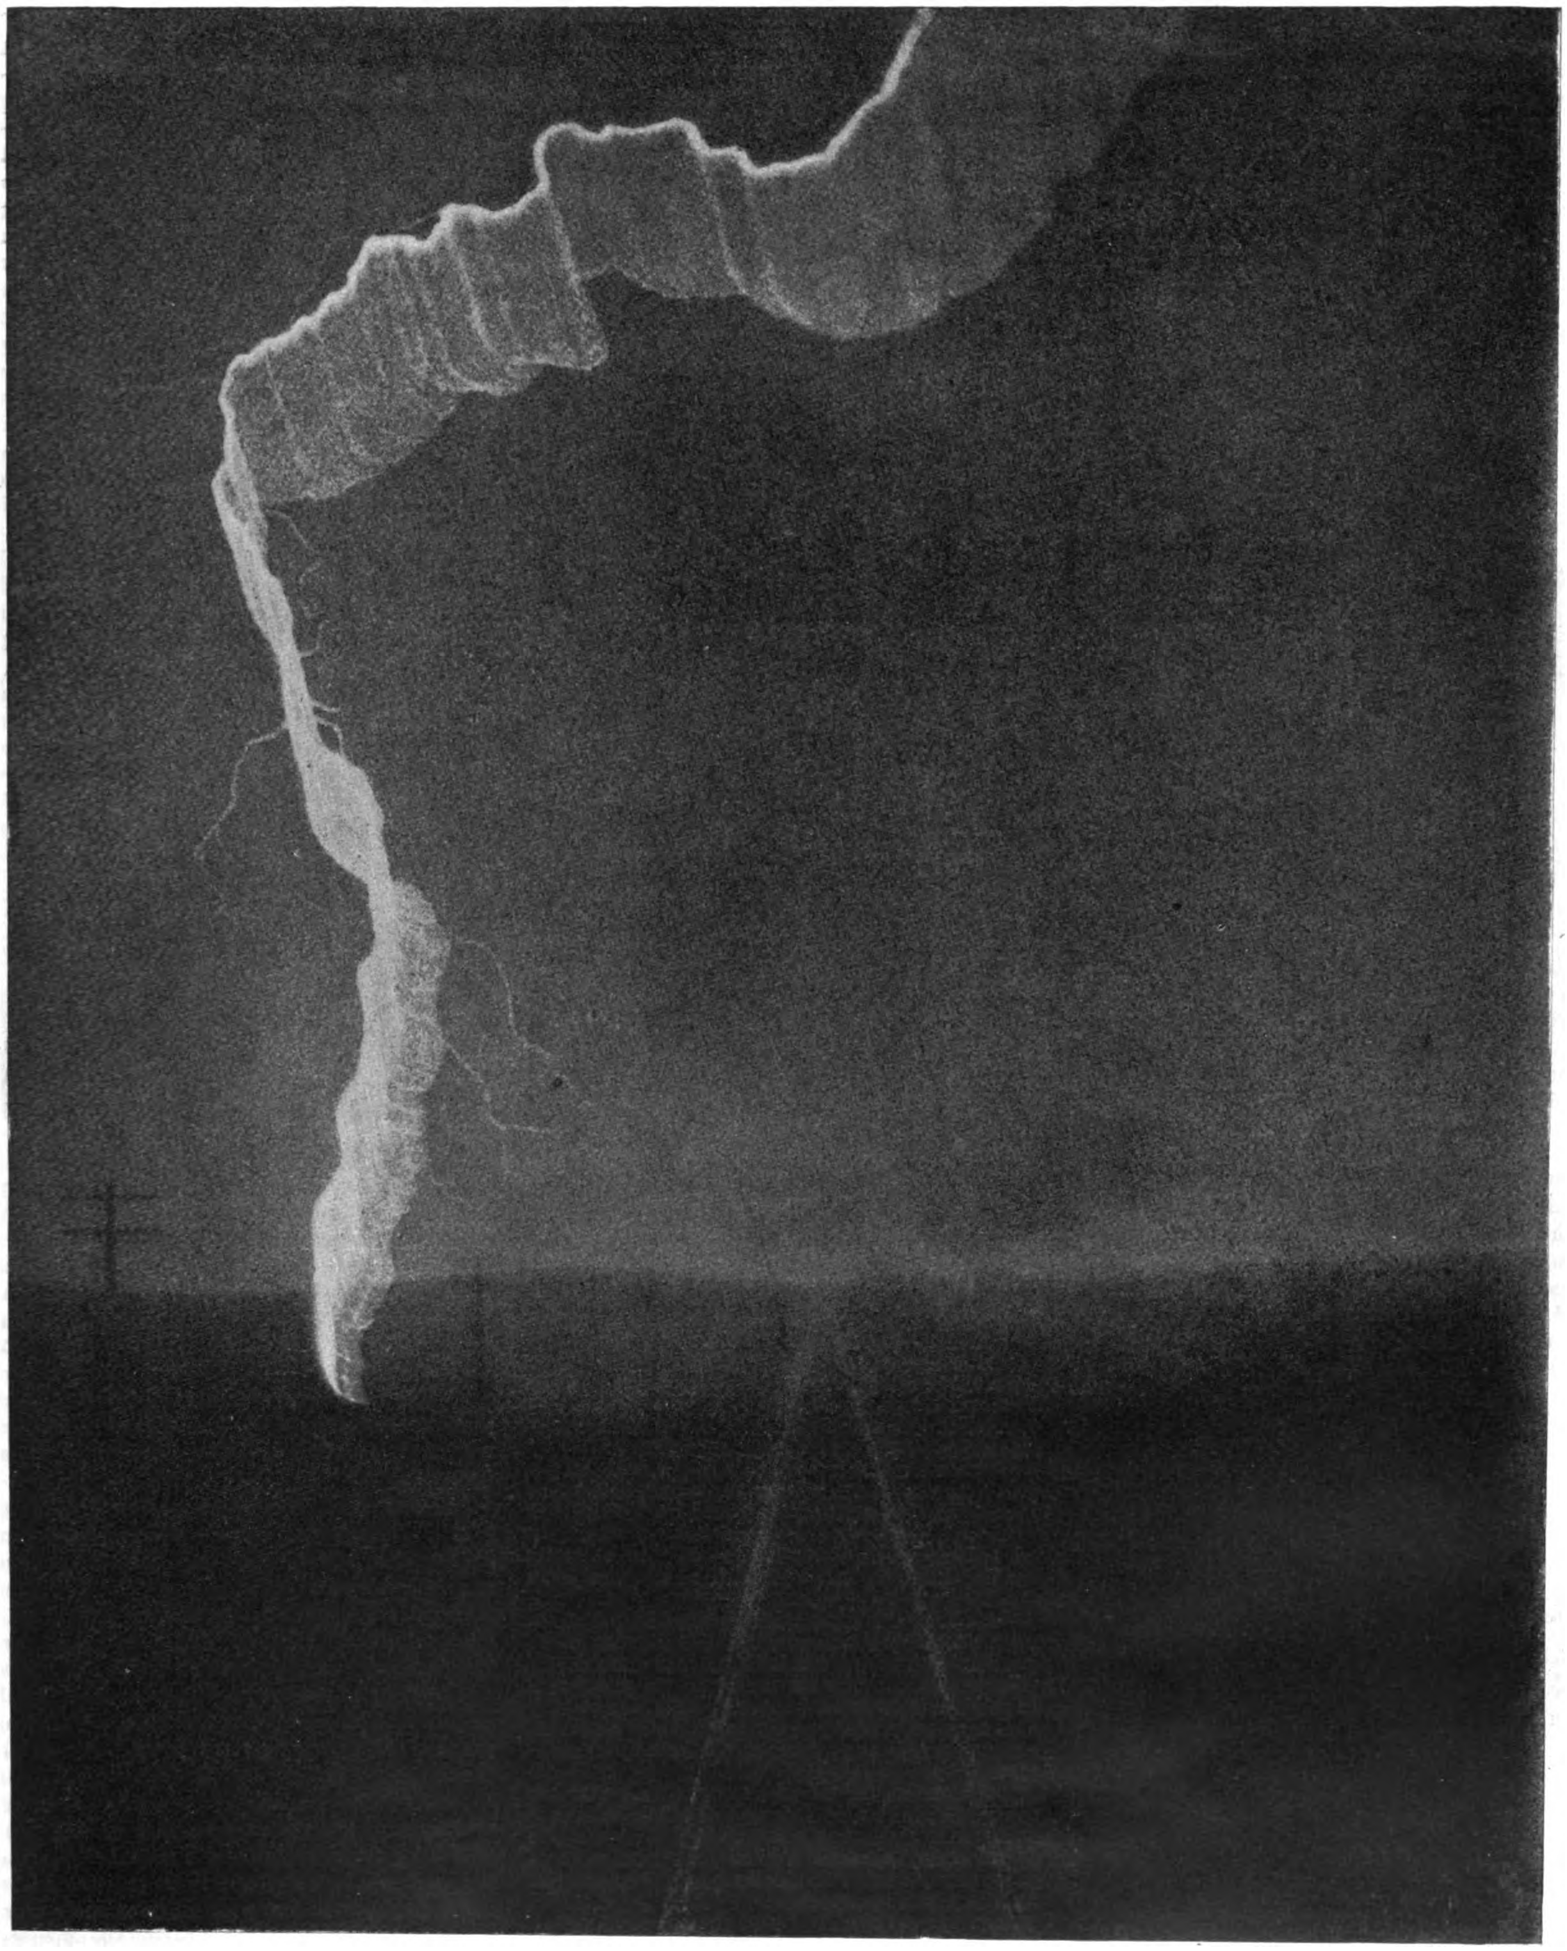
The Singing of the Trolley Wire Misinterpreted.

(From the St. Johnsbury Caledonian.)

A summer visitor who admires Brattleboro has become anxious concerning the proposed electric street railway there, and writes to the *Phoenix*, pleading that the streets of Brattleboro may be kept "inviolate from the rush, noise and danger of the city electric railway." The city folks are evidently somewhat jealous of the modern invocations which threaten to destroy the charm of the country towns of which they have grown fond.

Personal.

Mr. Walter Lodia, whose communications on electrical matters abroad have appeared from time to time in ELECTRICITY, has returned to this country and will represent several English publications at the World's Fair.



A DISCHARGE OF "RIBBON" LIGHTNING.

PHOTOGRAPHED FROM THE REAR PLATFORM OF A RAPIDLY MOVING TRAIN, CROSSING THE PRAIRIE OF NORTH DAKOTA.

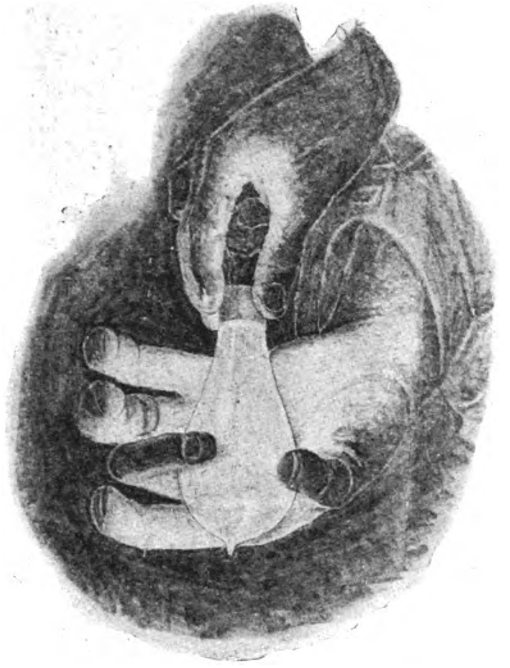
BY W. N. JENNINGS.

(FIG. 1.)

Glowing of Disconnected Incandescent Lamps.

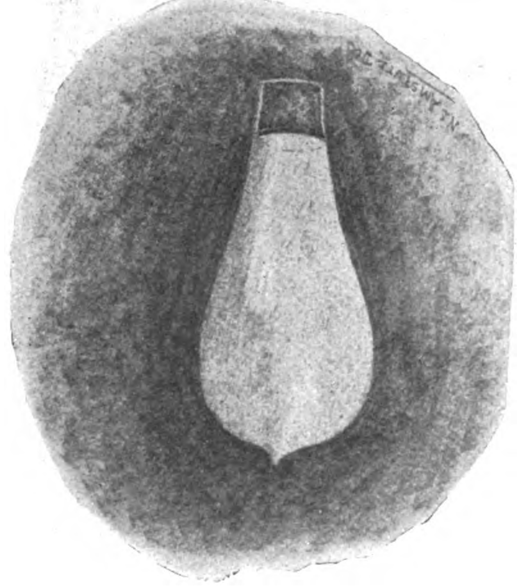
BY N. S. AMSTUTZ.

A most peculiar and interesting phenomenon may be produced from the ordinary incandescent lamp, in which a considerable illumination of the whole interior of the lamp can be produced for a very short time without having the lamp connected to any source of current by wires, etc. This interesting experiment may be performed in any one's parlor without any appurtenances other than an incandescent lamp, a darkened room and mechanical power in the shape of two unobstructed hands. The lamp is grasped about, as shown in Fig. 1, at its lower end with the thumb and first finger of the other hand partly and gently encircling the bulb of the lamp at its upper end—not holding the lamp so firm as to not enable the right hand to rapidly move the lamp up and down through between the thumb and first finger of the left hand, in the meantime holding the left hand stationary. After a few rapid movements the lamp will glow about as shown in the accompanying figures.



GLOWING OF DISCONNECTED INCANDESCENT LAMPS. (FIG. 1.)

At times the glow will be maintained for some moments after the left hand is removed entirely, showing a delicate cream colored phosphorescence with a slight bluish tinge, the apparent points of discharge being marked by increased luminosity of ever-changing forms, appearing very much as a miniature "aurora." Again, at times when this glow disappears, by returning the left hand to the position shown in Fig. 1 the glow reappears, but for only a moment. Simply bringing the lamp within the field of the left hand will sometimes cause the after glow to appear slightly. If the thumb and first finger be brought partially around the lamp the after glow is concentrated and intensified. I do not profess at this time to explain the phenomenon, but state these facts for the notice of others who have possibly investigated the same features. If ever a phenomenon was full of caprice, certainly this is one, for at times in following out the same conditions that have been acted upon previously no results whatever were produced. The experiment again has been a failure when tried at different locations, three or four miles apart, with the same lamp in use and taking precautions to carefully insulate the experimenter from possible grounds, etc., but without effect. Certain persons seem unable to call forth vacuo aurora after repeated attempts. The results are also modified by different kinds and sizes of lamps, the smaller bulbs appearing to give the best results. A specific instance of the capriciousness of the whole matter may be cited as follows: On September 29, 1892, I was enabled to produce the glow illustrated in the engravings shown, repeatedly, at my house, whether standing on carpets, wooden or cement floors. Upon the next day the same lamp was used at my office in a large vault having a cement floor without success. Standing on paper or rubber had no effect whatever in luring the phosphorescent glow from its mysterious stronghold.



GLOWING OF DISCONNECTED INCANDESCENT LAMPS. (FIG. 2.)

I hope the recitation of the experiments which have been performed may call out the experience of others in the same line.

In all of the experiments which were successful the glow appeared to be directly proportional to the speed with which the lamp was moved and the distance of such movement. Of course a limit of speed is soon reached, above which it is impossible to proceed by manual power. The glow did not affect the filament at all, and there were no peculiar sensations felt in the hands. A slight crackling sound was at times noticeable.

A Model Plant.

(From the Detroit News.)

Mayor Pingree is indignant over the proposition that this city should be made to purchase the plant of the Detroit Electric Light and Power Company. He said: "The idea of asking the city to buy such a rattrap plant is preposterous. By rights, their power house ought to be condemned." A few moments after the Mayor had said this, he received corroboration from Wm. C. Cullen, a mechanical engineer, who told his experience as follows:

"I think my health is as good as that of almost any man, but one week's work in the Detroit Electric Light and Power Company's plant was too much for me. In the first place I was offered $75 a month, a lower figure than has been offered me in twenty-seven years. I went to work, and intended to continue working, but I simply couldn't stand it.

"Their alleged steam condensers are located in the basement, but they are such poor machines that the steam pours out of them and fills the institution with a killing heat and vapor. I have left there with the perspiration pouring out of my shoes when the weather was freezing I left there last Sunday and my feet are still discolored. Their engines are no good, though the dynamos are not so bad.

"One night during the week I worked there. I think it was a week ago Tuesday, they shut down fifty minutes to repair one of the engines, and not a light was burning in the city during that time. Yet the next day the police reported only 25 lights of the 1,200 being out. I am now just recovering from my experience."

Mayor Pingree recently visited the plant and says he would not work there an hour for the price of the whole plant. He'd be afraid of being blown up.

The details of the Wyandotte fight with the General Electric Lighting Company have been carefully compiled by Mayor Pingree and sent to Lansing, where they will be used in aiding the passage of the Moore bill in the Legislature.

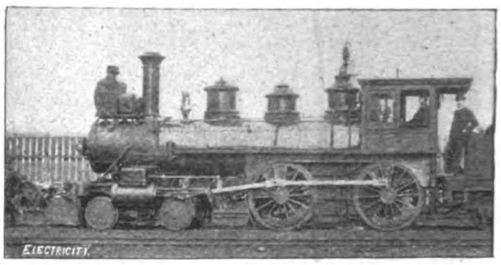
An Electric Headlight.

Designed for Locomotives.

The apparent slowness and disinclination of railroad authorities to adopt inventions of a class presumably beneficial is so often a matter of comment that it has grown to be an axiom. Be this as it may, it is a known fact that the heads of operating departments are constantly besieged with all classes of inventors, good, bad, and indifferent, to such an extent that an entirely separate and distinct bureau could be kept busy considering the multitudinous claims presented by the inventors. It is not to be wondered at in view of this fact that master mechanics and other officials are not consumed by a burning desire to welcome the army of claimants, but notwithstanding this fact, it can safely be said that the various departments are quick to take advantage of any improvements that will cheapen the cost of maintenance, facilitate the operation of trains over their lines, or render the liability of accident less.

Under the caption of the latter head, it is the purpose of this article to set forth in detail the system of electric head-light apparatus manufactured by the National Electric Headlight Company of Indianapolis, Ind.

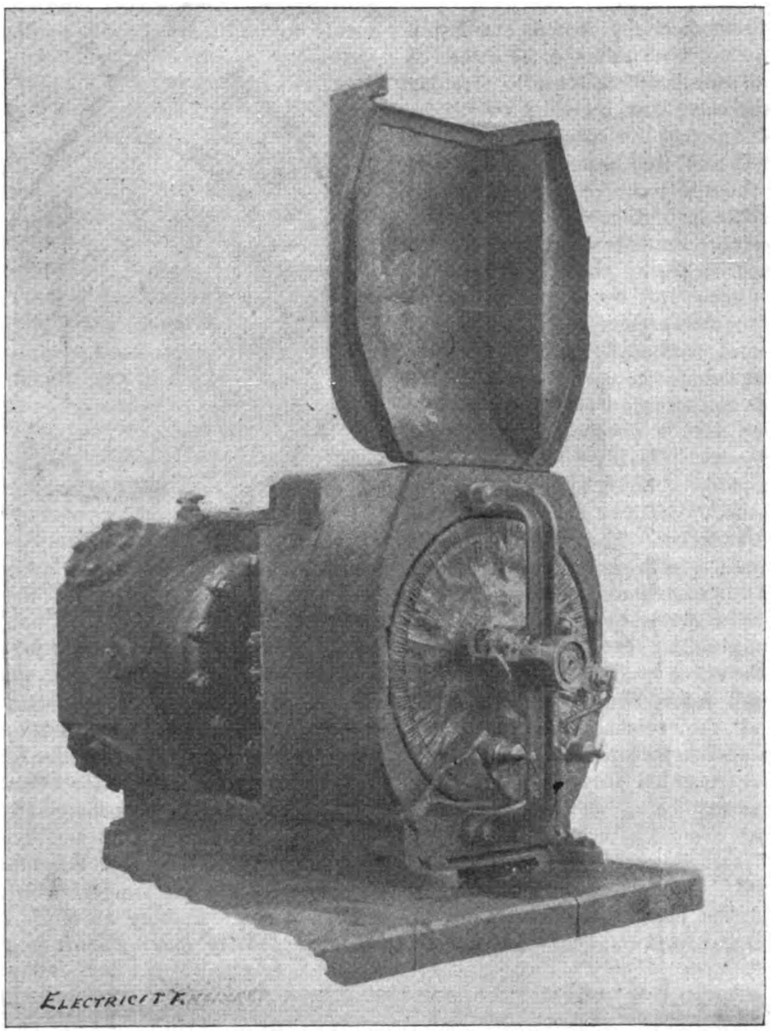
Two distinct views of the function of the headlight are entertained concerning its usefulness. The foreign one (and to some extent patterned after in this country) is that it should merely consist of a bullseye, this being all-sufficient, for the reason that it fulfils its purpose in warning stationmen and others of the train's approach. It is claimed that this is all that is required, that the purpose is served with a lens three inches in diameter fully as well as a twenty-two inch reflector, inasmuch as the latter does not well illuminate the track for any distance sufficiently to make an emergency stop. The other view taken is that it can be used as an illuminator of ample power to determine a scope of vision of sufficient length to make a stop for an obstacle or any other cause within the rate of speed now run by the fastest trains.



AN ELECTRIC HEADLIGHT. (FIG. 1.)

It would seem, from a humane standpoint, that such an agency for preservation would be a great desideratum, not only by reason of the distance seen ahead by the engineer and the protection afforded thereby, but on account of the most effectual warning given to those approaching dangerous grade crossings at night, a continual and fruitful source of accident, for such a light affords a most positive notice of the train's approach. General Superintendent Neilson, of the Cincinnati, Hamilton & Dayton R. R., also contends "that the use of so powerful an illuminant entirely obviates trouble arising from mistaking train orders and rights by reason of the warning being given in so positive a manner as to preclude the possibility of their being misunderstood," and for that reason the apparatus manufactured by the above mentioned firm is being generally placed on locomotives of that system, freight as well as passenger.

In analyzing the list of accidents on railroads, compiled monthly, the fact is very apparent that the use of just such an agency as is herein described would have averted a large per cent. of them, and on systems where it is used repeated instances have arisen where wrecks admittedly have been averted, but as corporations naturally are averse to have information of this character paraded before the public, the strong endorsement, fairly obtained, cannot be utilized to further the claims of the apparatus.



AN ELECTRIC HEADLIGHT. (FIG. 2.)

With the advent of the arc light to commercial use, attention was at once directed toward applying it to the locomotive, and for a number of years much hard work and great sums of money have been expended in solving the problem, and devising a plant that could be placed on a strictly commercial basis. Probably no department of electrical science involving the given amount of machinery has presented so many difficulties of so varied a character. It is not desirable here to go into too great detail touching the developments that have taken place ; suffice it to say that the mere mention of the great variation of steam pressure, the exposed situation of the apparatus, the determination of speeds for both dynamo and engine that would be conducive to longevity in both, devising a lamp that would be absolutely trustworthy in the hands of the average engineer and be surely operative under the most adverse conditions, to feed at the predetermined time and duration under the violent vibration to which the front end is subjected while running sixty miles per hour, drawing a heavy load—these are some of the essentials, and they have been successfully met.

The pioneers in this branch of study were George C. Pyle, of Indianapolis, and Howard L. Pyle, of Wilmington, Del. Experiments conducted by them at various times were contributory to the stock of knowledge on the subject, and opened up a thorough understanding of the needs of the situation. To the former belongs the credit of embodying practically the improvements and latest practice as shown.

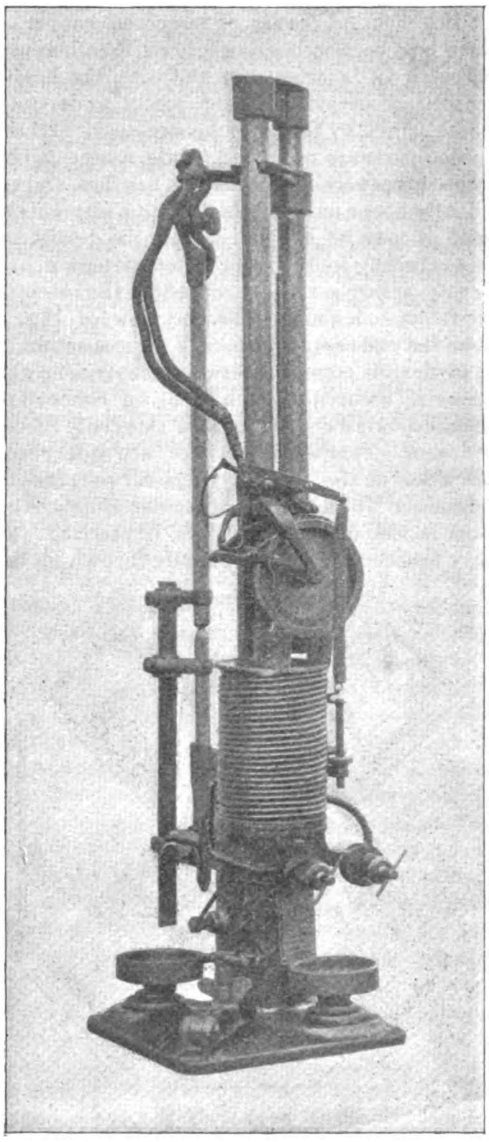
The apparatus as shown in Fig. 1, on Engine 26 of the Wilmington and Northern Railroad, is placed between the head case and the stack. The lamp is placed in the location formerly used by the oil font, the reflector in the same relative position. Steam is taken from the boiler end in the cab, where access to the valve and lubricator are within easy reach. Without leaving his seat, the engineer can obtain any size of light he wishes by admitting the necessary amount of steam.

Fig. 2 gives in perspective on an enlarged scale the coupled dynamo and engine, with the protection case of the dynamo thrown up and the coupling guard removed.

The total space occupied is 28 inches long by 15 inches wide and 17 inches high ; the total weight is 650 lbs., and the normal speed 425 revolutions per minute.

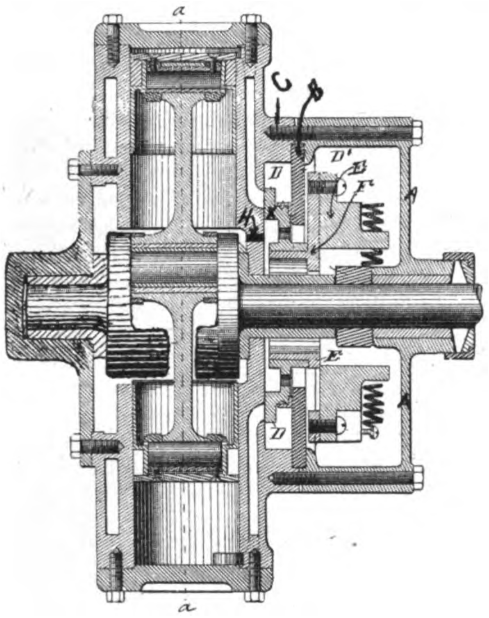
Fig. 3 shows the lamp removed from its position by the reflector, revealing the elements incorporated for operation. It is so designed that the feed guide and carbon rod can be lowered to enable its being removed from the case. The mechanism is positive in its action, and by the predetermined adjustment, keeping the feed securely locked till the time for the same coming into play arrives, when it is released, a friction pull comes into action, and the descent of the rod and carbon are smoothly intercepted. Should the feed be a fraction too much, the arc is at once automatically re-established to the normal point. The lift or feed is obtained by the use of a single solenoid in the main current. The hand nuts at the base allow the lamp being focussed within the reflector ; the set screw and lifting screw at the base serve to allow the apparatus being raised and lowered in a vertical plane for the same purpose. New carbons are readily inserted by lifting the rod and carbon holder up within the scope of travel, when the latch is then dropped in engagement with the ratchet wheel. The new carbon is then entered in the guide, the latch released, the holder descends to and is secured to the carbon, when the lamp is ready for operation ; each carbon averages from eight to eight and one half hours in consumption. The earlier experiments in lamps were confined to using two carbons in producing the arc, and with a great range of readings of current, varying from fifty to one hundred and twenty volts and from ten to twenty amperes; but after a long series of experiments it was finally determined that for practical usage this form was undesirable for the reason that differential ratios of consumption could not accurately be maintained, and as a consequence the focus was so constantly disturbed as to throw the beam of light either up or down, thus impairing its efficiency. After a long series of experiments, a rating of current was determined by which the use of a copper rod could be substituted for the lower carbon, the deterioration being nil. The current used gives practically the same result in penetration and volume of light, while the temperature is considerably below that of the ordinary arc in common practice, and safely inside the melting point of copper. When the latter becomes blunt by long usage, it can be taken out and retipped.

One of the imperative requirements of the situation as made manifest was the need of a suitable guide to hold in alignment the descending carbon. The arrangement shown meets this by providing two such guides insulated from a bar of iron, one of which embraces the lower electrode of copper, the other allows the carbon to pass freely through it; when the current is off, the tapered points are thus held in fixed and operative relationship. It is absolutely impossible to submit the lamp to action however violent



AN ELECTRIC HEADLIGHT. (FIG. 3.)

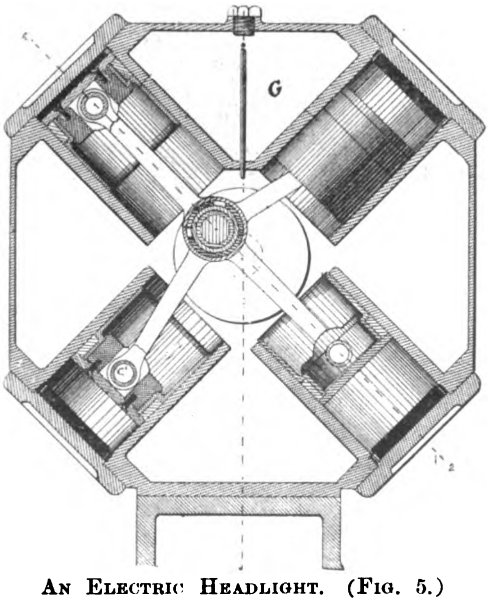
enough to destroy the arc in operation, and exemplifies what may be accomplished in a given direction by persistent effort and research.



An Electric Headlight. (Fig. 4.)

The dynamo, which is coupled direct to the engine by means of an improved flexible coupling, is of the bipolar type, designed and constructed on the most approved scientific principles, giving out the required current with the low rotative speed mentioned. The bearings are of the latest production graphite filled, requiring little or no oil; the commutator is of tempered copper on which bear carbon brushes, giving excellent service with little attention, and with the holder comprising an arrangement easily understood and managed by the average engineer. All the exposed parts are protected, while a zinc cap on hinges gives accessibility to the brushes, and effectually keeps out cinders and the elements to which it may be subjected. All the details are most carefully looked after in construction, and the satisfactory service rendered by the machine attests its efficiency. The end view of Fig. 3 shows the end case thrown back for inspection.

The flexible coupling between the dynamo and engine is secured to each by being clamped to the end squared on each, and is especially clever in design. Tempered springs are interposed both sides of the driving wings for purposes of cushioning. In the event of sudden stoppage by water in the engine cylinders in starting, the heavy armature is thus gradually thrown on the engine and parts, reducing the chances of breakage to a minimum.



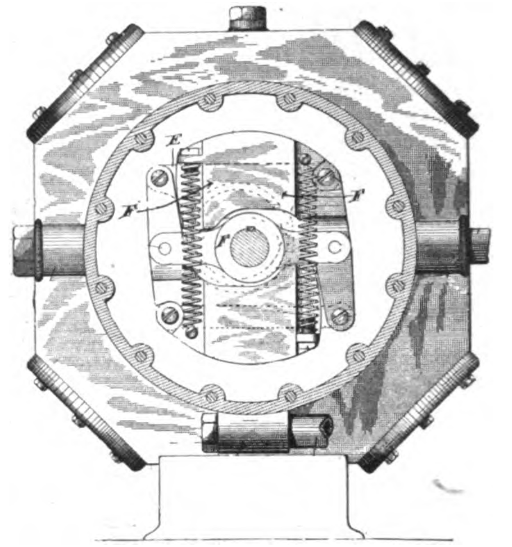
An Electric Headlight. (Fig. 5.)

The engine is of the multiple cylinder type having four cylinders, each set at an angle of ninety degrees with each other, as shown in Figs. 4, 5 and 6. Fig. 4 is a section through the lines 2–2 of Fig. 5. Fig. 5 gives a side elevation showing all four pitmans in position, and Fig. 6 an end elevation with the exhaust chamber removed, displaying the governor and valve. The pistons are of the trunk pattern, each by the pitman having a direct bearing on the crank pin bushing. The exhaust chamber A by means of studs, clamps an annular plate B on the circular off-set C from the valve seat, by which two divisions are formed, one for live steam D, the other for the exhaust D'; in the latter is placed the governor E of the disc pattern, erected directly on the shaft. The swinging yoke F under the control of the weights, extends through the opening of the plate, engaging the valve X, conveying to it the throw, and by the action of the weight controlling the speed. The valve is circular in form and balanced, admitting steam and receiving the exhaust at the same time. By this method of construction, close regulation and extreme simplicity is obtained, allowing accessibility for repairs. Having no dead centres, the engine is capable of being started from any point of the stroke, a condition strictly essential by reason of its location. The cylinders are all erected and contained in the crank casing, which contains an overflow of exhaust pressure, thereby reducing the loss of steam by radiation in the cylinders to a minimum. This chamber allows space in which the crank and pitmans play constantly in oil and water, thus affording ample lubrication to all the wearing surfaces. This arrangement in construction protects all the moving parts and frictional surfaces from dirt, cinders, etc., the same being entirely enclosed. Outside governors are also eliminated.

Three large bearings are provided of crown bronze. The shaft is of forged steel, and all the appointments of the engine are first class in point of material and workmanship. An oil font P is cast between the two upper cylinders, carrying a good supply of oil, so arranged as to feed directly on the wrist pin. Through means of the overflow ducts H, the surplus oil and water is carried over to the valve, affording an excess of lubrication other than that coming from the sight feed in the cab. The engine was patented by Geo. C. Pyle in 1891.

Fig. 7 is a view of the track lit up by the light looking *from* the engineer's seat. In ordinary weather twenty to thirty-four telegraph poles can be counted. Twenty-eight to thirty poles are placed to the mile. Thus it is evident objects can be seen within that distance, dependent upon the prominence and color.

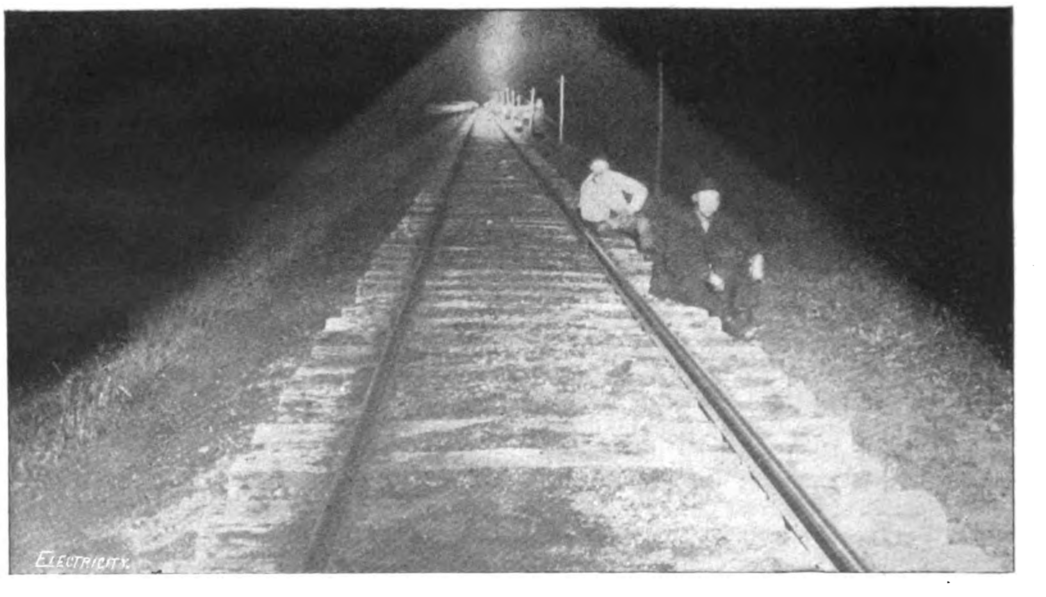
Semaphores, switch-lights, targets, etc., can be seen plainly, giving both the day and night colors, the lenses in the lanterns refracting the light, thus enhancing their power of illumination. In clear weather the results are of course the best, but the cases are very few when storm or fog renders the limit of view to a dangerously short space. An engineer familiar with his road would undoubtedly be able to discern his landmarks even in the darkest night for safe running, and it could hardly happen that the beam would not penetrate sufficiently far to stop the train for an obstacle, a misplaced switch or broken rail.



An Electric Headlight. (Fig. 6.)

Sitting in the cab back of one of these lights is decidedly a novel sensation. Small objects are brought out most prominently at long distance, the color of foliage in summer is exquisitely lit up, and the eyes of animals that chance to be in the path of light are converted into resplendent globes of fire. Passing through a snow storm with the swiftly moving shaft is a sight of rare beauty; the flakes become miniature prisms reflecting the rainbow's gamut of colors, while the search beam lights up for the passing moment all objects within its path, producing weird effects. No more beautiful sight would one wish to see than tracing the coming of an engine equipped with the apparatus through a snow storm or through fog; the illumination can be seen at a distance so great as to tax the credulity of the uninitiated should he not see for himself. There is but one word from engineers and firemen using the light, and that is praise. In the language of one of them, "They have daylight both ways now."

In addition to other virtues, the cost of the headlight apparatus is comparatively little, quite inconsiderable compared with the advantages to



An Electric Headlight. (Fig. 7.)

be gained from its use, when a single collision averted would prevent a loss sufficient to entirely equip the road with these lights, which would render such accidents very improbable.

Only one objection has been raised to the use of electricity, and that by pilots, but notwithstanding this, the powerful search-light is one of the surest safeguards of men-of-war and other vessels, and is now considered part of a first class equipment. It is in a measure true of the mechanical as well as the physical world that "nature deals in compensations," and so it is with the use of the headlight; running against it may possibly make the distinguishing of signals more difficult, but this is mitigated by having the system standard and lights of a given intensity oppose each other. Even the large oil lamp kept in good condition is amenable to the same argument. Experiments on the Cincinnati, Hamilton and Dayton Railroad on forty miles of double track, with these lights in actual use, reveal no actual difficulty from this source, and this section includes the suburban district of Cincinnati, where signals of all classes are extremely plentiful.

The whole equipment thus set forth is admirably adapted in its appointments for the purpose for which it was designed, and the satisfactory service obtained in use is its best recommendation.

Lights are now regularly in operation on the Vandalia lines, the Cincinnati, Hamilton and Dayton, Indianapolis, Decatur and Western, Michigan Central, Cincinnati Southern, Columbus, Hocking Valley and Toledo, Louisville, New Albany and Chicago, Rock Island, Wilmington and Northern, Chesapeake and Ohio, Chicago and Eastern Illinois, and on several others. A number of these systems have a large installation in nightly service.

Electric Light for Brussels.

The contract for lighting the city of Brussels throughout by electricity has at last been signed by the Silvertown Indiarubber Company. The following are some of the specifications and clauses in the contract:

All the cables are to be insulated with indiarubber. The first station is to have six units of 500 H. P., but each machine is to be able to furnish, if so required, 625 H. P. The battery of accumulators which will be employed is to have a capacity for supplying 1,250 lamps of 16 candles each.

The station is to be built where the old church (to be pulled down in February), Sainte-Catherine, now stands, close to the boulevard Anspach.

The boilers are multitubular, with 226 square metres surface each, and are to be of the Sulzer compound condensing type, as constructed by Carels of Gand.

The distribution system to be adopted is the three-wire system. The station is to be completed and ready for working by October next. The current will be sold by the Indiarubber Company for two years, after which the city will take the plant over from them.

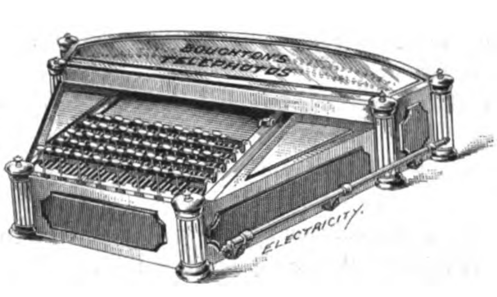
The electric meter patented by Oscar Fröhlich, and assigned to Messrs. Siemens & Halske, consists of a soft iron bar capable of oscillating on a central axis, two coils through which the current to be measured, or a certain fraction of it, is made to flow, one wound transversely and the other parallel to the iron bar; means consisting of a polarized relay, intermediate mechanism and circuit connections for alternately reversing the direction of the current through the coil wound parallel to the iron bar. The effect of the oscillation is somewhat that of a hairspring of a watch, or the escapement of a pendulum, and the oscillations are indicated by a set of gears and escapement in the usual way.—*London Electrical Engineer.*

The Telephotos.

A New Electric Signalling Device.

The members of the Buffalo Electrical Society and their friends were recently entertained by Mr. C. V. Boughton, the inventor of the "telephotos," at his laboratory. That more than ordinary interest was centered in this invitation was evinced by the large number who assembled to witness the practical working of the apparatus, which was operated and fully explained by Mr. Boughton.

The "telephotos" is designed for the purpose of communicating between ships at sea, armies in the field, and for other similar purposes now usually accomplished by means of rockets, flags and other visual devices. Among the advantages claimed for Mr. Boughton's invention is the facility with which such communications can be effected, the compactness of the apparatus, which permits of easy transportation, and the unlimited scope of the communications. The Morse telegraphic code of dots and dashes is employed for signals, and they are produced by means of incandescent lamps operated by dynamo currents and controlled by a keyboard on which the characters are designated or marked by Roman letters, thus enabling anyone, whether familiar with the Morse code or not, to transmit dispatches, which must, of course, be received and translated by an attendant expert in reading those characters.



The lamps employed to produce the dots and dashes are arranged in a vertical or horizontal line and are of the ordinary 32 C. P. make. The lamps are placed in individual pockets with suitably arranged reflectors for projecting the rays of light. There are 106 of these lamps, two of which are glowed to produce a dot, twenty to produce a dash and twenty intervening lamps left unillumined to effect the space between the dots and dashes. Sixty lamps are glowed for a long dash representing the cipher or naught, and two red lamps denote a period. The case is made of aluminium to secure lightness, and is contained within an area of two and one half feet square with a depth of six inches. The keyboard, comprising thirty-seven letters, numerals, etc., occupies one foot and six inches; the remaining portion is taken up by the electrical connections, of which there are necessarily a great number. The manner in which the multifold connections necessary to energize the required number of lamps to produce any required letter when the key is depressed are made is best understood by imagining a flat commutator, having a segment for each lamp, against which is pressed a metallic bar covering all of the segments, on the face of which are gaps over the segments connected with the lamps not to be energized in producing the letter represented by the key depressed. The keys are marked by letters and figures on rollers running across the keyboard which are simultaneously revolved by a thumbscrew and ratchet at the side of the machine. As each side of the rollers has a sequence of letters, etc., starting from a different letter of the alphabet, secret signalling is effected by a transposition of the alphabet and the code. When the rollers are in their normal position the letters correspond with the Morse characters produced, but when the rollers are turned, depressing the key designated by the letter A may cause the Morse B to be shown by the lights, or any other predetermined Morse character. Attached to the keyboard is a very ingenious and simple device, the invention of Mr. Boughton, which locks all the keys except the one depressed and prevents more than one key being depressed at a time. Mr. Boughton has also applied this device to typewriting machines, where it will fill a long felt want.

The key and the lamp boards are connected by a cable containing the requisite number of conductors, and may be of any length desired. The weight of the keyboard is about 75 pounds and that of the lamp frame 120 pounds. It is stated that the weight of a wagon containing all the apparatus necessary for field operation, including boiler, engine and generator, will not exceed 1,500 lbs.

Mr. Boughton has demonstrated that his signals can be read at a distance of three miles by daylight and ten miles at night. He feels confident that these distances can be increased. The apparatus can be worked at a speed of fifteen words per minute, and has the advantage of greater scope and precision than any other method of signalling in vogue.

Mr. Boughton has just completed a keyboard which contains an automatic device for recording the messages as they are transmitted. This is accomplished by an ingeniously arranged type-wheel mechanically controlled by the key bars which, when depressed, bring the corresponding letter on the type-wheel in position to be embossed on a moving paper tape, by the pressure of the armature of an electro-magnet energized when its circuit is completed by the key being fully depressed. The record produced is authentic, because it can only be made by operating the lamps.

Mr. Boughton sails in a few days for England, where he will exhibit his system to the British Navy. He will also have it in operation in Washington during the International Naval Review to be held there in April.

The American Institute of Electrical Engineers are preparing for the Chicago Congress. They want a unit of "magneto-motive force," and one of "magnetic intensity," which appears to be induction. "Magnetic reluctance" is, fortunately, preferred to "magnetic resistance"; it is a pity they adhere to "magneto-motive force" for a quantity which is not a force but a potential. They also speak of the "meter candle" and "foot candle," when they mean candle per square foot or square meter. "Current strength" appears for "current." Attention is called to these points, which would in ordinary circumstances be trivial, because in connection with an International Congress scientific accuracy is of the first importance. With most of the recommendations electrical engineers in this country will cordially agree. "Voltage" is really a barbarous word, which is quite unique in its termination, and is therefore unsystematic. "Diphase" and "triphase" are common, but inaccurate. Why not double-current and triple-current? The exact meaning of the word "phase" is seldom understood. In America electricians talk of alternators being "out of phase," and so on. The word comes from astronomy. If a planet had two or three satellites we should not say they were diphased or triphased; we should say there were double or triple satellites, or two or three of them. It is thus simpler to talk of double and triple currents. We shall probably return to the subject of electrical nomenclature before the summer comes upon us, as we fear by the autumn most of our readers will be very tired of it.—*Industries.*

ELECTRICITY

The Popular Electrical Journal.

GEORGE R. METCALFE, - - - EDITOR.
K. H. WILLOUGHBY, - - ASSOCIATE EDITOR.

W. M. ALLISON, - - BUSINESS MANAGER.

B. E. GREENE, Publisher.

PUBLICATION OFFICES:
6 Park Place - New York

CHICAGO:
J. F CONNOR, - - 823 Monadnock Building.

BOSTON:
W. S. KEY, - Room 34, 620 Atlantic Avenue.

ELECTRICITY IS PUBLISHED ON WEDNESDAY OF EACH WEEK

Our columns are open for the discussion of any question in which the interests of the Electrical Industry are at stake. News notes, descriptions of new devices with drawings or photographs, are at all times desired.

SUBSCRIPTION RATES:

UNITED STATES, - - - - -	$2.50
IN CLUBS OF FIVE OR MORE, - - - -	$2.00
FOREIGN COUNTRIES, - - - - - -	$4.50

ADVERTISING RATES:
As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.
Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

OUR Table of Contents will be found on the last page of this issue.

To their eternal discredit be it said that, with the single exception of ELECTRICITY, the *Electrical Journals of this country have not done their duty.* If they had, the smokestacks of many a factory, now closed, would have visibly spoken of activity and business. Hundreds of men, now idle, would have been earning a living for their families. The dark cloud of impending ruin would not now be hanging over the electrical trade.

The guilt of these cowardly journals is black as hell. *The Trust could not have maintained its insolent and outrageous policy in the face of the united attack of all the electrical journals.* They have so'd themselves too cheap. A few hundred dollars more or less is no equivalent for reputation and self-respect.

Whatever be the merits or the shortcomings of ELECTRICITY, the fact remains, and cannot be blotted out, that the other electrical journals HAVE NOT DONE THEIR DUTY. The chief culprit, the Coward of cowards, is the *Electrical World.* But the conduct of all of them, since the avowed intention of the Trust to drive everybody else out of business became a matter of common notoriety, has been an exhibition of bad faith and selfishness unparalleled in trade journalism.

"Electricity," under its present ownership, has never solicited the advertising patronage of the General Electric Company.

The St. Louis Convention. The programme arranged for the Sixteenth Convention of the National Electric Light Association, at St. Louis, is an admirable one. It proves the good fortune of the Association in the selection of its chief executive officers, Mr. James I. Ayer and Mr. George F. Porter. From a scientific or technical standpoint, the meeting is sure to be a grand success, unsurpassed in the history of the Association.

But from the inception of the Electrical Industry, it has been impossible to set apart or ignore the *business* side of the Industry. By far the larger number who have attended previous Conventions have been *business men*; and it has been universally recognized that the scientific men in the trade cannot well dispense with the business men, or *vice versa.* Hand in hand, and working generally in harmony, the two elements have built up an enormous industry, one in which a vast majority of the city and town residents in this country are interested, directly or indirectly.

The chief factor in the rapid growth and development in the business has been active competition—the persistent struggle to produce something better.

If the ultimate has now been reached in electrical development, then monopoly may be endurable; if it has not been reached, the situation demands continued strife, continued competition. Technical men have as vital an interest in this subject as the purely business men.

Monopoly means stagnation, a cessation of the development of more efficient methods. Open competition means a yet more rapid improvement.

We desire to impress upon all who gather at St. Louis the momentous importance of the independent business interests in the trade, the necessity for their preservation.

Will this Convention mark a turning point, a distinct change for the better in the present critical condition of the electric lighting business, or will it be remembered as marking the end of the independent element, the end of decent business methods in the trade?

Will it stand in history as a gravestone, bearing the inscription, "Here was buried forever open competition in the electrical lighting trade of America?" A demonstration of the proper kind at St. Louis would go far towards furnishing an immediate answer.

The independent manufacturing and selling interests are not alone in danger of extinction. Central Station men have already felt the weight of the iron hand of the Trust.

It is unnecessary to dwell on the present aspects of the situation. They are too well known.

But it is imperative that consideration be given to the topic of possible relief. How can the trade free itself from the proposed monopoly?

Almost the first distinct policy announced by Mr. Coffin as President of the Trust was the consolidation of local electric lighting interests. These consolidations have been brought about in many cities. And it is pertinent to ask, Who has been benefited? What are the prospects for the consolidated companies? In no instance, save perhaps in Buffalo, has such a deal proved satisfactory. In nearly every town which has been bottled up, municipal plants are threatened, or new companies have been organized. Competition in this line cannot be killed. The price of city lighting cannot be raised without creating a new danger—a municipal plant.

We hold that the Central Station men have just as much at stake in this matter as the supply men. The prime requisite for a successful Central Station is an open market. With monopoly once firmly established, it is not difficult to foresee where the profits would go. Central Station men should not be compelled to pay any interest whatever on thirty-five millions of water.

There will never be a more appropriate time for discussion of these matters than at St. Louis. The battle will be fought and won before another year has rolled around. The next Convention may hold an autopsy over the corpse of the independent interest, or it may hold a celebration over the death of monopoly.

In our last issue we outlined several methods for securing relief. They are all worthy of consideration.

* * *

The Association and the Supply Men. At the time of the Niagara Convention a majority of the National Electric Light Association were of the opinion that the supply men and manufacturers should be excluded from voting privileges in the conduct of the Association. At that time it was perhaps best to take this action, though men of sound judgment then expressed the opinion that, with this plan in practice, the Association would sooner or later come under the control of the one company which controlled the greatest number of Central Stations.

It is not our purpose to question the wisdom of the Association in adopting this rule. Whether wise or unwise, it was done.

But it is now in order to consider the changed condition of affairs. The one company is in virtual control at the present time of an overwhelming majority of the Central Stations.

The Central Station men, who are the voters in the Association, should ask themselves the question, Cannot the supply men and manufacturers do us good in the present crisis? Have not our interests come to be identical? *Do we not need each other?*

We fail to see how there can be two opinions on these points.

Central Station men are threatened, nay, are actually experiencing, extortionate charges for supplies of various kinds at the hands of the Trust. Do they wish to see the grip of the Trust strengthened, or are they willing to assist in forcing it to relax?

Gentlemen, these are questions of vital import. Can you stand further increase in the cost of your supplies? Can you in turn get higher prices for your light, or is your business so profitable that you can still make money? Does not the craze for municipal plants, from Maine to Texas and from Washington to Florida, answer emphatically, *You cannot charge more for light?*

Is not the very safeguard of your success in business **an open market in which to buy your supplies and additional machinery?**

Cannot the Association take action which will aid in preserving this open market? And,

Cannot the independent manufacturers and supply men, if you give them a voice and vote in your deliberations, give you inestimable aid in preserving for you this **open market.**

* * *

ELECTRICITY'S Headquarters for the Convention is the Ladies' Parlor, first floor, where all our friends will be welcome.

* * *

Dividend Paying Stations. It has been unfortunate perhaps for the central station industry that in its early days the cost of incandescent lighting was considerably misrepresented, and the inference was natural that this method of illumination was at its commencement able to compete with gas lighting upon an equal basis.

That such was not the case is evidenced by the number of stations which have since been established that from a commercial standpoint have met with comparative failure. The price for incandescent lamps of sixteen candle power has generally been fixed at one cent per hour each, and it has been a matter of considerable moment to central station men to operate their plants profitably on this basis.

Every succeeding year has seen more economical methods evolved, and further refinements added in the line of central station lighting, so that to-day everything which tends to diminish the operating expenses of a station is the object of careful study by electrical engineers.

Higher steam pressures than formerly were used, compound and triple expansion engines, units of large size, automatic apparatus and every expedient which practice has shown to conduce to economy of operation are now being adopted by progressive stations.

The Brooklyn Edison Illuminating Company, whose latest plant is described and illustrated in this issue, is a notable example of the engineering skill which central station lighting should receive, and the results achieved in this case prove the possibility of competing with gas lighting at equal rates. Experience has shown this to be impossible unless every feature of economy is included, but the case just cited proves that this business may be put upon a sound financial basis if the best engineering practice is followed.

* * *

THE ELECTRIC TRUST COULD NOT SURVIVE AN IMPARTIAL AND FAITHFUL INVESTIGATION BY A CONGRESSIONAL COMMITTEE, WHAT CAN YOU DO TO BRING THIS INVESTIGATION ABOUT?

* * *

IN the defeat for re-election last Tuesday of Mr. Thomas Mud Hammett, the Trust loses its most influential agent in the Philadelphia City Council.

Common Sense Sacrificed for Dramatic Effect. The annals of history furnish almost innumerable instances where men have achieved imperishable fame through giving utterance, at a critical moment, or at a time of great popular excitement, to terse or striking expressions, which have since been incorporated into the traditions of nations, and are constantly appearing in varying form throughout the entire range of literature. Not a few even great men are better remembered by the exclamations which thus came from their lips on the spur of the moment than by all the real accomplishments of an active life. These famous sayings supply in fact the light by which we see, as if present in the flesh, many dead men.

Our first proposition is that these famous sayings, however effective they may have been at the time of their expression, are found, upon cold and unsympathetic analysis, to be either false, misleading, vague, or inaccurate, or all four.

Addison, it will be remembered, came into fame and a Government office by comparing that old sinner, the great Marlborough, to an angel, who,

> " . . . pleased the Almighty's orders to perform,
> Rides upon the whirlwind, and directs the storm."

But poets have ever been exempt from a criticism of this nature. Common sense may be freely sacrificed for the sake of poetry. In fact, the rule has been, we think, the less common sense, the greater the poet.

Examples in support of our argument could be produced without end. But we will limit them to a few famous sayings, which are found in most of the School Readers, and consequently are familiar to all.

Daniel Webster cheered the watchers at his bedside when he cried triumphantly, "I still live!" but in the next second he was dead.

Richard III. shouted, "My kingdom for a horse!" when Bosworth field was wholly lost. Therefore he had no kingdom to offer.

Patrick Henry electrified the Virginia Legislature and immortalized himself by exclaiming, "Give me liberty or give me death!" Yet he continued for many years to take his chances of securing liberty rather than seek certain death.

Nero, the infamous, cried out, "When I am dead let the world return to chaos!" But he overestimated his importance. The world is farther from chaos to-day than when Nero tortured his subjects with impunity.

Those who have followed us will admit, we believe, that our initial proposition was well founded. But would these Famous Sayings have been better unsaid? Certainly not. We are a poetic people, and like to be startled. But plain *business men* should avoid creating these Famous Sayings. Although they have in some cases preserved the authors from oblivion, they have frequently left an unfavorable impression of a man whose many estimable qualities were forgotten—*vide* Jim Fisk, who explained his lack of assistance to his associates on Black Friday by stating that it was "Every man drag out his own corpse." William H. Vanderbilt also will be longer remembered for having said "The public be damned" than for his numerous good works.

We have now cracked the shell and arrive at the kernel of our remarks: When Mr. Charles A. Coffin said, "*We are going to do this business; you may as well fold your tents and get out,*" he was talking through his hat.

This famous saying is all four—untrue, misleading, vague and inaccurate. Untrue, because they (the Trust) are not going to do this business; misleading, as it is calculated to give the ignorant a false impression; vague, because it does not specify where the Independents may get to; inaccurate, for the reason that the Independents do not live in tents. A great many of them are right here in the heart of the metropolis. ELECTRICITY'S main office is less than a mile from 44 Broad Street. In Philadelphia the Heisler Company hold forth in the marble palace of the Drexels. In Boston the Beacon Company own a strong building of brick, and will be pouring hot shot into the camp of the Trust before many weeks have passed; the Mather Company are in the centre of the town, and ELECTRICITY'S flag floats from the very citadel of monopoly, 620 Atlantic Avenue. The Westinghouse Company has a solid fort at Pittsburg, and Chicago has the Standard, Western Electric, Siemens & Halske, and many other companies, and will call out the militia to protect them if necessary. Hundreds of cities and towns have their companies, all secure in habitations of brick and stone. Not one of them lives in a tent. How can they, therefore, "fold their tents and get out?" Bosh!

We submit, in closing, that this particular famous saying would have been better unsaid; that Mr. Coffin would have been more highly respected if he had never said it; that his descendants will blush when they read it; that Elihu Thomson and every other honorable man in the service of the General Electric Company is ashamed of it for Mr. Coffin's sake; that when Mr. Coffin finally retires to Lynn, he will wish that he had not said it; and further, that he will yet wish that his company had stuck to their own legitimate business, and had not incited the infamy which is now theirs.

* * *

"LIFE is not so short but that there is always time for courtesy," and the representatives of the General Electric Company will be cordially welcomed at the headquarters of ELECTRICITY during the Convention.

* * *

THE most striking episode in the National Republican Convention of 1884 was when Mr. Daniel Webster Flannagan, of Flannagan's Mills, Texas, his trousers in his boot tops, jumped up on a chair, extended his massive right arm like the branch of a mighty oak, and shouted "What in hell are we here for?"

What Flannagan will arise at St. Louis and ask this question for the independent supply men and manufacturers?

* * *

WE GIVE it as our honest opinion that if the *Electrical World* and the *Electrical Engineer* had done their full duty in discussing the conspiracy to ruin all the smaller manufacturers and supply men, the Electric Trust would have been driven to the wall long ago.

* * *

We fear that too many of our friends who write us letters of encouragement and commendation, hold that virtue should be its own reward. We contend that virtue, in order to be of any substantial benefit to the world, must have something substantial to live on.

* * *

A few direct statements (under oath) from Mr. Charles A. Coffin and Mr. Frederick L. Ames, before a Congressional Committee, would be a valuable contribution to the stock of public knowledge.

* * *

THE ELECTRIC TRUST COULD NOT SURVIVE AN IMPARTIAL AND FAITHFUL INVESTIGATION BY A CONGRESSIONAL COMMITTEE, WHAT CAN YOU DO TO BRING THIS INVESTIGATION ABOUT ?

* * *

How many securities of electric roads in the South and Southwest which have gone into receivers' hands were transformed, by removal to the far East, into first-class collateral?

* * *

When Messrs. Barstow, of the Brooklyn station, Edgar of Boston, and Smith of New York, return from their European trip, it may be found that they have learned something of interest to other Central Station men.

* * *

No man should buy one dollar's worth of supplies of the Trust which can be purchased elsewhere. Independent concerns should be aided in every practical way, and there is no more practical way than this.

Trust Methods.

Syracuse is "Bottled Up."

Everybody is Satisfied.

In our issue for December 28 we devoted some two columns to the very interesting situation in Syracuse.

We are now advised that, as far as the Onondaga Company and the Syracuse Electric Light Company are concerned, matters have been "arranged" in a highly satisfactory manner.

If our information is correct, and we have no reason to doubt it, a use has been found for a portion of the $750,000 of bonds of the Syracuse Electric Light Company, $200,000 or $300,000 of which ELECTRICITY suggested might be used among the "proper people" in securing a franchise for the company. Mayor Amos did not approve of granting a franchise in a hurry; meantime the bonds were unsalable.

It seems that the franchise granted to the Onondaga Company was not without "riders." It did not give the company all they wanted by any means. There was likely to be a good deal of friction.

Our advices state that the Onondaga Company realized this fact, and when offered $200,000 of the bonds (4 per cent.) of their other company for their franchise and capital stock, accepted promptly. The capital stock was $250,000, one-third of which ($83,333) was claimed to have been paid in, but probably not in cash. Thirty thousand dollars would be a fair estimate of the actual cash required in securing the franchise.

The $750,000 of bonds now have *some* value, and Mr. Kirk and his associates could probably unload at a fair profit. It is easy to see where the profits of Mr. Garfield, R. T. McDonald and their associates come in. Uncle Ellery's fine hand was not "bundled up in an old New England mitten," and the records do not show that Mr. McDonald was caught napping.

The probable evolution of the remainder of these bonds into gilt-edged securities, held by the New England investing public, or perhaps the clergy of Central New York, would make a good story, and we trust that the *Standard*, *Courier* and *Herald*, of Syracuse, will work it up. We suggest an interview with Mr. Garfield or Mr. McDonald on the subject. The chief characteristic of both these gentlemen is frankness and freedom from guile, and they could no doubt give the information.

We suppose the true state of affairs has not escaped the notice of Mayor Amos, the taxpayers and the daily press of Syracuse.

There will be no competition between these two companies, and we leave it to our readers to judge whether the Hon. W. B. Kirk and his associates have been outclassed or not.

We again venture a prediction—i. e., that the subject of a *municipal* plant will receive careful study in Syracuse before the time has arrived for making another contract for city lighting. Mayor Pingree of Detroit is in position to favor Mayor Amos with a good deal of information as to the methods of the combination which now controls *all the electric lighting and a large block of the surface roads* of the latter's city.

Syracuse is an A1 city to be squeezed.

The United Electric Securities Company.

What Is There Behind Its Issues of Bonds and Stocks?

The following question and answer recently appeared in one of the daily papers of Boston:

> The United Electric Securities Company offered by advertisement for subscription $750,000 7 per cent. preferred stock.
>
> To what amount has the offering for subscription been increased since, and has it all been subscribed for?
>
> Query—How can that company afford to pay 7 per cent. for the money, and is there anything behind the stock but the capital of the company. If yea, what?
>
> MANY INTERESTED.
>
> Boston, Feb. 16, 1893.
>
> The United Electric Securities Company has a capital of $2,000,000. Of this $1,000,000 is a 7 per cent. accumulative preferred stock, all of which was offered for subscription, was underwritten, and has all been taken. The common stock is all of it held by the General Electric Company. The company does practically a banking business for the General Electric Company, and is earning large dividends on the stock. In fact it is hinted that the common is earning upwards of 20 per cent. per annum. The company buys the bonds which the General Electric Company gets in trade from electric light, railway or power companies which they have equipped, provided they are sufficiently good. These bonds are examined with great care, and if they come up to requirements are taken by the Electric Securities Company at 80, the company issuing their own debentures against them. As these bonds are afterwards sold at 92, 93, 94 or 95, the debentures issued against them are taken up, the company netting the profit between the original purchase and the selling price. Some bonds were sold the other day at as high a figure as 101, which had been originally taken at 80. Between 93 and 95, however, is considered a fair price to obtain for this class of bonds. By this management the General Electric Company, which of course receives through its holdings of the common stock of the Electric Securities all profits over the 7 per cent. on the preferred, saves a good deal of money. Each series of debenture bonds has fixed collateral behind it and it is not allowed to change the collateral. The bonds, however, can all be drawn at 105. There are eight series of these debentures listed at the Boston Stock Exchange—the first two due in 1920, the next three in 1921, the last three in 1922. Of the first series the amount is only $118,000; second, $101,000; third, $268,000; fourth, $287,000; fifth, $710,000; sixth, $795,000; seventh, $1,000,000, and eighth, $78,000. The Electric Corporation, the new company just formed, will take more ventures than this company. It will take greater risks, and at the same time possibly chances for greater profits. By arrangement with companies like these, the receipts of the General Electric Company are reduced from a credit down to nearly a cash basis.
>
> RIALTO.

The proof of this answer was no doubt submitted to the Press Agent at 620 Atlantic Avenue for his O. K. before publishing. It contains some truths, and we believe no untruths. It has been known for some time that the pace of the United Securities Company was not rapid enough for Mr. Coffin. He demands immediate "action" on his money, and would like to abolish "splits" as an unnecessary delay.

The only fault we have to find with "Rialto" is that he is all too brief. He does not crack the shell and give us the milk of the cocoanut.

If the financial editors of the Boston daily press wish to perform a real service to the investing public of New England and New York, and to the bamboozled clergy of Central New York, they will devote more investigation to this matter. It will take time, and very shrewd work; it is a closely guarded secret. But we believe our New York newspaper men would get to the bottom of it in a week. Is it possible that the Bostonians are too slow, or are they rank cowards?

One interesting line of investigation would be to find out *what collateral* is behind each of these issues of debenture bonds? The various lists must be attainable. When these lists are before you, then engage three or five electrical experts to visit the various plants against which the collaterals were issued, and appraise their value. Tell us why it was that these local securities could not be floated in their respective towns; why the glamour of mystery surrounds them; if, for instance, there are any Little Rock or Syracuse bonds among them.

A complete and impartial narrative would fill many columns of the Boston *Advertiser*, and would be worth a hundred dollars a column to any enterprising daily.

Legal Notes.

The decision of Chancellor Carroll in the case of the Thomson-Houston Company of Chicago against the Little Rock, Ark., Electric Street Railway Company and the First National Bank of Little Rock, for the appointment of a receiver, denies the application. The attorneys for the plaintiff after hearing the decision dismissed their bill, with all interventions. The court further ordered that the National Bank of Commerce of St. Louis be enjoined from negotiating income bonds transferred to it by the City Electric Street Railway.

Attachment papers were issued against the Street Car Company by Attorney George B. Rose, for the Thomson-Houston Company, after the delivery of Chancellor Carroll's decision. The amount of the first one was $186,631.46, of the second $6,365.43. The complaint alleges that the money due is for promissory notes and open account. There are twenty-three notes. The writs were placed in the hands of the Sheriff and served.

In the consolidated cases of William Harriman et al. against the People's Street Railway, Electric Light and Power Company, at St. Joseph, Mo., Judge Ramey recorded the decree ordering a sale of the lines. The court has found the bills of complaint of the Central Trust Company of New York are true, and ordered the property to be sold as an entirety and without appraisement, under the supervision of the special master already appointed, on a day to be named by him. The sale is to be advertised for six weeks in the St. Joseph and New York papers, and the master is instructed to accept no bid for less than $100,000, and to require a deposit of $50,000 in advance. The proceeds of the sale are to be applied to the costs of the suit, to the payment of claims prior in equity to the lien of outstanding bonds and coupons secured by mortgage, and then to the principal and interest of the bonds and coupons.

Note.

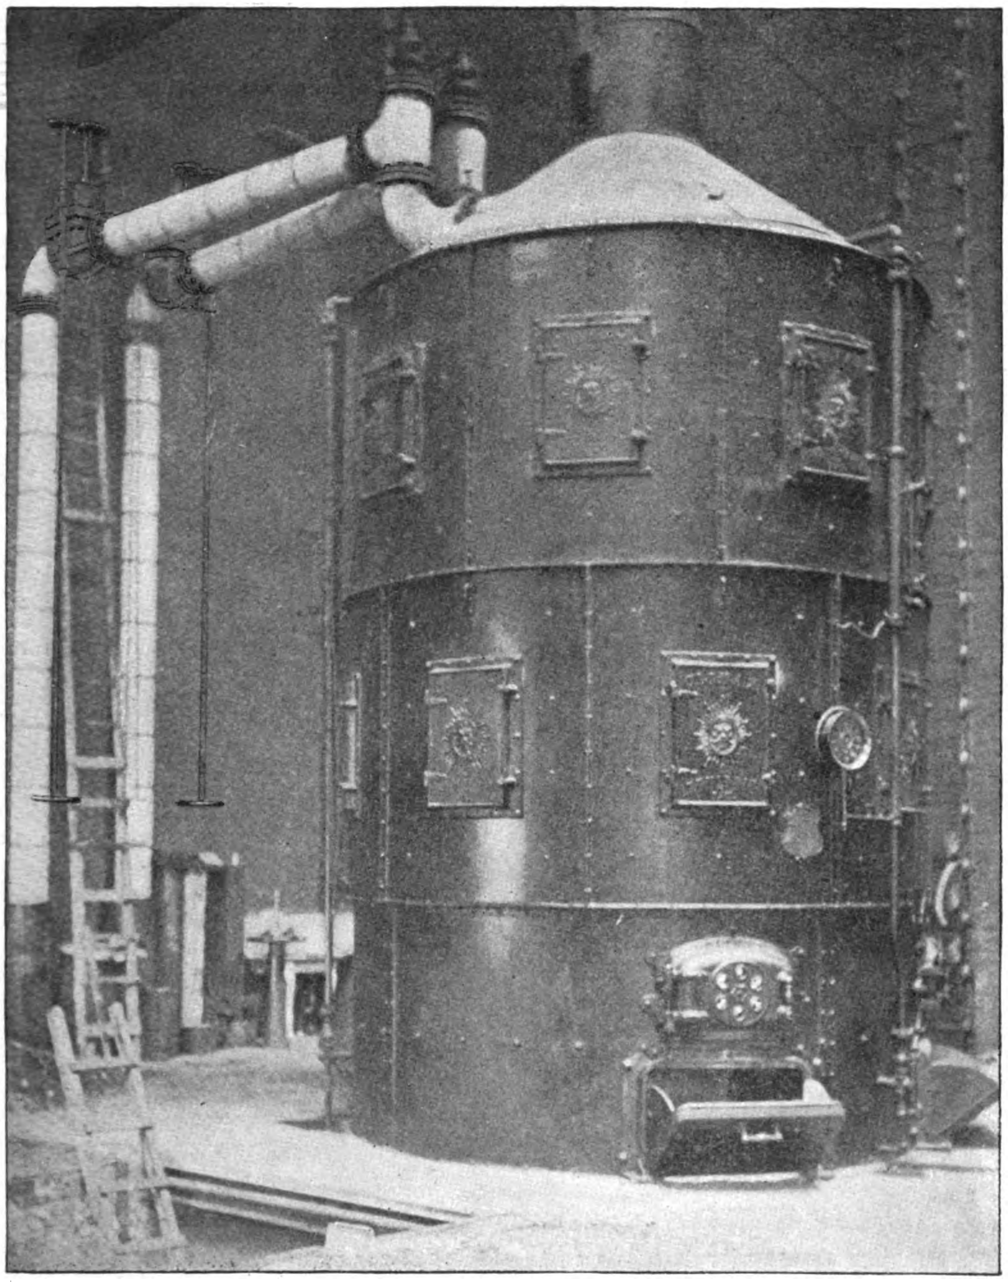
If Mr. F. T. Hardwick will kindly send us his address we will communicate with him.

A Model Lighting Station.

Where Current is Supplied at a Profit.

The Brooklyn Edison Illuminating Company's New Plant on Gwinnett Street.

The Edison Illuminating Company, of Brooklyn, although in operation only a little less than four years has found the demand for incandescent lighting in that city so large that to-day it is operating three stations whose underground system of mains from which the service wires are taken covers a distance of fifty-three miles. Of this, forty-five miles are operated by the first and second district stations and eight miles by the third district station on Gwinnett street. The latter plant, which has been built during the past year, embodies the most recent engineering practice in central station work, and the arrangement of the machinery is such as to make this the most compact plant for its capacity that can be designed, and to reduce the attendance to a minimum.



A MODEL LIGHTING STATION. (FIG. 1.)

The present building is 175 feet front and 75 feet deep and is divided into two main rooms. The boiler room in the front of the building is 52 feet 8 inches by 70 feet in area, and contains two Climax boilers, one of which is shown in Fig. 1. These are of the vertical type and contain 360 tubes 9 feet 2 inches in length and 2½ inches diameter. The boilers are rated at 250 H. P. each, and are connected to the engines by a duplicate system of piping and run at from 160 to 185 lbs. pressure according to the load on the station.

They were built and installed by the Conbrock Iron Works, and are placed so as to occupy only one half of the present boiler room space.

The steam and exhaust piping, condenser, feed water heater, etc., are situated in the basement of the building, and their general arrangement is shown in Figs. 2 and 3. The steam mains are 12 inches in diameter and are disposed so that either engine may be supplied by either main. The two pipes shown in Fig. 1 lead to the mains below, which run along the length of the building and rise directly beneath the engines. The boilers are fed by two Smith-Vaile 10" x 7" x 12" duplex feed pumps and are equipped with the Locke automatic damper regulator. The coal and ashes will be handled by a conveyor which is being put in place at present. The coal storage vaults are situated in front of the building just under the entrance, and have a capacity of about 300 tons. From these the conveyor delivers the coal to two 12 ton hoppers situated one over each boiler. By closing the coal chutes, the same conveyor is able to carry the ashes which are carried to a bin and delivered through a chute in front of the building. The conveyor was built by C. W. Hunt of New York.

A 600 horse power Conover jet condenser is used, and is supplied by four driven wells with condensing water. These wells are capable of supplying 1,500 gallons of water per minute. The stack, which is of steel, was manufactured by the Connery Boiler Works of Philadelphia. It is 7 feet 6 inches in diameter, and extends 115 feet above the grate level, and is self-supporting, there being no guy wires or other support than its connection with the foundation and station wall.

The main exhaust pipe is 16 inches in diameter, and its general arrangement and connections will be seen in Fig. 4. The condenser and Goubert feed water heater, shown in solid lines, are installed at present, and the dotted lines represent the provision that has been made for future extensions of the machinery. The James W. Birkett Manufacturing Company, of Brooklyn, were contractors for the entire steam fitting work of the station, and the valves were supplied by the Chapman Valve Company.

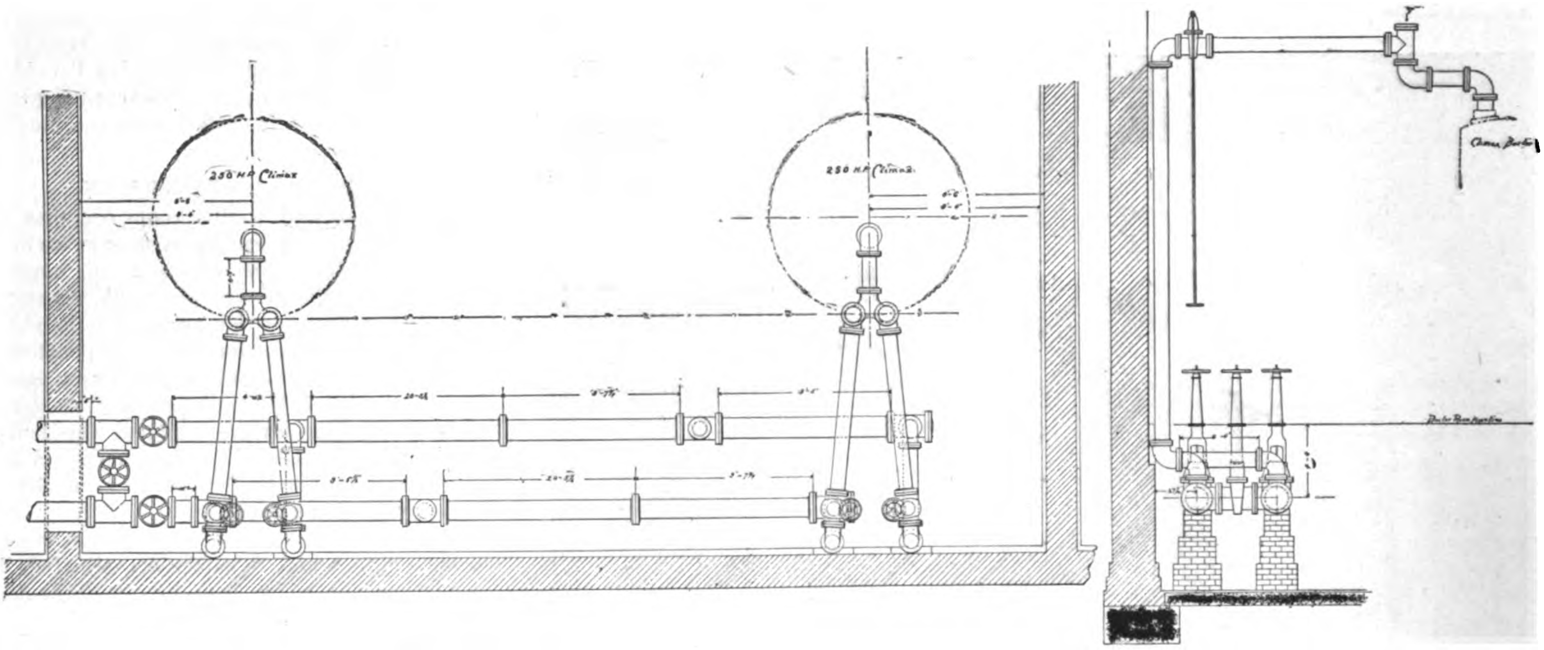
THE DYNAMO AND ENGINE ROOM.

The dynamo and engine room occupies the rear of the building, and has a floor space of 41 feet 4 inches by 70 feet, of which only one-half is occupied by the present plant. A fifteen ton travelling crane spans this room at a height of 31 feet above the floor line, and is supported on brackets built into the wall capped by bluestone slabs. The roof is constructed of steel and has a ventilating skylight running the length of the building provided with swinging sashes. This work was done by the Berlin Iron Bridge Company of Connecticut.

In one end of the room the two direct connected engines and dynamos are situated, the foundations for which are built up to the floor level. Our Frontispiece gives a general view of these machines. The smaller engine shown on the left of the cut has a capacity of 350 H. P., and the large one is rated at 850 H. P. These are both triple expansion engines of the same pattern, and were manufactured by the Lake Erie Engineering Company. The 350 H. P. engine has a stroke of 20 inches, and the cylinders measure respectively 10 inches, 16 inches and 25 inches. The large engine has a 32 inch stroke, and the cylinders are 15 inches, 24½ inches and 38 inches in diameter. The former runs at 172 revolutions per minute and the latter at 120 revolutions. Upon the same bedplate and connected upon each end of the shafts of these engines are two multipolar dynamos of the type manufactured by the Edison Company. These machines are 100 K. W. and 200 K. W. capacity respectively, the two of equal size being run on opposite sides of the three-wire system. The armatures are of the gramme ring type and the sections are connected in multiple. The operation of these machines is remarkably noiseless, and not the slightest sparking is to be seen at the brushes. The absence of belting and the slow speed at which the engines are run make it impossible to distinguish the least sound of running machinery in the adjoining room.

THE SWITCHBOARD.

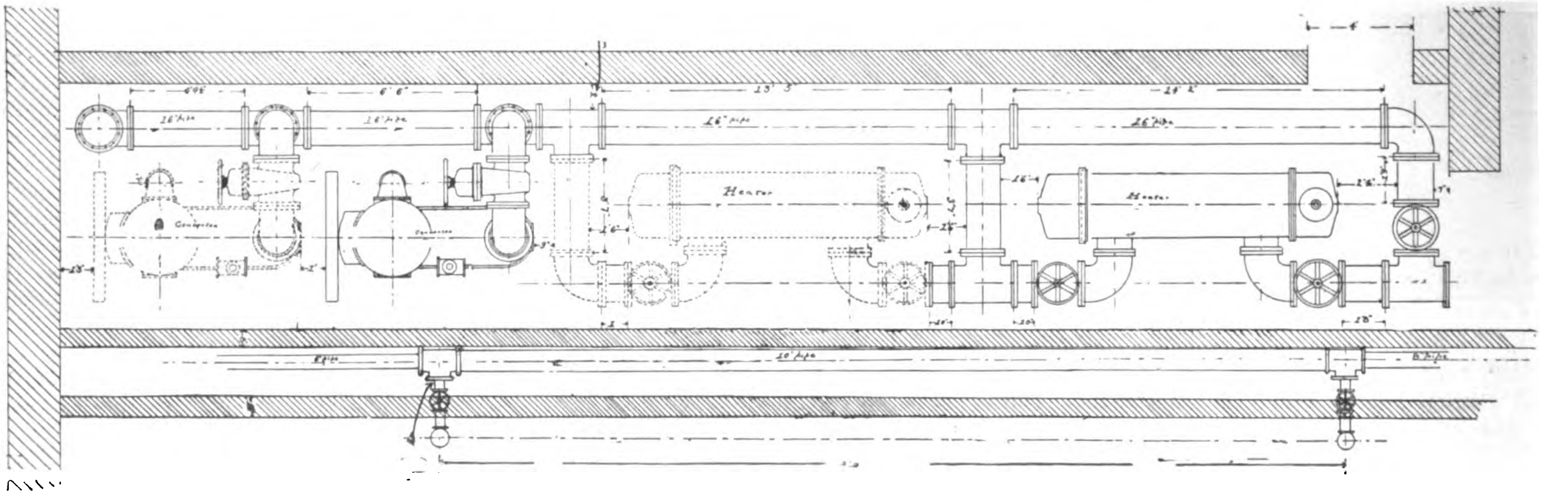
One of the most interesting features of the dynamo room, although perhaps the least conspicuous of any, is the switchboard, a view of which will be seen in Fig. 4. This is built of polished black marble, supplied by the Sullivan Mineral Insulation Company, and, as will be seen, nothing but the dials of the instruments and the switches appear on the front of the board. There are three double switches for connecting each of the dynamos with the main and auxiliary bus bars which are run behind the board, and another set of switches is used to connect the second and third district stations, so that an overload on either may be taken by the other station, the two being connected by three special cables of 1,000,000 circular mils section, and 8,290 feet in length. The first and second district stations are similarly connected, so that the chance of shutting off the lights due to accident or the overloading of either station is reduced to a minimum. The rheostats, shown at the right hand in Fig. 4, are merely temporary arrangements for adjusting the voltage of the machines, as there is in preparation a device for controlling the pressure at the dynamos entirely automatically. In changing the load from one station to another, the attendants make the necessary adjustments by communicating by telegraph. This has been found more efficient than the telephone, as the latter is liable to trouble on account of induction. The telegraph also has the advantage that the sounder may be heard while the operator is at work in any part of the room.



A Model Lighting Station—Diagram of Steam Piping. (Fig. 2.)

The instruments used throughout this station are of the Edw'd Weston make, the pointers moving over the glass dials, which are illuminated by incandescent lamps placed behind them. This makes it possible to observe the reading of each instrument from a considerable distance.

The accuracy of these instruments permits the current to be measured in a way not hitherto employed in central station practice. There are no contact joints on the board, the cables being soldered at the lugs of the switches, and connected to the bus bars without passing through the ampere meters. Two pressure wires are connected to each of these cables, at a distance of 2.8 feet, and these wires are led to a voltmeter. The latter measures the drop of potential in this 2.8 feet of cable, and is calibrated so as to give the readings directly in amperes.



A Model Lighting Station—Diagram of Exhaust Piping. (Fig. 3.)

These cables have a section of 750,000 circular mils. It has been found that a thousand amperes gives a drop of .024 volts in 2.8 feet. These readings have been compared with those of a standard instrument, and found to be identical throughout the whole scale.

THE UNDERGROUND SYSTEM.

The method of distribution adopted for the underground system of this station is somewhat different from that employed in the older stations, as is also the kind of cable employed.

Several centres of distribution are located, and three special trunk feeders, a positive, negative and neutral, each in a separate tube, are led from the station to these centres. From these points several sub-feeders radiate, whose ends are all connected by a tie line of the same size. The mains are then taken off any point on the sub-feeder system. The object of this method of distribution is to reduce the number of trunk feeders, and in consequence the cost of material and labor in laying the system.

The cables employed are called reversible, as each being in a separate tube anyone of them may be used as the neutral in case it should be burned out. This acts still further against the danger of a shut down. There are already 15,000 feet of trunk feeders laid and 6,000 feet of sub-feeders of 500,000 circular mils section. The mains are connected to the latter, and, as stated above, have a total length of eight miles.

The foregoing description and illustrations will serve to show the remarkable compactness of this plant, in which respect it is second to no other station in the United States. The space which has been reserved in this building will allow the present capacity of the plant to be more than doubled, as considerably larger units than the present ones can be used.

The operation of the station is also so simplified that but three or four attendants will be needed, and this economy in the cost of labor and the efficiency of the machinery employed account to a great extent for the satisfactory dividend paying basis upon which this company has operated.

Mr. Barstow, the General Superintendent, is at present in Europe, where he expects to study the application of the accumulator system, as well as the most recent developments in central station engineering practice, with a view to incorporating any improvements found in the future extensions of the company's works.

The officers of the company are:

Ethan Allen Doty, President.
Edwin Packard, Vice-President.
Royal C. Peabody, Secretary and Treasurer.
W. S. Barstow, General Superintendent.

Among those who have been actively engaged in the construction of the new station are: Chas. H. Thompson, architect; R. Lindsay, electrician; John W. Wolff, steam engineer; Theo. Gilleaudeau, chief engineer in charge.

A Brief Sketch of the Company.

The Edison Illuminating Company of Brooklyn was incorporated March 10, 1887, with a capital stock of $500,000. The incorporators were: Charles E. Crowell, Eugene Crowell, George W. Nash, Edward H. Johnson, John C. Tomlinson, Spencer Trask, William D. Sargent, Charles F. Bound, Charles E. Chinnock, Wm. H. Richardson and Sigmund Bergmann. The first officers of the company were: President, Charles E. Crowell; Vice-president, Charles E. Chinnock; Secretary, R. C. Peabody.

With plenty of money in its treasury, and a natural anxiety to put a plant in operation, there was nevertheless an unusual delay in getting ready to turn on the current. The Brooklyn Board of Aldermen thought they saw an opportunity to increase their bank accounts, and stood out against a franchise with permission to open the streets for subways. The Board had passed an ordinance in 1886 forbidding the granting of permits to open the streets without their consent. Of this ordinance the Brooklyn *Eagle* said: "This was thought to be an effective stopper of the spectacle of corporations getting a chance to do business without proper consultation with the representatives of the Anti-Poverty Society."

The matter was finally carried to the courts. A special bill was also passed by the Legislature, but was vetoed by Governor Hill. At length the matter was brought again before the Aldermen in October, 1888 (during the gubernatorial campaign), when in deference to the public sentiment the Board yielded. They had not been able to squeeze the orange.

There were, it may be remembered, two companies already in the field, the Municipal and the Citizens', both of which, however, were chiefly for arc-lighting.

The Edison Company's main plant in Pearl street was begun in March of 1889, and the lights were turned on September 1 following. The original capacity of this plant was 25,000 16 C. P. lights, which has been increased to 75,000 at the present time.

In 1891 a branch station was built in Lexington avenue, chiefly for residence lighting, with a capacity of 15,000 lights.

The Brooklyn Company is now second in the list of incandescent lighting companies in this country, the New York Company alone exceeding it in total capacity. In addition to the incandescent lighting business, it is doing an increasing business in arc lighting, running at the present time about 2,000 Ward arc lamps.

The capital stock of the company has been increased to $1,500,000, and a majority of the stockholders have voted for a further increase of $1,000,000. Dividends have been paid since 1891. Following is a summary of the last annual statement, submitted in January of the present year:

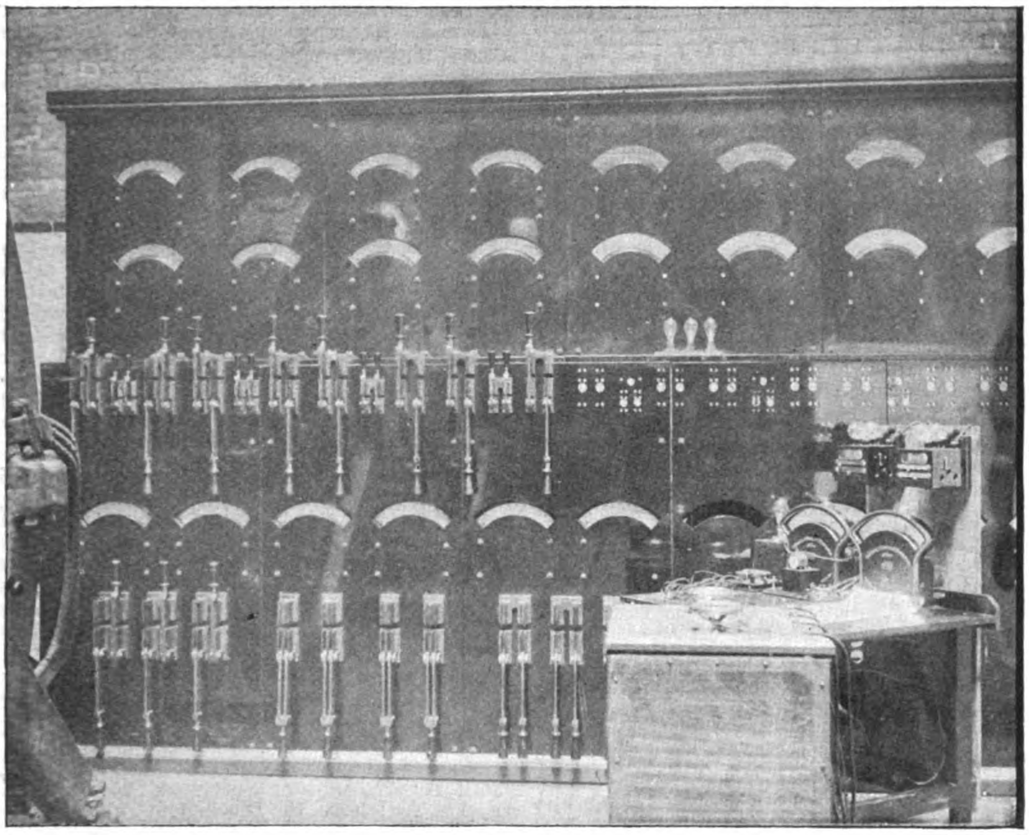
	Gross Earnings.	Operating Expenses.	Net Earnings.
First six months....	$ 98.106 59	40.919 87	57.186 72
Second six months..	1 2,804.89	62,927.92	69,966.96
	$231.011.48	108,847.80	127,153.68

Net result 12 months, first district..........	$102 606 56
Net result 12 months, second district........	23 058 05
Net result 6 months, third district..........	1.489.07
Total..............................	127.153 68
Income from all other sources................	38.445.08
Total..............................	165,598 76
Less general expenses, taxes and fixed charges..........................	64,317.01
Net income for 1892................	101.281.75

This was an increase in net earnings of 54 per cent. over the previous year.

The price of the stock has increased from par (100) to about 130.

The success of the Brooklyn Edison Company, and the sources of it, are worthy of careful consideration by central station men everywhere. It has been managed from the start by business men of high standing, who have conducted its affairs with due consideration for the rights of the public. In station equipment and accessories no money has been spared to get the best, and the three stations of the company are in the front rank of the world's central lighting stations.



A MODEL LIGHTING STATION. (FIG. 4.)

Electricity for the Paris Abattoirs.

The *Abattoirs* at Paris are about to be lighted by electricity. The City Council has recently voted a sum of money for that purpose. At present the slaughter houses and grounds are lit by gas at a cost of £6,920 ($34,600), and by adopting the "new" light, a saving of £620 ($3,100) will be effected annually. The electric light company that has mains which pass by the abattoirs is the promoter of the scheme, which comprises 91 arc lamps, 237 16 C. P. and 40 10 C. P. incandescent lamps. In the adjoining grounds and market there will be 51 arc lamps, 268 16 C. P. incandescent lamps, also 26 of 10 C. P., making a total when all lights are burning of 7,704 C. P., which will cost only £6,298 per annum. The cost of this installation will amount to $82,200, and $51,200 is to be spent on the generating plant, while $30,000 is the estimate for wire, fittings, etc.

Official Programme.

Sixteenth Convention, National Electric Light Association, St. Louis, Feb. 28, March 1 and 2.

TUESDAY, FEBRUARY 28TH.

Meeting of the Executive Committee at 9 o'clock, [illegible] parlor, Southern Hotel.

Morning Session, 10:30 o'clock.—Address of Welcome, Hon. E. A. Noonan, Mayor of St. Louis.

Address, President, James I. Ayer.

Report, Committee on Data.

Afternoon Session, 2 o'clock.—Report, Committee on Safe Wiring.

Report, Committee on World's Columbian Exposition.

Paper, A. D. Adams, "Wrought versus Cast Iron for Field Magnet Frames."

WEDNESDAY, MARCH 1ST.

Morning Session, 10 o'clock.—Paper, H. C. Meyers, "Preservation of Poles and Cross Arms."

Paper, Chas. S. Bradley, "Long Distance Transmission of Power."

Paper, L. B. Stillwell, "Under What Conditions Is the Use of Water Power Economical?"

Afternoon Session, 2:30 o'clock.—Paper, E. A. Armstrong, "Morals of Corporations."

Paper, R. H. Sterling, "Some Experiences with the Alternating System."

Paper, William Brophy, "Relation of Insurance to Electric Lighting and Power."

Evening Session, 8 o'clock.—Lecture by Nikola Tesla.

THURSDAY, MARCH 2D.

Morning Session, 10 o'clock.—Paper, W. H. Browne, "Underground Conduits and Conductors."

Paper, Calvert Townley, "Incandescent Lamp from a Commercial Standpoint."

Paper, Louis Bell, Subject to be announced.

Executive Session.—Report, Secretary and Treasurer.

Election of Officers.

The St. Louis Electric Club announces the following programme, subject to change:

MONDAY.

Afternoon.—Special Committee to meet incoming Vandalia train at East St. Louis, or farther out, if possible.

Evening.—Reception Committee at Union depot and all hotels. Informal reception at Electric Club rooms.

TUESDAY.

Evening.—Visits in carriages to the Missouri, Municipal, and Union Depot electric plants.

WEDNESDAY.

Afternoon.—Theatre party for the ladies accompanying delegates.

Evening.—Tesla lecture. Reception immediately afterward.

THURSDAY.

Afternoon.—Carriage drive for ladies through West End, Tower Grove Park and Shaw's garden.

Evening.—Theatre parties for delegates and ladies.

FRIDAY.

Morning.—Meet at Electric Club rooms at 10.30, take suburban electric cars to DeHodiamont; inspect power station; proceed out suburban road to Ramona lake; thence return by Union avenue branch to Forest Park; take carriages to Jockey Club at Fair grounds for lunch. Return, if time will permit, via Benton-Bellefoutaine Railway station, reaching hotels at 5.30.

At West Lynn, the other day, a locomotive was coupled to a large electric car and power was applied to them in opposite directions. For some time neither gained an inch, but finally with the aid of sand thrown on the track the electric came off victorious.

The best lighted city in Europe is Milan. American machinery only is employed in its two central stations. A curious feature of the system of distribution is that the wires, instead of being carried on poles, are suspended from the brackets under the eaves of the houses.

Spirit of the Foreign Electrical Press.

At the meeting of the Société Française de Physique on the 6th ult., M. Guillaume presented, on the part of MM. Sarasin and De la Rive, a large photograph of their new apparatus for the study of electric waves in the air. In a first series of researches, carried out in 1890, the authors showed that the internode or wave-length of oscillation observed along a pair of wires depends only on the resonator and not on the exciter, a phenomenon of which M. Poincaré has given the theory verified later by M. Bjerknes and M. Pérot. According to experiments which M. Sarasin has repeated before members at the central laboratory, MM. Sarasin and De la Rive showed, by small resonators, that the speed of propagation of electric waves is the same in the air as along wires. M. Blondinot has already shown the beautiful application he has made of this principle to the direct measurement of this speed. But for long waves the equality of speeds has remained without experimental demonstration, the experiments of Hertz on this point not being sufficiently clear, and indeed had led their author to believe in the possibility of a different speed. The narrow dimensions of the Hertz reflector and the first reflector used by Sarasin and De la Rive did not allow of more than one node, using a reflector with circles of more than 50 cm. diameter. After having extended their laboratory, the authors found their first results confirmed, but only obtained moderate sharpness in the phenomena; they therefore decided to work on a still larger scale, and set up in the building of the Geneva waterworks a zinc reflector of eight metres by sixteen metres; on a perpendicular raised to its centre, and at fifteen metres distance, was placed the exciter, whose large spheres were 0.8 metre diameter. The small spheres were immersed in oil. Between the exciter and the reflector a funnel was mounted to permit of observations being made in the dark as before; the observations were made by measuring, for a series of points between the exciter and reflector, the explosive distance on an interruption of the resonator; these distances, plotted as ordinates (the line joining the exciter to the centre of reflector being the abscissa), form an undulating line on which it is easy to measure wave length. The results obtained with circles of 50 cm. and 75 cm. diameter were as follows: "The wave length of a resonator is sensibly equal to eight times its diameter. In the case of normal reflection, the first node is exactly at the reflector. The speed of propagation in air is the same as along the wires." This experiment, carried out under such perfect conditions, is identical in principle with the beautiful experiment of Lippmann on the photography of colors. The air in front of the reflector is the seat of movements analogous to those which in the film of collodion determine the formation of layers giving rise to the perception of colors. Pursuing the analogy, M. Guillaume thinks that a series of semi-transparent mirrors (metallic woven fabric or wetted cloths) arranged parallel to the reflector at equal distances, would give, by reflection, as in M. Lippmann's films, perfectly pure waves. The comparison of these waves with those of the exciter would show the degree of purity of the latter.—*London Electrical Engineer.*

Personal.

Capt. William F. Rossem, formerly engineer member of the Board of Commissioners of the District of Columbia, has been chosen as Vice-President and General Manager of the General Electric Company, with headquarters in Boston.

The decision of the Common Pleas Court of Chester County, Pa., under which the city of Chester recovered license moneys for telegraph poles erected there and operated by the Western Union Telegraph Company, was affirmed by the Supreme Court.

General News.

What is Going on in the Electrical World.

Fall River, Mass.—The Fall River Electric Lighting Company has petitioned for permission to furnish power as well as light.

Riverside, Ohio.—An application has been made to the council for permission to establish an electric street railway within this town.

Youngstown, Ohio.—The project of building an electric car line from Youngstown to Canfield is now in a fair way of being carried out.

Richmond, Va.—There is a report here that the Richmond Railway and Electric Company intends to buy out the Richmond and Manchester Railway Company.

Fort Worth, Tex.—The telephone line (metallic circuit) from this city to Sherman is completed to Dallas.—A new line is under construction between Dallas and Corsicana.

Toledo, Ohio.—The indications are that an electric railway will be built from Manhattan to Point Place, following the Ottawa from the bridge at Kramer's to the Point.

Binghamton, N. Y.—Every street car in the city will soon be operated by electricity. Arrangements have been made by the Court street and East End Company whereby they will, in a few days, change their motive power from horses to electricity.

Boston, Mass.—It is reported that the Thomson Electric Welding Company has secured control of an electric loom, which is expected to revolutionize the present manner of weaving textile fabrics.

Tacoma, Wash.—The Light and Water Committee of the City Council are said to be inclined to advise the city to purchase the electric, gas and water plants of the Tacoma Light and Water Company for $1,900,000.

Odin, Ill.—A company is being organized to build and operate an electric street car line connecting the four towns of Centralia, Sandoval, Odin and Salem. It is also intended to furnish electric lights to the towns.

Oakland, Cal.—Work has been begun on an electric road on Twelfth street, the original franchise of which was granted to Grossmeyer and others and which has been purchased by W. F. Rudolph, Warren Olney and others.

Augusta, Ga.—A new electric railway line proposed is to extend to Murray Hill, and a beautiful surburban residence section will thus be brought within easy distance of the city. The length of the proposed line is six miles.

Southbridge, Mass.—The directors of the Worcester, Leicester and Spencer Street Railway Company have been notified that they have been granted a franchise for their electric line to Southbridge through parts of the town of Oxford.

Lancaster, Pa.—The extensive improvements at the Edison electric light station in this city are rapidly nearing completion, and in a short time Lancaster can boast of one of the most complete electric lighting and power plants in the country.

Bellaire, Ohio.—Steps are being taken toward building an electric railway from the upper end of Martin's Ferry to the lower part of Bellaire and the Wheeling Creek coal works, four miles west of Bridgeport. Pittsburg capitalists are said to be back of the project.

Greenport, L. I., N. Y.—It is proposed to increase the capital stock of the Greenport Electric Light and Power Company so as to build an electric railway between Greenport and Orient, and use the improved plant of the company to supply the motive power for the road.

Lowell, Mass.—The contract with the local electric light company being about to expire, the mayor has sent out a circular to a large number of cities and towns asking for information relative to the cost, etc., of electric lighting under the various systems adopted by them.

Toronto, Can.—An automatic street indicator is being introduced on the Toronto Electric Street Railway cars. Instead of calling out the name of the streets the car is provided with an indicator so that when a car leaves a corner a bell rings and the name of the street is shown.

Phœnixville, Pa.—A site has been purchased for the etablishment of an electric light plant by a company composed almost entirely of Philadelphians. The same company, it is stated, will construct and operate an electric railway in the borough, plans for which are now being arranged.

Brooklyn, N. Y.—Noah L. Cocheu, president of the State Electrical Light and Power Company, has offered $10,000 for a franchise to do business in Brooklyn. Mr. Cocheu promises, if he is granted a franchise, to furnish electric light at twenty cents per lamp less than the price now paid.

Wilmington, Del.—The rivalry between the Wilmington City Electric Railway Company and the Wilmington and New Castle Company, which were asking a charter for an electric line between this city and New Castle, having been terminated by compromise, the road will be built by the latter company.

Atlanta, Ga.—Five electric lines of street railway are proposed and under way here: the East Lake line, the White Electric line, the Traction line extension, the line to Decatur, and a line to run out Mangum and West Hunter streets toward the Atlanta University. The line to Decatur will be completed by the 1st of May.

Kalamazoo, Mich.—The General Electric Company has been granted a franchise to construct, own and operate a single or double track electric street railway with all the necessary curves, turntables, switches, turnouts, etc., in, through, over, upon and along the streets, avenues, highways and bridges in this city.

West Chester, Pa.—The projectors of the new electric railway from West Chester to Downingtown, via Cope's bridge, on the Brandywine, have organized by electing Thomas Pennypacker, of Marshalton, president, and Joseph H. Baldwin, Secretary and treasurer. It is proposed to commence building this line in a few weeks.

Allentown, Pa.—There is a report here of the formation of a company to be known as the Lehigh Valley Traction Company, the leading spirits of which are A. Johnston, of Cleveland, and John K. and Howard Page, of New York. The purpose of the company is to build an electric railway beginning at Egypt and passing through Allentown, South Allentown, Ainesville and up the Lehigh Mountain, terminating at South Bethlehem.

Paterson, N. J.—The *Call* says: "The officers of the Central Electric Railway Company expect to have cars running through to Little Falls in a short time, and then good-bye to the old stage that has done duty for so many years. It ought to be sent to Chicago for exhibition along with the Columbus caravel, the exploring boat of the Norsemen and the first passenger coach on the Pennsylvania Railroad."

Providence, R. I.—The *Journal* says: "It is not improbable that the present generation will see Providence connected by electric railway with cities, towns and principal suburbs within a radius of about forty miles. Warren, Bristol, Fall River, Taunton, Worcester, Boston, Woonsocket, Attleboro, the Blackstone Valley villages and those of the Pawtuxet Valley, and others along the Moshassuck and Woonasquatucket—in fact, wherever a steam railroad is now in operation, or projected, an electric line may parallel it or cut across country, tapping every point of importance or of promise."

McKeesport, Pa.—The present contract of the McKeesport Light Company with the city will expire June 1 next. The whole number of arc lights in the streets is 113 and of incandescent lights 57. The city pays $100 each for arc lights and $13 for incandescent lights.—A syndicate, believed to be the Widener-Elkins McKee combination, has secured options on the property of the McKeesport and Reynoldton Passenger Railway Company and the White Traction Company, with the idea of consolidating these companies in a scheme that reaches to Homestead and from there to the heart of Pittsburg.

New York.—Judge Andrews has overruled a motion to strike out a demurrer put in by John T. Zebley & Co to the complaint in the suit brought by the Edison General Electric Company to recover $31,949.74, and about a year's interest from the Eastern Electric Company, on promissory notes. John T. Zebley & Co indorsed the notes and demurred to the complaint on the ground that they were not liable.—The report of the Board of Electrical Control for the month of January sent to the Mayor's office to day, showed that eighty-eight poles and 104 miles of

wire have been removed during the month from the streets of the city. The Department of Public Works removed sixty-three miles of the wire and the electric companies the remainder.

"Okonite."

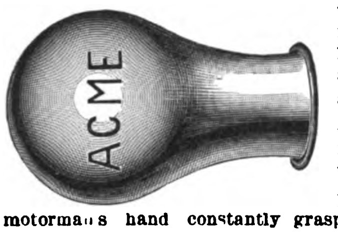
Before the National Electric Light Convention, now holding forth in our midst, has drawn to a close, we will have heard a great deal about "Okonite." "Captain Candee," "Geo. T. Manson" and the Okonite Company (Limited). There is a good reason for this. "Okonite" is rated above par as an insulating medium. "Captain Candee" and "Geo. T. Manson" are jolly good fellows, bright lights, who would be sorely missed at any gathering of the electrical fraternity, and the Okonite Company (Limited) is one of the best known and most pushing, enterprising concerns in these grand and glorious United States.

The "Captain" has just returned from a six weeks' trip abroad, whither he stayed in the interests of that wonderful compound, Okonite, and reports the affairs of the company at the London headquarters in a flourishing condition.

"Okonite" has made a grand record in this country, and is undoubtedly the most popular insulating material made. It is regarded as the highest insulation known. If you use "Okonite" insulated wires and cables you use the best. They are very tough and tenacious and are not affected by extreme changes in temperature. For electric light, telephone and telegraph purposes they stand unrivalled. If you are at all skeptical on this point, tackle the "Captain" or "Geo. T."—but be careful how you do it.

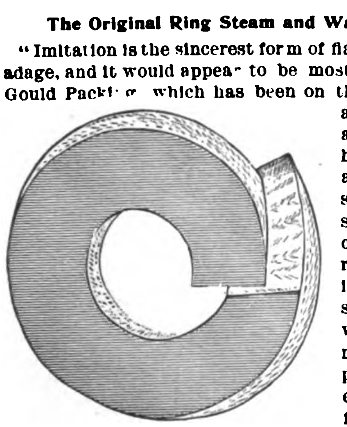
Something New for Motormen.

Since the introduction of the electric street-car system various improvements have been made tending to greater comfort and safety for the men operating the cars. Notwithstanding these changes and advances, however, motormen are subjected to inconveniences and discomforts that ought to be got rid of. Among these are occasional shocks from the electric current which will, at times, find its way through their bodies by way of the handle by which they control the current. This thing is liable to occur on any car equipped by any system. As these handles are almost invariably made of brass, it has been proven that the motorman's hand constantly grasping the handle is liable to blood poisoning should he have any scratch or skin abrasion on the hand. There have been quite a number of such cases in Boston alone, where motormen employed on the electric cars have had to lay off and even been treated in hospitals for this very thing. Any device, therefore, that is likely to ensure the men from these mishaps and painful experiences is sure to meet with speedy recognition. Such a device is the "Acme" shield, a cut of which we herewith publish. It is made of rubber to conform to the shape of the handle; can be easily slipped on and off, though it clasps the handle very tightly when in place; is a thorough insulator, and being finely finished, soon pays for itself in the saving on the wear and tear of gloves or mittens such as motormen usually wear. It is manufactured and sold by Mr. C. C. Lewis, rubber and oil-goods manufacturer, corner of Cornhill and Washington streets, Boston, from whom they can be had at fifty cents each, or three dollars per dozen. Boston motormen are in love with them.



The Original Ring Steam and Water Packing.

"Imitation is the sincerest form of flattery," says an old adage, and it would appear to be most applicable to the Gould Packing which has been on the market now for about thirteen years and continues to hold its own against all comers. Novel in shape, as may be seen from the accompanying cut, rendering this packing adaptable to any service in steam or water; made of a material specially prepared and treated scientifically before being shipped it is not to be wondered at that this specialty should have become absolutely indispensable in every electric light and power station, as well as with every engineer throughout the country.



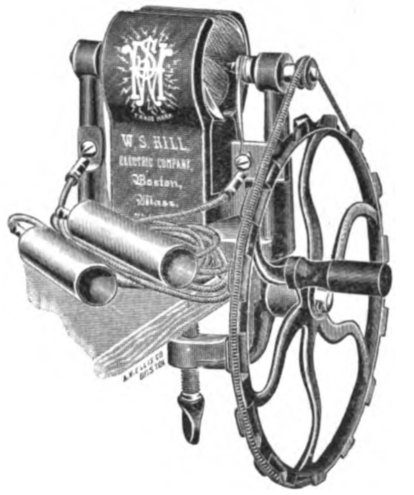
That the Gould Packing is the only "original" ring packing is proven by the fact that it was patented, manufactured and in general use no less that six years before any similar packing was dreamt of.

This packing is made by the Gould Packing Company, Cambridge, Mass., in all sizes from the largest to the smallest, hence meets every conceivable requirement.

What is Electricity?

Such is the heading given to a very handsome circular just issued by the W. S. Hill Electric Company, Boston, which title is followed by a brief dissertation answering the above cogent query.

Although covering less than a single page of said circular, the explanation will be found of exceeding interest to every one, as will also be the brief description of the powerful generator, a cut of which appears herewith. The president of this prosperous company is also the inventor of what is, without doubt, not only the most elegantly designed, but the most powerful little electrical generator now on the market. It is only a few months since this novelty was first placed on the market, and the demand instantly became phenomenal, for it was purchased in large quantities for Christmas presents, and in innumerable homes during the recent holidays this device furnished more excitement and fun than all the rest of Santa Claus' presents put together. No end of funny experiments can be performed with this miniature machine, rendering it a most welcome auxiliary to every enterprising boy's mechanical and scientific equipment and budget of fun. But not only so. It is a real scientific apparatus of great practical utility, and as such is being used extensively by medical men and others as a remedy for various ailments. It far excels the old fashioned magnetic machines for use in cases of nervous and other affections; and the manufacturers are in receipt of many strong endorsements from medical men of eminence, who now use this machine or instrument regularly in their practice with most gratifying results.



The price is only *nominal*, the demand is *phenomenal*; indications warranting the belief that there is likely to be difficulty in shipping them fast enough to keep pace with the constantly increasing demand.

Insulation.

The subject of a perfect insulating compound for electrical purposes has long held paramount sway in the minds of those engaged in nearly every department of the business, and such a preparation is a desideratum. Thus far many different substances have been used with varying degrees of success. Considering the exacting nature of the service to be rendered, and the trying conditions to be provided for, it is gratifying to know that many difficulties in this department have been overcome and a measure of perfection attained.

And among those who have made a special study in this department of practical electrical science are certain gentlemen identified with the Massachusetts Chemical Company, a Boston corporation which, after long, patient and costly research, and the most thorough scientific analysis, have possessed themselves of a preparation already widely known as "Insullac," which, since its introduction only a few months ago, has grown into all but universal demand. Not only has this new insulation been applied to the most exacting uses, and placed under the hardest possible conditions, but it has been severely tested time and again by several of the leading electrical engineering firms in their laboratories, with the unvarying result of proving itself to be a perfect insulator in every respect.

The indorsements it has received from many quarters have been of such character that the demand has become quite phenomenal, and the manufacturers have found it necessary to quadruple their facilities for producing it. Nearly every electric light and power company as well as manufacturing firm in the country, use it almost exclusively and are more than satisfied with it.

From time to time the manufacturers receive warm commendation from their customers, and they have permitted us to publish the following communication from Mr. Barton L. Peck, of Detroit:

"I have tested your Insullac and find it even better than you claim. Some time ago I insulated a Commutator with canvas which had been treated with Insullac, and the owners claim that the machine runs satisfactorily for the first time since they owned it.

"The trouble has been with the oil soaking into the insulation and burning there, causing short circuits.

"The canvas when properly treated seems to be proof against either oil or water.

"The canvas should be first treated with a thin coat of Insullac and well dried, after which it may be cut up and placed in the commutator ends and the edges trimmed down flush with the collar. Heat the commutator quite hot, and while in that condition apply a heavy coat of Insullac to all exposed parts, and allow the same to dry hard before starting the machine."

Testimony even stronger than this foregoing letter may be found on page 6 of this issue.

The Consolidated Engineering Company of St. Louis.

This company was organized Sept. 10 last, and has built since that day, or has still in course of construction the following plants: Columbia, Ill., for the Eagle Electric Company, central station, 500 light alternator, 75 horse power Ideal engine and steam plant complete; station buildings, steam and electric plant, pole line, wiring for both commercial and arc circuits, as well as installation of all lights; plant completed Nov. 24. Marion, Ill., 30 light arc, 600 light alternator, Brush Electric Company make, being built for the Marion Electric Light and Street Railway Company; contract calls for complete plant, both steam plant, electrical apparatus, lines and installation of all lights steam plant 100 H. P. Ideal engine, boilers, etc. Fayette, Mo., municipal plant consisting of 160 light arc, and 650 light incandescent, Fort Wayne Electric Company make, together with the entire steam plant, buildings, etc., engine being 125 H. P. Ideal. Rothschild building, St. Louis, small electric plant and wiring of building for 250 lights. Globe Shoe and Clothing Company, 240 light arc, 2,400 light incandescent, of Standard and National make, also wiring of entire building for 800 incandescent and 80 arc lamps.

Interesting to Manufacturers.

During a recent tour among the celebrated manufacturing districts of Philadelphia, Pa., made in company with the Investigating Committee of the famous Franklin Institute, we visited the extensive chemical works and laboratory of Mr. G. W. Lord, the well-known and popular manufacturer of "Lord's Boiler Compound."

After explaining the object of our mission, we were cordially received by Mr. Lord in his private office; and the hospitality of his establishment was courteously extended to us.

Mr. Lord personally conducted us through the many departments of his plant, fully detailing and explaining the various processes associated with the manufacture and production of chemical bodies; and further, instructed us as to the chemical properties developed and augmented by the progressive manipulation presented to our observation. Subsequently we visited Mr. Lord's laboratory, where all the requisite implements and instruments were represented necessary to effect the chemical analysis of substances whose elementary constituents were to be ascertained. The specific details and progressive processes of chemical analysis were there intelligently and instructively explained to us, after which Mr. Lord supplemented his previous assertions by prosecuting some very interesting chemical manipulations with the foreign impurities of natural waters. During these demonstrations, Mr. Lord effected the complete precipitation, neutralization and decomposition of all the incrustating and corrosive impurities contained in the sample of water examined; which was subsequently affirmed by the incompetency of the usual reagents to effect any chemical reaction.

After completing our tour of Mr. Lord's manufacturing departments, we were shown through his shipping establishment; here his celebrated chemical preventive of incrustation and corrosion, known under the trade mark of Lord's Boiler Compound, practically existed in inexhaustible quantities. Countless numbers of packages of diversified capacity were apportioned off in car-load lots, then being delivered to our representative oil houses and mill-supply houses from ocean to ocean; the tons and tons of Compound here distributed best demonstrates the popularity and demand for this superior preparation.

Mr. Lord has gained a high reputation in the chemical treatment of water; his preparations are in exclusive use by the United States and most foreign Governments, and we find his preparations endorsed and recommended in our best modern treatises on steam engineering. Like all genuine and successful commodities to which attach good will and confidence, Lord's Boiler Compound has had to contend with numberless counterfeit and imitative articles on its onward march to success. Mr. Lord presented to us for examination many letters from steam-users all over the country, who complain of the unscrupulous and dishonest representation of dealers, who have imposed upon them spurious articles represented as Lord's Boiler Compound.

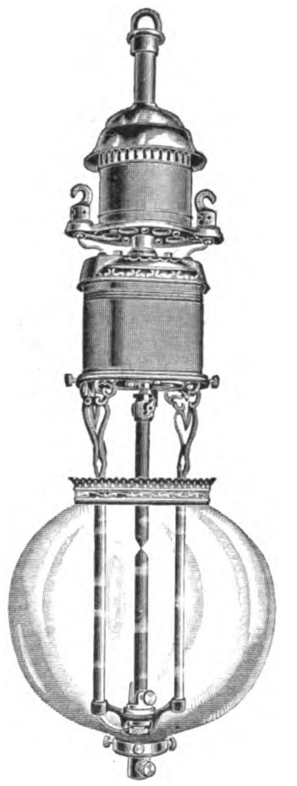
We would respectfully caution the trade against these impostors, and recommend their mailing their orders for Boiler Compound direct to Mr. G. W. Lord, 316 Union street, Philadelphia, Pa.

Unlike the many nostrums formulated by incompetent parties with which the market is flooded, and which usually consist of dangerous and inflammable oils, caustic alkalis and acids, compounded in various proportions to meet with the ideas of the manufacturer, Lord's Boiler Compound is formulated to fulfil the requirements of the individual steam-user, based upon an exhaustive analysis of the water used, and is composed only of such reagents, as are consistent with the highest chemical authority, and whose merit, both separately and collectively, has been confirmed by thirty years of usage. To those in need of a sure and effective preventive of boiler incrustation and corrosion, we are familiar with no preparation deserving of greater consideration than Lord's Compound. • • •

The New Kester-Atwood Arc Lamp.

The lamp herewith illustrated has recently been patented and placed on the market by the A. H. Atwood Electric Manufacturing Company of Chicago. The lamp is the invention of Mr. Kester, formerly of the Kester Arc Lamp Company, and has been designed especially for incandescent circuits of all potentials but the company also makes them for arc light circuit work.

The lamp is of a very neat and ornamental design, being highly finished of bronze metal and heavily lacquered. The frame work is very rigid, being made of steel and bronze metal. The feeding mechanism is exceedingly simple, being composed of a single lever clutch actuated by a single set of magnets. The lamps are made to operate on any system from 50 to 500 volts.



THE NEW KESTER-ATWOOD ARC LAMP.

COMMERCIAL PARAGRAPHS.

The Standard Electric Construction Company of St. Louis have recently placed a 150 light direct current machine of the United States type, in the Bauer-Walter Buggy and Carriage Company. They have also sold two 500 light generators to the Merrimac and Hyland Improvement Company.

Messrs. H. H. Cutler and E. W. Hammer have established a manufacturing plant at 313 So. Canal street for the purpose of manufacturing and designing electrical machinery and testing electrical apparatus. Both of these gentlemen have had a long and extensive experience in this line of work. Mr. Cutler is well known as the inventor of the Cutler non-inductive measuring instruments. Mr. Hammer has until recently been superintendent of the Chicago Electric Manufacturing Company.

The C. W. Hunt Company, 45 Broadway, New York City, is doing a big business. Its system of industrial railways for electric light and power stations and general manufacturing establishments, is becoming decidedly popular. We notice in the uptown power station of the Broadway Cable Road, New York, that the Hunt system is used for conveying coal and ashes to and from the boilers. The ash cars are run on a sunken track directly under the furnace doors and are of the latest improved pattern made by the C. W. Hunt Company.

The Weston Electrical Instrument Company, Newark, N. J., is habitually a very busy concern. Orders for the celebrated Weston electrical measuring instruments come thick and fast and continue to increase in numbers year by year. The demand for these goods from abroad is very large, the exhibit of the company at the Frankfort Exposition stirring up a general interest and call for them.

The improvements which have been made in the Fishkill-Corliss Horizontal Engine during the last few years adapt it especially for the exacting duty required in electric light and power stations, and it has come to be a very popular engine for such situations. The Fishkill Landing Machine Company, Fishkill-on-the-Hudson, N. Y., are the builders and report a lively demand for their specialty.

INCORPORATIONS.

The Camden and Princeton Connecting Road Company, Burlington, N. J. Incorporators: J. Randolph Appleby, Charles F. Blondin and James Benson, of New York City. The proposed road will be operated by electricity, and will take in a number of leading towns between Camden and Princeton, N. J. The principal office will be at Burlington.

Charters were granted at the State Department, Harrisburg, Pa., on the 20th ult., to the Phœnix Electric Street Railway Company, capital, $60,000; Interstate Traction Company, to do business in Gettysburg and Philadelphia, capital, $60,000.

The Fairview and Riverton Passenger Railway Company, Fairview, Pa. Capital stock, $25,000. Directors: Henry McCormick, James M. Cameron, Harry B. McCormick, Frank Martin and Lemuel Spong.

The consolidation of the Des Moines Water Power Electric Light Company and the Edison Light Company, also of Des Moines, has been consummated and the articles of incorporation of the new company filed. The capital stock paid up is $600,000. The title of the company under the new deal is that of the Des Moines Electric Company, and its corporate existence is to extend over a period of twenty years. The officers are: President, Fred D. Goode; vice-president, B. E. Sunny; secretary, J. A. Colby; treasurer, V. F. Newell. The officers named, together with Lowry Goode, J. I. Beggs and N. W. Jordan will constitute the board of directors.

The gas and electric light plants in the cities of Salt Lake and Ogden have been consolidated under the name of the Salt Lake and Ogden Gas and Electric Light Co. The names of the incorporators under the consolidation are: W. S. McCornick, George M. Scott, P. L. Williams, V. M. C. Silva, J. Elliot Condict, George F. Penhale and James Moffatt.

The Poulson Telephone Company, of Western New York, to operate in Erie, Niagara, Chautauqua and Cattaraugus Counties, the telephone lines to be private lines and not connected with any general office. Principal office in Buffalo. Capital $50,000. Directors: Herman W. Ladd, of Boston; George R. Taylor, Edward Smith, John C. Bains and Fred L. Bennett, of Buffalo.

The Western Telephone Company, Chicago. Capital stock, $50,000. Incorporators: J. E. Kellelyn, G. F. Stich, John F. Scanlon and Miles Kehoe. The company was organized for the construction of telephone exchanges in the United States. They claim to have control of thirty patents, covering various apparatus necessary to a complete exchange which will not infringe upon any other patents now in use by the Bell company after March 7.

Salt Lake and Ogden Gas and Electric Light Company, Salt Lake City. Capital stock, $1,500,000.

The Denver-Highlands Electric Company, Denver, Col., has filed an amended certificate of incorporation, by which it is empowered to manufacture and distribute electricity and gas.

Among the companies recently chartered at Harrisburg, Pa., was the Jersey Shore Electric Heat, Light and Power Company. Capital, $5,000.

Altoona Electrical Engineering and Supply Company, Altoona, Pa. Capital stock, $15,000. Incorporators: Wm. F. Taylor, Abraham B. Norton, Wyllis H. Markland and Edgar B. Green, all of Altoona, and Walter D. Antrim, of Camden. The objects of the corporation are to build, construct and equip electric light and power plants.

The Springfield (Vt.) Electric Company has increased its capital stock to $25,000.

The City Electric Light and Power Company, Nashville, Tenn. Incorporators: M. A. Spurr, J. N. Brooks, Jos. A. Humphreys, W. A. Wray and Wm. C. Collier.

The Adams Electric Manufacturing Company, Chicago. Capital stock, $[illegible]00,000. Incorporators: William B. Mather, William L. Sutherland, James S. Wheeler, Jr.

The Chicago Electric Supply Company has changed its name to the Kay Specialty Manufacturing Company.

Electric Light, Power and Heating Company, Springfield, Ill. Capital stock, $[illegible]0.000. Incorporators: Frank Reisch, George Reisch, J. H. Shuck, Charles Shuck, Clara Herman.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED FEBRUARY 21, 1893.

ELECTRIC RAILWAYS AND APPLIANCES.

491,988. Electric-Railway Trolley. Alfred Dickinson, Darlaston, England. Filed Feb. 9, 1892.

492,106. Conduit Railway. Frank B. Rae, Detroit, Mich., assignor to the Detroit Electrical Works, same place. Filed April 11, 1891.

492,265. Conduit Electric Railway. Fred W. Brann, Oakland, Cal. Filed May 16, 1892.

492,301. Coupling for Trolley-Wires. William H. Keckeley, Covington, Ky. Filed Dec. 10, 1892.

DYNAMOS AND MOTORS.

491,982. Electric Motor and Controlling Apparatus for Cars. John V. Capek, New York, N. Y., assignor of one-half to Edward H. Johnson, same place. Filed Nov. 14, 1891.

491,990. Multipolar-Dynamo-Electric-Machine Armature. George E. Dorman, Chicago, Ill. Filed Jan. 4, 1892.

492,036. Automatic Circuit-Breaker for Motors. Robert T. Lozier, New York, N. Y., assignor to the Edison General Electric Company, same place. Filed April 4, 1892.

492,151. Dynamo-Electric Machine. Wallace E. Freeman, Long Island City, assignor to Lawrence M. Closs, New York, N. Y. Filed July 8, 1892.

492,176. Commutator for Dynamos or Motors. Joseph A. Williams, Cleveland, Ohio. Filed May 2, 1892.

492,244. Method of Construcing Armature-Cores for Electric Motors or Dynamos. Albert W. Smith, San Francisco, Cal. Filed Feb. 20 1892.

492,274. Street-Car Motor. James A. Currie, Springfield, Ohio. Filed June 10, 1892.

492,291. Commutating Apparatus for Dynamo Electric Machines. Edward J. Houghton and William White, London, England. Filed March 26, 1892.

492,355. Magnetic Core for Armatures. Thomas H. Hicks, Detroit, Mich. Filed Oct. 6, 1892.

ELECTRIC LIGHTS AND APPLIANCES.

491,992. Cut-Out for Incandescent Electric Lamps. Thos. A. Edison, Llewellyn Park, N. J. Filed Nov. 12, 1891.

492,008. Pole-Standard for Arc Lamps. Frederick D'A. Goold, Schenectady, assignor to the Edison General Electric Company, New York, N. Y. Filed April 15, 1892.

492,124. Duplex Electric-Arc Lamp. Barton B. Ward, New York, N. Y. Filed May 17, 1892.

492,150. Process of Coating Conductors for Incandescent Lamps. Thomas A. Edison, Menlo Park, N.J., assignor to the Edison Electric Light Company, New York, N.Y. Filed Oct. 26, 1882.

492,200. Electric-Arc Lamp. Henry Harper, London, England, assignor to himself, John Tryon and Thomas George Poole, same place. Filed July 10, 1891.

492,215. Hanger for Electric Incandescent Lamps. Samuel O. Larkins, Blair, Neb. Filed Feb. 17, 1892. Renewed Dec 17, 1892.

492,295. Incandescent Gas-Lamp. Joel G. Jackson, Minneapolis, Minn., and Addison L. Daniels, Marion, Iowa. Filed Feb 24, 1892.

492,312. Electric-Arc Lamp. John Thompson, New York, N.Y. Filed May 17, 1892.

TELEPHONE AND TELEGRAPH APPARATUS.

492,110. Automatic Individual Telephone-Call Apparatus. Joseph Sack, Berlin, Germany. Filed Sept. 18, 1891.

492,019. Magneto-Telephone Switch. William Humans, Cambridge, Mass., assignor to the American Magnetic Electric Company, Jersey City, N. J. Filed July 23, 1885.

MISCELLANEOUS.

492,011. Electrical Indicator. Henry J. Haight, New York, N. Y. Filed June 1, 1892.

492,160. Electric Elevator. Frank E. Herdman, Indianapolis, Ind. Filed March 8, 1892.

492,219. Lightning Conductor and Arrester. Adelvin B. Lyman, Cleveland, Ohio. Filed Oct. 28, 1892.

492,245. Magnetic Tool. Jacob F. Standiford, Muscogee, Ind. Ter. Filed July 14, 1892.

492,247. Electrical Foot-Warmer. William E. Ulmer, Hoquiam, Wash. Filed April 27, 1892.

492,309. Electric-Bell Alarm. Gustaf L. Reenstierna, Boston, Mass. Filed Oct. 12, 1892.

492,330. Electric Burglar-Alarm. Julius Kemsler, New York, N. Y. Filed Dec. 15, 1892.

492,377. Electric Reduction of Refractory Metallic Compounds. Thomas L. Wilson, Leaksville, N. C. Filed Aug. 9, 1892.

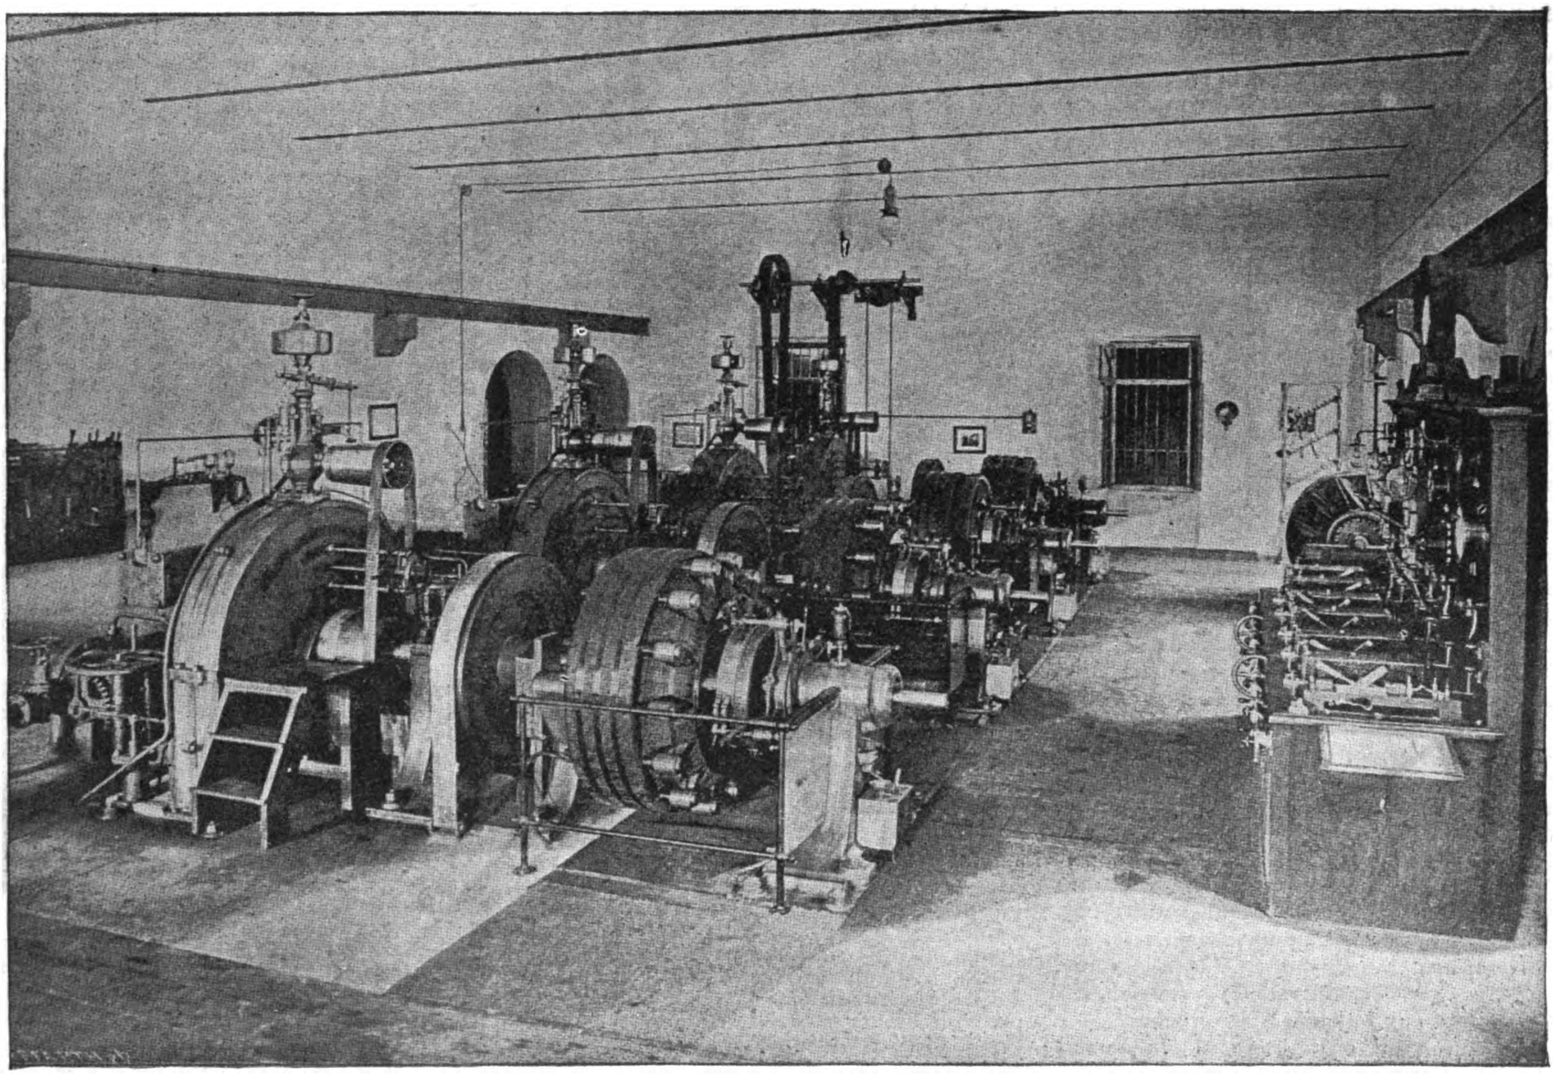
ELECTRICITY.

VOL. IV. NEW YORK. MARCH 8, 1893. CHICAGO. No. 8



A FIVE WIRE STATION. (SEE PAGE 101.)

St. Louis Convention.

Sixteenth Annual Meeting of the National Electric Light Association.

Report of Proceedings.

The sixteenth meeting of the National Electric Light Association was held in the Bell Telephone Building, Olive and Tenth streets, St. Louis, Mo., February 28th, March 1st and 2d, 1893.

President Ayer called the meeting to order at 10:45 o'clock on the first morning, and introduced Hon. E. A. Noonan, Mayor of St. Louis, who welcomed the delegates to St. Louis in a brief address in which he said: "In the four years of my official term I have had occasion to address bodies of gentlemen representing in convention the great forces, I might say, of modern civilization; but at no time have I had the pleasure to address those concerned in what to my mind is now the greatest, the most wonderful, the most far-reaching, of all forces known to man—the force of electricity.

"You have come together in council in the greatest electric city of the world. Although somewhat in the far West from where energy is supposed to reside—along the Atlantic seaboard; although we are in a great valley where we are charged with lethargy and the taint of the lassitude that comes with a southern breeze; notwithstanding that, we find in this city of more than half a million people the greatest electric plants in the world. The birth of this great power took place before the Christian era; I am wrong—it was born with the primitive and primeval forces; it was born when light was born—when Ayer came. I mean to say that it was discovered or rather known to men earlier than the Christian era, but that its development is modern.

"I will not delay this representative body of gentlemen. You are familiar with the subject; you are masters of a science that to the layman is much of a mystery. Neither time nor opportunity has permitted me to become even in the way of an amateur familiar enough with the subject to warrant me to go any distance into that strange and remarkable field. Therefore, permit me modestly to retire from it, and leave it where it belongs—to the men who have mastered it, who are making it the study of their lives, who are giving to it all that the artist can give, all that the enthusiast does give. Let me rather go into the channel which I should follow; the channel that brings me here; the channel of hospitality, of reception, of entertainment.

"I represent the people of St. Louis. On this occasion especially have the public press announced, and in a hundred different ways it has come to me, that so far as this particular convention is concerned, St. Louis will outdo herself in making life pleasant and agreeable for the gentlemen who have come here to deliberate in our midst upon these important matters.

"Now, gentlemen, in all seriousness, this is the most important convention, in my humble judgment, that St. Louis has ever had; not in numbers of delegates, not in the great acclaim that has attended your arrival, but in the light of what you represent, in the sense of what will be accomplished by reason of your sessions here.

"Gentlemen, the City of St. Louis is yours, your wives, your daughters and your sweethearts —if you have any with you."

President Ayer then introduced Mr. Robert McCulloch, President of the St. Louis Electric Club, who said:

"Mr. President, Ladies and Gentlemen: I did not expect this of Mr. Ayer. He has followed the Mayor's directions and begun his paralyzing. I can only repeat what the Mayor has said, and that is, that the city belongs to yourselves, your wives, your daughters and your sweethearts."

Address of the President.

Gentlemen of the National Electric Light Association:

Since the first meeting in 1885 at our sister city by the lakes we have spread upon our records evidence of the wonderful progress of the great industry which we represent, and while as measured by time the years are few, the progress is marvellous. No art, no industry, no science can compare with it; and in no more forcible manner can it be presented than by stating that there is more capital invested in St. Louis in the application of electricity to-day than the sum total of investments throughout the United States for the production of apparatus and its use when this Association was born. These are facts well known, yet hardly realized by those of us who are engaged in promoting this remarkable development.

Since our last meeting much has transpired of interest to the members of the Association. Important developments have been announced from time to time through the press, as the result of the work of inventors, and many valuable items of detail have been brought out to add to the efficiency and satisfactory working of existing apparatus. The commercial development, however, has been confined to improvements in well-known apparatus and not to radical departures in character of generators as many were led to expect a year ago. More light will doubtless be given us in this direction through some of the papers we will be favored with; but there seems to be little likelihood of the introduction of new methods soon which will affect the quality of investments in existing apparatus, though there is reason to expect in the very near future that which will likely solve the problem of long distance transmission in a satisfactory manner. The much desired power motor for simple alternating circuits we are still anxiously looking for, and for some applications such motors as are known to be practical should be produced.

The recent patent decisions have introduced a new condition to many, brought anxiety and trouble to some, and satisfaction to others. To those of us who were lulled into security by the tedious delays of the courts and the persuasive arguments of our friend the salesman, who had so many advantages to offer, comes anxiety. To those of us who have only recently entered the field, and who heard very little of claims for "Foundation Patents," it is a new condition we can hardly realize, and we doubt its reality; and and we are strengthened in our doubt by those who don't want it so. To those of us who considered carefully and believed in the ultimate establishment of the inventor's claims and rights and who gave evidence in support of this faith by paying, in addition to a fair market price for the apparatus, an additional sum for the right to use it, and who have waited many years to receive the protection we paid for, comes the feeling of satisfaction.

That such a condition as exists to-day can be brought about calls for prompt action, that the rights of the people may be better protected. That the inventor can be so long deprived of his rights that many are led to believe by the delay that he has none, and to such an extent that millions are invested in developing a business made possible by his invention without regard to his claims, is clear evidence of the need of reform in our laws which will provide adequate protection for the investor as well as the inventor; and we earnestly recommend some action on the part of this Association, that our properties which have been so long regarded with distrust and suspicion by the financial world may not have added to their burdens the question of their right to use devices which are vital to their success; and to so place the station manager that he must not add to his other essential qualifications that of being able to divine what the courts may do in the far future. At previous conventions this topic has been considered, and efforts made to have Congress take such action as would give relief. Work in this direction should be taken up again by this body and vigorously pushed to completion.

In the past year much work has been accomplished by our secretary, and the showing for the year will, I feel, be very satisfactory when his report is read. Three volumes of the Association proceedings have been edited, published and delivered to members within the year, bringing this work down to date.

The interest in the procedings of the Convention evinced by the educational institutions throughout the country is one of the encouraging signs of the times, and justifies the statement (which is evidenced in many other ways) that the power and influence of the Association are extending. The increase of membership is flattering. With this condition existing there will come up for your final consideration the question relative to the reduction of dues.

From the beginning until to-day every producer and operator in the electrical field has had before him the serious problem of how to get men sufficiently skilled to execute in a satisfactory manner the duties assigned them. Undoubtedly this business has attracted in all departments the most ambitious elements from other lines of work, but as we can all testify, their education in the new field has been enormously expensive to their employers. But the future outlook is promising. While within the past three years this army has more than doubled, and the new element had little or no previous training or knowledge of the work, yet there have been established more rapidly than ever clubs, societies, trade guilds and labor organizations, with the principal avowed object of self-education. Their objects and efforts in this line are to be commended, and form a pertinent topic for this body to consider.

Within the past year there has been organized the National Association of Electrical Workers, with headquarters in this city, and having branches in many towns and cities. This organization is largely composed of linemen, though it expects to embrace in its membership electrical artisans or workers in every department. Their principal object, as stated in the first number of their journal, is to band themselves together for mutual education and improvement; to establish rooms and provide instructors, and adopt such other methods as may improve the standard of electrical labor. This organization is capable of accomplishing a vast amount of good if maintained on the high plane outlined. If the effort is earnest and honest we can all lend them a helping hand and will do it gladly. The wage question will never be an element to make a breach when the rank and file of electrical workers have mastered their business. But until that time arrives those who are among them as leaders should keep in mind that satisfactory work performed in a conscientious manner is the first essential to pleasant mutual relations between the employer and the employed, as well as the strongest lever to raise wages that can be produced.

During the year that has passed death has claimed an unusual number whose names have been prominently identified with the active promotion, development and application of electricity in its various branches. Those particularly interested in the department of telegraphy were: Cyrus W. Field, Wilson G. Hunt, F. M. Gisborne, Jay Gould and Norvin Green. In electric lighting and railways: C. J. Van Depoele, E. T. Lynch, Jr., M. M. Slattery, and in Europe, Werner Von Siemens. In this list are the names of those who have borne much of the heat and burden of the day and were among the few pioneers who hewed the path and assisted to broaden the road by overcoming difficulties which we, who find it so comparatively smooth to-day, little appreciate.

To our guests who have assembled with us and honored us by their presence, and who will further honor and instruct us with their words of wisdom, I want to express our thanks; and I trust that the members will by their presence at the different sessions demonstrate the sincerity of this expression on their behalf.

At the conclusion of his address, the President declared the Sixteenth Convention of the National Electric Light Association formally opened.

The President announced the burning of one of the largest stations under the management of Ex-President Huntley, at Buffalo, and read the following telegram:

"I regret my inability to be present. You have my best wishes for a successful convention.
"C. R. HUNTLEY."

The paper by Mr. A. D. Adams on "Wrought versus Cast Iron for Field Magnet Frames" was the first paper on the programme, after which, there being no discussion on this paper, the Secretary made the following announcements:

Letters of regret were read from Prof. Henry T. Bovey, Montreal, Canada; Prof. Ed. L. Nichols, Ithaca, N. Y.

Letters of invitation to participate in courtesies were read from Merchants' Exchange, St. Louis; Bell Telephone Company, St. Louis; Pastime Athletic Club, St. Louis; Knapp-Sellner Chandelier Company, St. Louis.

An invitation to hold the next meeting of the Association in Omaha, Nebraska, was read from Hon. G. P. Bemis, Mayor of Omaha.

On motion of Mr. Armstrong the latter was referred to the proper committee, and the former were accepted with the thanks of the Association.

The President stated that the Knapp-Sellner Chandelier Company would make quite a display of fixtures, and it was desired that as many of the delegates as possible would avail themselves of the invitation. Also that there would be open house at the Electric Club at all times of the day and night, where a buffet lunch would be served, and all in attendance at the Convention might resort at any time.

The President read the programme of entertainment provided by the local committee, a copy of which will be found elsewhere in this issue.

Mr. E. A. Armstrong then read the report of the Committee on the World's Columbian Fair, the Chairman, B. E. Sunny, not being present.

REPORT OF THE WORLD'S COLUMBIAN EXPOSITION COMMITTEE.

The Paris Exposition of 1881 was lighted in part by 1,383 arc lights, and was the first arc lighted Exposition. The Louisville Exposition of 1882 was lighted by 5,000 incandescent lights of 16 C. P. each, and this was the first use of incandescents for Exposition lighting. The New Orleans Exposition was lighted by both arc and incandescent.

The Paris Exposition of 1889 made the largest use of electricity up to that time. There were for public lighting service 1,093 arcs and 8,837 incandescents.

For private lighting there were used 623 arcs and 4,010 incandescents. The total of the service installation aggregated 3,125 H. P. capacity, and with small installations the grand aggregate capacity reached nearly 4,000 H. P. There was practically no use made of electricity as a motive power.

The World's Columbian Exposition has placed contracts for 4,500 arc lights, of 2,000 nominal candle power each, and received donations from miscellaneous exhibitors of about 700 additional. They have placed contracts for about 80,000 incandescent lights and received donations as special exhibits of about 10,000 additional. They have placed contracts for 2,900 H. P. capacity of power generators and received donations of 1,600 H. P. capacity.

They have made contracts for electrical fountains requiring an installation of 900 H. P. capacity. The aggregate of power generators and fountain plant (the latter will be used particularly for charging the storage batteries of the electric launches) is 5,300 horse power.

The total aggregate of the electrical installation therefore amounts to 19 500 horse power. The total aggregate of boiler capacity employed is 18,000 horse power on the standard rating of 30 pounds of steam per horse power. With such efficiency as should be expected from the engines installed, this represents an effective total of about 24,000 horse power.

The most interesting point of this plant will be the use of oil as a fuel. From the time the crude petroleum is emptied from the railroad tank cars into the World's Fair storage tanks, at the extreme southeast corner of the grounds, this oil becomes part of the power plant, the pressure upon the delivery pipe being automatically controlled by the steam pressure in the boilers. Delivery to boilers is made by pipes laid underground from the storage tanks to the boiler house, and the oil introduced into the furnace through an atomized jet.

A point of exceeding interest in the engine and dynamo room will be the very large adaptation of dynamos to Corliss and medium speed types of engines in direct connected combinations. The largest of these will be a set of vertical triple expansion engines with two connected armatures. At 160 pounds steam pressure this single unit will give most economically 1,200 horse power, with a capacity for continued service of 1,500 horse power output.

Next to the universal distribution of electric power for all points of the ground, the most marked advance of the time is the application of electricity to the transportation service of the Exposition. This service will be by a three mile double track elevated railroad, following all the precedents and best practices in block signalling systems, power brakes and all other safeguards of the modern steam railroad used in exclusively passenger traffic. The entire operation will be, however, by electric power drawn from an independent power plant of more than the aggregate capacity installed at the Paris Exposition. In this power house will be found the latest examples of the large range of direct driven power generators, five in number and aggregating 3,500 H. P. capacity.

To those who have not had an opportunity of informing themselves of the part that electricity is expected to play at the Exposition, these figures will be interesting and will indicate to all how much greater by comparison with preceding Expositions the Columbian Exposition is bound to be.

The sensational reports telegraphed from New York that many of the prominent electrical firms in that State had decided to abandon the space allotted to them and make no exhibit, were found on inquiry to be based on the fact that three small concerns had gone out for reasons that were personal to them. Every foot of space in the great building has been taken and every electrical concern of any consequence in the world will be fully represented.

The active work of preparing for the exhibits has been going forward for some weeks and many of the electrical firms have made substantial progress in the erection of their booths.

The intellectual programme under the auspices of the World's Columbian Auxiliary promises to be of remarkable interest. As you know, Prof. Elisha Gray is at the head of the electrical branch and he now has assurance that the gathering of electricians from all parts of the world will be a grand one.

Respectfully submitted.
B. E. SUNNY, Chairman.

At the conclusion of the reading of the report, the meeting adjourned until 2 o'clock.

AFTERNOON SESSION.

The President called the meeting to order at 2:30 P. M. The first business of the session was the reading of the paper on "Relation of Insurance to Electric Lighting and Power," by Mr. William Brophy. At the close of the discussion on this paper, Col. Meyer announced that President Scullin of the Union Depot Railroad would provide special cars for such of the delegates as desired to visit the power station of the company in the evening. The paper by Mr. R. H. Sterling was then read, on "Some Experiences with the Alternating System." After which the Convention adjourned until Wednesday morning.

Wednesday, March 1, 1893.

MORNING SESSION.

President Ayer called the meeting to order and announced the first business to be the paper by Prof. George Forbes, of England, on "Thermal Storage for Central Stations," which was discussed at considerable length during the morning session, after which the meeting adjourned until 2 P. M.

AFTERNOON SESSION.

After Mr. Charles S. Bradley, of Rochester, N. Y., read to the Convention his paper upon the subject of "Long Distance Transmission of Power," the President stated that there were three papers on this particular subject, one by Mr. Bradley, one by Dr. Louis Bell, and one by L. B. Stillwell. The subject was treated by the three gentlemen from three different standpoints and could most profitably be discussed after listening to all of them.

The next paper on the programme was that by Dr. Louis Bell, entitled "Power Transmission for Central Stations," which was followed by Mr. L. B. Stillwell, of Pittsburg, who read his paper, "Under What Conditions is the Use of Water Power Economical?" After the discussion of these papers the President then laid before the Convention an invitation from the Seigel Gas Fixture Company to visit their establishment at 219 N. Broadway and inspect their stock of gas and electric lighting fixtures, and also an invitation from Mr. Henry Sylvester to inspect at 113 Chestnut street a model of a special type of underground subway which in the opinion of Mr. Sylvester might be of interest to some of the members and which he would be happy to exhibit. Also a communication from the Columbian Underground Electric Traction Company inviting the Convention to inspect a new street-railway system, underground conduit. Also an invitation from the St. Louis Car Company to examine a new model president's car constructed by it for the New Orleans street-railway system, costing about $9,000, and at the same time offering the use of carriages to convey such of the members as signified a desire to examine the car mentioned.

The Convention then adjourned until 10 A. M. Thursday, March 2, 1893.

Thursday, March 2, 1893.

MORNING SESSION.

The Convention was called to order at 10 A. M. by the President, who announced first that any of the members of the Association who might desire to visit any of the theatres of the city of St. Louis this evening would be provided with tickets for that purpose upon application to the Secretary; and second, that the first order of business of the day would be the reading of a paper by Mr. W. H. Brown, of New York, upon "Underground Conduits and Conductors." Mr. Brown not being present in person, the President called upon Mr. William Hammer to read Mr. Brown's paper for him.

Mr. William Hammer, in response to the request of the President, then advanced to the platform and read to the Convention Mr. W. H. Brown's paper, entitled "Underground Conduits and Conductors, and the Experiences of the Electric Lighting Companies of New York City." This was followed by a lengthy discussion by Messrs. DeCamp, Francisco, Moore and others. The next paper on the programme was "The Incandescent Lamp from a Commercial Standpoint," by Calvert Townley.

Mr. Townley on introducing this paper said: "Before beginning to read the subject matter of this paper I want to ask your indulgence to one thing. In listening to papers at gatherings similar to this one, I myself have found it impossible, wherever there was any considerable amount of mathematical formula presented in the paper, to follow the formula while the paper was being read. In preparing this paper which I am about to read to you I obtained some results which appeared to me rather remarkable, and which I do not feel justified in presenting to the Association without giving a certain amount of mathematics to show that they are correct. It has therefore been necessary to insert in the paper a number of mathematical formulæ which are more or less of a complicated nature, and in order to make the intelligence of the paper continuous I shall have to read them, but as the paper is printed those who care to do so can consider such formulæ at their leisure afterwards."

The paper on "The Incandescent Lamp from a Commercial Standpoint" was then read by its author, Mr. Calvert Townley, after which a recess was declared until 2 o'clock.

AFTERNOON SESSION.

Vice-President Armstrong called the meeting to order. The first business was the reading of the paper of Mr. H. C. Meyers on "The Vulcanizing Process for the Preservation and Strengthening of Poles, Cross Arms, Ties, etc.," after which the paper of Mr. E. A. Armstrong on the "Morals of Corporations" was read.

The discussion on the paper of Mr. Calvert Townley, on "The Incandescent Lamp from a Commercial Standpoint," which was read at the morning session, and discussion on which was postponed until the afternoon session, was then taken up.

A rather general discussion was participated in on the relations of the supply companies to central station men which was incidentally introduced. Prof. Weston gave a description of the successive stages through which the incandescent lamp has passed as regards the production of the carbon and guarding against the rapid destruction of the lamp.

The general discussion concerning the supply companies was participated in by Dr. Bell, A. J. DeCamp, T. C. Smith, J. J. Burleigh and W. S. Howell.

The question was referred to the Committee on Relation Between Manufacturing and Central Station Companies.

Mr. Armstrong offered the following resolution:

Resolved, That the sincere thanks of this Association are due and are hereby tendered to the citizens of St. Louis, the Electric Club, the Electrical Exchange, the Bell Telephone Company and the city press for their very full reports, as well as to many others, for the very elaborate courtesies they have extended to us, which have rendered our stay here so exceedingly pleasant. We have discovered that the kind proffer of His Honor the Mayor in his welcoming address has been liberally realized. St. Louis and all that she has is ours.

The resolution was unanimously adopted.

Mr. Armstrong also offered the following:

Resolved, That we extend as an Association and individually our thanks to our esteemed President, James I. Ayer, for the ability and courtesy with which he has discharged the responsible official duties of his position. As individuals we want put on record the fact that from our experience here in St. Louis at this Convention we have learned that his affability is perfectly generated, is of the highest efficiency, the lines are innumerable and are all overground, the current is sent out without a drop or flash, and on these lines there is no switchboard, throw-out, cut-off or arrester; and against its power no amount of trouble has been able to act as an insulator.

The resolution was unanimously adopted.

President Ayer responded to the resolution and expressed himself as pleased to know that the delegates had been so well provided for; and said that he in turn was indebted to the citizens of St. Louis for the earnest efforts they had put forth on this occasion.

He thanked the gentlemen for the attention they had given to the meetings of the Association.

At this point the regular sessions closed, and the meeting went into executive session.

An interesting feature at this time was the passage through Tenth street of the vehicles used in the service of the Municipal Electric Light and Power Company of Missouri, of which Mr. Ayer is general manager. The procession consisted of the superintendent's light wagon, pole wagon, dynamo wagons for the handling of heavy machinery, linemen's wagons, trimmers' carts, inspectors' carts, line repairers' carts, metermen's carts, and one or two other kinds of carts, the whole aggregating about eighty. The company serves a territory of upwards of sixty square miles in St. Louis and East St. Louis, and finds these vehicles necessary in the conduct of its business.

In the executive session the Secretary's report was read, which showed the Association to be in a most healthy financial condition.

There were thirty one new active members gained during the year, and the total membership of all classes is now 250.

Nikola Tesla and James I. Ayer were elected as honorary members of the Association.

A hearty invitation was given to the Association by Dr. E. C. Kilbourne, of Seattle, Wash., for the Association to meet there next year. The invitation was most cordial, and went to the extent to state that the expenses of every one in attendance at the meeting would be paid by the citizens of Seattle.

The following were elected the officers of the Association for the ensuing year:

President, E. A. Armstrong, Camden, N. J.
First Vice-President, M. J. Francisco, Rutland, Vt.
Second Vice-President, C. H. Wilmerding, Chicago, Ill.
Secretary, George F. Porter, New York.
Members of the Executive Committee:
J. A. Seeley, New York.
E. F. Peck, Brooklyn.
A. J. DeCamp, Philadelphia.
W. A. Morrison, Woodstock, Conn.
H. J. Smith, New York.
C. H. Blaxter, Pittsburg.

The place for holding the next meeting was referred to the Executive Committee.

The Convention then adjourned.

Wrought versus Cast Iron for Field Magnet Frames.

BY A. D. ADAMS.*

The modern bi-polar dynamo may be broadly divided into two essential parts, the field magnet and the armature.

The office of this armature is to conduct magnetism through its core, and cut or cross this magnetism by means of its windings or inductors.

The office of the field magnet is to conduct magnetism from one side of the armature to the other, and usually to carry the field coils.

It is entirely possible to draw a current from an armature when revolved within an exciting coil, even though it have no field magnet to complete the magnetic circuit.

One objection to such an arrangement would be the excessive amounts of copper and energy required in the exciting coil for a given effect, as the lines of magnetism would have to pass through the air in order to complete the magnetic circuit from one side of the armature to the other.

The great advantage of the combination of the armature and field magnet over the above arrangement lies in the fact that the field magnet forms a magnetic path of much less resistance than the air.

The same reasoning that leads to the completion of the magnetic circuit through the field magnet seems to indicate that the best metal for this purpose is that having the greatest magnetic carrying capacity and permeability per unit of area and cost.

The aim in this paper is to point out some of the advantages of wrought iron over cast iron for the field magnet frames of bi polar dynamos.

The researches of Prof. Ewing and Dr. Hopkinson show that the same magnetizing force per unit of length, as measured in ampere turns, which produces in good hammered scrap iron a magnetization of 100,000 lines per square inch, produces in good gray cast iron only about 42,000 lines per square inch, and these values are about as high as we can go in either of these metals and get anything like a proportionate increase in magnetism for increase in magnetizing force.

If, then, the same number of ampere turns are to be used for a given length of magnetic circuit, cast iron must be about two and a half times the section of wrought iron.

Since the field magnet, to have the same magnetic carrying capacity at the same permeability must have about two and a half times the section when made of cast as when made of wrought iron, the weight of cast iron for the same type and capacity of machine will be about two and a half times that of wrought.

In order to compare the relative amounts of copper required in field magnet windings for machines of the same capacity, but with different metals in the field magnet, the same wattage or exciting current must be assumed for all types.

Take two machines of the same type and capacity, with the same length and section of air gap between the armature core and pole pieces, and let one field magnet be made of wrought and the other of cast iron throughout, each having the field magnet core circular in section and the area of the cast iron core two and one-half times that of wrought.

Since the ampere turns required on each magnet are equal, also the watts expended in winding, there will be the same number of turns of wire on the cast iron as on the wrought iron field.

As the two field cores are circular in section and one two and a half times the area of the other, the length of wire required around the cast iron will be to that around the wrought iron core as $\sqrt{2\frac{1}{2}} : 1$.

Since the weight of copper required to transmit a given amount of electric energy at a given pressure and loss varies as the square of the distance, the weight of copper on the cast iron will be to the weight of copper on the wrought iron core as $(\sqrt{2\frac{1}{2}})^2 : 1^2 = 2\frac{1}{2} : 1$.

The general practice among American manufacturers of bi-polar dynamos and motors is to use either cast iron entirely or cast iron yokes and pole pieces and wrought iron cores.

In the latter case the sections of the cast iron parts are usually made only about one and a half times that of the wrought iron.

With these proportions between the wrought and cast iron either an excessive amount of magnetizing force must be expended to drive the magnetism through the pole pieces and yokes, or else the wrought iron core must be only saturated to a very low degree.

The amount of copper or field current must be in either case considerably increased above that required when the cast and wrought iron parts have their correct relative proportions.

Magnetic leakage is considerably increased by the use of cast iron, as compared with wrought iron, by reason of the greater surface of the cast iron, also the much higher relative degree of saturation at which it is frequently used.

It is evident from the above that the weight of iron and of copper for the field magnet and winding in a machine of given capacity are both more than twice as great when cast as when wrought iron is used entirely.

When the field magnet is made partly of cast and partly of wrought iron, the increase of iron and copper is not so great and varies with the relative section of the cast and wrought iron parts.

---

* Read before the National Electric Light Association, St. Louis, Mo., February 28 and March 1, 2, 1893.

The advantages of wrought iron over cast for the field magnets of bi-polar dynamos seem to be more generally appreciated in England than with us, as nearly all the leading makers of such machines there use forged wrought iron entirely for field magnet frames.

As the relative magnetic value of wrought and cast iron becomes more generally appreciated by dynamo builders in this country, the former will, no doubt, be much more generally adopted.

The following data of a two horse-power, 110 volt motor, designed by the writer, and having a forged wrought iron field magnet throughout, may be of interest as illustrating some of the above points:

Type of motor, bi-polar.

Type of armature, smooth core, Gramme.

Weight of motor, 250 pounds.

Speed of armature without load, 1,700 revolutions per minute.

Turns of wire on the armature, 360.

Size of wire on the armature, No. 15 B. & S. gauge.

Weight of armature wire, $3\frac{7}{10}$ pounds.

Resistance of armature, cold, $\frac{32}{100}$ ohms.

Resistance of field coil, cold, 140 ohms.

Current in field coil, $\frac{78}{100}$ ampere.

Wire in field coil, 26 pounds No. 21 B. & S. gauge.

Particular attention is called to the number of indicators on the armature of this machine, namely 360, which is very small when its weight and the moderate speed at which it runs are taken into consideration.

It is very evident that these results could not have been obtained had cast iron been used, either wholly or in part, for the field magnet.

It may be pointed out that the weight of wire and the energy required for field excitation might have been considerably reduced had it been thought best to reduce the length of the air gap, but it was desired that the field exciting force should practically overcome the tendency of the armature to distort the magnetic field in the air gap, which result has been obtained by the above construction, so that no change of lead, with the brushes, is necessary when the load of motor is varied from nothing to its full capacity.

Relation of Insurance to Electric Lighting and Power.

BY. WM. BROPHY.†

Is has been my good fortune to be in a position to witness the early attempts to introduce the electric light, and the attitude of the insurance companies and their agents as well as State and local boards.

To say that they received this new form of illuminant with unmistakable manifestations of welcome would not be in exact accordance with the truth.

Insurance companies have paid dearly in the past for the mistakes of those engaged in the introduction of all modern forms of artificial illumination and many forms of heating.

But in spite of their evident hostility, the electric light made slow but steady progress in the good graces of the public, and while looked upon as being capable of doing more than its share to reduce dividends on insurance stocks, yet it has gained somewhat in favor with them.

The insurance inspector instead of assuming a knowledge which he did not possess, for the sake of increasing his own importance in the eyes of those who employed him, kept in touch with those whose daily experience enabled them to detect any inherent weakness in the devices and systems of transmission, and enabled him to assist in perfecting the same by advocating all improvements that increased the safety and did not impair the efficiency of the system. In this way the standard of safety has been raised to a degree that approaches perfection.

In this way fire losses caused by electric current decreased, notwithstanding the enormous increase of electric light, power and railway business, and the fears of the insurance companies were in a great measure allayed. In marked contrast with this mode of procedure is that of certain insurance inspectors and others who are now engaged in an attempt to undo all that has been done to bring about an era of good feeling between these two great interests and enable them to work together harmoniously.

This attempt at mischief-making is all the more reprehensible owing to the progress that has been made toward harmonious relations at a meeting of your representatives and those high in the councils of insurance associations. With the exception of one or two of those present at that meeting, all expressed themselves in the most friendly terms toward those engaged in the electric business, and desired to cultivate this feeling of friendship.

The real fact in the case is that millions of insurance has been placed by the agents and brokers on property that is far more hazardous than the very poorest electric light plant in the business portion of the city, and in view of the fact that it is now proposed to add a small charge to the rate of insurance where electric lights "are installed in compliance with board rules and specifications," and a charge of 25 cents where they do not meet with the approval of the insurance inspector, I would advise you to proceed with as much care as though the building in which you are installing wires and fixtures was your own and you had no insurance on it. Do not rely on the uncertain movements of the insurance inspector. You are the one whose business will suffer from the bad effects of fires caused by defective wiring.

Do not place a station in some old abandoned building, as an increase of rates will follow. Do not set your machinery down on the ground and build a tinder box around it, for besides assuring high rates of insurance it does not speak well for the business sagacity of the owner.

Proceed as though you proposed to do a legitimate business and for all time. Build your station on solid foundation, the walls of brick or stone, not over two stories high.

Take every possible precaution known, and you need have no fears of acts of unneighborly conduct or apparent neglect of your property by the ever active insurance agents. Instead of waiting for you to seek them out and beseech them to insure it, they will be as attentive to you as the most ardent young suitor ever was to his lady-love. Remember that so-called tariff rates and agreements, that hold insurance associations together for the purpose of maintaining high rates, are but ropes of sand, and that keen weapon, active and oftentimes bitter competition, is continually cutting it up in little pieces and letting this craft, that should be rightly named "Trust," drift on the hostile shore of independent action.

Some Experiences with the Alternating System.

BY R. H. STERLING.*

To those who adopted the alternating system in the early days I need not recall the feelings with which we looked on this long-distance transmission of energy for incandescent lighting. It was such a gigantic stride—such a radical departure from previous methods of incandescent lighting—that many who had experimented for the benefit of parent companies before were a little cautious about nursing this new infant up to the state of practical manhood. Especially were we so when so much was said and written by the opposition side and by others who claimed to be non-partisan. However, our company, among the first, did install a large alternating plant—the largest, I believe, at the time in the United States. How wise we were in doing so I will answer by pointing to the enormous growth and success from the start of alternating current lighting, and its finally being fostered by those who were at first its bitterest enemies.

A few minor details in apparatus did not just meet the requirements for practical use; but our parent company has always been willing to adopt the suggestions of its users and remedy defects discovered by them—a plan, by the way, which should be followed by all who manufacture apparatus—for the central station men are those who are best able to judge its merits and criticise it from all sides.

I will begin with the switchboard. A circuit board is eminently better made of marble, as a matter of both safety, durability and appearance, and should have plenty of space between it and the wall. The dynamo bus wires should run in horizontal rows on the back, with plug holes extending through to the front, to connect to either side of the changing switch. There is a changing switch, of course, for each feeder or circuit, and all bus wires can be connected to any particular feeder. The front of the board should be divided into perpendicular panels, each panel representing a feeder.

On the back there will be the converter for voltmeter, compensating devices, etc., and the fuse blocks. These are preferably placed on the back, as it is an unpleasant thing to have a fuse blow in a man's face, and they should not be so high on the board that they cannot be reached standing on the floor. Many of you, undoubtedly, have had trouble with a fuse arcing, and finally melting the fuse block into a conglomerate mass, or setting fire to the switchboard. There are two simple remedies for overcoming this: one is to have all fuses covered with a piece of asbestos paper rolled around the fuse wire or link in the form of a tube, a little larger on the inside diameter than the wire, to allow for radiation of heat, so that the fuse will not melt under its rated capacity. These asbestos tubes are very easily made, and can be pasted either with shellac or silicate of soda, which is preferable, the idea being that when a fuse is blown the pent-up gases in the tube are forced out at either end so violently that the resulting arc is dissipated immediately.

Another simple plan to prevent arcing is to have all fuse blocks placed on a narrow shelf, with their faces up, as there is always a tendency in an arc to take an upward direction owing to the current of heated air resulting from it, and in taking this direction there is a natural pulling away of the arc from the two metallic portions of the fuse block, whereas were it in a perpendicular position with the current usually coming in at the bottom of the block, this upward tendency of the arc only completes the path across the gap, and so continues arcing. Fuse wire as now made is quite reliable as to its carrying capacity, but, like many other good things, is not trustworthy if abused. A lead fuse, either wire or flat link, should never be screwed down under a screw head and washer, no matter how small the carrying capacity it is intended for. This may do for a short time, but the soft metal soon loosens up, a poor contact is formed and the fuse melts from the heat thus generated, causing no end of annoyance. This applies to fuses, no matter where they are used, all over the circuit. The one way out of this is a small flat copper terminal, slotted to slide under the screw head, and soldered to each end of the fuse wire. We now compel all wiring contractors to use a copper terminal fuse, and we ourselves replace all blown-out ones with this style; but with seventy-five thousand lights connected up, we do not see our way clear to weeding out the old fuses just at present; so let this be a warning to those young in the business.

On the front of the switchboard we have for each section or panel a volt and ampere meter for every feeder, one over the other, and surmounting these a pilot lamp run from the converter supplying the voltmeter, whose primary should be tapped on the feeder wire above the fuse block, so that should a fuse go out quietly, as is generally the case when fuses are arranged in the manner I have mentioned, the attendant's attention will be called to the fact by the extinguishing of the pilot lamp. The changing switch, generally placed on the front of the board for each feeder, should be about breast high, so as to be easily reached to make a quick throw. I say usually placed on the front of the board, as it is only recently that a new switch has come out that has its jaws and contacts so arranged that it can be placed on the rear of the panel, with the lever extending through a slot to the front of the board. Placing the switches horizontally will lessen greatly the continuance of this arc on the same principle that I have mentioned the placing of fuse blocks on the switchboard with their faces up, and a fibre or slate partition between the jaws will prevent the arc short-circuiting the dynamo. It is due to inductive discharge from converters and line, and is similar to the extra current or field discharge of a dynamo. Its occurrence depends largely upon the period in the wave phase at which the circuit is opened, and is proportional to the length of the circuit and the number of converters connected on the line. I have found this discharge to occur more frequently on circuits whose converters were partially loaded. This would naturally seem to be the result when the secondary coils of the converters were exerting no action on the primary, but I have had the most severe arcing on circuits with heavy loads. The damaging result of these arcs, however, has been entirely diminished since placing the switches horizontally, as I have described. I have spoken only of the feeder ammeters. There should, of course, be an ampere meter for each dynamo. These are preferably placed together in a group at one end of the board, so that at a glance the attendant can see what load he is carrying, or on what dynamo there remains room for more feeders as the load comes on or goes off. The regulators and rheostats can be placed at the base of the switchboard, or much better, if there is room, in a compact row out in front of the board about four feet on a strong framing of wood or iron, so that all the voltmeters can be watched at the same time that the adjusting of the pressure is taking place. This saves the annoyance of the attendant jumping from the rheostat out to the front to catch a glimpse of the voltmeters to see how near he has come to guessing at the right amount of resistance he should have thrown in or out. The result will be far better service if the rheostats are thus arranged.

---

† Abstract of paper read before the National Electric Light Association held at St. Louis, Mo., February 28 and March 1, 2, 1893.

* Abstract of Paper read before the National Electric Light Association at its Sixteenth Convention, St. Louis, Mo., February 28 and March 1, 2, 1893.

This now brings us up to the remaining feature of the switchboard—the lightning arrester. There may, however, be a lightning arrester on each side of every feeder, placed in a row at the top of the board or on the wall back of it, and a heavy copper wire running along past this row and connected to each arrester with a tap wire, and the main wire leading to a good ground in as straight a path and with as few crooks and turns as possible, as every bend offers a source of self-induction detrimental to the flow of the lightning discharge. The source of ground cannot be too perfect; have several of them radiating off to different points, so should one fail the other may be relied upon. The lightning arrester itself should be an instrument devoid of fuses, be capable of rupturing instantly the arc formed, and still remain set for a second discharge; should be free from all moving parts, not absorb energy, and should be so reliable and substantial that they could be set up anywhere on the line and forgotten and still perform their duty. A very convenient method I have found to make a reliable earth connection for arresters out on the lines, is to dig a hole at the foot of the pole about two feet in diameter, three feet deep and driving down through it a twelve foot length of one and a quarter inch galvanized iron pipe, having on the lower end a driven-well point to allow it to be driven easily, and a cap screwed on the upper end to prevent the sledge hammer splitting the pipe. The No. 6 wire can be more thoroughly soldered to the pipe before it is sunk. The upper end should be driven to about one foot below the surface, and the hole filled in with finely broken coke, which increases the conducting surface at that part of the earth that is the dryest, and the lower end of a twelve foot pipe will usually be in moist earth, and can be relied on to furnish a good connection at all times

As alternating stations increase in size and larger units of dynamos are adopted—which is certainly a wise step towards economy—another class of appliances are required at the switchboard; namely, devices for independently regulating the state of pressure on any particular feeder, the dynamo pressure remaining the same. The necessity of this can readily be seen, for we will have, say, on the same dynamo, when it is of large capacity, several feeders of different loads; those carrying the greatest number of amperes requiring a higher electromotive force to overcome the drop on line, so that if this required pressure all came from one source these feeders of lighter load would be receiving too much potential, and a large lamp breakage would be the result. Therefore, the potential of the dynamo is regulated for the lighter feeders, and pressure raisers or "boosters" used to bring up the potential still higher for the remaining feeders. The principle of these regulators is this: If we take a converter whose capacity equals the maximum load of the circuit and connect the secondary in series with one side of the feeder, and the primary across the two sides, we are then adding the fifty volts of the secondary of the converter to the 1,000 volts of the line, raising its initial pressure five per cent. Adding a number of these in series in like manner and having a suitable switch to throw them in or out in succession, makes a very convenient means of raising the voltage.

Reactive or choking coils may be employed instead of "boosters," with the same end in view —i. e., the proper adjustment of pressure on feeders of unequal drop supplied from one source —only in their use they will be placed on the lighter feeders and the dynamo be made to raise the electromotive force for those having the heavier load.

A serious annoyance is often met with on the line from the inductive effect of two parallel circuits upon each other, causing the lights to waver or "pump," which better expresses it.

We seldom find this effect in small stations unless the feeders are parallel to each other for a considerable distance. It is most marked in circuits that are parallel and one of them carrying a heavy load, which exerts this inductive influence on neighboring lines on the same principle as the primary coil of a converter inducing currents in the secondary parallel to it; only in the case of this action on the lines where each line is fed from a separate dynamo, their phases, of course, not corresponding, we have in this cross-induction a very unsteady action in the current. Annoying as this trouble is, it is one of the easiest to remedy. First, see if some combination on the switchboard will not bring about a change in affairs. Ascertain if the several lines on which this trouble is noticed cannot be all run on the same dynamo; but if this should cause this induction to appear on other circuits formerly free from it, the then remaining way is to transpose the circuits midway between the starting point and where they cease to run parallel, by inserting a break arm in each side of the line, and joining in the shape of a cross the four ends thus formed. This will neutralize and break up the trouble completely.

These topics I have touched on in my paper have been chosen as those most interesting and worthy of discussion, and with the hope that they will be of benefit to some of you, and call to mind other experiences I have not mentioned, which, if given freely before a body of this nature, will help bring about the results we are all striving for—good service and dividends.

Thermal Storage for Central Stations.

BY PROF. GEO. FORBES.†

When asked to give you a paper on some electric lighting subject, it seemed to me that I could not choose a better one than Thermal Storage for Central Stations, which has had so much attention directed to it lately in England. It has long been evident that storage of some kind might lead to great economy in central station work. The reason of this is that the demand for light has in most cities a maximum for only two or three hours of the day. Not only do we require to have plant lying idle all the rest of the day, but the expense of working for those few hours is increased by its temporary character. This loss of economy has occurred both in engines and boilers. Underloaded engines are very inefficient and use up a lot of coal. This defect is, however, got over in all important central stations by having at least a few engines of small power to carry the day load. We are thus able to have engines in use always working their most economical load, that is near full load. The other loss in economy comes from the boilers which have to be fired up and heated only for a few hours' work, and then banked or else allowed to cool down. This loss cannot be overcome by working the ordinary plant in any special manner. At the Kensington Station in London, where the engines are always working at an economical load, 5 lbs. of coal are used per electrical horse-power per hour, whereas in tests of twenty six hours' duration, made on the same plant with all the boilers doing full work, only 3½ lbs. of coal were required for the same duty. If, then, we could have storage of any kind by which power is absorbed at times of light load and given off at times of heavy load, we should save 1½ lbs. of coal per horse-power per hour.

Some have thought that the use of storage batteries would overcome this trouble. It does so, but at an enormous capital expenditure in storage batteries, with a loss of 20 per cent. in the energy given to the batteries and with a depreciation account which no one would put at a less figure than 12 per cent. per annum.

I have previously proposed that in a hilly country the boilers and engines should be working all the twenty-four hours at the rate of the average demand, and that they should be used to pump water through a pipe to a high reservoir at least 500 feet above the pumping station. At the lower end of the pipe turbines are placed driving dynamos. During the daytime the reservoir is being filled, and in the evening it is being emptied. This procures a saving in boilers and the substitution of cheap turbines and a small number of efficient pumping engines for a large number of less efficient engines to drive dynamos. It also reduces the coal consumption from 5 lbs. to 3 lbs. per horse power per hour. In a paper read last year before the British Association for the Advancement of Science, I showed that this plan could easily be adopted at Edinburgh, in Scotland, the saving in capital and annual expenses being both very large.

But it is not every city that has these advantages, and I wish now to introduce to your notice the excellent scheme which has been invented by Mr. Dewitt Halpin, of England.

He proposes to put up boilers only of the average capacity and to work them day and night. At times of light load the steam is carried through pipes into large iron reservoirs of cheap construction, and is used to heat up the water in these reservoirs to a high temperature and pressure. When the heavy demand comes on in the evening, steam is drawn from these reservoirs. The losses of heat from radiation from the reservoirs can be made very small indeed with proper lagging, in fact quite imperceptible.

This is the general scheme of Mr. Halpin's plan. But it has two advantages which are not so apparent at first sight. One is the purity of water supplied to the boilers. Mr. Halpin's pumps feed water into the hot reservoirs when impurities are precipitated in a place where they can do no harm. The boilers, on the other hand, are fed from this pure water in the reservoirs.

The other incidental advantage of the system is that priming in the boiler does not cause any inconvenience, as the steam is all supplied to the engines from the reservoirs. Now it has been found from the experience with the water-tube boilers which are so much used in this country, that only three pounds of coal per hour can be burned per square foot of heating surface, on account of excessive priming, instead of the six pounds per square foot which we can use with the Cornish or Lancashire boilers, and which might be used with water tube boilers if priming were no objection. Thus it appears that the adoption of Mr. Halpin's system not only reduces the number of boilers that we require, but also doubles the capacity of each boiler.

Mr. Halpin has worked out the relative cost of supplying machinery to the central stations of Berlin (1) without any storage, (2) with storage batteries and (3) with thermal storage. He first selected this station because the output at each hour of the day all through the year was published before any other central station had published similar data. In this system there are four central stations, giving off about ten thousand electrical horse-power.

The load at different times of the day is such as to lead to the following data:

Maximum load	7,500 kilowatts.
Mean load	2,030 "
Excess of max. above mean	3,080 "
Duration of ditto	7.5 hours.

Now Mr. Halpin claims that he can replace 22 boilers for working in the ordinary way by 5 boilers and 92 of his storage cylinders, which are cheap to construct and have necessarily a small depreciation. His claims, which I must admit seem to be quite well founded, are that while laying out somewhat more capital on his plan he gets a very large return from the extra capital spent.

I consider that in these days, when we are learning to realize the importance of cutting down working expenses in central stations, this system must necessarily occupy an important place. But it is of peculiar interest to me, owing to its applicability to a kind of work to which I have devoted a large part of my time in the last seven or eight years. I refer to the burning of the house refuse and garbage in our cities.

Taking the ordinary house refuse consisting of ashes, coal, wood, paper, old boots, vegetables, bones and scraps, crockery, tin-cans, iron pots, bottles, and adding thereto occasionally dead cats and dogs, infected mattresses and condemned meat, I can throw the whole of these without sorting upon the furnaces, and without producing any offensive odor or dust I can raise the temperature of the gases where they reach the boilers to over 2,000 degrees Fahrenheit. From my data as to the amount collected in different houses in England per head of the population, I find that from the house refuse of any town I can supply enough steam to generate electric light at the rate of one 16 candle power lamp per head of the population for two hours every night of the year. By doing this I am saving the municipality from $10.000 to $20,000 per annum per 100,000 inhabitants for the cost of removal of house refuse. I am preventing these objectionable materials from being dumped in the outskirts of the city, where building operations will soon commence, or in the neighboring harbors or lakes, either of which plans is a nuisance and unhealthy. The only resulting material is a clinker, which can be broken up and which when mixed with cement makes admirable concrete or artificial stone for paving, while by itself it makes excellent foundations for roads.

---

† Abstract of paper read before the National Electric Light Association held at St. Louis, Mo., February 28 and March 1, 2, 1893.

Now these enormous advantages, of the truth of which we have ample proof from a practice extending over nearly twenty years in England, can be worked at full economy only when the burning of refuse is quite continuous and uniform. To do this we must have storage of some kind. In hilly countries the plan I have advocated of water storage is generally available and is very economical. In all other cases thermal storage is far and away the most economical mode of working, and in this line alone, if in no other. I have always said from the first moment I knew of Mr. Halpin's invention that we have here the last item which was wanting in order to do away with the barbarous methods generally adopted for getting rid of house refuse, and at the same time utilizing the refuse in a manner that will confer material benefits on all the inhabitants of a great town, and pecuniary advantages on those who undertake the work.

DISCUSSION.

Dr. Bell—I think we are fully alive to the importance of testing this kind of storage work to which Prof. Forbes has called our attention. In our country it seems to me that his plan of storing water power is one that can be worked successfully, quite aside from the matter of thermal storage. There are certain parts of our country where coal is very dear, and where everything in the way of power that can be saved should be saved. There are places that are so situated as regards topography that the water storage scheme could, I believe, be successfully worked.

As to the thermal storage itself, I hardly feel competent to speak in extenso. I will simply say that it seems to present a very important possibility; and I can heartily add that I most cordially agree with Prof. Forbes in the great value of working out a commercial system for the destruction of garbage.

Mr. De Camp—Up to what temperature does the water in these reservoirs rise ?

Prof. Forbes—The highest temperature is about 407 degrees; it runs from about 350 to 407. I think that corresponds to the variation between 120 pounds pressure and 250.

Mr. De Camp—When the time of maximum use of power arrives, does Mr. Halpin put the hot water that is in these reservoirs back into his boiler for generating steam of sufficient pressure to run his engines?

Prof. Forbes—No, sir; the steam in the reservoir under normal conditions, we will say, is under 250 pounds pressure, and as he gradually takes off the steam in the reservoir to reduce the pressure, the water, of course, begins to boil, and gives off still more steam, so that he always has a supply of steam until the pressure in the reservoir has been reduced down to the working pressure of the engines. When he gets below that, of course, he has exhausted his steam, and has to put in more power from his boilers.

Mr. Haines—I would like to ask Prof. Forbes to give us a comparison of the efficiency of storage of water—raising water to a height—and the efficiency of the storage of steam in his cylinders, which would be of interest to many of us.

Prof. Forbes—The gentleman has asked me for a comparison of the relative efficiency or cost of the system of the storage of water which I had myself proposed, and that of thermal storage which Mr. Halpin has proposed. The running expense is almost the same in the two; but the economy of capital, if your reservoir is anywhere near your pumping station, is very much in favor of the water storage. The water storage takes off about 20 per cent. from the cost of a central station built upon the ordinary lines.

Mr. Hammer—I heard a lecture that Prof. Forbes delivered in London, on the subject of the "Utilization of Rubbish in Producing Power." I would like to know what were the results of the experiments in London. Also, will he please state if a central station will use five pounds of coal per horse power hour, what the amount of rubbish is compared with coal to produce the same power ?

Prof. Forbes—We have reduced the quantity down to about five or six pounds of refuse to be equivalent to one pound of coal; therefore, in answer to Mr. Hammer's question it would take about thirty pounds of house refuse to equal five pounds of coal.

Mr. T. C. Smith—I would say to the members of the Association that a very common and familiar example of much the same process that Prof. Forbes has outlined can be seen in the boiler and engines commonly used for hoisting purposes. Take a small five horse power boiler, with pretty large storage capacity, and they will use that and drive an engine which will develop from twenty to thirty horse power. The fire is kept going at the same steady rate all day long, and in the intervals of the hoisting, when the load is being lowered, the pressure will rise to one hundred and twenty pounds. When the hoisting is being actually done the pressure will drop back to one hundred or down to eighty pounds. Then the engine is at rest for a while, but the boiler keeps on making steam and storing it. In this way we are enabled to do with a small boiler work that is far beyond its capacity.

Prof. Forbes—I am obliged to Mr. Smith for his excellent remarks on this point. They are most appropriate. He has spoken about the hoists being practically worked on the same lines. I may mention that water storage, which I have also advocated, has been used similarly for hoists and for hydraulic accumulators by Lord Armstrong, very largely indeed.

Mr. Wirt—The fireless steam locomotive is also another example in point. We had these engines in service in Chicago for many years, during which they did good service, and were finally replaced by the cable line. These locomotives were of the ordinary type, but had larger steam boilers than usual. The boilers had no furnaces and were charged at one end with hot water under high pressure from an ordinary stationary steam boiler. The locomotive ran a round trip of six or eight miles perhaps, and pulled very heavy cars and heavy loads, giving regular and satisfactory service, winter and summer.

Mr. Stillwell—I want to say a few words in regard to the saving being effected at an early or late step in the process of transforming the potential energy of coal into light or power for sale. It seems to me that we should bring out the fact that a great deal depends upon the relative length of these steps. The central station man who is paying for energy in the form of coal and selling it in the form of light is losing various amounts at each step of the process, but up to the present time he is losing far more before it gets to the dynamo than he is after it leaves the dynamo.

Mr. Smith—We have come to the conclusion that it would not pay to have storage batteries in a large building for the purpose of getting rid of night running. We have come to the conclusion that it will cost you as much to get your light from your battery, and you will burn the same amount of coal, for the reason that you at once lose twenty per cent. of your energy in the battery.

The Incandescent Lamp from a Commercial Standpoint.

BY CALVERT TOWNLEY.†

All modern commercial forms of electric incandescent lemps in this country are similar in that each produces light by heating to incandescence a hard carbon burner of comparatively high resistance, enclosed in a glass receiver from which the oxygen has been largely exhausted. We know that after a time a burner so heated gradually depreciates, either by disintegration, oxidation, or some other cause, and is finally destroyed. We know that of two similar burners that raised to the higher temperature will require less energy per unit of light produced, but that its depreciation will also be more rapid and its destruction take place sooner. Consequently, in determining the temperature at which a carbon should be burned to secure the best economy, we are influenced to use a high temperature on account of the first condition, and a low temperature on account of the second condition.

There may be said to be other causes, due to differences in the design and construction of various lamps, which will affect the length of the lives of their burners, but it seems fair to assume that, by the employment of proper methods, these causes may be eliminated in so far as they hasten depreciation in one carbon more than in another, and therefore, in discussing the relation between the life and efficiency of different lamps, we may consider simply the characteristics of their burners.

For convenience in discussion, we may divide the commercial lamp burners into three classes, viz.:

1st. The untreated or natural burners used in the Edison lamps.

2d. The treated or flashed burners used in the Sawyer-Man, Thomson-Houston, Beacon, and a number of other lamps.

3d. What we may call the super-treated burners used in the new Westinghouse stopper lamps.

In all published tests of the life of burners there is shown to be a definite relation existing between the life of a carbon and the temperature at which it is burned, this relation remaining fixed for carbons of the same kind and varying only for carbons of different kinds. If we formulate this relation, it will assist us to determine what temperature of any kind of carbon may be expected to yield the best commercial results; that is to say, how much money it is desirable to spend on the maintenance of the carbon, and how much on the energy to heat it. The temperature of a burner is difficult of measurement. It will, therefore, be simpler, and quite as satisfactory, if we consider the relation between life and energy consumed, expressing the latter in watts.

By a series of experiments extending over several years and covering tests of many thousand lamps, Mr. Frank Stuart Smith has found the relation between the life and efficiency of the Sawyer-Man carbons, and through his courtesy I am permitted to give you the results. The relation is expressed by the curve A, illustrated herewith in Plate I, where the axis of Y represents hours life, and the axis of X watts per each candle of light produced. As this relation is confirmed by so many tests made at different times, upon lamps of different efficiencies, and under the care of different assistants, there can be no reasonable doubt as to its correctness. From a limited number of experiments made on many other lamps having treated carbons, it is indicated, as might be expected, that the relation between the lives and efficiencies of their burrers follow the same general law. Therefore, if we assume that these lamps are constructed with the same detailed attention to design and manufacture, we may then also assume that their curves will not vary materially from that of the Sawyer-Man carbon.

The exact mathematical expression corresponding to this curve is somewhat complicated, but as we are considering the question from a purely commercial standpoint, we may consider the curve between commercial limits, in which case we can express the relation within one-half of one per cent. by the formula—

$$L_{,}=3.742\,E_{,}^{5.78} \qquad (1)$$

where L represents hours life and E watts per candle.

During the past year many tests have been made by Mr. Smith with the super-treated carbons of the Westinghouse stopper lamps, and the relation between life and efficiency thereby found to exist is illustrated by another curve shown B, Plate I. With the same degree of accuracy as above, we may represent this curve between commercial limits by the equation—

$$L_{,,}=5\ 44\,E_{,,}^{5.684} \qquad (2)$$

We note that this curve corresponds very closely in its general form to the curve of the treated burners, except that for a given efficiency the life of the super-treated burner is always longer. This is as it should be inasmuch as the super-treated burner is, in fact, a treated burner which has been subjected to an additional process to render it more stable.

BOSTON:
W. S. KEY, - Room 84, 620 Atlantic Avenue.

ELECTRICITY IS PUBLISHED ON WEDNESDAY OF EACH WEEK

Our columns are open for the discussion of any question in which the interests of the Electrical Industry are at stake. News notes, descriptions of new devices with drawings or photographs, are at all times desired.

SUBSCRIPTION RATES:

UNITED STATES, - - - - -	$2.50
IN CLUBS OF FIVE OR MORE, - - - -	$2.00
FOREIGN COUNTRIES, - - - - - -	$4.50

ADVERTISING RATES:
As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be eadily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not ater than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

Gas vs. Electricity for Lighting. A suggestive article is contributed in this number by Mr. Hesse, concerning the relative efficiencies of conversion into light energy of gas and electricity, which points to a possible economy in the production of illumination, a subject that has hitherto received but little attention in this country. The figures submitted in this article show that while 14 per cent. of the total energy of gas may be obtained in producing mechanical power, the same amount of gas will give a much lower efficiency when transformed into light energy.

On the other hand we find the conversion of electric energy into light involves but a small loss of energy, from which it follows that the production of light from gas may be accomplished with greater economy by the use of a gas engine and dynamo than by burning the gas direct.

There is no doubt that the slow progress that until lately has marked the development of the gas engine in this country has been a potent cause for the neglect of this branch of the lighting question, and the inefficiency of this class of engines has doubtless been sufficient to discourage experiments in this direction. But recently the gas engine has attained an efficiency and reliability that warrant a trial of this method, he economy of which is too apparent to be gnored.

OUR Table of Contents will be found on the last page of this issue.

"Electricity," under its present ownership, has never solicited the advertising patronage of the General Electric Company.

THE ELECTRIC TRUST COULD NOT SURVIVE AN IMPARTIAL AND FAITHFUL INVESTIGATION BY A CONGRESSIONAL COMMITTEE. WHAT CAN YOU DO TO BRING THIS INVESTIGATION ABOUT?

* * *

"You may dam up the waters of agitation, but if their source remains, you are but preparing in the future for a great disaster."

* * *

The St. Louis Convention. The Sixteenth Convention of the National Electric Light Association, held during the past week at St. Louis, was a notable one as regards the number and importance of papers read and discussed, and more than kept pace with the steady improvement which has marked the progress of its career. The report of the proceedings, presented in this issue as fully as space will permit, shows the practical character of the subjects discussed, and the large attendance and increase of membership point to the benefits derived from these meetings by central station men. A number of changes were found necessary in the programme as originally planned, owing to the general interest taken in the papers, which manifested itself in the extent of the discussions which followed.

The supply men were well represented, but, with few exceptions, attended the regular sessions while omitting the exhibition of electrical goods which in former years constituted a feature of these conventions. The papers read excited discussion to such an extent that the time allotted to the sessions was found to be too brief to transact some of the routine business which has usually been brought before the meeting, and the consideration of such was necessarily relegated to various committees for adjustment.

The lecture, with experiments, given by Mr. Nikola Tesla on Wednesday evening, proved a most welcome innovation judging from the extent of the audience which it attracted. These experiments, which corresponded closely to those performed at his celebrated London lecture on "Alternate Currents of High Potential and High Frequency," were generally novel to his audience and elicited their closest attention and hearty applause.

The association is to be congratulated upon the success of its latest meeting and its growing usefulness to the central station industry.

* * *

Central Station Power Transmission. The growing importance of this branch of central station work and the increasing demand for power services called forth several papers and considerable discussion at the St. Louis Convention of the National Electric Light Association. To the central station manager the production of an alternating current motor of any desired capacity capable of operating on the ordinary incandescent light circuit would prove a means of providing a day load for the stations, thus enabling them to run at or near the full capacity of their machinery during the greater part of the twenty-four hours' run. Besides the added income from such a source, there would result an additional saving due to the increased efficiency of the plant in operating under a practically constant load.

The experience of those who have attempted to build this class of motors, however, is far from encouraging, and to-day the prospect of transmission of any considerable power by means of the ordinary alternate current generator of the usual frequency appears highly improbable of immediate solution.

Of course there are plants in successful operation employing synchronous motors, but these are adapted only to a comparatively constant load, and being non-starting require special devices to bring the armature up to a speed at which it will fall in step with the generator. Before attaining this speed no torque is developed by these motors, which involves starting them without load, but after coming into synchronism with the generators they will run satisfactorily within certain limits of change of load.

The direct current system, which at high potentials offers some advantages over the alternating system in the matter of regulation, has been advocated by many of the leading men in the profession, and several instances of its use at as high as 5,000 and 6,000 volts have been cited. The practicability of this plan where but a small current is transmitted is unquestioned, but conservative engineers are not yet ready to endorse the plan when a large amount of current is to be carried, and no one has been radical enough to introduce such a system on any extensive scale.

The most promising solution of this question in its present stage is the multiphase system, which, while adding some complications to the machinery and the construction of the lines, permits the use of a motor which will start under full load, regulate with tolerable accuracy and does not require expert attendance. This system comes nearest to fulfilling the requirement of general distribution of power over long distances to various distributing points. Although either of these systems may be efficiently employed in the case of transmission between two points of a small power, the opinions expressed at the Convention seemed practically unanimous that an alternating current motor for use on existing circuits is not a present probability.

* * *

Power Storage. One of the most interesting papers read at the St. Louis Convention was that on Thermal Storage by Prof. Geo. Forbes, printed elsewhere, describing a simple though apparently efficient method by means of which the boilers can be run constantly at a stated capacity, and the excess of power generated during the periods of light load stored in the form of water at high temperature and pressure. Incidental to this, the question of utilizing the refuse of a city for fuel was also treated in the paper.

The lack of suitable provision for the storage of power in central stations during the time of light load has the effect of reducing the efficiency of the plants at these periods, as well as necessitating the installation of considerably more machinery than would be necessary if the total daily output of the station were distributed evenly throughout the day. This fact has long been recognized by central station engineers, and the demand for some means of power storage has been constantly increasing.

In Europe the storage battery has been quite extensively employed for this purpose, and were it not for certain difficulties which its use presents would prove the most direct method of power storage.

The testimony of the station managers who have operated with storage batteries as to the saving in operating expenses is often very contradictory, some claiming their use to be a marked economy while others have found it an additional expense. The type of batteries used in different cases will no doubt account to some extent for this difference of opinion.

In the United States practically nothing has been done with storage batteries in this capacity owing largely to the patent complications which have resulted in continuous litigation since the introduction of accumulators here. At present however, the tendency is in the direction of the Planté type of grids which aside from the patent question, in which they are not involved, have been found the most serviceable type. The limited use for these cells of a capacity necessary for station work has not called forth efforts on the part of the American manufacturers to produce them, and for this reason we are considerably behind European manufacturers in this line of work.

The necessity for storage in some manner is too thoroughly felt by central station men to allow the subject to drop, and the invention of Mr. Halpin, as outlined by Prof. Forbes, opens a new line for experiment in this direction. It is specially applicable to the plan for utilizing refuse, and the economy of these schemes taken together if successful should warrant the expense of a trial.

* * *

The Papers. The papers read at the St. Louis Convention this year, while not of a technical character, were of an exceedingly practical nature and treated of topics which will be of practical interest to all central station men.

Wishing to give our readers the text of these papers as complete as possible, we have given those published this week at considerable length, which makes it impossible to include the entire programme in this issue. The papers of Dr. Bell, Mr. Stillwell and Mr. Bradley on the Transmission of Power, and Mr. Brown's sketch of the subway work in New York City, and those of Mr. Armstrong and Mr. Myers, which complete the entire list, will appear in next week's issue.

* * *

THE staff of ELECTRICITY at St. Louis included scores of friends who are not on our salary list.

"THE object of this Association shall be to foster and protect the interests of those engaged in the commercial production of electricity for conversion into light, heat or power."—*Constitution of the National Electric Light Association, Article 2.*

* * *

THIS is the slogan. No man should buy one dollar's worth of supplies from the Trust which can be purchased elsewhere. Independent concerns should be aided in every practical way, and there is no more practical way than this.

* * *

ARGUMENTS as to the intentions of the General Electric Company should be left to babes and sucklings. Business men should rather consider the most efficient method of thwarting these intentions.

* * *

ELECTRICITY is eminently satisfied with its reception at St. Louis. Modesty forbids further comment.

* * *

THE demoralization or lack of organization of the representatives of the Westinghouse interest at the Convention was conspicuous. This, of course, might be construed as highly creditable to the Westinghouse management. But we hold that as long as the General Electric Company see fit to send a delegation of lobbyists to these Conventions, all independent interests should get together and work in entire harmony.

* * *

WHEN the war is over and peace is finally declared, ELECTRICITY will be the most urbane paper in the field. It will continue to be, as it is now, the best read paper.

* * *

MR. B. E. SUNNY spent only one day at the Convention, and in that day he made more of an impression on the course of events than many of the gentlemen who were in town three days.

* * *

WE extend to the lobby of the General Electric Company assurances of caustic consideration. Their efforts shall not pass into oblivion.

* * *

IT would have been more creditable to the General Electric Company if its delegation at St. Louis had included more men of brains and standing like Dr. Louis Bell and C. S. Bradley, and fewer lobbyists and wirepullers.

* * *

IT is perhaps cruel, though pertinent, to remind Mr. James Reliable Keene and Mr. Stephen Vehement White that General Electric has not yet touched 150.

The Trient Five-Wire System.

The City of Trient has a municipal station which is operated on the five-wire system, and in which the dynamos are driven by turbine water wheels. The station was started in April, 1890, since when it has been in successful operation. The dynamos are inside pole, direct current Siemens & Halske machines, which have a capacity of 140 amperes at 540 volts. The armature shafts are coupled direct to the turbine wheels which run at 265 revolutions per minute. The nominal capacity of the six dynamos is sufficient to supply 5,500 incandescent lamps of 16 candle power.

The machines are connected to two outside lines only and the lamps are four in series, giving 110 volts between any two adjacent wires of the system. The two lines from the station are carried to the center of distribution, at which point they connect with an automatic regulating machine and the five distributing mains are run from this regulator, whose object is to balance the loads on the four sides of the system.

The Incandescent Lamp from a Commercial Standpoint.

In 1888, Mr. John W. Howell presented a paper before this Association, in which he exhibited a curve stated to have been constructed from the results of a large number of tests made with the Edison or untreated burners. I have taken the liberty of reproducing a part of this curve in this paper, shown C, Plate I, but using a different scale of measurement. It will be noted that this curve is very similar to the curve of the treated and super-treated burners, and, considered between the same commercial limits, we can express it with equal accuracy by the formula—

$$L_{,,,} = 1.052\ E_{,,,}^{6 \cdot 453} \qquad (3)$$

$L_{,,,}$ and $E_{,,,}$ having the same significance as before. For a given efficiency, we find the corresponding life of any class of carbon by tracing a perpendicular line until it intersects the proper curve, the corresponding life being found directly opposite the point of intersection horizontally. Thus for an efficiency of 2.5 watts we find the life of the untreated burner to be 400 hours, of the treated burner 713 hours, and of the super-treated burner 962 hours.

It is important to remember that these curves represent the results of laboratory tests, in which the electromotive force is kept more nearly constant than is ordinarily possible under the conditions of central station lighting. Therefore, in order to obtain an expression which will represent commercial conditions, we must introduce the element of a variable electromotive force. In Plate II, I illustrate a curve verified by numerous and exhaustive tests by Mr. Frank Stuart Smith, showing the relation between total energy consumed and the light emitted. This relation is such that a line drawn from any point of the curve O (as AO) equals the tangent of the angle made by such line with the axis of *X*. It is represented by the equation—

$$I = \frac{W^2}{\sqrt{R^2 - W^2}} \qquad (4)$$

where I equals the total illuminating power expressed in candles and W equals watts, R being a constant, which depends for its value on the size and efficiency of the lamp. R is, in fact, the radius of the circle to which our tangent is referred. While the position of this curve varies with different lamps, the relation between the watts consumed and the light emitted remains unchanged through all tests. We know that the resistance of a heated filament will remain practically constant through the comparatively small variations in voltage to which a commercial lamp is subjected. Therefore, if we let p equal the per cent. variations in electromotive force, we may write from our fundamental electrical equation $(1 + p)\,C = (1 + p)\frac{e}{r}$, whence

$$W_{,} = W(+ p)^2$$

By a combination of this equation with formula (4) we get the expression $\left(\text{since } \frac{W}{I} = E\right)$

$$E_{,} = \frac{\sqrt{E^2 + 1 - (1 + p)^4}}{(1 + p)^2}$$

where p equals per cent. variation in electromotive force due to commercial conditions. Substituting this value of E, therefore, in equation (1), we get the expression for the commercial curve of the treated filament

$$L_{,} = 3.742\ \frac{[E_{,}^2 + 1 - (1 + p)^4]^{2 \cdot 865}}{(1 + p)^{11 \cdot 46}}$$

By substituting the same value in equation (2) we get the expression for the commercial curve of the super-treated filament

$$L_{,,} = 5.44\ \frac{[E_{,,}^2 + 1 - (1 + p)^4]^{2 \cdot 842}}{(1 + p)^{11 \cdot 368}}$$

Again, by substituting in equation (3) we get the expression for the commercial curve of the untreated filament

$$L_{,,,} = 1.052\ \frac{[E_{,,,}^2 + 1 - (1 + p)^4]^{3 \cdot 226}}{(1 + p)^{12 \cdot 906}}$$

It is, of course, impossible within the limits of this paper to attempt to express all conditions; but by a comparison of laboratory and central station records a fair average assumption seems to be that, with proper attention to regulation, the commercial variation is equivalent to a constant excess voltage of 3 per cent. I have taken this as a basis, and constructed commercial curves for the treated, the super-treated and untreated filaments, which are shown as dotted lines in Plate I, and designated as A, B and C, respectively. It now becomes possible to calculate accurately the efficiency at which any class of lamps should be burned in order that they may yield the best economy.

It is important to note the great effect that a comparatively small rise in electromotive force has on the life of a lamp. Any neglect to maintain the best possible regulation, therefore, will result in an increased bill for lamp renewals entirely out of proportion to the variation in voltage itself.

The condition of the incandescent lighting business throughout the country is undeniably prosperous. Everywhere central station companies are wiring additional lights or preparing to increase the capacity of their machinery. We will not be far wrong, therefore, if we assume, in the consideration of our subject, that the central station company has a market for all lamp hours it can furnish during a certain portion of the day's run. With this assumption, let us formulate an expression for the profit in incandescent lighting, then we may determine what conditions will give this profit a maximum value. In the consideration of this matter I have taken as the unit of value one 16 candle lamp hour, assuming that what the public want is light, and that, other things being equal, they do not care whether much or little energy be expended to produce it. Therefore, whenever we can increase the efficiency of our lamp, we not only reduce the cost of the energy required to burn it, but also increase the lamp capacity of our station, lines, converters, etc., by a proportional amount. Owing to the fact that the various meters in use measure, not light, but energy in one form or another, when we make our unit the lamp hour and afterwards increase the efficiency of our lamp, we must also increase our charge per unit of energy in order to maintain the same standard of price. Were any unit of energy to be taken as the unit of value, the receipts from a given output would become fixed, and the best lamp at once the most inefficient and longest lived. Political economy is clear, however, that to reduce the price of any commodity increases the demand for it, and in competition with other illuminants the only proper standard can be that of illuminating power. It is nearly always possible to change existing rates whenever it is proper to do so.

With our unit of value illuminating power, therefore, our profit will obviously be the difference between the cost and selling price of a lamp hour multiplied by the number of lamp hours sold. We may, therefore, write the expression—

$$P=(v-c)\frac{S}{W}$$

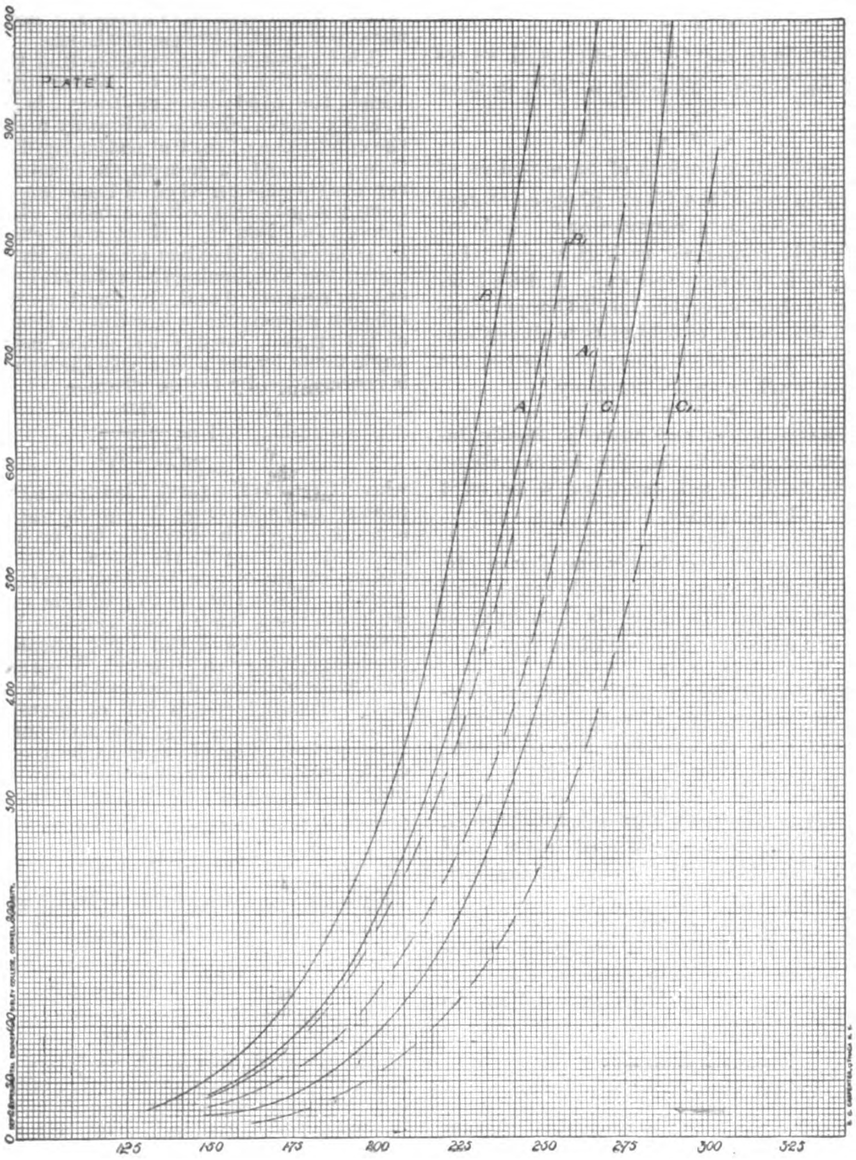
where P equals profit, V selling price, c cost of lamp hour, S output of station in watt hours for the time for which our profit is estimated, and W watts required per lamp. Again, the cost of producing one lamp hour is clearly the proportionate cost of the lamp itself plus the cost of the energy consumed by it. We may, therefore, write—

$$c=\frac{1}{L}+\frac{g}{1000}W$$

where 1 equals cost of a lamp in cents, L its life in hours, and g cost of producing one kilowatt hour of energy. Substituting in this expression, from the formula of our commercial curves, the value of lamp life in terms of efficiency (bearing in mind that for a 16 candle power lamp $E=\frac{W}{16}$), and putting our expression for the value of c in place of c in the formula representing our profit, we have the equation—

$$P=\frac{VS}{W}-\frac{S1\,(1-p)^{2b}}{Wa\left[\frac{W^2-256-256(1+p)^4}{256}\right]^{\frac{b}{2}}}-\frac{Sg}{1000}$$

where a and b stand, respectively, for the coefficients and exponents of the second terms formulæ (1), (2) and (3).



The Incandescent Lamp from a Commercial Standpoint.

	A	B	C	D	E	F	G	H	K
v	.005			.0075			.01		
g	5	3	2	5	3	2	8	6	2

Curves similarly lettered are constructed with similar values of g and v, the differences in their position and form being caused partially by the different costs of the lamps and partially by the differing relations between the lives and efficiencies of the several classes of carbons.

I illustrate in Plate III a number of curves constructed for the untreated, the treated and the super-treated filaments, using this formula. I have taken the original cost of the lamps at, respectively, 35, 50 and 20 cents, the selling price of a lamp hour at, respectively, .5, .75 and 1 cent, and the cost of producing current at, respectively, 2, 3, 5 and 8 cents per kilowatt hour. By the courtesy of a considerable number of central station managers, who have furnished data concerning their respective plants, the average cost of this energy appears to vary between 3 and 7 cents. The only cases where 7 cents is exceeded are those in which fuel is a very expensive commodity and the station output is small. Where 3 cents is too high a very cheap fuel is used and a very large station operated. In assuming these values, I believe that we have covered as nearly as possible the conditions which actually exist, but it is quite easy to adapt our expression to any set of local conditions.

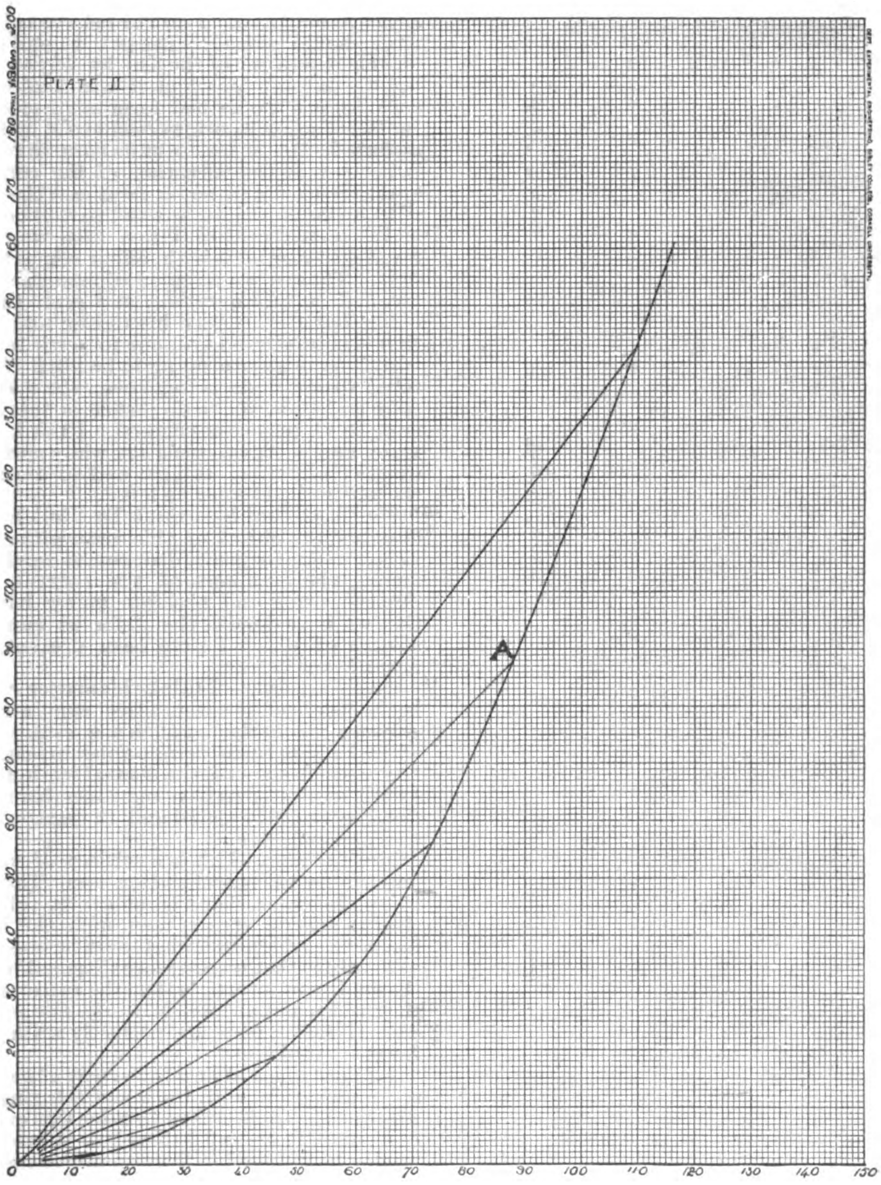
In Plate III you will note that the (Y) axis represents cents and the (X) axis watts per lamp; the station output estimated upon being the unit of one kilowatt hour. The highest points of our several curves represent the conditions under which our profits are a maximum, and the vertical distances between these highest points and any other points on the same curves show the loss in profit due to the use of a lamp of other efficiency than the most economical. The vertical distances between the highest point of any curve of one class of lamp and the highest point of a corresponding curve of another class of lamp show the profit or loss resulting from the use of different classes of lamps at their respective best efficiencies. Other combinations will be readily noted by observation. For example, with the price of a lamp hour at one cent and the cost of generating current six cents per kilowatt hour, the best result we may expect from the treated filament lamp at 50 cents each is, with a 38 watt lamp, *i. e.*, 2.37 watts per candle, when our profit should be (see curve H) 16.6 cents per kilowatt hour. With the super-treated lamp at 20 cents, other conditions remaining the same, the best results are obtained with a 30 watt lamp and our profit should be (see curve H) 22 cents per kilowatt hour.

Considering all these curves together, two facts are especially prominent, namely: first, that although we have assumed strictly commercial conditions, the profits obtained are in excess of those actually made in practice, and, second, that the most economical lamp efficiencies are considerably higher than those of any commercial lamps now in use. It is interesting and very remarkable to note that in every case the profits fell off very rapidly for lamps of either too low or too high efficiency, the variation being more marked where current is dear and running expenses high. By putting these facts together, it is apparently clear that the long lived inefficient lamp is a very expensive article, and that too much weight has been given to the cost of lamp renewals, which shows prominently on the expense side of our ledger, while we have not paid enough attention to the great waste of energy due to low lamp efficiency. By a reference to Plate I we note that the most economical conditions call for, in the case of the untreated filaments, a life of between 250 and 525 hours; in the case of the treated filaments, a life of between 286 and 620 hours, and in the case of the super-treated filaments, a life of between 138 and 260 hours; the shorter life being in each case where both the cost and selling price of the lamp hour are high. I submit these figures for your consideration.

You will note from Plate III that with a charge of three-quarters of a cent per lamp hour and five cents for the expense of generating one kilowatt hour, the use of a 50 watt lamp loses the operating company 1.05 cents for every kilowatt hour sold when using the 35 cent lamp with the untreated burner; 1.4 cents when using the 50 cent lamp with the treated burner, and 5.2 cents when using the 20 cent lamp with the super-treated burner, as compared with the profits which might be made if these various lamps were used at their respective best efficiencies.

It is gratifying to find that the possibility of increased profits carries with it the implied possibility of reduced prices to the public, and therefore a great demand for light, and greater success to the companies furnishing same, in competition with other illuminants.

I have said nothing in this paper in regard to fall in candle power, for the reason that, in both the treated and super-treated filaments this fall is roughly proportional to the time the lamp has been burning as compared to its total life; that is to say, if a filament has a life of 1,000 hours at a given efficiency, and during that time its fall in candle power is *A* per cent., if this filament is burned at an efficiency which will make its life 500 hours, its fall in candle power will still be approximately *A* per cent., so that our commercial results are not appreciably affected. For the untreated filament the fall in candle power is proportionately larger than in the other two filaments. Therefore, if we are making a comparison of total illuminating power per energy consumed, we must put the untreated filament on a somewhat lower scale than shown in the comparisons I have drawn.



THE INCANDESCENT LAMP FROM A COMMERCIAL STANDPOINT.

DISCUSSION.

Mr. Burleigh, of Camden—To those of our members who were able to follow the formulæ of Mr. Townley's paper it must have been interesting. To me a great deal of it was lost. Of course I am not able to follow out the mathematical part of it. My only excuse in rising to speak to so formidable a paper is that I am in great difficulty just now. It is not as to which kind of carbon lamps, treated, untreated, or super-treated, but as to how I am to get any at all. To my last order the reply was: Your valued order received; owing to the shutting down of our factory we will not be able to fill it. If Mr. Townley or any other gentleman could tell me whether I should be justified in entering into a long time contract for lamps, or whether I am to hope to get a lamp to obtain which I shall not have to enter into such a contract, I should be obliged. Mr. Townley refers in his paper to a certain lamp. I would like to ask him if we may expect such a lamp soon, and if it will be generally supplied to those wanting to use it, or if there will be such contracts as are imposed by the other people who manufacture lamps?

Mr. Townley—I suppose the gentleman refers to the stopper lamp. If so, I can say that they are being made and supplied every day.

Mr. T. C. Smith—I have been identified with the association for a long while, and I think there are members here who know that I have been one of those who have always declared for the central station man as against every other element in the Association. I was one of the first to urge that supply houses should only be made associate members; but I was also one of those who always strenuously urged that their representatives should have the right of the floor in the discussion, and every other privilege except voting on the official action of the Association. I did this because at the time there were a good many papers, such as Mr. Townley's, of the utmost value to the central station men. It has been urged against such papers that they are to a very large extent means of advertising. We are willing to let them go at that. They create discussion on subjects of great importance to us all.

If, as it would appear at present, there are only two companies that are going to supply lamps to central station men, we are in very poor shape. I have no axe to grind in this matter, our station being in the fortunate position of having been in business prior to July 14, 1891 (?) The General Electric Company must supply us lamps. They have been very nice about it, with this unfortunate distinction, that because we are in a town in which there is a local Edison Company we are compelled to buy Edison lamps. I do not want to tread on anybody's toes. I am only giving my own experience, and that is, that the Edison lamp for a central station man is the poorest lamp on the market to-day. (Applause) We have gone to the General Electric Company, and said; Gentlemen, we do not use many lamps; we are in the fortunate position of not supplying many renewals to our customers; we have discouraged that, and want to get in the position of the gas companies and supply current through meter. We do, however, supply renewals to a few customers, and we do not care particularly about the price of the lamp. You tell us the Edison lamp is 35 cents. If you will furnish us Thomson-Houston lamps at 45 cents we would rather have them; or if you will furnish us Sawyer-Man, Perkins or Beacon lamps at 50 cents, we would rather have them. They answer, You cannot have these; the Edison Company has the right to sell lamps in this town, and you have got to take that lamp. That is the condition of affairs, but it does not affect us very much; but more than half the central stations have to supply their customers with lamps. They are compelled to take a lamp they do not want. The price has not been raised to any excessive point, however.

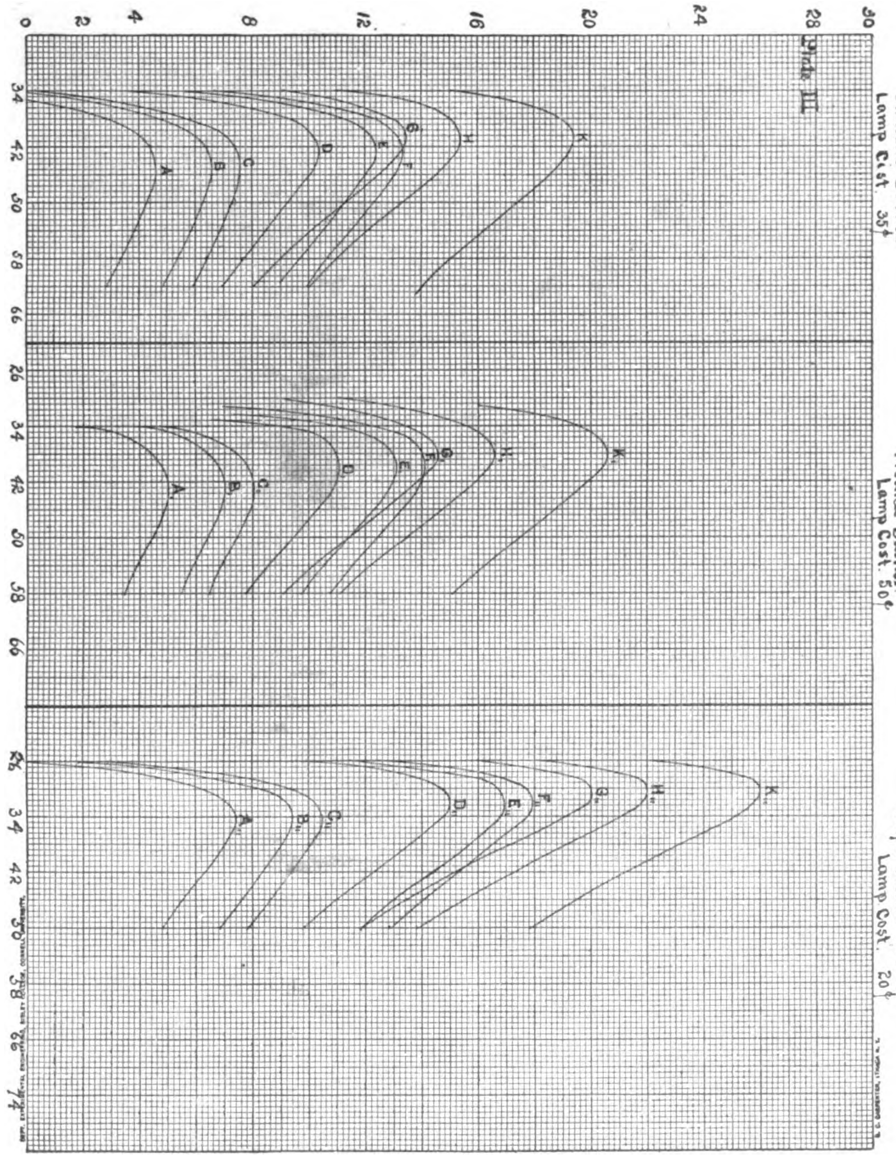
I think this Association ought certainly take some steps, either as a body or bring its members to some concert of action, to break up this state of affairs. The result of competition in any line of trade is improving. I do not think I can take any better example than the transformer. Leaving out of account the rights of the case—who was the inventor, or who had the best claim—I think no one will deny that the converters at present are not only cheaper, but are 50 per cent. better than the converters we used four or five years ago. This has come from the fact that one company would make an improvement and another company would try to beat them.

The method of dealing with the question before us is a difficult one to outline. I would say, however, that in any discussion that takes place, I hope it will be moderate in tone. There is absolutely nothing to be gained by abusing the fellows on top. They are there. The law has given them the right, no matter what are the equities of the case. What the judges thought of the equities of the case their decision shows; but, unfortunately, the parties in question have the legal right to do this thing. The statement has been made that the company having absolute control will not raise prices, and will not make any arbitrary distinctions. They do make these distinctions, in the fact that they compel you to take a particular form of lamp. The idea that any individual or corporation with absolute power in its hands will not abuse that power is too ridiculous to give consideration for a moment. You will remember that the statement was made in court by the counsel that there was no intention to shut these factories up; that they only wanted their rights to get royalties, etc. I made the inquiry of an authorized official of the General Electric Company whether other lamp manufacturers would be licensed. He told me in so many words: We propose to have this business, and we are going to get it, and you fellows will have to pay the price. Immediately after that came out the question of the Goebel lamp. The change in policy was apparent at once. The minute they get hold of that, they will be there again as strong as ever. I do not want to go into the equities case, or go over the history of it. I want to get right down to the root of the question, which is, How are the central station men going to fight this? I do not think there is a central station man who wants to swindle the General Electric Company or the Edison Company out of anything that the law gives them. They have spent a great deal of money to get this monopoly, and there is no reason why they should not be sustained in it; but I do not think that they should tie us down to using something we do not want. It seems to me that the whole equity of the case would be met if the General Electric Company did as they very plainly hinted they meant to do and as they wished the impression to go abroad, and that is, that they would license the various lamp manufacturing companies, and charge a royalty. If they do that, I will have no objection. The Edison lamp is made at 40 cents, we will say, the Thomson-Houston at 50 cents. I am perfectly willing to pay ten cents a lamp more for a lamp of any of about ten different makes. It seems to me if we could bring that state of things about we would all be satisfied. Let them decide what is a fair royalty to charge. Let them give us a chance to get what we want. Give the lamp manufacturers a chance; the moment the price is at a level that moment they will have to get the trade by improving their product instead of lowering the price. We want the best lamp and the best lamp will, of course, in the end be the cheapest.

I do not know that I can say very much as to the policy to be pursued on this question. I know what mine shall be; that I will never buy one cent's worth of material from the General Electric Company until they do that thing. (Applause.) I shall never buy one cent's worth of supplies from that company that I can possibly buy from an independent concern; and I shall do all in my power to advance the sale of any lamp which is put on the market which can be manufactured without coming under the law of infringement.

President Ayer—This topic is very interesting and properly should be discussed; but the hour is getting late, and we have considerable business to transact. I do not wish to convey the idea that I want to limit or restrict discussion. I desire, however, that gentlemen will speak briefly and to the point.

In relation to this matter I will state that we have a standing Committee on Relation of Manufacturing to Central Station Companies. That committee and our Executive Committee, I can assure the Convention, will take such steps as are necessary to bring about the results desired by the Association. These gentlemen will look after the matter, and this thing will naturally be followed up. These committees are composed of central station men only, and they are the men best calculated to carry out the objects of their appointment.



The Incandescent Lamp from a Commercial Standpoint.

Mr. Howell, of Newark—I was not surprised at all to hear the applause that greeted the statement concerning the Edison lamp. I do not wonder at all at some of the experiences with the Edison lamp, especially on stations where the regulation is anywhere from three to eighteen volts more than the normal pressure at which the lamp should be operated. I have made a specialty for the last few years of meeting complaints against the life and performances of Edison lamps. I could bring here a vast amount of data to show the reasons why people had poor results with lamps, why lamps had performed badly on their circuits; but to get down to the pith of the matter, a lamp should be operated at the voltage and candle power marked on the lamp. A 16 candle power lamp should be operated at 16 candle power; not 24. A lamp intended for 110 or 114 volts should be operated there. A lamp of 3 1-10 watts should be operated more closely than a lamp of 4 2-10 watts, for obvious reasons. It is a well established law, and one I have found to be familiar to many, that there is a great decrease of life with increase of voltage; and that law is this: three per cent. increase of pressure halves the life of lamps. That is good for all lamps. Three per cent. on a 50 volt lamp means 1 1-2 volts excess. That 1 1-2 volts excess will halve the life of the lamp. If it be a 3 1-10 watt lamp, and the average life of the lamp under proper conditions be 1,000 hours, that 3 volts excess will halve the life, or bring it down to 500 hours average life. If you are using a 3 6 10 watt lamp, whose average life may be about 1,800 or 2,000 hours at normal candle power, that 3 volts excess pressure will reduce the lamp 1,000 hours. In the case of a 4 watt lamp the average life of an Edison lamp will be about 3,000 or more hours at normal candle power. You may abuse that lamp very much. Your 3 volts excess pressure will halve the life. Increasing the pressure another 3 volts, or another 3 per cent., will bring it down again to half of that, or one-quarter the life—750 hours. That is the reason why the Beacon, Sunbeam, Perkins and some other lamps are better than the Edison lamp. They are a 4 watt or 3 6-10 watt lamp, and they will stand all kinds of abuse and give you a fair commercial life. In buying lamps you should buy lamps to suit your conditions of pressure. If you can maintain on your circuits a constant pressure with a variation of only 1 1-2 or 2 per cent. above or below normal, which is very good, you can operate a 3 1-10 watt lamp with very excellent life—about 800 hours. If you cannot maintain your regulation, or do not care to maintain your regulation, you will buy a lamp of lower economy, 3 6-10 watts. If you have commercial reasons, or reasons based on competition, and wish to run your lamps high—if you wish to buy a lamp of 16 candle power and run it at 24—if your reasons are good for doing so, and you are satisfied with the ledger balance, buy a 4 watt lamp and run it there; but remember that the life of the lamp is always halved by 3 volts excess of pressure; another 3 volts will bring it to one-quarter of what it would be if operated at the candle power for which it was intended. I have for the past year or eighteen months investigated a very limited number of complaints from Edison central station men, and in not one case have I found a fault to exist with the Edison lamps; in every case I have found the pressure too high. In every case when short life of lamps was proven, the pressure has made the life of the lamp short. In no case have I found a shipment of poor lamps from our factory in 18 months. The Edison lamp is not a poor lamp; but it is not as tough at 3 1-10 watts as it is at 3 6-10 or 4 watts. You pay your money and you take your choice.

Dr. Louis Bell—I am very loath to enter into this discussion, and it is with great hesitation that I take any hand in it whatever. Although I happen to be with a particular company, about which some remarks have been made, I first of all want to be of service to the National Electric Light Association. I do not believe this Association should be made a catspaw to pull commercial chestnuts out of the fire by anybody. It is not the purpose for which it was founded, and I consider it not only bad form but discourtesy to the Association to bring commercial matters into dispute before it, unless at its specific request. I believe it is the intention of the company in question to do, in so far as it is in the power of any corporation, justice to all parties concerned, and to protect central station men who have entered into contracts with either component part of it. There are a number of manufacturers interested in this question, and each thinks the other has transcended his rights; and the question is naturally a hard one to settle, and somebody's feelings are going to be hurt. The only thing to be done is to go over the matter carefully and endeavor to do justice as nearly as possible to all parties concerned. I think there are many men in this Association who appreciate the exact condition of things; and to them I think the matter had better be left.

Mr. T. C. Smith—I think Dr. Bell has misunderstood the object of this Association when he says it was not organized for commercial purposes among the members of the central stations. Such an utter and absolute going back on all that we have done at the different conventions, at each of which I have been present, I have never heard before.

President Ayer—I think this matter can be left in the hands of the committee appointed for the purpose of considering such a question, and who will take into consideration the grievances, the wants, or desires of the central station interest. I shall be pleased to have some member move that the discussion be closed and the matter referred to that committee.

Mr. DeCamp—This is a subject of very great importance to central station men. There is one thing, however, that I think can be relied upon, that we central station men wish the manufacturers to understand, whether it be one company or another, that we are more disposed to criticise the quality of an article than the price, and that if they will make an article worth the money the central station men are perfectly willing to pay for it. (Applause.)

I do not know of any better way of getting into communication with the manufacturing companies on this subject than to refer this question to our committee; and I therefore move that the matter be referred to the Committee on Relation of Manufacturing to Central Station Companies.

The motion was put and carried.

The New York Special.

The sun shone brightly on the morning of Sunday, February 26, as a jolly party of gentlemen, accompanied by a few ladies, crossed the North River, New York, and took their seats in the "Electric Special," consisting of baggage, dining and three drawing-room cars, that was to convey them, and those who were to augment the party, for certain 'Phillies' had promised to "join the procession" and faithfully kept their promise, as did those at Pittsburg, Altoona, Indianapolis and other points, until the augmented party had passed the century mark by just one soul. Of course, on so long a trip the creature comforts of the party were not neglected, and the capacious recesses or larders of the dining-car freely gave up some of their savoury contents to appease the appetites of those aboard; for though it was the Sabbath day, the boys did not mope away their time, but spent it in pleasant and friendly intercourse, making new acquaintances and renewing old ones.

As the shades of evening deepened into the darkness of night dinner was announced, and though all had partaken of a hearty lunch at mid-day, they were ready to do justice to the more substantial repast, which proved to be "a free dinner," tendered to the large traveling company by Mr. C. O. Baker, Jr., master of transportation, whose experience and ability as an excursion agent had enabled him to provide a luxuriantly appointed train, including even a barber's shop with a real live tonsorial artist in attendance to scrape the chins and fix the bangs and switches, at a greatly reduced rate, but enabled Mr. Baker to tender his guests a first class dinner, "all complimentary" as it was said; even the gentlemen of color who waited at table politely declining the accustomed *douceur*, their services being "all complimentary" for the nonce.

With quip and joke and many a long drawn-out yawn the time was whiled away until Vandalia was reached on Monday evening; the special's approach being announced, or rather flashed, from afar by a powerful electric headlight, which made the surrounding darkness more hideous beyond the range of its divergent rays, while within its limits every passing object and the track itself for a mile or two ahead were illuminated and stood out in weird contrast with their surroundings.

At Vandalia the reception committee of sixteen gentlemen boarded the train to welcome the Easterners to the city of St. Louis. From their arrival to the end of the journey pandemonium reigned in the "Smoker," for the most hilarious gave full vent to their pent up feelings and East and West vied one with the other in trying to kill time in the most improved fashion.

About 7:15 the "Electric" steamed into the Union Depot, St. Louis, where Mr. James I. Ayer, President of the Association, was in waiting accompanied by several members, all alike anxious to extend a hearty welcome to the visitors from afar.

A very few minutes sufficed to convey all the party to the Southern Hotel, which was the rendezvous, and in double quick time all were comfortably quartered for the week.

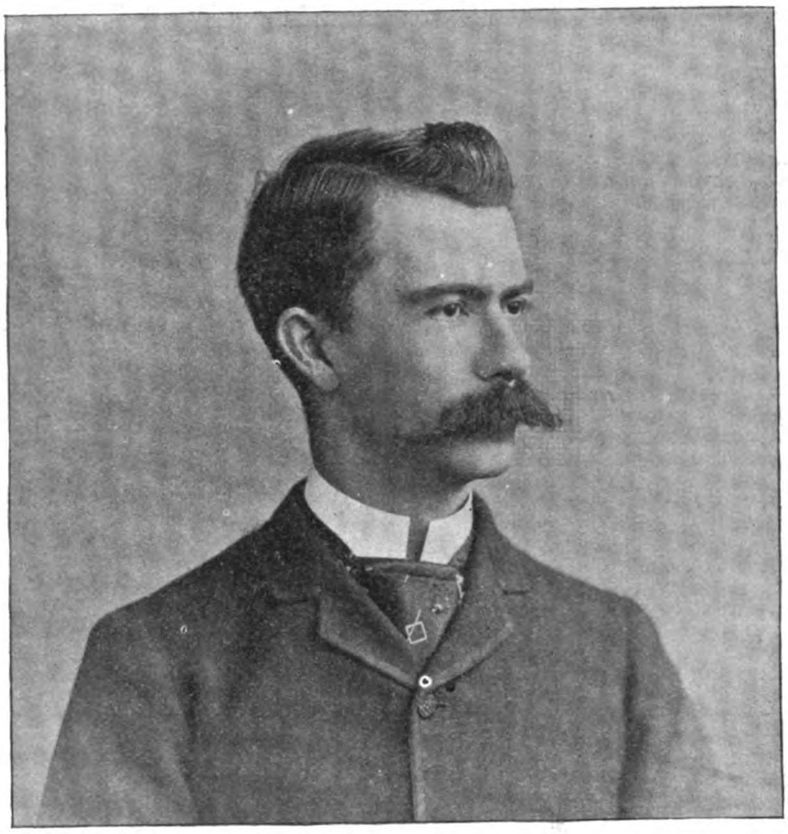
The New President.

The newly appointed President of the National Electric Light Association, whose portrait we have pleasure in presenting to our readers, is the Hon. E. A. Armstrong—Judge Armstrong—President of the Camden Lighting and Heating Company, Camden, N. J., a gentleman who has done yeoman service for the organization over which he will preside for the coming year. Judge Armstrong is so widely known and respected that we deem it unnecessary to write at length about him or in a biographical way; but he is fully entitled to have it said of him that ever since he became interested in things electrical he has evinced a growing desire to render every possible aid in the development of this great industry.

For several years past he has attended the Conventions, and by his weighty counsel in the debates as well as through the medium of the contributions he has made in the form of papers or addresses, he has convinced all of his great ability and wide learning. He has made a study of the legal aspects of the business, is well versed in the bibliolatry of the science and art, and is entitled to rank as one of the most solid and weighty men engaged in the business. He has long served on the executive council of the Association, and the members have done a gracious thing in recognizing his value by appointing him President for the coming year, a year which is expected to be fraught with interest and importance, and must of necessity mark an epoch in the history of the electrical business. During the World's Fair there will be so many responsible duties for the President to discharge that it would have been difficult, if not actually impossible, to select one in every way so splendidly equipped for so high an office as the one upon whom the honor has fallen—Hon. E. A. Armstrong.

Notes.

The brief and well presented one act drama that was performed in the chief parlors of the Southern Hotel on Thursday afternoon was, without doubt, the most pleasing, gracious and well merited act done during the entire Convention. It proved a great surprise party to the chief actor, the genial and popular favorite, Mr. C. O. Baker, Jr., who for several years has been unremitting in the discharge of his onerous duties as Master of Transportation for the National Electric Light Association. Recognizing the value of his services, always so freely and successfully given, Mr. Baker's hosts of friends determined that he should return to his beautiful home and estimable wife in Newark with a substantial token of their esteem, "chipped in" and purchased a massive and elegant silver punch bowl and ladle, having the same appropriately engraved with an inscription. About half past four on Thursday afternoon Mr. Baker was unwarily "steered" into the parlor, where were assembled a large circle of both ladies and gentlemen, who gathered round a stand on which rested a handsome case in blue plush. By a preconcerted arrangement Mr. T. C. Martin mounted a chair and in a few choice sentences presented the case and its contents to Mr. Baker, who fairly staggered under the unexpected shock it gave him, thus to be made, so unwittingly, the recipient of this handsome present. In his usual modest and blushing manner, Mr. Baker acknowledged his indebtedness to the donors; expressed the pleasure he always felt in making every one comfortable on their trips to each succeeding convention, and having received the congratulations of the crowd, an adjournment was at once made for the christening ceremony, which was performed—not with the usual liquid-water, but champagne—all alike standing in as sponsors. One of the boys remarked: "Baker, had your estimable, good lady been on hand you wouldn't have got that present." "Why?" was the reply. "Because it would have been presented to Mrs. Baker herself." Chorus: "For he's a jolly good fellow, and so say all of us."



Hon. E. A. Armstrong.

The 5,000 ladies and gentlemen who crowded the Exposition building on Wednesday evening to hear Mr. Tesla lecture, probably did not hear all he had to say; but his weird, brilliant and startling experiments more than compensated for the disappointment they all felt at being unable to hear his lucid remarks on the topic of which he is *par excellence* the acknowledged exponent and discoverer.

Mr. Tesla well deserved the plaudits of the multitude so generously accorded him, and which, in his charming manner, he so promptly acknowledged. Those who had the pleasure of grasping his hand at the reception subsequent to the lecture will long appreciate the honor of meeting with so famous a man and genius.

That was indeed a representative group of electrical genius which occupied seats on the platform during the Tesla lecture. It included some of the foremost men in the field of electrical science, there being present men of light and leading both English and American. This distinguished group consisted of Professor George Forbes, London, England, Dr. Edward Weston, Dr. Louis Bell, Messrs. John A. Seely, T. C, Martin, T. Carpenter Smith, F. A. Nichols, W. J. Hammer, James I. Ayer, C. S. Bradley, C. H. Wilmerding and G. H. Blaxter.

The Executive Committee of the Association must feel more than gratified with the present strength and staturs of the important organization they have the honor to control. Numerically and financially the Association was never so flourishing as it is to-day, and its power, influence and usefulness are destined to be greater than ever

The indefatigable secretary, Mr. George F. Porter, had a hard task in discharging all and every one of the onerous duties pertaining to his office. But he got through them just the same; and in being able to submit a financial statement showing several thousands of dollars of assets and the enrolling of no less than 31 new active members during the convention was an achievement he may well be proud of. May such good results continue to increase!

The tour of the various electric light and power stations, which was made in carriages provided by the Entertainment Committee on Tuesday evening was very much enjoyed by everyone who joined the procession and they were many. They were astonished at the splendid order everything was in and more than astonished when they had gone over the immense buildings of the Municipal Electric Lighting and Power Company, which now ranks as the foremost and largest central station in the country. Mr. James I. Ayer, the general manager, received many compliments from his visitors.

When Mr. James W. Godfrey returned from church to his room at the Auditorium on Sunday evening last, he first thought a Montana cyclone had been getting in its work on his furniture and traps. It was finally proved, however, that Mr. Dan Spruance had simply been fixing up a little object lesson, showing what the boys are going to do with the Trust before they finish with it.

Much has been written of late about the masked highwayman who rides on horseback in the streets of Chicago, holding up its citizens with impunity. In comparison with Mr. I. N. Took who pulled the leg of Brother Stump, a thoroughbred New Yorker and a newspaper man at that, the masked highwayman is a bungler in the business.

Those Present.

Gas and Electricity.

BY G. EMIL HESSE.

Electricity is a successful competitor with gas, especially with regard to power and light. Gas engines are not very extensively used in this country, but they are found almost everywhere in Sweden, Germany and England wherever power up to 100 H. P. is required. The increased efficiency of the modern gas engine is best illustrated by the fact that the first practical engine consumed 3 cubic meters gas per I. H. P. per hour, while those of modern construction only consume about 0.75 cubic meters for the same power. We find in practice that it takes about 0.85 cubic meters per actual H. P. One kilogram of gas is equal to 8,500 thermal units. The theoretical energy is therefore :

$$\frac{0.85 \times 1.251 \times 0.5 \times 8{,}500 \times 424}{75 \times 60 \times 60} = 7.095 \text{ H. P.}$$

The efficiency is consequently :

$$\frac{1}{7.095} = 0.141,$$

or a little over 14 per cent., which is very high indeed when we consider that the very best triple expansion steam engine does not give more under the most favorable conditions. Experiments with gas engines have even shown as high as 18 per cent., a figure never reached by the steam engine.

An ordinary good burner will consume 0.12 meters per 16 C. P. per hour. Utilizing the result in the equation above, we find that this is equal to :

$$\frac{7.095 \times 0.12}{0.85} = 1.001$$

theoretical horse-power hour. This gives per actual horse-power hour as consumed by the gas engine seven 16 C. P. lights, or 112 C. P.

The above figures show very clearly that there is a great loss when the energy stored in gas is changed to light, which latter is only another form of energy. This is due to the heat that is produced, which is a total loss, but there would naturally not be any light at all if not for the high temperature by which the carbon is made incandescent.

Electricity for power does not stand on an equal basis with gas, inasmuch as when used it is transmitted to some more or less distant place. The loss depends therefore on that distance, and a comparison is consequently out of the question.

Electricity for lighting, on the other hand, stands on the same ground as gas. One 16 C. P. lamp requires 50 watts. This is equal to :

$$\frac{50}{746} = 0.067 \text{ H. P.}$$

One actual horse-power will therefore give :

$$\frac{1}{0.067} = 14.92$$

sixteen candle-power lights, or 238 C. P. The difference is too great to pass over lightly. It appears from the above that one actual electric horse-power produces 238 C. P., and that gas equivalent to one actual horse-power produces 112 C. P. Allowing 90 per cent. as the efficiency of the dynamo and a 10 per cent. loss in transmission from the gas engine to the dynamo, we find that 1 H. P. as developed by the present gas engine will produce :

$$14.92 \times 0.81 = 12.08$$

sixteen candle-power lights. It is therefore evident that it is more economical to use the gas as motive power in a gas engine and driving a dynamo than to use it direct for light. The actual gain is :

$$\frac{5 \times 100}{7} = 71.42 \text{ per cent.},$$

which is really enough to set our city officials and gas companies thinking.

The Business End.

Electrical Exhibits at the Convention.

Although the exhibits at the Convention held in St. Louis last week were limited in number, in comparison with former meetings of the National Electric Light Association, they were sufficiently numerous to attract the attention of all the members present, between the intervals of the daily session. The goods on exhibition were of a character to interest not only the central station and supply men, but also the visitors not directly connected with the electrical business. Everything was arranged to attract the delegates' attention and every article was examined carefully.

The General Arc Incandescent Light Company, New York, had the most extensive and attractive exhibit of lamps at the Convention. It included nearly a score of different types of their artistic and efficient specialties. The introduction of these rare goods has created quite a demand, and many words of commendation were heard from the interested crowd which surrounded the stand the days of the Convention. Every lamp shown was a real work of art, the "Bijou," for hall lighting, being, without doubt, a petite gem, and must speedily grow into popular favor wherever good taste and artistic judgment are engaged in securing effectively brilliant results. It was nothing less than a rank injustice to this company and its fine display that through the neglect of some one sufficient current could not be secured to run the lamps in such manner as would have shown them off to the best advantage, besides attracting that full measure of attention they abundantly deserve. Mr. Augustus Noll, who had charge of this exhibit, did his best and succeeded admirably, notwithstanding the untoward incident that prevented him having all the electric current he required and had previously arranged for.

The Eureka Tempered Copper Company, North East, Pa., had an elaborate display of its specialties, including trolley wheels, commutators, dynamos, brakes, gear wheels, etc., all made of tempered copper. This display attracted a large share of attention, the goods being very popular wherever used.

The Okonite Company of New York, while not making any exhibit of their goods were as usual represented by Mr. George T. Manson, who, as every one knows, is a whole host in himself, and never fails to carry away with him from these conventions substantial and profitable evidence of the high reputation gained by the goods he handles.

The Central Electric Company, Chicago, had two able representatives in Messrs. W. H. McKi lock and C. E. Brown, who had charge of a few well-known specialties.

The Electrical Engineering and Supply Company, Syracuse, N. Y., with Mr. H. J. Gorke in charge, showed some handsome samples of switches, cut-outs, voltmeters, ammeters, etc. Two enormous central station switches attracted universal attention.

The Consolidated Electric Manufacturing Company, Boston, Mass., represented by Mr. C. E. Bibber, the live general manager, had a number of its well-known jackknife switches, push buttons, cut-outs, etc., on exhibit. Mr. Bibber also displayed diagrams of the new 60-light arc dynamo with Elkins' automatic regulator.

The Bryant Electric Company, Bridgeport, Conn., represented by Mr. W. C. Bryant, treasurer and manager, and Mr. Thos. G. Grier, Western agent, Chicago, exhibited a large, varied and most attractive display of their well-known and efficient devices. A handsome switchboard was filled with sockets, switches, cut-outs, carbon holders etc., etc. These varied devices are too well known to need any words of commendation from us ; suffice it to say that the display received close attention from all present. The handy little memo. and St. Louis guide book distributed by the Bryant Company was fully appreciated.

George Cutter, the ubiquitous one from Chicago, failed not in his efforts to have as usual an attractive display, which didn't fail to attract, for there were many novelties shown, such as shadeholders, sockets, switches, voltmeters, ammeters, snap knife switches and many other devices that are always in demand in both central stations and isolated plants. George Cutter himself was on deck as usual to welcome his innumerable old friends and to show them some fresh novelties, in which all were interested, the new type of lightning arrester in particular. Mr. Frank McMaster proved a valuable aid-de-camp to Mr. Cutter, and was unremitting in his endeavors to adorn every visitor by affixing a diminutive monkey built of chenille and supporting a Chinese lantern at the end of a fishing pole in its right hand.

The Fibrone Terreloid Company, Newark, N. J., distributed among their friends some very handy paper weights, made of highly finished fibrone, a substance which this company is manufacturing into nearly every conceivable electrical device which hitherto has been made of hard rubber, which fibrone closely resembles. The unique paper weights will find a place on many a desk, and fibrone goods will grow in demand in the electrical field.

The Chapman Valve Company, Boston, was represented by Mr. Buss, their Chicago manager, who had on exhibit three samples of their high grade valves, which are in use all over the world. For electric light and power stations these valves are in ever increasing demand and the company's factory at Indian Orchard, Mass., which is the largest valve factory in the world, is kept running night and day to fill orders.

The Ansonia Electric Company, of Chicago, had quite a display of its special lines of goods, including the Wirt Meter, which had many careful and curious examiners.

The Eddy Electric Company, Windsor, Conn., represented as always by the Messrs. M. E. Baird and A. D. Newton, had a complete working equipment consisting of a dynamo and 15 H. P. four pole motor of their well-known and efficient type which were kept running for the benefit of visitors. In connection with this installation a number of rheostats of a special type were shown in operation.

Chas. A. Schieren & Company, New York, exhibited an unusually large perforated leather belt, the largest of its kind ever made. It was 117 feet long, 72 inches wide, three-ply, and weighing 2 458 pounds. It was made to order for driving a Westinghouse dynamo of 1,000 H. P. at the World's Fair. As may be imagined, such a belt excited the attention of all the central station men present.

The Standard Electric Company had a number of their direct current arc lamps on exhibition in the main hall of the Southern Hotel.

The Washburn & Moen Manufacturing Company, Worcester, Mass., had samples of the famous Salamander wire on exhibition.

The Falconer Manufacturing Company, of Boston, placed their porcelain sockets and switches on exhibition in the main rotunda of the hotel. The display also included a full line of incandescent light supplies.

The Ward Arc Lamp Company hung several of their arc lamps in an exhibit room to the left of the hall ; connection was made with the incandescent circuit which showed the lamps in practical operation.

The Electric Appliance Company, of Chicago, presented a very neat advertising novelty in the shape of a celluloid toothpick of various colors with their name and business stamped in gold.

The Cutter Electric Manufacturing Company, Philadelphia, represented by Mr. H. B. Cutter, made an attractive display which included a large variety of handsome electric switches, cutouts, push buttons and electric locks. These latter devices are attracting unusual attention and rapidly coming into general demand. They are attachable to house, office, store and closet doors of every kind, the act of opening the doors, shutting off the lights in building or room, and turning on light or lights on opening any door. As a burglar alarm it is quite unique, for on being attached to a window the slightest attempt at opening said window turns on the light and so spoils the attempt. By a special contrivance and the aid of two keys light can be turned on and off at will by the one who carries both keys, while no one can tamper with either lock or electric switch. This company is meeting with splendid success with its many useful and ingenious devices. The Cutter electric locks are to be placed on every closet door in the new Netherlands Hotel, New York ; Insane Asylum, King's Park, N. J., and other public buildings, including the Metropolitan Life Building, corner of Twenty-third street and Madison avenue, New York.

The Weston Electrical Instrument Company, Newark, N. J., had a handsome display of its high grade standard measuring and other instruments, including station meters, voltmeters, ammeters and separate parts of instruments, arranged on a handsome showboard. During the Convention there was a constant stream of visitors to Room 70, where this attractive exhibit was shown. Mr. R. C. Heinrich making every visitor welcome to examine the brilliant exhibit.

The Carpenter Enamel Rheostat Company, Bridgeport, Conn., showed several samples of its now well-known instrument, which is meeting with well-deserved recognition.

The Fort Wayne Electric Company, Fort Wayne, Ind., had several arc lamps of the Woods type on exhibit, the improved features in which were carefully noted by and duly explained to those interested in arc lighting.

The Falls Rivet and Machine Company, Cuyahoga Falls, Ohio, showed a model of a friction clutch of their well-known type. These clutches are deservedly popular, being in use in most of the central stations throughout the country, and being of the simplest, most approved and efficient type.

The Electric Selector and Signal Company, of New York, had one of the most extensive and complete exhibits at the Convention. It embraced a complete working installation of their unique system of controlling arc and incandescent lights whether singly or in groups along the same single circuit. By the use of this apparatus any lamp or lamps can be started up or shut off at any pre-arranged moment, from the central station, thus securing for the company supplying current, or the users of same, the most punctual and reliable service, and ensuring the strictest economy in the consumption of current. Disputes as to quantity of current, or hours used, become impossible, and the same efficient service is secured on motor circuits as on lighting circuits. This system recommends itself to every user of electricity and is destined to play an important part in the future of the electrical business everywhere.

James J. Murray & Company, Philadelphia, had a full line of their well-known specialties, including glass globes, shades, reflectors, etc., etc., for use in electric service, wrought into many quaint and artistic forms. The arc and incandescent globes made by this firm are well known, their rich tints and artistic forms being known everywhere, hence the big demand that always prevails.

The Interior Conduit and Insulation Company exhibited several Lindell motors operating fans and driving miniature incandescent dynamos which were supplying current to a group of eight lamps.

Mr. James A. Pentz, of Philadelphia, showed one of the Pentz-Reckenzaun electric meters about which the electrical fraternity is soon likely to hear something that will be decidedly interesting and profitable. Arrangements were made to have this apparatus in actual operation, but through some misunderstanding connection with the only available line circuit could not be made until the close of the Convention. Suffice it to say that this instrument is so delicately adjusted that it will correctly measure current to the 1-40th of an ampere, and is in every detail a useful adjunct where electricity is used. It has been subjected to the most trying tests, and the Board of Trade in London, Eng., is so satisfied with its performance that it is to be adopted for general use by that important corporation.

Alexander, Barney & Chapin, of New York, represented by Mr. H. G. Issertel, displayed lamp sockets, push buttons and a general line of lamps and fixtures.

The Gould Packing Company, East Cambridge, Mass., makers of the only "original ring" steam and water packing, showed a pyramid of various sizes in its well-known specialty which is in universal demand throughout the electrical field as well as the engineering trades. This packing has proved itself superior to anything else of its kind on the market, hence the big demand which keeps the company shipping it to all parts of the world. Its wearing capacity is such that where it has once been used no other kind ever gets a show.

The W.S. Hill Electric Company, of Boston, Mass., had an extensive and attractive display which came in for no small amount of attention, and from which much fun and amusement were derived. These consisted of single and double pole switches, three pole single throw and double throw station switches with fuse—one being a massive 200 ampere double pole double throw station switch—all handsomely finished and on slate bases. There were also shown three of the wonderfully powerful and handsomely finished "Columbian" generators, which created quite a cyclone of fun among both the ladies, gentlemen and young folk who visited the ladies' parlors where the exhibit was shown. These diminutive machines are without doubt the greatest electrical novelties recently put on the market, which fact accounts for the phenomenal demand which has sprung up both among the juvenile part of the community and the medical profession by which it is now largely used in the treatment of rheumatism, sciatica, lumbago, neuralgia and other nervous complaints.

Mr. C. C. Lewis, Boston, Mass., showed a sample of his new "Acme" rubber shield for protecting motormen on electric cars from receiving shocks through the handle by means of which they turn the current on and off, as well as being a preventive of blood poisoning through the hands being in constant contact with the brass handles, which has and is playing havoc among street-car men. The shield fits the handles very tightly and is a sure and certain safeguard. Costing but a few cents each, the demand is becoming enormous, and ere long every car in the country will be equipped with this handy and efficient safeguard.

The Shultz Belting Company, St. Louis, which does such a phenomenal business with the electrical fraternity throughout the country, and indeed in Europe as well, did not show any specialty, but was well represented by Mr. J. A. J. Shultz, the general president of the company, and Mr. A. B. Laurence, Eastern agent, who was one of the party that travelled from New York per electrical special train. They assisted in making everyone enjoy the visit to St. Louis, and booked some good orders.

The Jewell Belting Company, Hartford, Conn., without having a single foot of leather belting on exhibit, were most ably represented by jolly C. E. Newton, who made everybody feel good by presenting them with a handsome and useful morocco portmonnaie in which to carry greenbacks, each of these little auxiliaries actually enclosing as a gift a spic and span flim-flam fac-simile of a $100 bill—"green goods." They were as welcome and useful as if genuine—that is, the portmonnaie.

The De Mott Motor Company, New York, showed samples of its efficient fan motor, which were run by bluestone batteries, both motors and batteries being of the most compact and neat design possible. These motors have proved their high efficiency and popularity, and are sure to secure a large sale for ventilating purposes when the hot weather gets around. Being highly finished in every detail, most compactly built and possessing the following salient features—noiseless, efficient and economical—they promptly recommend themselves. They are made in four sizes to meet the requirements of varied service, and combining the highest workmanship with cheapness in price, they are sure to become general favorites. The display at the Convention was carefully examined and approved by all who saw it.

The Blakeslee Manufacturing Company, of Da Quoin, Ill., was represented by Mr. A. H. Blakeslee, who has charge of the St. Louis branch. He distributed some beautifully designed cards and circulars.

Wm. Jessup & Sons, the great steel manufacturers of Sheffield, England, whose goods are employed largely in the manufacture of fine tools, were well represented by Mr. Ezra H. Lundley, a gentleman well known in St. Louis and to many of the delegates to the Convention.

C. W. Hunt Company, of New York, the well-known manufacturers of the Hunt system of Industrial Railways, distributed circulars which clearly demonstrated that coal and other materials can be more economically and quickly handled by their system than in any other manner.

The Ahendroth & Root Manufacturing Company, of New York, had a representative on hand, and some elegantly prepared catalogues which were eagerly sought after by the central station delegates present. Incidentally it may be stated that the Root boiler has been adopted by many electric light and power stations East and West.

James Leffel & Company of Springfield, Ohio, distributed a souvenir of worth and value, on the subject of water wheels for electric light and power stations. The popularity of the Leffel Wheel has long been an assured fact.

Messrs A. Wyckoff & Sons of Elmira, New York, were usefully represented at the Convention by catalogues and circulars, setting forth the merits of the Wood Water Pipe and Patent Steam Pipe Casing, the latter being an excellent non-conductor of heat, and the former being known for its economy in first cost, durability and other important features for the purpose designed.

The Manufacturers' Advertising Bureau and Press Agency, through its proprietor, Mr. Benjamin R. Western, a veteran in newspaper work and advertising, did most efficient work on behalf of its clients in furnishing information to the members of the press for publication.

There were some very novel advertising schemes sprung on the visitors to the Convention, several of them being particularly attractive and useful. Mr. Louis Cassier, of *Cassier's Magazine*, reminded his many friends that he was around by presenting them with a series of epigrammatic advertising truisms, which were enclosed under a cover consisting of a genuine new $1 bill, with a huge red seal at one corner securing the leaves of this artistic *billet*; said dollar bill being good for 100 cents purchase at any place in Uncle Sam's domain.

Mr. C. E. Newton, the enterprising secretary of the Jewell Belting Company, Hartford, Conn., endeared himself to all by presenting them each with a handsome morocco portmonnaie in which to carry their wads of current bills when they have any to carry.

The Electric Appliance Company of Chicago and Mr. B. R. Western, of the Manufacturers' Advertising Bureau, New York, anxious to have their names in everybody's mouth, distributed variegated quill toothpicks on which the names and addresses of their respective firms were inscribed.

Mr. C. E. Bibber of the Consolidated Electric Manufacturing Company, Boston, distributed ivory counters or markers for keeping the score in playing whist and other games, and of course some electrical men do play whist occasionally.

Mr. James W. Godfrey gave out large numbers of pocket memorandum books, containing a handsomely engraved portrait of James himself, looking as happy as though he had just made a sale of 1000 miles of Grimshaw wire.

Samples of Sperry fuse wire were shown by Mr. George S. Searing of New York.

The Norwich Insulated Wire Company, New York, represented by Mr. G. J. Jackson, had a most effective display of its wires and cables, which were arranged in a handsome case that contained no less than 100 different samples.

The Boston Incandescent Lamp Company showed a new series lamp which they are pushing.

A C. & C. motor and generator was exhibited in operation, furnishing current for the apparatus shown by the Electric Selector and Signal Company.

The Helios Arc Lamp was shown in successful operation at various places during the Convention, and Mr. D. Spruance must have felt abundantly satisfied with the flattering comments.

The Mosher Arc Lamp, for both direct and alternating circuits, were examined by many visitors, these lamps being in operation in the hall of the St. Louis Electric Club and other buildings.

The elegant, efficient and popular Ward Arc Lamps, which have become all the rage of late, were splendidly represented by Mr. Corey, who knows just how to handle such high-grade goods.

The Wagner Electric Manufacturing Company, St. Louis, showed a handsome 2 H. P. alternating motor, which was placed in the private office of the Missouri Electric Light Company.

A New Factory for the Crocker-Wheeler Electric Company at Newark.

The Crocker-Wheeler Electric Company, New York City, have bought the large plant of the Spiral Weld Tube Company at Newark, and are preparing to move in. A feature of the new factory will be the conspicuous absence of belting and shafting throughout the entire works. The plan to be adopted is to transmit the power to each machine by wires which will connect to a motor on the machine and drive it direct. This method will be followed in the case of every machine where it is found possible, and will result in a considerable saving of power which would be otherwise required to constantly run lines of shafting and countershafts to each machine, as well as a large saving in the cost and maintenance of belts, countershafts, pulleys, oiling, etc. It is expected that the new establishment will give employment to 1,000 hands, many of whom will go to Newark with the company.

INCORPORATIONS.

The Knox Gas and Electric Company, Rockland, Me. Capital stock, $200,000. President, G. E. Macomber; treasurer, A. D. Bird; directors: George E. Macomber, J. Manchester Haynes, H. L. Shepherd, E. K. O'Brien, W. S. White, W. T. Cobb and S. M. Bird. The corporation is a consolidation of the Rockland and Thomaston Gas Light Company, the Camden and Rockport Electric Light Company and the Thomaston and Warren Electric Light and Power Company, and its purpose is to supply light, heat and power by the manufacture and distribution of gas and electricity in the city or Rockland and in the towns of Thomaston, Warren, Camden and Rockport.

The Wichita (Kan.) Electric Railway Company and the Citizens' Electric Light Company have been consolidated under the name of the Wichita Electric Railway and Light Company, with a capital stock of $500.000, paid up. Officers were elected as follows: Charles E. Dustin, president of the Schuyler Electric Company of Hartford, Conn., president; A. L. Batchelder, president of the Cheshire bank of Keene, N. H., vice-president; J. W. O'Neil, of Wichita, secretary and general manager; George A. Litchfield, of Keene, N. H., treasurer, and Arthur Faulkner, of Wichita, assistant treasurer.

The Lancaster and Downington Street Railway Company, Harrisburg, Pa. Capital stock, $1,000,000. President, H. B. Piper, Tyrone; directors: John A. Clark, Lancaster; George W. Melly, S. A. Hench, A. E. Melly, Jesse Wingert, Harrisburg. The road to be built by the company will be operated by electricity and will be thirty miles long. It will run from the intersection of the Bridgetown and Horseshoe turnpike road and the Philadelphia and Lancaster turnpike road through the towns of Smoketown, Bird-in-Hand, Intercourse and Earl and Leacock townships over the public road leading past Smoker's coach works and Centreville school house to the limits of the town of New Holland, thence returning by same route through Leacock and Salisbury township, the two towns of Spring Garden, West Caln township, thence to the Borough of Downington.

The name of the Asbury Park Electric Light Company has been changed to "Neptune Electric Company," and the capital stock has been increased from $60,000 to $200,000.

ELECTRICITY.

VOL. IV. NEW YORK. MARCH 15, 1893. CHICAGO. No. 9

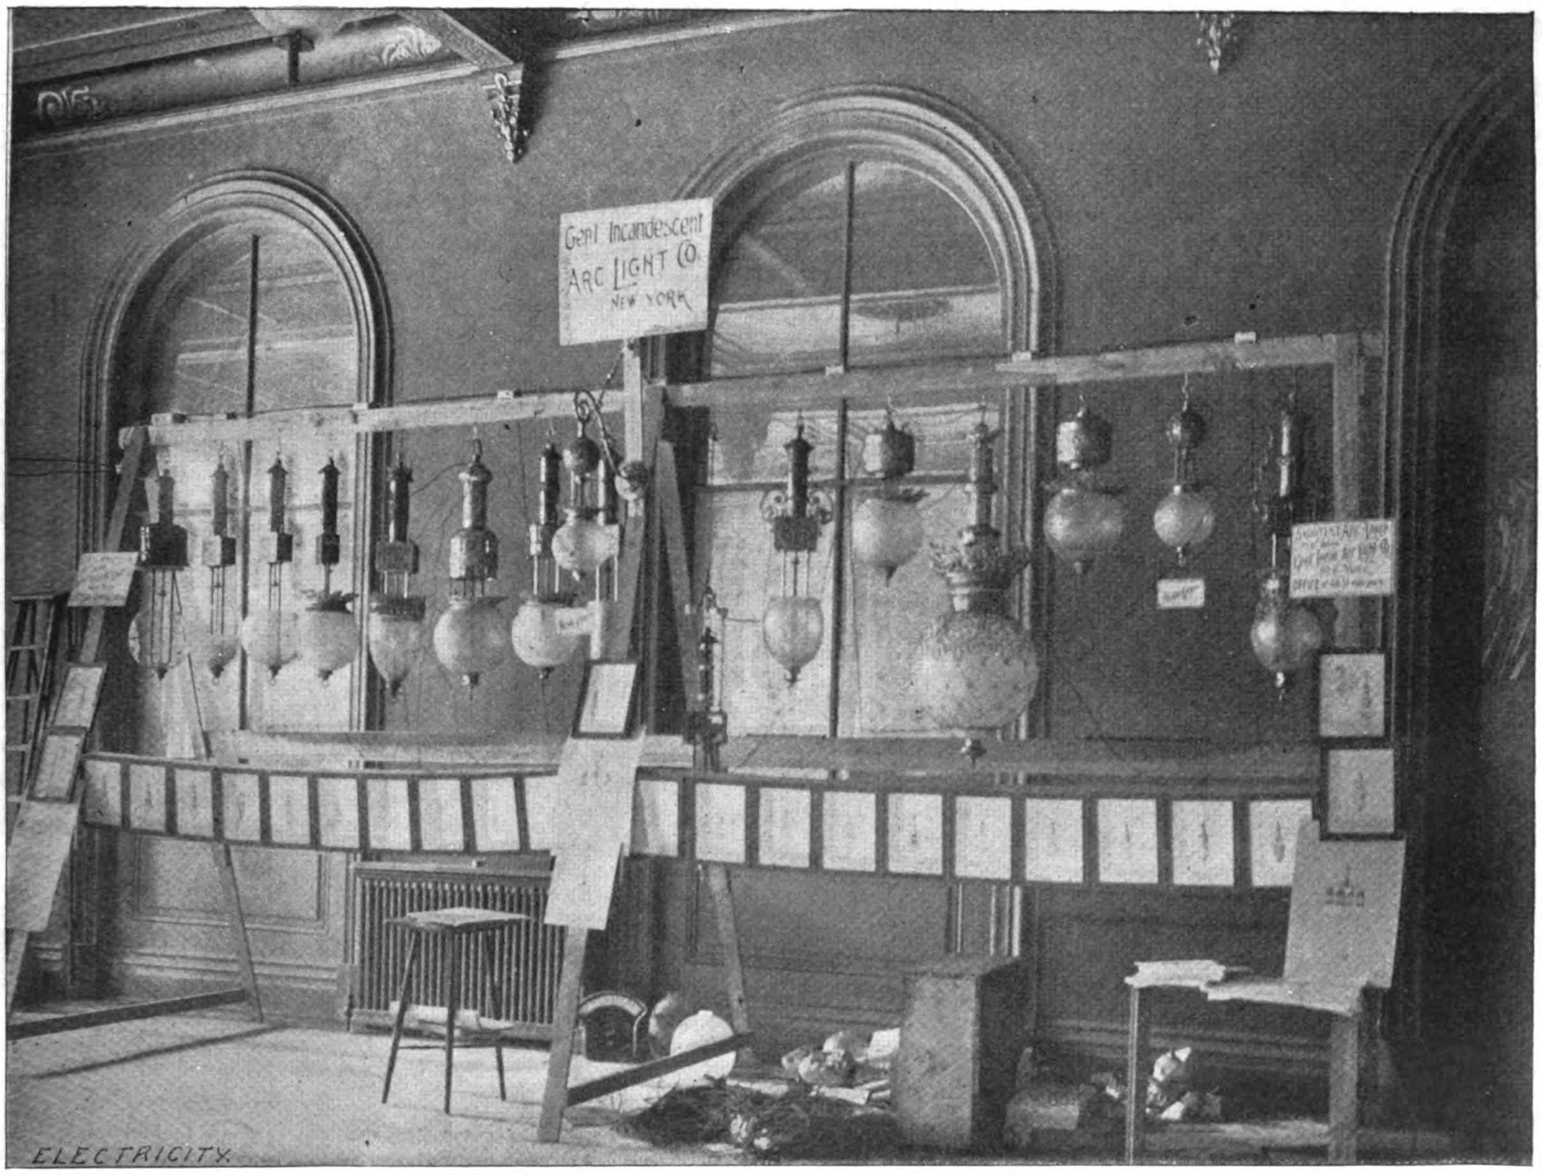

EXHIBIT OF THE GENERAL INCANDESCENT ARC LIGHT CO.—ST. LOUIS CONVENTION. (SEE PAGE 121.)

The New Kelvin Wattmeter.

A new engine-room wattmeter, the invention of Lord Kelvin, shown in the following illustrations, was recently exhibited by Dr. Fleming in his Cantor lectures. Fig. 1 gives a general view of the instrument with the case removed, which is described by our London contemporary, the *Electrician*, as having a main circuit formed of a double rectangle of copper rod of sufficient area to carry 200 amperes, and a shunt circuit with two fine wire coils astatically arranged. The main coil is mounted on a slate back so that the rectangles are horizontal. The shunt coils are mounted on a light but strong aluminum frame in the manner shown in Fig. 2. One end of this frame has a circular knife-edged hole fixed to it, and the other end has a straight knife-edge. These two knife edges rest on two phosphor-bronze hooks attached by insulating supports to the outside ends of the double rectangle. By this method of suspension complete freedom from friction is obtained, while the movable system is kept in a definite position without end guides. Each fine wire coil has about 1,000 turns of insulated wire, and its resistance is about 100 ohms. The current is conducted in and out from the movable system by two flat palladium spiral springs which also supply the restoring force for governing the sensibility of the instrument.

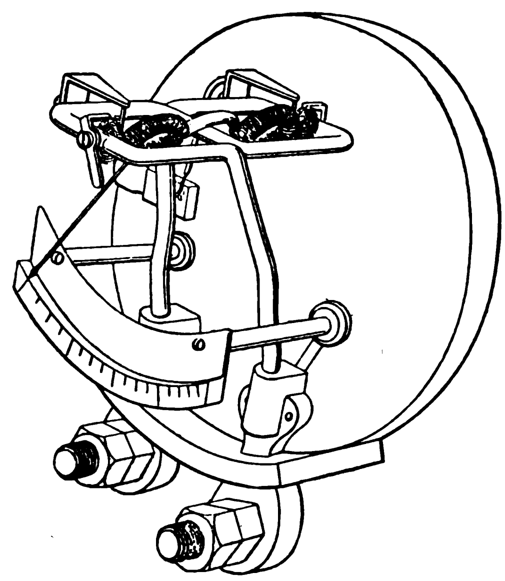

Fig. 1.

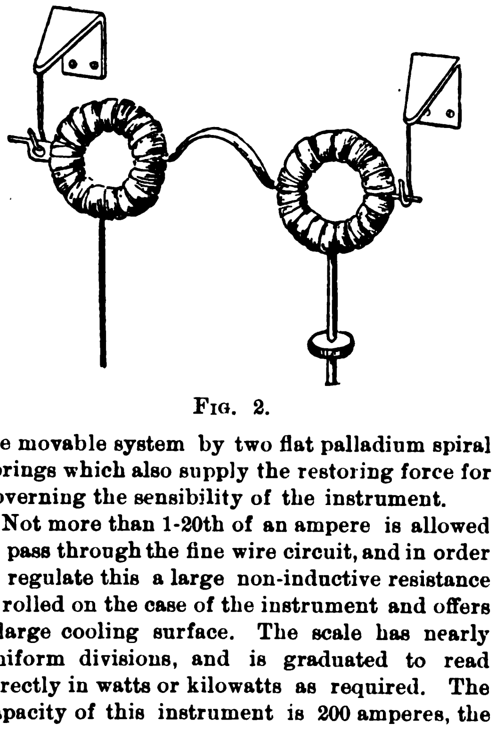

Fig. 2.

Not more than 1-20th of an ampere is allowed to pass through the fine wire circuit, and in order to regulate this a large non-inductive resistance is rolled on the case of the instrument and offers a large cooling surface. The scale has nearly uniform divisions, and is graduated to read directly in watts or kilowatts as required. The capacity of this instrument is 200 amperes, the volts being immaterial.

Mr. James W. Godfrey, of the New York Insulated Wire Company, left Chicago last week for a flying business trip to the Pacific coast.

Electrical Quackery.

A most important judgment was delivered in the London Law Courts (Queen's Bench) on Friday, February 17. The case was one for libel taken by a certain Dr. Tibbitts against the proprietors of the London *Electrical Review*. Our contemporary has always waged war against every description of electrical quackery, but more especially during late years has it condemned the electropathic appliances sold at a London establishment—so-called electric belts, which are declared by the vendors to cure almost every imaginable disease or complaint. In September last the *Electrical Review* received a pamphlet for review which proved to be nothing other than a testimonial written by Dr. Tibbitts, who it appears had been retained by the Electropathic and Zander Institute to report on these belts for a fee of 100 guineas. This pamphlet was in due course reviewed by our contemporary under the heading "Electricity and the Medical Profession," (September 23, 1892). In this review the qualifications of this doctor were seriously questioned and yet another attack was made on the Harness belts. Dr. Tibbitts accordingly filed action against the *Electrical Review*, as did also Mr. Harness. The former was the case which last week aroused much interest among the English public, crowds of whom assembled at the Courts while the action was proceeding. The case lasted for the greater part of three days, there appearing on the side of the defendants such witnesses as Lord Kelvin, Prof. Sylvanus Thompson, Mr. James Swinburne, Mr. H. R. Kempe and Mr. T. E. Gatchouse and a large number of eminent electrical and medical men. All of these witnesses testified more or less to the inefficiency of the appliance and to the fact that "the dear old doctor didn't know what he was writing about," to quote the words of Prof. Thompson when in the witness box. In the course of the evidence it was stated that Dr. Tibbitts was an undischarged bankrupt and the necessary funds for the present proceedings were being provided by Mr. C. B. Harness.

The verdict was given by Mr. Justice Mathew and the jury in favor of the defendants with costs.

This decision was received by the public in the court with much applause and there was even cheering, which as a rule is not permissible. There was, however, no attempt made on the part of the judge to stop this uproar.

Hon. E. A. Armstrong.

A contributor has furnished us with the following information in regard to the new President of the National Electric Light Association:

E. A. Armstrong was born in Salem County, New Jersey, December 28th, 1858. He studied law in Camden, and was admitted to the bar in 1880. He was four times elected to the House of Assembly, twice its Speaker, and he was Judge of the Camden District Court for four years. He is the President of the Camden Lighting and Heating Company, the Atlantic Electric Light and Power Company, the Electric Light Company of Atlantic City, and the West Jersey Construction Company.

He is the legal officer of several corporations, some of which are the New Jersey Trust and Safe Deposit Company, the Camden Horse Railroad Company, the Cape May, Delaware Bay and Sewell's Point Railroad Company.

Indeed there are very few enterprises in Southern New Jersey that he is not in some way connected with. He is a Republican, and in politics has always taken a very active part, being in great demand as a speaker.

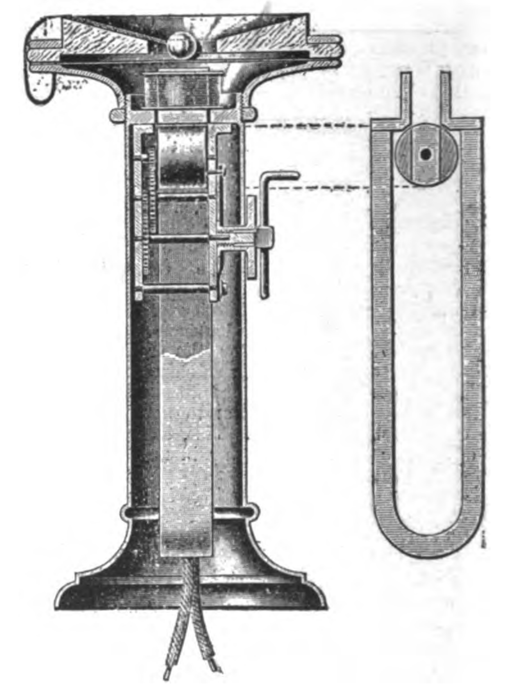
The Perkins Lamp Company.

Advices from Manchester, Conn., state that there is no prospect of the company being able to resume business. The managers of the Perkins Company have decided that they can no longer do business and they are now trying to dispose of their plant. The company employed about 100 hands and paid out wages amounting to $1,000 a week. The business was of great benefit to the town and its loss will be severely felt.

Siemens' Siren-Call for Telephones.

A special arrangement for a telephone call has been used with the Siemens bipolar telephone instead of the usual magneto call bell. This device, known as a siren-call, contains a brass cylinder of which two soft iron segments diametrically opposed form a part. This cylinder is rapidly revolved by means of a crank and train of gears connected to the armature. The *Electrical Engineer*, of London, describes the action of the instrument as follows: "This rotation causes a rapid introduction and removal of the armature from the magnetic field below the soft iron pole pieces, and a corresponding magnetic change in their cores which affects the home as well as the distant telephone diaphragms, setting them both into vibration. In general the siren-like sound emitted by the telephone alone is quite sufficient for the purpose of a telephone call; but the small bullet which is attached to the cord may be kept resting on the diaphragm; it is brought into violent movement by the vibration of the latter, and acts as an intensifier of the telephonic sound emitted.

"The armature if left to itself would take up a position across the field below the poles, and weaken the magnetic field through the diaphragm. In order to avoid this, when the telephone is used for conversation it is necessary that the armature be always brought into its neutral position and locked there. This is done by a special spring-catch dropping a pin into a pinhole, which arrests the armature in the proper position. When a call is given, this pin is first drawn out of action by a cam with a milled head, which, together with the crank-handle for rotating the armature, projects outside the telephone casing."



Siemens' Siren-Call for Telephones.

A New Electric Club.

The Elgin Electric Club, of Elgin, Ill., has completed its organization by the election of the following officers:

President—Frederick Purdy.
Vice-President—Dr. G. L. Marion.
Secretary—J. Frank North.
Treasurer—Henry Klinder.
Librarian—R. W. Pikerton.

The club begins its career with forty-eight members and was formed for the interchange of ideas, the promotion of scientific investigation and for social intercourse. It meets every Saturday evening.

The New Western Union President.

General Thomas T. Eckert has been chosen to fill the vacancy caused by the death of Dr. Norvin Green, President of the Western Union Telegraph Company. Gen. Eckert was previously vice-president and general manager of the company. He is a native of Ohio, and made his first appearance at St. Clairsville, in that State, on the 23d of April, 1825. His services to the Government during the Civil War, as Superintendent of the Military Telegraph, Department of the Potomac, were of a character to attract the attention of the Administration and he was placed in charged of the military telegraph headquarters in the War Department, in which position he was brought into close confidential relations with President Lincoln. Entering the service with the rank of captain he rose through the grades of major and lieut.-colonel, and was brevetted brigadier-general. He was one of the party who met the Commissioners of the Southern Confederacy in January, 1865. In 1866 he left the public service, being then Assistant-Secretary of War, and became superintendent of the Eastern Division of the Western Union Telegraph Company. When the Atlantic and Pacific Telegraph Company was formed he was chosen its president and as such entered with his customary spirit into the aggressive war which arose between that company and the one he left. The strife between the two companies ended in the sale of the Atlantic and Pacific to the Western Union, although the former company still retained its corporate existence and its president. In 1880 Gen. Eckert became president of the American Union Telegraph Company, a creation of Jay Gould. A rate war between this company and the Western Union prevailed from the first, and this engaged his active attention until in January, 1881, the rivalry was terminated by an agreement to consolidate the two companies, and Gen. Eckert then became the executive officer of the Western Union.

Gen. Eckert is held in high esteem by every one connected with the company, and being possessed of commanding ability and a thorough knowledge of all the details of telegraphy, he will doubtless prove fully equal to the requirements of the great office which his predecessor so ably filled.

D. Herbert Jeffery.

It is with sorrow we record the death of D. Herbert Jeffery, secretary of the Crocker-Wheeler Electric Company, which occurred on the 2d instant, from pneumonia, after an illness of only ten days.

Though Mr. Jeffery was but forty-one years of age at the time of his demise, his business career had been a wide and varied one. He was born at Corning, N. Y., and in the early years of the sewing machine business became connected with the Remington and Wheeler & Wilson companies. Foreseeing the great future of the electrical business he accepted the secretaryship of the Crocker-Wheeler Electric Company two years ago. His brief association with this company proved him possessed of great executive ability and a first class salesman, and had endeared him to all of his business associates and to the electrical fraternity with whom he constantly came in contact, doing the major part of the buying and selling for the concern.

He was well known in musical circles in New York, sang in several of the churches of the city, and was connected with a number of its choral societies. His numerous friends always found him of an extremely loyal and generous disposition, and his fine musical talent was always freely and cheerfully exerted in the cause of charity.

Aaron F. Perry.

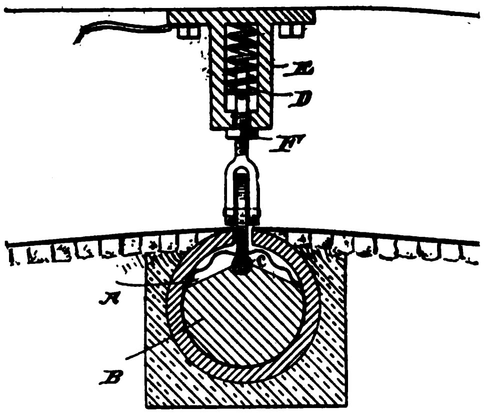
Hon. Aaron F. Perry, who died on Saturday last at his home in Cincinnati, was for thirty years a leading member of the Ohio bar. He was an ardent anti-slavery man, and sustained close relations to President Lincoln during the early days of the war. He was a life-long friend of the late Chief Justice Waite, and had represented his district in Congress. He retired from practice two years ago, at the age of seventy.

An Electric Railway Conduit.

A patent has recently issued to Mr. F. C. Perkins for an inclosed conductor for electric railways to take the place of the uninsulated trolley wire as ordinarily used. The invention contemplates the use of a supply conductor which is insulated throughout its entire length yet from which a continuous supply of current may be obtained by a moving contact or trolley. The cut shown below is a diagram of this arrangement in which A represents a metallic tube of any suitable material having the requisite elasticity for the purpose and being proof against the effects of the weather and at the same time a good conductor of electricity. This tube is formed in lengths which may be jointed and contains an insulating support B within it, which may be of wood impregnated with oil or otherwise treated to render it a good insulator, upon which is mounted a bare supply conductor C. This conductor C is referred to herein as a supply conductor, by which is meant either the outgoing or return conductor of a system of electric supply.

In its normal position the tube is maintained by its own elasticity out of contact with the conductor C and may be held at any suitable distance therefrom.

Upon the car is mounted a presser-foot which is preferably shod with a wheel at the point where it enters the conduit or comes in contact with the metallic tube, which may be arranged so that the degree of pressure may be controlled by the motorman. An elastic spring D surrounds a stem which enters a box E, the tension of which may be varied by adjusting the nut F. The pressure of the spring should be sufficient to force the top of the metallic tube A into contact with the conductor C. Under these circumstances as the car proceeds a shifting contact is maintained by the wheel between the tube and the conductor and the current is led from the conductor to the motor on the car by suitable connections, the tube rising away from the conductor as the car passes any given point and opening the connection at that point.



Personal.

Mr. W. S. Andrews has resigned his position of General Superintendent of the Works of the Canadian General Electric Company, Limited, at Peterborough, to assume the management of several large electric light and power concerns in Pennsylvania. His experience in this business dates from 1883, when, in connection with Mr. Frank J. Sprague, he put in the first Edison three-wire central station plant at Sunbury, Pa. Mr. Andrews began his electrical career with Mr. Edison at Menlo Park in 1879, and ever since that date he has been intimately and constantly connected with the manufacture, setting up and running of electric light and power machinery. His long training in these fields of work should be of especial value to the plants placed under his charge.

Mr. Nelson W. Perry, editor of the *Electrical World*, left New York on Saturday last to attend the funeral of his father at Cincinnati.

Long Distance Transmission of Power.

BY CHARLES S. BRADLEY.*

It now lies within our means to build an electric transmission of power plant from coal mine to city which shall cost $300,000 and will transmit 5,000 horse power. This plant will do the work of 30,000 men steadily day and night, year in and year out, and once placed will last a lifetime. The $300,000 represents the work of the 30,000 men for about four days, or an outlay of ten dollars each; thus these men can build a plant in four days that will do more work during their whole lives than they can. Can anything appeal to the imagination of man with more force? The energy of 5,000 horses transmitted noiselessly over a small wire; the coal from the mine placed by one act immediately beneath the boilers; the energy thence running to its destination without any labor from man; the air to supply combustion taken in the country, thus not robbing the human being gasping for breath in the city; the smoke and foul gases being thrown off where they will do no harm. Think of a city free from smoke, its cars, elevators, shops, run and lighted by electricity which shall be generated miles away. I have not said houses heated, but I hope that before 1900 we may say this also. The present obstacle to heating by electricity is the inefficiency of the steam engine. Many are looking for the direct conversion of the energy of coal into electricity. There is no doubt that it can be done, but I fear it will never be economical, for we must depend upon the combustion of the coal in the oxygen of the air.

For the electrical transmission of power we have two general systems—the alternating and direct. The multiphase alternating was advertised extensively by the Lauffen-Frankfort plant in 1891. This pioneer plant was built by much sacrifice of time and money, and we owe gratitude and honor to those men whose indefatigable efforts accomplished the beginning of an art which is destined to revolutionize the social status of mankind. This plant proved conclusively that very high voltages could be successfully used and the insulation maintained. This is the whole thing in a nut-shell; the choice of this or that particular way of generating and using the energy is of secondary importance, and will vary with each situation. Surprising as it may seem, the maintenance of the insulation was the least trouble in the operation of this plant. One of the greatest, the interference with the telegraph, which belongs to the German Government, and when the German Government says "stop" it means stop (in Germany). The next difficulty in importance is the static induction; each wire, being so long and exposing so much surface, becomes a reservoir to hold electricity, and the generator must fill this reservoir on each impulse before it can deliver energy at the distant end. When the generator reverses the direction of current, as it does some 100 times per second in the alternating, this reservoir must be discharged and filled with electricity of opposite sign; that is, if the first impulse to a given wire was positive and fills its capacity with the positive electricity, the reverse impulse must discharge the positive and then fill the reservoir with negative electricity. This operation consumes but little power; it is an ebb and flow, as it were. The trouble, however, is that this idle current swinging back and forth occupies the carrying capacity of the generating apparatus; so much so, that I saw the fuses blown at Lauffen with no load of consequence at the Frankfort end. In damp weather the insulators become wet on the external surfaces, and this largely increases the capacity, which is more serious than the increased leakage. These difficulties vary with the length of the line and the amount of power transmitted, the surfaces being proportional to the length of line. The carrying capacity is proportional to the square of the diameter of the wire, while the static capacity is proportional to the surface, which is equivalent to being proportional to the diameter, so that the larger the amount of current transmitted the less proportional influence the static capacity has. These things must be determined by the engineer in each case. The multiphase alternating is the most pliable, adjustable system that has ever been conceived. It is capable of transformation in voltage; will supply motors of either synchronous or non-synchronous type; will readily convert in motor transformer to direct current for electric railroad or direct current distribution, and thus supply direct current motors. A patent was issued to me October 2, 1888, which covers this ground, and it is surprising and gratifying to read the original specification filed April 23, 1887, now nearly six years ago, and note there the complete provision for the transformation for these varied uses. At the factory of the Fort Wayne Electric Company I have had exceptional facilities for experimentation on the multiphase systems, some 270 different tests having been made on motors, dynamos and transformers, the record of which fills a respectable volume. If this could be given to the world, that the engineers might know what not to do, undoubtedly the wings of many a genius would be clipped. Where the power is to be delivered in compact form the direct current offers some important advantages. We can get very high voltages by a battery of machines placed in series for the generator and motor stations. The placing of machines in series for power transmission was proposed by Mr. Edison in 1880 and Prof. Thomson in 1883. Each contributed some essential improvement, but it is evident that the enormously high voltages now contemplated were not then thought of. For the generator station I prefer compound wound machines; first, that the system may be self-regulating; second, that the series coil when a machine is thrown into action shall magnetize the field in the right direction; this also requires that the switch shall close the series coil first. The shunt coil would tend to reverse until the machine has attained electromotive force enough to overcome the resistance of its own armature. In order that each machine shall be as far as possible independent of its neighbors, I prefer that it shall be short shunt, or in other words, the shunt coil be charged direct from the brushes of each machine. I would use the 500 volt machines, and of such ampere capacity as the size of the plant demanded, and belt them all from one shaft. The 500 volts have been found safe to life and the commutator works well. Now, we must protect the insulation of the windings; the end machines where the terminal voltage, say, reaches 20,000 volts may, in case of grounds, be subjected to the piercing strain of the entire electrical pressure. It is impracticable to insulate the windings of each machine to stand any such potential; therefore, we connect the windings of the machine at some point with the frame so that it may never be subjected to a strain greater than its own voltage; next, each machine foundation is thoroughly insulated from earth, and in case this insulation fails for any reason, the fuses of the line will be blown, thus protecting the whole structure. It is easy, however, to make this foundation insulation so perfect that no derangement will take place. For this I have struck upon a cheap plan, which was not apparent at first. Having now provided for the insulation, we must next consider the safe handling of the machines. A moment's consideration of the electrical potential of each successive machine in the series will make it evident that the whole of each machine will attain the potential of its individual position; or, beginning on one end, each successive machine will be 500 volts above the preceding one. We can use a wooden platform around and attached to the base of the machine, so that the man must cross it before he lays his hand on the metal part. Here, again, I want to point out how essential it is that the windings be in metallic connection with the frame for the safety of the man. It secures that no part of a machine shall exceed its own voltage, and in case of a leakage in the foundation insulation, immediate detection. If this metallic connection were not provided and a leakage occurred in the foundation, you will readily see that it might be undetected, and a man touching the brushes and the frame would take a current through him of uncertain high voltage. At the motor station we use simple 500 volt shunt machines with the same precautions as at the generator station. Our power having been transmitted can now be converted into whatever may be demanded. If it is an electric system of distribution, we shall have the advantage of its being impossible for the high tension current to get into the system of distribution. If it is a large plant, the motor station may be subdivided into two or three parts, preferably in multiple arc, with the same potential on each. On very long lines I think the transmission must be done by direct current.

*Abstract of paper read before the National Electric Light Association at St. Louis, Mo., February 28 and March 1, 2, 1893.

Remarks Concerning Power Transmission from the Economic Standpoint.

BY L. B. STILLWELL.[†]

At the Buffalo Convention of the National Electric Light Association in February, 1892, in the general discussion of the subject of "Electric Transmission of Power," a great deal was said about different systems of electric apparatus which might be employed for this purpose. But the writer carried away from that Convention the impression that after all the manager or owner of a central station, or the business man desirous of securing information as to the practicability of profitable investment, must have failed to derive any great amount of information of the kind which he desired to obtain. The first question of such a man is "Does it pay?" and it is a question which an engineer who has become so involved in the consideration of technical points as to lose sight of the question of practicability from a business standpoint has great difficulty in answering. But the business man is right. "Does it pay?" strikes direct at the root of the whole matter. The practicability of all systems and of all projects of this description must be measured in monetary units, and electric transmission of power, as well as every other form of engineering undertaking, must find its ultimate reason for existence in considerations of economy. Any engineering project which cannot live when measured by this standard should never be undertaken.

At the present time we find in actual operation a large number of central stations utilizing the energy of coal by means of steam plants, and distributing power and light through the medium of various types of electrical apparatus. The number of central station plants operated by water power is, on the other hand, extremely limited. The best way to arrive at results of some tangible value is obviously to compare a hydraulic and electric transmission plant with a central station using steam engines to drive dynamos.

In the former we have the steam plant, consisting of boilers, engines, pumps, heaters, etc.; the electric generating plant comprising dynamos, exciters and all electrical apparatus located in the central station; and the distributing plant, comprising motors, lamps, transformers, and the conductors connecting these with the central station. In the latter case it is usually convenient to locate a sub-station at a point adjacent to the market, for example, on the spot where the central station would be located were we to obtain power from coal. In such a plant we have the hydraulic apparatus, comprising dam, flumes, draft tubes, turbines, regulators, etc.; the electric generating plant, consisting of generators, exciters, and all electrical apparatus located in the generating station; the transmission circuits between generating station and sub-station; electrical apparatus in the sub-station, which usually consists of transformers employed to reduce potential, together with switching and regulating apparatus; the motors, lamps and other translating devices, and the local distributing circuits connecting these with the sub-station. We may assume that the two installations from the point where the local distributing circuits leave the generating station on the one hand and the sub-station on the other to the premises of the consumer are precisely similar. There is no reason why they may not be so, and since the whole installation, no matter which of the two plans is adopted, must be designed to supply such service as the customer wants and will pay for, the assumption is perfectly fair. It follows that if the two contrasted plants are capable of delivering the same amount of power to the local distributing circuits they are alike as regards revenue. We may, therefore, at this point make our comparison still more direct by further narrowing the problem, disregarding the revenue side of the question and comparing simply annual charges. In other words, that phase of the general problem which I have selected as perhaps the most interesting may be stated as follows:

"What are the total annual charges against a hydraulic and electric installation utilizing cheap power at 'A' and transmitting it to 'B' as compared with the annual charges against a steam and electric plant located at 'B' and capable of supplying the same amount of energy in equivalent form to the local distributing circuits?"

We may conveniently construct an algebraic skeleton or framework of the annual charges against each of these typical installations. When we come to translate algebra into arithmetic by substituting numerical figures for the algebraic symbols, opinions will differ widely as to the actual values of the different factors, but I think that the skeleton will be useful, as by discussing, and, if possible, fixing one factor at a time, we shall be better able to arrive at some approximation to a definite and tangible result. It is in the power of this Association to compare, analyze and arrange this information in such a way as to make its application to a new project direct and reasonably conclusive. If there be any means by which failure in ventures of the kind in which you are and will be interested may be avoided we should certainly put ourselves in possession of these means as early as possible, and I would, therefore, respectfully urge the advisability of concerted action looking to the collection and proper analysis of information concerning each of the various items of expense and the various sources of revenue of your central stations. The problem is somewhat complex, and unless we have some definite and progressive method of analysis it is practically impossible for an association which may be considering the subject, or even for a select committee of engineers who may be called upon to advise with reference to a specific case, to arrive at an agreement in which all will concur.

In calculating the annual charges against the steam and electric plant we must consider the following:

Fb—First cost of real estate and buildings.
Pb—Percentage covering interest upon and maintenance of real estate and buildings.
Cb—Constant expenses, taxes, insurance, etc., on real estate and buildings.
Fs—First cost of complete steam plant, including engines, boilers, steam pipes, pumps, heaters, etc., installed.
Ps—Percentage covering interest upon and maintenance of steam plant.
A—Cost of fuel to produce one pound of steam.
S—Pounds of steam used per indicated horse power per hour.
N—Number of indicated horse power hours used per year.
Ws—Cost of water (if any) per annum.
Os—Cost of oil and waste per annum for steam plant.
Fe—Cost of electric generating plant, including exciters, regulators and complete station equipment.
Pe—Percentage covering interest upon and maintenance of electric generating plant.
Oe—Cost of oil and waste per annum for an electric plant.
Cse—Constant expenses, including superintendence, wages, taxes, insurance, etc., steam and electric plant.

Then $PbFb + Cb + PsFs + ASN + Ws + PeFe + Os + Cse + Oe =$ annual charges.

For the hydraulic and electric plant we have the following:

Fb—First cost of real estate and buildings.
Pb—Percentage covering interest upon and maintenance of real estate and buildings.
Cb—Constant expenses, taxes, insurance, etc., on real estate and buildings
Fh—First cost of hydraulic plant, including turbines, dams, flumes, etc.
Ph—Percentage covering interest upon and maintenance of hydraulic plant.
Oh—Cost of oil and waste per annum for hydraulic plant.
Ch—Constant expenses, including superintendence, wages, taxes and insurance on hydraulic plant.
A—Cost of water per horse power hour (where water rate is paid).
N—Number of horse power hours at turbine used per year.
Fe—First cost of electric apparatus between turbines and local distributing circuits exclusive of line.
Pe—Percentage covering interest upon and maintenance of electric plant exclusive of line.
Oe—Cost of oil and waste per electric horse power from generators for electric plant.
Ce—Constant expenses, including superintendence, wages, taxes, insurance, etc., on electric plant.
Fl—First cost of pole line, insulators and conductors.
Pl—Percentage covering interest upon and maintenance of pole line, insulators and conductors.
Cl—Constant line expenses (supervision and repairs).

Then $PbFb + Cb + PhFh + Oh + Ch + AN + PeFe + Oe + Ce + PlFl + Cl =$ annual charges.

And now, what have we accomplished? We certainly have not arrived at a definite solution of the problem of comparative annual charges, and the more carefully one looks at the statements, the more evident does it become that there are many factors the value of which can only be fixed by actual experience. It appears, however, that were we in possession of accurate and detailed data as to the cost, operating expenses and income of a steam and electric plant, we might form a pretty accurate idea of the practicability of an alternative project involving electric transmission of power. We should also need some information as to the cost of installing and operating hydraulic plants under various conditions, but this can be obtained with sufficient accuracy and with no great difficulty. The evolution of apparatus adapted to the efficient and reliable transmission of energy, and hence to the utilization of vast amounts of power in the form of falling water now wasted has reached such a stage as makes this question a most vital one, and the importance of information relating to the cost of steam and electric plants now in operation is manifest.

[†] Abstract of paper read before the National Electric Light Association at St. Louis, Mo., February 28 and March 1, 2, 1893.

This paper is offered simply in the way of suggestion and for the purpose of inviting criticism and comparison of opinions. The skeleton statements of annual charges have been hastily prepared and may doubtless be revised and amended with good results. It is intended simply for classifying purposes, to facilitate the accumulation of much needed data and to avoid confusion of ideas in discussion of the problem which I have attempted to analyze.

Power Transmission for Central Stations.

BY DR. LOUIS BELL.†

This paper makes no pretense at being an exposition of the theory and practice of long distance transmission of power, nor in it shall I attempt to go into lengthy discussion as to the relative merits of various methods and diverse apparatus none of which has been in use long enough to permit a ripe judgment of its relative qualities. I shall confine myself to discussing the question of power transmission as it appeals to the man who runs a central station, bearing in mind that however much may be learned from theoretical considerations, theory often needs to be chastened by facts.

If the problem arises of transmitting electrical energy from a distant point for use in light or power distribution, we must ask ourselves, before answering the all-important question of "Will it pay?" first, what are the conditions surrounding the transmission as such, and second, what are the conditions of the distribution that is to be accomplished?

If we simply desire to take a given unit of power and transfer it in the form of electrical energy from one point to another, the facts in the case are widely different from what they would be if it is necessary either to sub-divide that power unit at the receiving station or to scatter it along the entire path of the transmission. So far as distribution is concerned, we may then divide electrical power transmission into three classes: first, the transmission of single units; second, the transmission of power to a centre of supply from which point it is to be distributed in various ways; third, supplying the power for lights and motors throughout the length of the transmission line. Each of these classes of work imposes conditions on the possible methods of transmission, and requires special consideration. In new plants, hampered in no wise by existing stations, any one of these classes may exist, perhaps the last two more frequently than the first. Where a single motor is to be employed, the problem is exceedingly straightforward. Where a new centre of distribution is to be organized, some complications are encountered but not serious ones. Where power is to be scattered along the line, however, conditions arise which are not altogether easy of fulfilment and require a good deal of special care and skilful engineering.

In a general investigation of the methods which may be employed, the case stands somewhat as follows so far as the central station man is concerned:

First, if the distance over which he is to transmit power is moderate, he may use the ordinary direct current generator and motor, displace his engine with the motor and go ahead. But unfortunately direct current machines of any considerable capacity are practically limited in voltage by the existence of the commutator. Dynamos and motors of large size cannot, individually, in the present state of the art, be satisfactorily built for more than about 1,200 volts. Machines for greater voltage have very generally broken down in the experimental stage.

Multiphase currents—and by this I mean currents having more than one phase—are subject to the same general laws as any other alternating currents. Their most valuable peculiarity lies in the fact that for alternating currents of more than one phase excellent motors can be built which will run at steady speed, start under heavy load, and in general possess very much the same qualities as a well organized shunt motor of the ordinary kind. Incidentally, certain of the multiphase systems, more especially the three-phase, enjoy the advantage of effecting something of a saving in copper, under favorable circumstances up to 25 per cent. from what would be required by a plain alternating current of the same nominal voltage.

The fundamental difference between single and multiphase systems, then, is mainly the adaptability of the latter for driving motors, and multiphase are better than single phase motors principally in their ability to start under load and somewhat larger output for the same weight.

The multiphase motor can be pulled out of phase, but it can be readily started. We can, where railway currents are necessary, do much better than to drive the dynamos directly by motors of any kind. We can for this use start with the multiphase current, and through the medium of a single machine, scarcely more complicated than an ordinary railway dynamo, transmute this multiphase current into a direct 500 volt current of the ordinary sort. This very valuable result has been brought about through the ingenuity of my friend, Mr. C. S. Bradley, who invented the device a half dozen years ago. It has lain dormant, principally because there has been no special call for power transmission of any kind until recently, but to its thorough practicability I can personally testify, as a 100 kilowatt triphase direct current transformer which I recently tested, operated in the manner described, showed an efficiency of over 95 per cent. at full load, stood sudden variations from no output up to 100 kilowatts and back again without even a wink at the brushes, and bore up under heavy overload without difficulty.

Now, take up the case where a centre of distribution is to be fed, consisting it may be in part of an existing station and in part either of extensions and new circuits from this plant or subsidiary centres of distribution having other districts of the same town. Here the problem becomes more complicated and it is almost impossible to lay down any general procedure.

First, we can feed all existing railway circuits and extensions thereof very effectively and economically by use of the triphase direct current transformer just described.

Second, we can handle all direct current incandescent systems, whether two or three wire, by means of the same type of apparatus, the triphase direct current transformer.

Third, we can successfully operate any existing alternating incandescent circuits or any extensions thereof by feeding alternating current from the distant point directly into them through banks of transformers.

Fourth, if any new centres of distribution are to be made with circuits independent of those already in existence, we can operate these circuits very effectively for both lighting and motor service, if both be necessary, by employing multiphase apparatus; and right here let me say that there is one widely spread error which I desire most emphatically to contradict.

It has been asserted that incandescent lighting cannot be successfully done on multiphase systems especially triphase, since this happens to have been most talked about. This statement is absolutely false, to my own personal experimental knowledge. Lamps can be as successfully operated on systems of two, three or more phases as on an ordinary single phase circuit, provided equal pains be taken with the distribution of copper in the lines and the regulation of the voltage at the machine. If these conditions are observed, a two-phase circuit with separate wires acts substantially as if it were fed from two ordinary alternating dynamos. A triphase circuit gives a similar result, and if more phases were concerned the same would be true. If the condition of constant voltage at the centre of distribution be fulfilled, as it can be and must be for successful operation on any system whatever, two and three phase incandescent lighting systems can and do work admirably. Furthermore, if we combine circuits, for example, if we use three wires instead of six for the three-phase system, there is no exact equality of balance required between the lamps placed in different connections across these circuits. On the three-phase system we would place lamps between each possible pair of the three wires, this arrangement gaining, as I before mentioned, in copper wire enough to compensate for the slight inconvenience in connecting three sets of lamps instead of one or two. Branches can be run from any two wires of the triphase arrangement, and lights placed on them will act exactly as if they were placed on any ordinary alternating circuit. I lay stress upon this matter of incandescent lighting in defense of multiphase systems, because it is the one upon which they have been most often misrepresented, chiefly through foreign experiments, which I do not hesitate to denounce as clumsily conducted.

There has been much discussion as to the relative merits of two and three phase induction motors. In general the more phases the smoother action of the machines in various respects. I have never yet seen a two-phase motor any better than a three-phase motor. I should want a pretty careful series of tests to convince me that I had seen any one as good. The difference between them, with proper design, ought not to be very great, though the three-phase has the advantage in cost of wire. There are two important points in which multiphase motors have been misrepresented, which I should like to mention.

First, it has been stated of them that they take an enormous current when running light, and second, that they introduce a very large and most objectionable lag in the circuit, so that the apparent current on the line is much greater than the energy current. Such facts have doubtless been observed. Broadly speaking, they have been due to faulty design. A multiphase motor will always take a somewhat larger current when running idle than the corresponding direct current, but it takes very little more energy, as the phenomenon of lag then becomes noticeable, so that of the apparent current running light only a portion represents energy.

In case, then, of working a central station from a distant water power where necessity for extensions or new centres of distribution exists, we have plenty of methods available. Triphase direct current transformers for railway and direct current lighting service, alternators to feed into the existing mains or to supply extensions for them and for new centres where light alone is to be employed, ordinary alternating currents, or where both light and power are necessary multiphase apparatus, which, as I have shown, is entirely applicable for such a mixed system.

I may add that there is a possibility that we may have before long practicable motors to run on an ordinary alternating circuit constructed after such methods as were suggested by Prof. Thomson a few years ago. In very small sizes they are already practicable. Brown, abroad, has been making a desperate effort to exploit these very methods on his own responsibility, and has obtained motors which run successfully, but as yet do not start well under load. From what I can learn of them I doubt very much if they are any improvement on the motors of the same type shown by Prof. Thomson at the Paris Exhibition, or on Mr. Tesla's motor for running on a two-wire circuit.

The amount of drop advisable in long distance lines will depend of course principally upon the relative prices for copper and the apparatus necessary. If copper be relatively cheap, it pays to employ a good deal of it. If apparatus is relatively cheap, it is better to use larger generators, and allow more drop on the line—15 to 20 per cent. will hit the large majority of cases on the score of economy and convenience. It should be remembered, however, that for such drops as these good regulation is most essential, but good enough is available with direct, alternating or multiphase machines to make these drops thoroughly practicable.

I think cases would be rare where transmissions, the advisability of which would be dictated by commercial consideration, would encounter serious difficulty from inductants and capacity. I have never personally investigated a proposed transmission of over fifty miles that gave any promise whatever of financial success, but the time may come when such a case will appear, and if it does, the work can be done successfully so far as the electrical part of the matter is concerned. I think the greatest difficulty in surmounting long distances is the difficulty of keeping a long line in proper repair. Eternal vigilance will be the price of success in this respect, otherwise there is little trouble. The apparatus is thoroughly reliable and efficient, and the methods comparatively straightforward and simple.

Throughout this discussion I have taken the position that no one method of procedure is applicable to all cases. Personally, I am decidedly eclectic in my taste, believing that it is better to put in for each individual case such apparatus as on the whole proves to be cheapest and best rather than to advocate on any fine drawn theories methods which might be applied to the perfectly general case of transmission of power.

---

† Abstract of paper read before the National Electric Light Association at St. Louis, Mo., February 28 and March 1, 2, 1893.

DISCUSSION.

President Ayer—Gentlemen, you have listened to a series of papers pertinent to a topic that is fraught with interest to almost every central station man. The rapid development of our business brings forcibly to our minds the necessity of transmitting large amounts of power over long distances in large units, or on the other hand of maintaining central stations and smaller units. The proposition is presented to us that in the near future we shall have to add enormously to our station or generating capacity for the manifold uses of electricity.

To-day we are placed in a peculiar position. Our attention is called to the direct system, moderate sized units, covering a large area, which looks to be a very practicable method for many uses, and also to one very large unit, transmitting power to various centres of distribution and there distributing it; and a further suggestion comes to us, especially where we are located near our coal fields, of generating power at the mine and transmitting it to the various points of distribution; so that it may be wise to consider the advisability of one or the other of the multiphase systems that are offered. My experience is that the more we look into it the less we seem to know.

Mr. Hammer—I have a few remarks to make on this subject, which is a pretty large one. Mr. Bell states that it is not practicable to use direct current machines over 1,200 volts. I think there are machines, not very far from this city, running direct currents of 3,000 and more volts. Moreover, the other night Prof. Crocker made the statement that he had been running for some time direct current machines of 5,000 or 6,000 volts without any difficulty whatever. Mr. Bell has stated, in speaking of the three-phase system, that the current at one time was passing through one wire and returning through the other two. I think it is generally expressed the other way; that the one wire is the common return of the other two. I do not think he placed enough importance upon the application of the motor transformer in this country. I think it would be very interesting to all the station men here if Mr. Bradley, Dr. Bell and Mr. Stillwell and others would get up and state just why it is that the alternating motors of large capacity are not in use.

Dr. Bell—I shall be pleased to vouchsafe Mr. Hammer any information on the subject. In the first place as to high voltage. We know we can make an arc machine to work on high voltage. I practically stated in the paper that high voltage could be used requiring the employment of 1,200 volts or thereabouts if the machine is designed to carry large currents. Experience up to date has shown that they will not work satisfactorily for any length of time.

As to why alternating current motors in large sizes have not been used up to the present time, I think the principal reason is that there has been no very large call for long transmissions until quite recently. Apparatus does not spring up like crocuses in the spring; it comes after a demand for it has arisen; it is dragged out of the inventor's brain when commerce demands. And the reason why we have not had more of this long distance business is because we have not had any very large call for it.

Mr. Stillwell—As to Mr. Hammer's question as to why these motors are not used extensively at the present time, I think that Dr. Bell's answer is very true as far as it goes. At the same time the demand for this long range transmission has existed. The development in this country of the multiphase systems was taken up, as you know, by Mr. Tesla, or rather it was taken up on the other side of the water, and he brought it to this country about 1888, and he spent with others a great deal of time in working up the applications of this multiphase system, which opened the door to a type of alternating current motor which would start from rest and work with efficiency. The last or at least one of the recent additions to the system, although the thing had been worked out before a long time ago, is the rotary transformer. The application of that, as Mr. Hammer says, is certainly of the greatest value.

There is one point of a great deal of practical interest in regard to the difference between two-phase and three-phase machinery. Dr. Bell has stated his belief that the triphase has some advantage over the two-phase. There is one advantage of commercial importance, and that must be carefully considered, and that is the slight economy in the investment of copper. The triphase effects a reduction of about 14 per cent. in the amount of copper for the transmission circuits that would be needed by a two-phase system. Now that does not mean that we must increase our potential by any such amount as 14 per cent. in order to come back to even terms on the copper proposition. It is sufficient to go up about seven or eight per cent.; seven per cent. would cover it unless I am mistaken. Seven per cent. increase of potential would bring the two-phase on all fours with the three-phase on this point.

Mr. Adams—It seems to me that the last question that Mr. Hammer asked on the floor was very important. While we may recognize and admit that we have not to-day large alternating systems of transmission because there has not been much demand for machines of that class and transmission of that kind in this country, I do not see that we have an answer to the question "Why we have not to-day, if it is possible to produce such a machine, an alternating current motor, in moderate sizes, which will fill, to use a trite expression, a long felt want?" That is a question I believe an answer to which would be very interesting to all present.

Mr. Hammer—I do not consider that Dr. Bell or Mr. Stillwell has answered the question I asked. For instance, in St. Louis there is a large alternating current station, and I cannot believe that an establishment of that kind would not be very glad to have a large number of fifteen or twenty H. P motors to run elevators and things of that kind. If there is nothing in the way of their being supplied, they ought to get them.

Mr. Bradley—I tried to build those motors and I have not been able to do it. We succeeded in building a one to two H. P. motor to work on a single phase alternating circuit which had an efficiency of fifty-two per cent. We have never been able to construct one without a commutator, and wherever a commutator is used the sparking is something dreadful. If it is not bad when the motor is first started, after a few hours it becomes very bad, and we have not been able to design any brush that will obviate the difficulty.

Dr. Bell—I will simply add to Mr. Bradley's statement of the case what I have been able to get hold of regarding the Brown alternating motor which has been exploited in Europe somewhat. The first efforts in the way of getting a motor to run on an ordinary alternating circuit which would be self starting were made by Zipernowski and his associates; that started well, but as Mr. Bradley stated had a continuous blaze on the commutator during starting.

I have no grudge against the two-phase motor at all. And as far as the transformers go it does not make any difference whether it is a multiple of two or multiple of three. In one case we have the same number of wires as in the other; in the three-phase we would only run three wires; in two-phase we run three or four; I think the usual practice tends more to four wires, so that I think the difference is quite largely constructional difference.

Prof. Weston—I think that Mr. Bradley hit the nail on the head a moment ago when he frankly admitted that he had tried to build an alternating motor of large power but had been unable to do so. There can be no question as to the fact that there has been and still is a large demand for such a system of transmission of power as has been referred to, viz., a simple transmission by means of the ordinary alternating current generator. Therefore I do not think it is exactly fair to dodge the question. There has been a demand. The demand exists to-day The difficulties have been so great that they have not been able to surmount them.

I would like to ask Dr. Bell why he makes the statement that 1,000 volts is the limit of work for the direct current, giving anything up to 100 amperes. I do not think that statement was well founded. I do not know whether Dr. Bell has any particular instance in mind—if so, I do not think the machine could have been designed correctly. I am quite sure of that, for with correctly designed machines I do not think there is any difficulty in running up to 5,000 volts, and with very large currents—very large currents—several hundred amperes. The question of the advantages of the two processes is still an unsettled one, and will not be settled probably for some years to come; it is a question of the survival of the fittest. But it does seem to me that the direct current system has a great many advantages over the alternating and *vice versa* ; just how the matter will terminate we shall have to wait I think to find out.

Mr. Bradley—I think this is a question of current; that is, as you increase the current you will have to decrease the voltage. It is not 1,000 volts, nor is it 1,200 volts, nor anything of that kind. With an arc machine having nine or ten amperes you can readily reach 6,000 or 7,000 volts; with a machine having 20 amperes you can reach perhaps 5,000 or 6,000 volts. I do not mean to say this as a scale; I am merely trying to give an example of what the thing probably is. If it is 50 amperes the voltage has to be reduced. I think that is the explanation.

Mr. Nunn—From experience in the back part of the room I am very much afraid I shall not make myself heard. I suppose my testimony in reference to the alternating plant that we have been operating is what is wanted. I can say that from its first installation to the present time it has been under my care, and I consider it a brilliant success, especially when I compare it with direct current systems which are in use around us. Our greatest trouble has been from lightning and from ground—ground very largely. The lightning has caused many defects and made many of the plants failures. We have to start our motors with a special starting apparatus, and we once in a while have a little trouble with that; that is as far as the operation of starting is concerned very simple. The men who take care of these machines, with two exceptions, are men who never saw an electric apparatus before.

Mr. Hine—My experience is entirely commercial I am not an electrician nor an inventor. I think that there is a demand for a system, whether single-phase or multi-phase, which can be used in cities like St. Louis for supplying power for all sorts of purposes—two horse power here, two horse power there, and ten horse power over there. I think it would be a great advantage if a central station man would be able to run the same generator and same system of circuit in a city like St. Louis. Long distance transmission is one thing; transmission of power for various purposes in a city is another thing.

Mr. Hammer—I would like to have Prof. Forbes give us his experience with the two-phase against the three-phase system.

Prof. Forbes—I can only say this in response to Mr. Hammer's kind invitation, that both the three-phase and the two-phase systems are working very satisfactorily in Europe. I have examined the apparatus and have made tests of the efficiency and I feel confident that we shall get very good results from either of those two systems. Of course there are two problems totally distinct as has been already mentioned—the question of transmission of power and the question of distribution of power. They are two very different problems and are capable of being treated in totally different ways. Of course besides these two systems of transmission and distribution, for these are systems which are very applicable for distribution as well as transmission, we have also the single-phase system, which works remarkably well, and of which we have had considerable experience in this country as well as in Europe.

President Ayer—This discussion has been exceedingly interesting and I think quite profitable to the membership. We have demonstrated one thing here to the central station men, viz., that our American electricians have very little faith in the promise or in the probability of the development of a practical alternating current motor for the single-phase current. We are either turned back to our direct current motors for power, where it is to be utilized in varying units such as are demanded of us for commercial wants to-day, or else we have to look forward to the development and introduction in the near future of the multiphase motor. We all hope that that time will be hastened so that we may be able finally to decide the problem, because long distance transmission of power goes and must go hand in hand with the distribution of power.

Underground Conduits and Conductors.

BY WM. H. BROWNE.*

Those who are intimately acquainted with the histories of the electric lighting companies of New York City may be pardoned if they believe that the experiences undergone by those companies have been unique, and that they afford to companies elsewhere opportunities for beneficial consideration.

---

* Abstract of Paper read before the National Electric Light Association at its Sixteenth Convention, St. Louis, Mo., February 28 and March 1, 2, 1893.

In the years 1880 and 1881, but twelve or thirteen years ago, two companies began in New York City the business of distributing electric current from central stations. They were the pioneers, at least in that city, in the business of electric lighting. They were provided with apparatus which, compared with present standards, would be considered totally inadequate to the designed purpose.

Coincident with this imperfect apparatus and other difficulties, the best medium then obtainable for the transmission of current of high potential was bare wire.

The first step from that bare wire towards the underground conductors of to-day was soon found necessary.

That necessity developed the cotton-covered wire, and with that the operatives felt safe from injury by shock.

Soon some protection from the conveyance of fire by the covering became necessary, and then followed the saturation of the cotton covering with lead. This proved so equal to the conditions that the fire underwriters in the interest of insurance companies formulated rules prohibiting the use of any other but that wire, which obtained their own name of "Underwriters."

With the improvement of insulation came improvements in the apparatus, and it became possible to pass through one entire night occasionally without having lights out or a "dead ground."

In the year 1884 manufacturers of apparatus saw in New York City a field of profit and advancement for their machinery. The result was that in that year, 1884, franchises were granted to no less than six other companies, all of them primarily intended for arc lighting. Some of the companies created in that year did not make rapid progress, and the increase of poles and wires for electric lighting was not materially appreciable until 1888.

The wires for telegraph, telephone, messenger service, police and fire alarms, however, increased rapidly and became so numerous that a bill was passed in the Legislature directing that the wires be removed from the streets.

Some approaches were made to the two old companies engaged in electric lighting as to their taking upon themselves the task of building subways for electric lighting purposes; but they, it appears, chose to refuse to entertain the propositions.

After a long contention between the city and the companies, nearly all the wires for all the high tension arc and incandescent service transmitted in the City of New York below the Harlem River were placed underground. Above the Harlem River the Board of Electrical Control allows the construction of aerial lines, no subways having been built in that section of the city. Below the Harlem River no overhead wires are permitted to be erected and few of those that were in existence remain. It is probable that before the end of this year scarcely any will be in existence. The penalties endured by the companies for their opposition to the subways have been severe and drastic. The expenses imposed upon them in their effort to take care of their business and meet the requirements of transferring their systems from overhead to underground have been enormous and burdensome. The expenses continuing for rentals, due in a large measure to the amount of subways constructed and not occupied, continues and seems likely to continue to be an onerous tax. These expenses and burdens have tended and are likely to tend further in the future to confine the operations of the companies to territory contiguous to their generating stations, and may also tend to avoid the fierce competition which existed during the days of aerial transmission, and which lowered prices to below remunerative rates.

Is it not advisable for controllers and managers of companies in such places to recognize that condition, and endeavor to avoid the experiences of New York companies by planning deliberately the procurement of the right to themselves to build and operate their own subways and further to utilize the experiences of New York to avoid the expensive mistakes there made and to place their business on a stable footing and in a position where they may have immunity from injurious and cheap competition and secure service to their customers free from the interruptions belonging to aerial transmission? The telephone companies find it materially to their advantage to use underground conductors and are doing it in many cities.

Underground conduits and conductors for electric lighting and power, provided with due care and deliberation, need not increase the fixed charges of companies doing a reasonable amount of business to such an extent as to be prohibitory.

The transmission of electric current is entirely analogous to that of gas, water or steam and must inevitably, in the not very distant future, be conducted underground as they are. To electric light companies, as to gas, water and steam companies, the Legislatures and law-making bodies should give rights enabling them to meet the conditions in the manner calculated to produce the best results for the companies and the public users.

DISCUSSION.

The President—Gentlemen, you have before you for discussion this paper of Mr. Browne's, which is a very full exposition of the experiences they have had in New York with the underground conduits. The paper perhaps, considered as a whole, is indicative of the solution of the question or the scheme of operating high pressure currents underground. He cautions central station men there to beware of the pitfalls that the New York companies have fallen into. He outlines some of the mistakes made in laying the conduits, and in other ways gives advice and caution. There is a good deal to consider, and the development of the future is not one of the simplest factors to be taken into consideration on planning and laying out underground wires and conduits. The question is peculiarly interesting to the companies in St. Louis, where the subject has been agitated in the last year or two Efforts have been made to pass State laws compelling the companies to go underground in the cities of Missouri. The telephone company has been endeavoring to get a franchise to go underground, but there is a difference between them and our local legislators, and they seem to be unable to get a satisfactory franchise; at the same time the local city government have been endeavoring to procure State legislation compelling them to go underground. No doubt many of you have had similar experiences. I would like the discussion on this matter to be as full as possible, but at the same time I desire to remind you that our time will be very limited to-day for the amount of business we have yet to transact.

Mr. De Camp—I would like to ask, as I am not personally acquainted with the gentleman, who is Mr. Browne who writes the paper.

The President—I am informed that Mr. Browne is the General Manager of the United Electric Light and Power Company of New York, and that he is the gentleman who took charge of the Consolidated Companies several years ago at the time the Westinghouse Company went into New York.

Mr. Moore—I would say, having been through the underground law in New York, that I would like to make a little statement of the state of affairs there. The New York situation was brought about mainly I think through the stupidity of the companies themselves. In New York two companies controlled the arc lighting business. The price for city lighting was 70 cents a night. It was generally understood that it was to be made about 50 cents. My company were very anxious to get into the business. They wanted to bid way down and I said no, "the present price they are going to bid is $182.50 a year." I wanted to bid $181. They gave me my way on every piece of territory there except the Bowery. They said we must get into the Bowery, and we made the price $160. On the opening of the bids one of the old companies made this statement: "If you will throw out all those bids we will light the entire city for 25 cents a night." In response to that statement and in compliance with their duty, they threw out all bids and we were asked to bid again, and our company bid $19\frac{9}{10}$ cents, and we got a very large order, one thousand lights.

Mr. Smith—I do not know how other members of the Convention feel, but I have attended some seven or eight conventions right straight along in which this matter has been thrashed out until all the grain was out of it and nothing left but the straw. You can read over the last five printed reports and find that all this has been gone over time and again. You can read them at home and save a great deal of time here. We do not want to go underground if we can help it, and the best way to stave it off is to do good overhead work.

CORRESPONDENCE.

Multiple Images in Lightning Photographs.

To the Editor of ELECTRICITY.

SIR: In regard to the fine photograph of so-called ribbon lightning by Mr. W. N. Jennings, a reproduction of which appears in your issue of March 1, 1893, I would suggest the following explanation.

It is not unusual with a heavy flash of lightning that the main stream brings the air particles in it to such a high state of incandescence that an appreciable interval exists after the flash during which the path remains more or less luminous, just as a meteor track fades out gradually. This is due to the gradual cooling of the hot stream of particles. If, therefore, such a flash be photographed by a camera which is moving or swinging, as would be the case on the rear platform of a rapidly moving train, the vibratory ramifications of the flash would come out rather sharply, as would also the rails and ties and other objects in the view, illuminated instantly by the main flash and not illuminated sufficiently by the hot streak remaining after the flash. The hot streak itself would, however, be spread out from the main flash like a ribbon, due entirely to the motion of the camera, and the direction of spreading would indicate the motion which the camera had instantly after the flash. In the picture of Mr. Jennings this motion was evidently an upward swing of the camera tube, and a swing a little to the left after the upper limit had nearly been reached. The motion is not directly upward, as shown by the transverse streaks having an inclined direction. The middle portion of the flash does not show the ribbon-like stream, and for the simple reason that it happened that the motion of the camera tube was in the direction of the line of the flash at that part. This, I think, will be found a complete and satisfactory explanation of the picture as obtained. A very slight angular movement of the camera tube would give the ribbon appearance of the stream in the picture.

The pictures showing multiple images are explained not because the lightning flash is of an oscillatory character, because such oscillations would be manifestly more rapid than would permit the change of position of the camera to take superposed pictures with the objects displaced. There are two causes for these multiple images. In the first place, it is well known that the heated gas left after a discharge of lightning acts as a good conductor and provokes the passage of other discharges down the same path. Now, the train by moving the camera will have changed its position between these separate discharges and each one of them illuminates the landscape, but the impression of the objects will be on different portions of the plate so that multiple images will be formed. Again, if there be a high wind blowing, the hot stream left after the discharge is itself displaced somewhat between the times of the flashes, but this displacement would be apt to be so slight that it would only blur the images and not cause them to be separated as they are shown in Mr. Jennings's pictures. I am therefore of the opinion that the multiple images were formed by the movement of the camera tube occurring between the times of the successive flashes down the same path. Yours truly,

ELIHU THOMSON.

Lynn, Mass., March 7, 1893.

New Companies.

The Riverside Park Railway Company and the Sioux City, Iowa, and Leeds Electric Railway Companies have filed articles by which the companies agree to a consolidation of the operating departments of the two roads, a sharing of expenses of operation, etc.

The Beverly and Edgewater Park Electric Light and Power Company, Mount Holly, N. J. Capital stock, $30,000. Incorporators: Louis R. Hibbard, John V. Rice, Jr., Edmund G. Harrison, George M. Lane and William E. Harrison.

ELECTRICITY IS PUBLISHED ON WEDNESDAY OF EACH WEEK

Our columns are open for the discussion of any question in which the interests of the Electrical Industry are at stake. News notes, descriptions of new devices with drawings or photographs, are at all times desired.

SUBSCRIPTION RATES:

UNITED STATES, - - - -	$2.50
IN CLUBS OF FIVE OR MORE, - - -	$2.00
FOREIGN COUNTRIES, - - - - -	$4.50

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

"Electricity," under its present ownership, has never solicited the advertising patronage of the General Electric Company.

THE ELECTRIC TRUST COULD NOT SURVIVE AN IMPARTIAL AND FAITHFUL INVESTIGATION BY A CONGRESSIONAL COMMITTEE. WHAT CAN YOU DO TO BRING THIS INVESTIGATION ABOUT?

I do not know that I can say very much as to the policy to be pursued on this question. I know what mine shall be; that I will never buy one cent's worth of material from the General Electric Company until they do that thing. (Applause.) I shall never buy one cent's worth of supplies from that company that I can possibly buy from an independent concern; and I shall do all in my power to advance the sale of any lamp which is put on the market which can be manufactured without coming under the law of infringement.—*T. Carpenter Smith, of Philadelphia, before the National Electric Light Association.*

THIS is the slogan: No man should buy one dollar's worth of supplies from the Trust which can be purchased elsewhere. Independent concerns should be aided in every practical way, and there is no more practical way than this.

Lightning Photography. The publication of the remarkable photographs by Mr. Jennings, taken from a moving train, which appeared in our issue of March 1, has given rise to various expressions of opinion as to the explanation of the "ribbon" effect and the multiple images.

We print in another column a communication from Prof. Elihu Thomson, giving an explanation of the lightning's effect on the camera plate. In order to bring out more information on this subject, we invite expressions of opinion from others who have witnessed these phenomena.

* * *

Direct vs. Alternating Currents. One of the questions which came up during the discussions before the National Electric Light Association was the relative efficiencies of the direct and alternating current systems of distribution from central stations. A company about to establish a new station is generally confronted with the difficulty of making a choice between these two systems, and the desirability of either cannot be generally decided to cover every case.

The most important factor in the decision will probably be the distance to which the current is to be transmitted. The low voltage and heavy currents which are employed with direct current distribution make the use of a heavy system of conductors necessary, and practice has shown that beyond a certain distance the interest on the investment in copper conductors becomes great enough to eat up the profits of the lamp rentals. The introduction of the three-wire system enables this distance to be extended with some economy over the two-wire system, and in a few cases in Europe the use of the five-wire system has still further reduced the first cost of the copper used in the distributing system. The limit to which both of the latter systems may be carried is, however, soon reached, and their use introduces to some extent complications in the methods of regulation and additional apparatus which operates to increase the running expenses at the station.

The direct current offers in several respects some advantages over the alternating in a district comparatively compact and where the services are evenly distributed. This is especially the case in regard to the operation of motors, which is a most desirable service for stations, as it helps to overcome the difficulty of a light day load—a condition for which most station men are seeking a remedy. Although alternating current motors of a capacity of one horse power or less are now made to operate successfully and with a fair efficiency on the usual single phase alternating current employed for lighting circuits, there is no motor of this class on the market of large size which can start with a load and be put in the hands of the layman with confidence, nor at present is the prospect of such a machine encouraging. In some cases these large size alternating current motors are employed with success, but where the variations in the load are large the motor is apt to be pulled out of step with the generator or perhaps stopped altogether. Another advantage offered by this system is the possibility of utilizing electrical storage, which, although not yet employed in this country to any extent, is daily becoming more and more recognized as essential to the highest economy of operation.

The charging of batteries for isolated plants is also impossible in the case of alternating currents, although such a service is frequently called for. The regulation of the voltage is less exact with the latter system, and the economy varies to a greater extent with the decrease of load than it does with a direct current. This is due to the loss in efficiency in the transformers as their load decreases, although this factor has been very materially reduced recently on account of the improvements in the design of transformers now on the market.

For a small station supplying current over a limited area and for various kinds of service the direct current offers the greatest flexibility, but on the other hand a good many cases arise where the alternating system is the only possible method, from a commercial standpoint, and in other cases the question of the difference of the cost of installing and operating either of these can only be decided after careful investigation of each particular case. There has lately been a far greater tendency towards the use of alternating currents than formerly. Were it not for a few of the drawbacks mentioned, its economy in almost every case would be unquestioned. To-day it has the field of long distance transmission for lighting almost to itself, and with some modifications will take the same position with long distance power circuits.

Should the future produce a satisfactory motor for this current and some efficient means of electrical storage, the alternating current would no doubt take its place at the head, but now the question between direct and alternating currents must remain to be decided in any particular case according to the distances to be covered and the class of services rendered.

Encouraging Symptoms. When ELECTRICITY, a little over six months ago, began a vigorous and effective attack on the Electric Trust, there were few who believed the attack to be unjust, but there were many who believed it to be premature, if not wholly unnecessary. The intention of the Trust to wipe out by any means, fair or foul, all competition, was not doubted; its ability to carry out its intentions to any disastrous extent was doubted. ELECTRICITY knew what it was talking about, and was content to wait for a wider dissemination of knowledge of the actual condition of affairs. It has not been compelled to wait long.

It was made clear at St. Louis, where were gathered representatives of nearly all the leading manufacturing houses and a large number of Central Station men, that the entire body of independent interests has in a few months come to know that ELECTRICITY was right; that we were not even premature; that the danger was present then, and is still present; that decisive action is necessary to preserve any measure of competition in the trade.

History has been made in the past six months. The Trust has proved not only its intentions, beyond any doubt whatever, but it has also proved its power of injury. Although business as a whole is good, there is not a supply house but has been made aware that the Trust *can* curtail its profits; there is not a builder of dynamos but has learned that the uncertainty as to a supply of lamps has injuriously affected his trade; there is not a Central Station man but knows that the price of Trust supplies has been increased, and that with all competition crushed the prospects for profit in his business are gone.

With this realization of the truth by the independent interest, the battle is, perhaps, half won. But we are not among those who underestimate the strength of the General Electric Company, the effectiveness of its methods, and its many advantages in the fight.

Its primary advantage is that it has no conscience; that it will and does stoop to methods which decent business men are not accustomed to meet. And there is no prospect that, whatever its earnings or losses, it will be without ample funds for a year to come.

We place ourselves on record as asserting that the trouble has only begun with the closing up of the various lamp factories, and that before January 1, 1894, it will be found that the Trust has stronger cards than it has yet played.

A plan of redress must be adopted and carried out with vigor.

We believe that a thorough and impartial investigation by a Congressional Committee would do more to break up the whole Trust machine than any other action which could be taken.

Every man in the trade should do his utmost to bring this about. We shall send out with our next issue blank forms of petitions which we trust will be filled up speedily and forwarded by the hundreds to various Representatives.

Meantime, Central Station men should not buy one dollar's worth of supplies of the Trust which can be purchased elsewhere.

IF YOU have been receiving an occasional complimentary copy of ELECTRICITY, and like the paper, *send in your subscription.*

* * *

IT IS about time for those old sea-dogs, Lieutenant Greene and Midshipman Colvin, to concoct another letter proving that the General Electric Company has no policy.

* * *

QUESTIONS for every independent manufacturer and supply man to consider : Is ELECTRICITY aiding me in my business in any degree? Should it not have my support?

* * *

IF Captain Eugene Griffen is to pose as the President of the General Electric Company after the next annual election, assuming all the odium with none of the power of the office, he is making a sacrifice for friendship's sake which few men are capable of and which few friends would insist on. Mr. Coffin is not going to lay down the reins; and working under a blanket his power for evil will be increased rather than diminished.

* * *

The *Electrical World* in a recent issue saw fit to publish its views as to the proper field of a trade paper. It practically asserts its cowardice, and glories in it. It proclaims itself a poltroon, and is proud of it. This would have been surprising from any journal with an average sense of journalistic proprieties; but coming from the *Electrical World* it is just what was expected. The proprieties of the situation would have demanded an apology, not brazen glorification.

* * *

THE admirable remarks of Dr. Edward Weston on the incandescent lamp question, in discussion of Mr. Townley's paper at the St. Louis Convention, will be presented next week.

Trust Methods.

Notes and Comments from Various Sources.

Even Painful Duties Must Be Performed.

To the Editor of ELECTRICITY.

DEAR SIR : If you can give the necessary space in your columns, I should like to add a few words of appreciation to those heard on every hand of your outspoken antagonism to that modern octopus, the General Electric Company.

The constantly increasing antipathy toward its methods on the part of the public, past and present employees, and all who are much thrown into business contact with its officers must certainly have an effect in due time, and it is refreshing to see at least one Electrical journal with sufficient disregard for "policy" to take an outspoken position.

A somewhat intimate contact of several years' duration with Mr. C. A. Coffin and the select few whom he has found most ready to sink their own personality in attaining true perfection from a Thomson-Houston Electric Company standpoint, has filled the writer with surprise that a gentleman of such marked and acknowledged business qualifications, and withal the ready capacity for making friends whenever it suits his purpose to do so, should allow himself and his executive officers to make enemies of the very men who have helped secure for him his present success, through utter disregard of verbal or written agreements, and continual favoritism for those in a position to exert political or social influence.

A greater contrast can hardly be imagined than that between the *esprit de corps* which permeated the whole working force of the Thomson-Houston Company when "the boys" were content to take part pay in promises, and the "every-man-for-himself" feeling which has come as a natural result of their non-fulfilment, with continued acts of petty injustice.

Should it ever become your painful duty to chronicle the downfall of the present oligarchy, I shall be pleased to add a few facts and figures to the volumes which will then be at your disposal, to show "on what meat doth this our Cæsar feed that he is grown so great," but in the meantime I must, for obvious reasons, confine myself to other lines of service.

Very truly yours,
ATLANTIC AVE.

The General Electric Company has long made a specialty of statistics. The records in their office are voluminous, and contain more or less detailed information in regard to every electrical plant and manufacturing concern in the country. They include, among many other points, the capital stock of the various manufacturing companies, amount paid in, time they have been in business, profits made, percentage of those profits made on goods controlled by the General Electric Company, price required to buy out each company in a legitimate way, and diverse Mems. as to personality of the managers and chief stockholders.

Mr. Coffin has not trusted wholly to his young men in the gathering of these statistics. He is an artist in this line, and does not depend on circulars. Personal interviews have been more in his way.

Mr. John Doe of Oshkosh receives a polite invitation to call at 44 Broad street to discuss the matter of purchase of a controlling interest in his business. He feels honored. The profits which he has worked for so long seem at last to be his, and all at once. Of course that corporate Crœsus, the General Electric Company, will pay a handsome figure.

Mr. Doe takes the first train for New York, and the first cab to 44 Broad street. Sometimes he waits three days for an audience, but New York is a great town, and he enjoys himself. At length he is ushered into the Presence. Mr. Coffin dispenses with servants, and himself takes Mr. Doe's hat, top-coat and umbrella, and lays them carefully away.

And here begins an Exhibition of Magnetism, surpassing Tesla's experiments in brilliance. Indeed, Mr. Coffin's Exhibitions are no experiments; they have been conducted scores of times, and have failed just often enough to prove the general rule.

Mr. Coffin smiles (who has known him to do anything else?). "Why, Mr. Doe, I am surprised to find you so young a man. Knowing all that you have accomplished, I had supposed you were a man well along in years; but you are only a boy."

Mr. Doe feels at once entirely at ease, and mentally raises his price $5,000. The Exhibition of Magnetism continues for a half-hour or so, and then Mr. Doe begins to wonder where he is at. He has told about all that he knows, and the offer made for his property is about one-quarter of what he expected.

Sometimes the climax is postponed for two or three sittings, but is almost always the same.

Mr. John Doe returns to Oshkosh, and reflects. If he is a man of brains and courage, he sets to work with doubled energy to work out his own salvation. But meantime he has placed himself at a disadvantage. His enemy knows his vulnerable points.

How many men, when they read of Mr. Doe's experience, will imagine that they have been dreaming of a recent occurrence in their own lives?

We think these Exhibitions of Magnetism have gone far enough. A man's business secrets are not well kept in the books of his adversary.

Mayor Pingree Wins.

The Boodle was Wasted.

The Michigan House of Representatives has passed the bill authorizing the city of Detroit to own and operate its own electric light plant. By the terms of the bill the amount which the council can expend for this purpose is $600,000. Any expenditure in excess of that sum must be authorized by the vote of the people.

If Mayor Pingree and Controller Black will now stick closely to Frank Rae, Detroit will have a lighting plant which will be the envy of her neighbors.

Wyandotte Still in Trouble.

On March 1 the common council rescinded their action giving the contract for a lighting plant to the Western Electric Company of Chicago, and voted to give a contract to the Wyandotte Electric Light Company for five years. Saturday Louis George and seventy-four other Wyandotte taxpayers filed a petition in the Wyane Circuit Court asking for an injunction against the mayor and common council to enforce the contract made with the Western Electric Company. Judge Hosmer granted a temporary injunction. Meantime the Western Electric Company is proceeding to carry out its contract as rapidly as possible. The probabilities are that Mayor Campan will win.

The Break in General Electric.

Views of Financial Authorities.

(*New York Tribune.*)

The only decided weakness shown yesterday in the market was in General Electric stock, which fell about 5 per. cent. on unusually heavy transactions. The decline was ascribed by the bulls to sales for the short account, but there were many shrewd observers who contended that liquidating sales were responsible.

(*New York Times.*)

Yesterday the star performer was General Electric Trust. It opened above 104. It closed a little above 99, a drop of about 5 points. The heavy selling was from Boston. Many stories circulated as to the cause of the drop, but none of them was accepted as satisfactory. It was announced some time ago that the Electric Trust was in a snarl with New England money lenders, and this rumor was revived yesterday and elaborated. There were supplementary reports suggesting that the Electric Trust proposes to issue a big block of new bonds.

(*New York Mercury.*)

The sensation of the day, however, was a bad break in Edison General Electric, which a couple of weeks ago was selling around 111, when it was reported that the Board of Directors was seriously considering the division of surplus earnings. Yesterday the stock broke from 100 at the opening to 99¾, and only recovered a few fractions before the close of the day.

. . . Edison General Electric, which sold last week at 108, was marketed about 11 o'clock yesterday morning at 98. When it looked as if the bottom would fall out of this particular specialty, Van Dyke & Williams appeared on the floor and bought 5,000 shares in one block at 99 and gave up Drexel, Morgan & Company as their principals. The traders immediately recognized that a battle royal was imminent, and they bought Edison General on the discovery that the millionaire banking-house was protecting the stock. It rallied to 102¼ on very few sales and closed at a net gain of 3⅛ per cent. over the lowest price of the day.

The weakness of General Electric is more deep-seated than the financiers would have us believe.

It is entirely unnecessary to explain why something worth 75 cents does not sell for $1.50. As we have before stated, the manufacturing plants of the General Electric Company could all be duplicated for about $10,000,000 to $12,000,000.

Probably less is known about the actual value of this stock than of any stock dealt in on the Exchange. *Electrical men*, who ought to know a little about it, have not been buyers.

It is probable that even the Wall Street speculators are being frightened out by the prospects of a Congressional investigation, and by the enormous legal expenses—expenses which cannot be estimated in advance—with which the company is handicapped.

On September 7, and again on October 12, we predicted in these columns that this stock would soon sell below par.

If any one is surprised at the slump, it is not electrical men, who know that the PROFITS OF THE COMPANY WILL NEVER PAY INTEREST, no matter how ingenious the annual statements may be in their construction.

It is believed by well-informed men that the Chicago branch of the company has made a *loss* in the past ten months of over $500,000. This office ought to be profitable if profits are to be made anywhere.

When the stock has dropped about thirty points further it will be somewhere near its intrinsic value.

The Most Economical Age of Incandescent Lamps.

BY CARL HERING.*

It is generally supposed that it is an advantage for incandescent lamps to have a long life; the object of this paper is to show that this is a delusion, and that it is not substantiated by facts, but that on the contrary under normal conditions a very much shorter life represents an actual gain in dollars and cents; or in more homely language, if the lamps do not die a natural death, it is more economical to break them at a comparatively early date than it is to keep them in use. The results obtained in the present deductions are so different from what is generally believed that they will doubtless be discredited by many.

TABLE I.

	Watts per mean horizontal candle power.							
	A.	B.	F.	G.	K.	L.	M.	Av.
Hours.

At the June meeting of this Institute last year a very able and valuable paper† was presented by Prof. Thomas and Messrs. Martin and Hassler on "The Life and Efficiency Test of Incandescent Lamps." This paper gives a very complete life-history in the form of data and curves of representatives of almost all the incandescent lamps made in this country. With this very complete and reliable data as a basis, I have endeavored in the present paper to deduce some figures to show what the best life of a lamp is, everything considered. It is well known that lamps deteriorate and blacken with age, becoming less efficient, and it is therefore an important question to know at what age they should be replaced by new ones; it is this point which the present paper is intended to answer.

The method by which the best age is to be deduced is the new and very rational one suggested by Mr. O'Keenan and described in *L'Industrie Electrique*, Nov. 25, 1892, page 510, also in *The Electrical World*, Dec. 24, 1892, page 404. As it is fully described in these articles I will merely state it briefly here. Calculate *for each hour* in the life of a lamp the *total quantity of light* given off by it in candle power hours *from the time the new lamp was first started;* similarly, calculating *for each hour* in the life of a lamp the *total cost* of this light, that is, the original cost of the lamp added to the cost of all the energy consumed by it *from the time the new lamp was first started* up to that particular hour. Now, it is evident that if for each hour in the life of a lamp we divide this total cost up to that hour by the total quantity of light up to that hour, we will obtain the *average* cost of a candle power hour of light from the beginning up to this hour. From this final data it can readily be shown at what age this total average cost is the least. If based on actual measurements of the lamp made throughout its life, it is evident that this method will give the most rational and only strictly correct way of determining the real cost of the light actually produced; the only factor which it does not include is the interest on the cost of the lamp and power which evidently are negligibly small. It includes the effect of the blackening of the bulb and of the lowering of the efficiency. It should be distinctly understood, however, that this method is based on the actual amount of light produced and on the actual cost of the power; whenever therefore either or both of these factors are not of importance, the results deduced here are also of less importance. I desire to emphasize this as it will doubtless be claimed by many, and with right, that the diminution of the light is of less importance to some consumers than the cost of a new lamp would be.

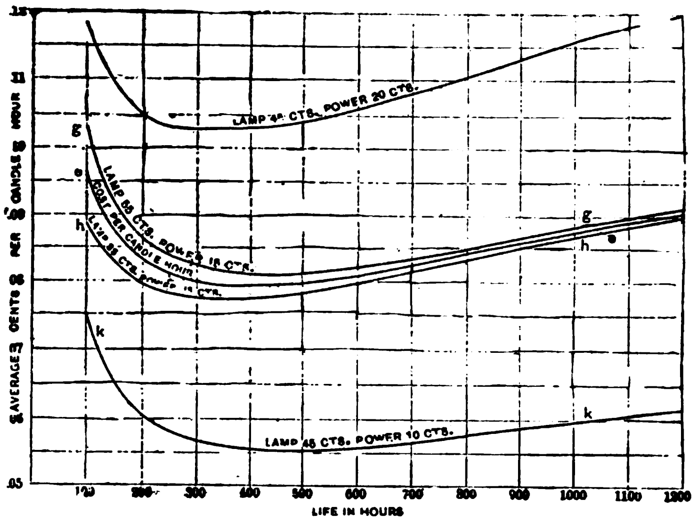
---

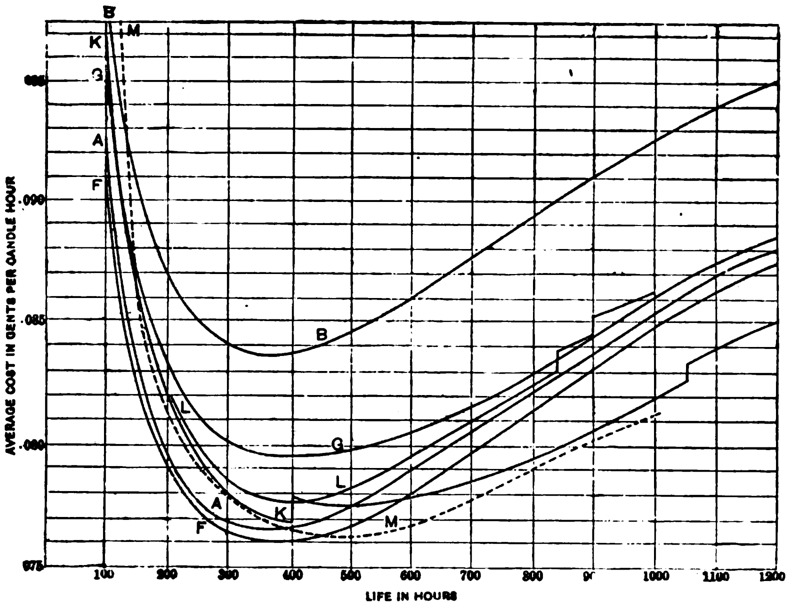
* A paper read at the seventy-fourth meeting of the American Institute of Electrical Engineers, New York, February 21st, 1893.

† TRANSACTIONS, vol. ix, 1892, p. 271.

Having given the candle power and the power consumption of a lamp throughout its life, any one can by this method deduce the final results as described. In the present case, however, the work, which is somewhat tedious, is greatly simplified by taking the data from Table V in Prof. Thomas's paper giving the watts per mean candle power. This data is given here in Table I for the seven most important of the thirteen makes of lamps; the last column giving the average, is the average of all of the thirteen lamps of that paper and not of the seven which we have here taken as the most important. By using the watts per *one* candle power it is evident that the candle power curve in the present calculations becomes a straight line, thus reducing the work by more than one-half.

To illustrate the method let us deduce the results given for the average lamp in the last column. Instead of calculating the results for every hour, which is a very tedious process, it is sufficiently accurate to do so for every hundred hours. From the last column of Table I calculate for each hundred hours the total kilowatt hours consumed per candle up to that age, the result gives the curve *a* Fig. 1. Multiply these values by the cost of a kilowatt hour of energy; fifteen cents is the price assumed here; this gives curve *b*. Add to these values the original cost of the lamp *per candle*, that is, the total cost of the lamp divided by the candle-power at the start; this gives curve *c* which is evidently parallel to curve *b*. Draw curve *d* representing the total candle-power hours from the start; in this case this line will evidently be straight; it would be curved if the watts consumed by the whole lamp and if the whole candle-power had been used instead of the watts per one candle. Curves *c* and *d* are those sought for. These curves are evidently the integrals of those represented by the numbers in the table. The process of integrating is effected most readily by purely arithmetical means as described above, that is by simply calculating the totals for each hundred hours, and it can, therefore, be performed by any one without a knowledge of algebraic integration. These curves, however, need not be plotted, they are given here only to illustrate the method. Now





divide each ordinate of the cost curve *c* by the corresponding ordinate of the light curve *d*, and the result is the curve *e* which is the final curve sought for.

This curve *e* gives for each age the cost of a candle-power hour of light, that is, *the average cost for the whole time from the time the lamp was first started up to that particular hour.* This is the curve which gives us the final results. The interesting feature about it is that it has a minimum point at about 400 hours, which means that at the end of 400 hours you are paying the least for a candle-power hour of light, that is to say, your light is then the cheapest during the whole life of the lamp, all things considered. If you continue to use those lamps longer than 400 hours the *average* price for the light will again increase and will continue to do so. Strange as it may seem, therefore, it is more economical to break the lamp at that age rather than to continue running it, even though this means buying a new lamp. This result will naturally be discredited by many but it is nevertheless true, always remembering that we are concerned with the cost of a candle-power hour of light under normal conditions and over an indefinite period. If the amount of light is of no great importance, but the price of the lamp is, then run them until they die a natural death; the same if the power cost nothing. If your lamp costs nothing, but your power does, then replace them as often as possible. The effect of different relative costs of lamps and power will be discussed later. The data assumed in this curve is that the average lamp costs 45c. and the power costs 15c. per kilowatt hour; the latter figure was obtained from a well known central station manager as a fair average for 110 volt continuous current circuits from central stations or for private installations of about 500 lamps; for installations of less than 500 lamps the cost will be greater, and for more it will be less.

As this curve must always have a minimum point for lamps which deteriorate, there is no question that there is such a minimum value in the cost of the light. Mr. O'Keenan calls this point by the appropriate name "smashing-point." To show the results of an ideal lamp, curve *f* has been drawn. This ideal 16 C. P. lamp, costing 48 cents and consuming 4 watts per candle, is supposed not to blacken or to change in any way. It is evident that in this case there will be no minimum point and the longer such a lamp is run the cheaper the light is, although after a few hundred hours the cost diminishes very slowly, being practically the cost of the power only.

To show what the curve *e* really means in dollars and cents let us calculate an actual case. If run 1200 hours the average cost per candle-power hour is .0903 cents or a total of 108.4 cents per candle for 1200 hours. A 16 C. P. lamp therefore represents a total cost of $17.344 for power and lamp, assuming for the sake of simplicity that it continues to give 16 candle-power. If stopped at 400 hours the cost of the light is only .0792 cents per candle hour or a total of 31.7 cents per candle for 400 hours; if renewed three times in the 1200 hours the cost will be 95.1 cents or $15.22 for 16 C. P. This shows that replacing the lamp after every 400 hours represents an actual saving of 13.3 cents per candle during a period of 1200 hours or a total of $2.12 saved per 16 C. P. lamp every 1200 hours. This amount of money represents the cost of almost five lamps at 45c., which might be interpreted so as to show some very curious results, namely, if you bought eight lamps originally, used only three of them for 400 hours each and threw the other five away, it will in the long run cost you the same as to buy one lamp and run it for 1200 hours, assuming that you are paying for light actually received. As the cost of the light at 400 hours is over 12 per cent. less than that at 1200 hours, it is an actual saving of 12 per cent. in dollars and cents if the lamps are replaced every 400 hours.

Another curious result which it will be hard for many to believe, is shown by the fact that the curve *e* cuts the .09 line at 1200 hours and also at about 130 hours, which shows that the light costs just as much whether the lamp is broken at 130 hours or run for 1200 hours. The curves being flat near their minimum points shows that it makes practically no difference (always remembering that we are considering the cost of a candle-power hour of light) whether the lamps are replaced every 300, 400 or 500 hours. It might at first be thought that at 300 hour renewals the lamps will make the cost greater than at 500; but this is not the case as the curve includes the cost of these new lamps. The explanation of this is that we are considering a constant amount of light, and if run to 500 hours more lamps must be used to give the same amount of light owing to their reduced candle-power. Of course in practice they will be renewed at 500 instead of 300 hours because the difference in the light would be noticed less than the price paid for the more frequent renewals.

EXHIBITS AT THE ST. LOUIS CONVENTION. (FIG. 1).

Another interesting and somewhat surprising result which may be deduced from the curves is that an ideal lamp of 16 C. P. which remains constant may cost originally as much as $5.75 and will then give precisely as cheap light during 1200 hours as the existing lamps, and even then it will be cheaper during the next 1200 hours than the others. An ideal lamp equal to the others at 400 hours instead of 1200 can cost as much as 75 cents and will even then be considerably more economical after those 400 hours. This theoretical deduction only goes to show how very great the value in dollars and cents is of a lamp which remains constant.

To show the effect of the price of the lamp and the price of the power, the curves in Figure 2 have been drawn. Curve *e* is, as before, that for the average lamp costing 45 cents while the power costs 15 cents per kilowatt hour. In curves *g* and *h* the cost of the lamp was taken at 55 and 35 cents respectively. They show that the minimum point is reached only about 50 hours later when the lamp is 10 cents dearer, and only about 50 hours earlier when it is 10 cents cheaper. The minimum cost is about 2½ per cent. more in the first case, and 2½ per cent. less in the second. The cost of the lamp therefore makes comparatively little difference in the best age of the lamp; it affects the cost considerably more at 400 hours than at 1200 hours where it is practically insignificant.

If for the same price of the lamp, namely 45 cents, the cost of the power is taken at 20 and 10 cents, the resulting curves will be *i* and *k* respectively. This shows that the minimum point is about 100 hours earlier in the first case and 100 hours later in the second. This point is furthermore more decided when the power is more expensive (see curve *i*), showing that for expensive power it is very much more important to replace lamps earlier, while for cheaper power it will make less difference. For cheap power with cheap lamps the position of the minimum point with respect to time will be altered very little from that of the mean curve *e*; this is also true for expensive lamps with expensive power. The five curves show the following: that even for considerable ranges the best age remains at between 300 and 500 hours; that the effect of the cost of power is much more important than that of the price of lamps; that the latter is not of so much importance as is generally believed. All the curves show that while there is a minimum point it is not very definitely located as to time, that is, it makes but very little difference if the lamps are replaced at 300, 400 or 500 hours, but after that the difference becomes apparent.

So far we have been considering the average of all the lamps in Professor Thomas's paper. In order to show the relative differences, as well as the absolute values for the different lamps, the curves in Fig. 3 have been drawn for seven of the most important of the thirteen lamps; they refer, though not in order, to the Thomson-Houston, Packard, Edison, Beacon, Perkins and Pennsylvania lamps. The letters of reference are the same as those in Professor Thomas's paper. He selected these seven as the most important and gave me the price of each lamp. These prices were divided in each case by the initial candle-power of each make, as given in that paper, to obtain the cost prices per candle. These candle powers were as follows: A = 16.0, B = 13.1, F = 14.2, G = 17.1, K = 17.0, L = 13.2, M = 12.5.

A comparison of these curves with those in Professor Thomas's paper will show the effects of certain features. Such a comparison will be far more interesting and instructive were we allowed to know the names of each one of the lamps.[*] We can merely say here that *B* and *G* are evidently poor lamps, while *M*, *F* and *A* are the best, notwithstanding that one of the *M*'s died very early, which is equivalent to increasing the price of the other nine lamps. *K* would have been among the best had not one lamp broken at the critical point. The best age of all but *M* are between 300 and 400 hours.

The scale of ordinates in Fig. 3 is much larger than that in Fig. 2, and the minimum point is therefore much more marked. The offsets in curve *K* and *L* are due to breakages among the 10 lamps of which these results are the mean. Curve *M* is dotted merely to distinguish it from those which it crosses at a number of places.

In addition to these curves attention is called to those shown in *L'Industrie Electrique*, Nov. 25, 1892, page 510, or in *The Electrical World*, Dec. 24, 1892, p. 404, deduced by Mr. O'Keenan for foreign lamps, in which the best age is less uniform and somewhat earlier.

Whatever other deductions may be made from this investigation, the most important is that lamps might to advantage be forced much higher than is customary, at the expense of their life This, though it requires more frequent renewals, will be a gain to the consumer as well as to the central stations; the former will get better and cheaper light, while the latter will be able to increase their output in lights or run the same number of lights at less loss in the mains, or what is equivalent, run the same number of lamps on considerably smaller mains. How far the lamps may be forced before the other extreme is reached, is a question to be determined when we have the data for such new lamps.

In conclusion I desire to state that while some of the results obtained from the present investigation are somewhat striking, it must not be forgotten that we have been considering the cost of *a candle-power of light*; as it is far more difficult to notice slight differences in the light than it is to notice the bills for lamp renewals, it would not be wise to adhere too strictly to what theory tells us. In practice, therefore, lamps need not be renewed as early as these deductions point out; at the same time, however, the results clearly show that it is absurd to keep lamps running too long, and that the life of our present lamps is more than sufficiently good. Perhaps the best practical rule for renewing lamps is to run them until the diminution in candle power becomes noticeable; after that point is reached we may rest assured that it is economical to throw them away. It might be argued that the original data is of too crude a form to admit of making deductions involving small differences. The differences, however, are not slight but very apparent, and, I presume, much greater than any possible inaccuracies in the original measurements. Furthermore, they show the existence of a uniform law. This paper should be considered more as an investigation of the subject and not as one claiming to show that present practice is radically wrong. I merely wished to prove conclusively the well known fact that it is absurd to run lamps too long. By far the most important conclusion is, that it would be far better to force lamps at the expense of their life than to run them at the present efficiency.

---

[*] Just before going to press I have received permission from the makers to state that the lamp marked M is the "Pennsylvania" lamp.

Convention Exhibits.

The exhibits of supplies, etc., at the St. Louis Convention were not so numerous as in previous years, but several concerns made handsome showings.

Our Frontispiece shows the most elaborate of the exhibits this year—that of the new General Incandescent Arc Light Company—which attracted a great deal of attention.

The Eureka Tempered Copper Company, of North East, exhibited a great variety of their specialties (Fig. 1), and the Bryant Electric Company, of Bridgeport, Conn., and George Cutter, of Chicago, also made creditable showings (Fig. 2).

There were, as mentioned in the last issue of ELECTRICITY, many other fine exhibits, of which, however, we were unable to obtain photographs.

Death of D. A. Andrews.

Mr. D. A. Andrews, President and Treasurer of the Pettingell-Andrews Company, Boston, died at Washington on Saturday last. Mr. Andrews had been in attendance at the inauguration festivities, and contracted a severe cold, which finally developed into the fatal attack of acute rheumatism.

Mr. Andrews was highly respected in Boston, and was looked upon as a man with brilliant prospects in the trade.

General News.

What is Going on in the Electrical World.

Jacksonville, Fla.—The electric railway is now open, and cars are running regularly.

Owego, N. Y.—There is talk of organizing a company here to build an electric railway.

Toronto, Can.—The American Watch Case Company are going to erect a new factory, and will use electricity as a motive power.

Boonsboro, Md.—The proposition to supply the town with an electric light plant was carried at the municipal election on the 7th.

Jersey City, N. J.—The North Hudson Railway Company has decided to give up cable and horse power and to use the trolley entirely.

Dayton, Ohio.—The report that the Dayton Electric Light Company had sold its plant to the General Electric Company of New York is denied.

Massillon, Ohio.—If the council of Navarro grants the right of way, an electric railway will be built between Massillon and that town without delay.

Detroit, Mich.—A bill has passed the House of Representatives authorizing this city to establish an electric lighting plant, limiting the cost to $500,000.

Olyphant, Pa.—The Olyphant Suburban Traction Company has been granted a franchise for an electric railway in the town and out to the borough line.

New Orleans.—The receipts on the new Carrollton Electric Railroad are already 100 per cent. over those of the old line on which mules were employed.

Harrisonville, Mo.—At a special election held here the proposition to issue $12,000 worth of bonds to erect an electric light plant was carried by a vote of 287 to 29.

Augusta, Ga.—The contract for the entire construction of the Murray Hill line has been awarded to Messrs. White & Company, electrical and civil engineers, of New York.

Watertown, N. Y.—At an election held here on Monday, there was a majority of 87 in a vote of 817 in favor of the city putting in a plant and doing its own street lighting.

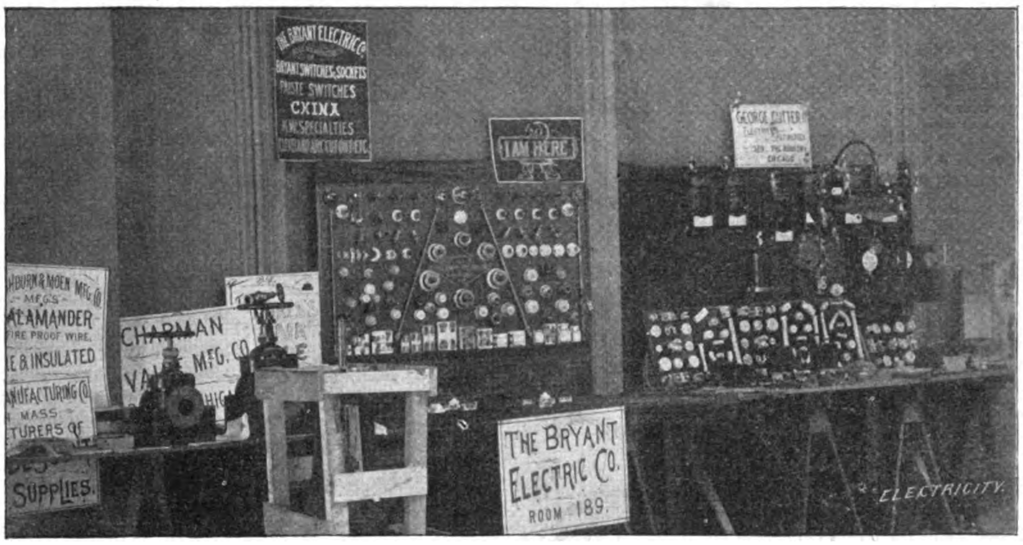
Alton, Ill.—The old street railroad lines have become the property of the Alton Electric Street Railroad Company. The roads will be changed into electric lines and some changes made in their routes.

Grand Island, Neb.—The city council has granted to the Grand Island Street Railway Company the right to construct and operate an electric street railway system and operate in connection therewith a system of incandescent lights.

Kalamazoo, Mich.—The street railroad property, for two years in litigation for the foreclosure of a mortgage, has been formally transferred to the General Electric Supply Company of New York, the last of the $32,000 purchase price having been paid.

Asbury Park, N. J.—The township committee has granted the application of the Asbury Park and Belmar Street Railway Company for a franchise to operate and maintain an electric railroad on Main street, between Wesley Lake bridge and Shark River.

Owego, N. Y.—A franchise has been granted the Owego Railway and Navigation Company to build an electric railroad in Owego. Work must begin in three months; one and one-half miles to be built by next September and the whole route to be finished in five years.



EXHIBITS AT THE ST. LOUIS CONVENTION. (FIG. 2).

Dubuque, Iowa.—At a sale under order of the court, the Dubuque Electric Railway, Light and Power Company's plant was recently purchased by a bidder representing the Old Colony Trust Company of Boston for $225,000. A new company will probably be formed.

Bridgeton, Pa.—The Bridgeton Rapid Transit Company, which was granted a franchise to operate electric cars on January 31, and according to the State law had thirty days in which to accept the ordinance, has applied for and obtained an extension of the franchise.

Findlay, Ohio.—Putting salt on the tracks during the recent heavy snows had a damaging effect on the electric street railway, and many cars were rendered helpless. It has been discovered that a brine is formed that saturates the motors as the cars pass, and this has been slowly eating the insulation of the wires.

Waynesboro, Md.—It is said that Baltimore and Waynesboro capitalists contemplate building an electric railway from Pen-Mar to Waynesboro. The distance is four and one-half miles. It is urged that the railway would be a great convenience to guests of the Blue Mountain House and Buena Vista Springs Hotel.

Montreal, Can.—The Montreal Electric Railway Company will spend a good deal of money during the coming summer. They have purchased 57,000 feet of land in St. Ann's ward, and will erect a motor house capable of furnishing 6,000 horse power. The company expects to lay sixty miles of track during the summer.

Portland, Ore.—The Portland General Electric Company has entered into an agreement to light the city for two years from the 1st of April next at the following prices : For each electric arc light of 2,000 candle power, $9.50 per month; for each similar lamp thereafter established, $9; for each incandescent light of 25 candle power, $1.95.

Bristol, R. I.—A petition to the General Assembly to incorporate an electric railway company to establish and maintain rails and supports for wires to connect the towns of Bristol, Warren, Barrington and immediate towns and villages with the town of East Providence, is being circulated and signed very generally by taxpayers of Bristol.

Norwalk, Ohio.—The Norwalk Incandescent Light and Power Company have filed a deed of assignment in the probate court, F. H. Jones and J. W. Foster being the assignees. The liabilities of the company are estimated at about $35,000. The company claims its assets are worth from $35,000 to $40,000, and that every claim will be paid in full.

Altoona, Pa.—The Altoona *Times* says: "Th work has been completed of fitting up car No. 1. of the City Passenger Railway Company with th Westinghouse motor, set in a Robinson truck, which replaces the Brill truck and Thomson-Houston motor. The trials of the car have demonstrated the superiority of Westinghouse motors in various ways."

Glen Cove, N. Y.—Curtis & Dean, of New York City, have been granted a franchise for "stringing electrical wires and lines of cable for transmitting electric light and power in, under, over and upon the highways, roads and streets of the villages of Glen Cove, Glen Head, Locust Valley and intermediate places outside the limits of the incorporated village of Sea Cliff."

Lewiston, Me.—There is a scheme on foot to connect Lewiston, Me., with North Conway by an electric road. The line is to take in by the way Minot Corner, Hackett's Mills, Mechanics' Falls, Page's Mills, Welchville, Oxford granite quarry, Oxford, South Paris, Norway, Frost's Corner, etc. The route will cover twenty-two miles of the best towns in Maine.

Tampa, Fla.—The Consumers' Electric Street Railway Company's electric plant will be run by steam for the present, but the company proposes to utilize the fine water power of the Hillsborough River for that purpose in the future. The dam is six miles from the city, where there is a fall of fifteen feet, which will furnish power enough to run all the factories in Tampa.

Chicago.—The Controller, in a report to the City Council makes this statement : "The city is now paying to private corporations for electric lights in the Town of Lake and South Chicago at the rate of $175 per lamp per year. If the posts, etc., can be erected by special assessment double the number of lamps can be maintained for the same cost—viz., $35,000."—Forty-two firms in the Department of Electricity at the World's Fair have begun work on their displays.

Kansas City, Mo.—Eastern capitalists having bought up the properties of the Citizens' Electric Light Company and the Electric Street Railroad Company, will consolidate the two companies. A mammoth power house will be built at a central location. Charles E. Dustin, of Hartford, Conn., will be president of the consolidated company, A. T. Batchelder, of Keene, N. H., vice-president, and George A. Litchfield, of Keene, N. H., treasurer. The active management will be in the hands of J. W. O'Neill, of Kansas City.

Madison, Wis.—The Northwestern Electrical Association, which recently held a meeting at Milwaukee, will hold its next meeting at Madison in the third week of July. The association is formed of owners, stockholders, managers, superintendents and electric engineers for all electric light companies doing business in Illinois, Michigan, Minnesota and Wisconsin, and its objects are mutual benefit and the dissemination of knowledge concerning electrical appliances.

Indianapolis, Ind.—The policy of the new Citizens' Railway Company will be, it is stated by one of the officials, to build up the road and make it first class in every particular; to abandon the old lines and old cars and replace them with electric lines and the latest improved cars.

Muncie, Ind.—A dispatch to the Cleveland *Leader* from Muncie says: "The Muncie Electrical Works is the name of a new manufacturing concern that will employ about one hundred hands here. The gentlemen at the head of the enterprise are James Chamberlain, Fred McNamee and others, of Cleveland. The company is capitalized at $50,000, and will manufacture electric motors, dynamos, and general electrical machinery."

Paterson, N. J.—A Boston syndicate has been formed to build an electric car line through the valley east of the Orange Mountains. The road will extend from Paterson to South Orange, and will pass through Montclair, Bloomfield, West Orange and Orange proper. Consents have been secured to build the line from Bay Lane, Bloomfield, to Paterson, and also for the Montclair connection through the Watchung Heights and Whitsey and William tracts. In Montclair, it will connect with the Montclair line, which has already obtained its right of way.

Philadelphia.—The Schuylkill Traction Company, an electric trolley road, running from Locustdale through Ashland to Girardsville, and then to Shenandoah and Mahanoy City—about twenty-three miles in length—has been purchased by a syndicate of Philadelphia capitalists represented by William F. Harrity and Dallas Sanders. Thirteen miles of the road are now in operation, and it is expected to have the whole line completed by the middle of March.—The abandonment of the cable system has been decided upon by the Traction Company. Overhead electric trolleys will be substituted as soon as authority can be secured from the city councils.

Boston.—As a means of preventing such a terrible loss of life as that which occurred a few weeks ago at the Dover Almshouse a correspondent of the *Globe* suggests that all the locks on the doors in such institutions be connected by electricity with some central point easily reached by those in authority.—The American Bell Telephone Company has been given until August 25 to put in further testimony before the various examiners appointed by the United States Circuit Court in the suit of the United States against that company and Prof. Alexander G. Bell. This is the old suit brought wherein it is alleged that a certain patent upon the telephone was obtained from the Patent Department by means of fraud.

Grand Rapids, Mich.—The West Michigan Electric Company has let to the Siemens & Halske Electric Construction Company the contract for the machinery, wiring and other things necessary for the plant which is to be used in manufacture of electricity in Lowell and its transmission to this city. The specifications call for a 1,000 horse power dynamo. The local company first organized as the Michigan Electrical Company, but on filing the papers in Lansing it was discovered that a company bearing the same name had already been organized in Detroit, so the company reorganized as the West Michigan Electric Company with the same officers, as follows: President, C. Jesse Church; vice-president, E. F. Sweet; secretary, A. C. Sekell; treasurer, C. A. Church.

Newark, N. J.—The fine plant of the defunct Spiral Weld Tube Company has been sold to the Crocker-Wheeler Electrical Company of New York for $45,000, and that company will take immediate possession. The electrical works will give employment to over 1,000 hands.—Permission has been given to the New Jersey Traction Company to erect and equip in Kearny Township an electric railroad along Harrison avenue to the Hackensack. It is proposed to build the road through Harrison from Newark to Newark avenue, Jersey City, and thence to the ferries, and to charge ten cents fare.—The Newark Electric Light and Power Company has made a ten years' contract with the city for lighting the streets. There are now 2,600 street lamps in use nightly in the city.—To enable the syndicate which has gained control of the surface railroads in Essex, Hudson and contiguous counties in New Jersey to consolidate the railway, power and lighting interests involved, a bill has been prepared for presentation to the Legislature for that purpose.

Hartford, Conn.—A sub-committee of the representatives of the various city governments of the State have drafted a bill relating to street railway companies. The first section provides that any company chartered to operate a street railway in any town, city or borough, shall cause a plan of the streets and proposed grades, kind of tracks to be used and the motive power, to be presented to the Mayor and Common Council, selectmen or warden and burgesses, who shall give notice of a public hearing to all persons interested. If the plan is rejected an appeal may be taken to the Superior Court, where the matter will be heard and determined. Section 2 gives the officials full direction and control over the placing, erection, construction and maintenance of any tracks, wires, conductors, fixtures, etc., including the power of designating the kind, quality and finish thereof. Section 3 limits the time of the construction of any road receiving a charter from the General Assembly to the first day of December prior to the next session of the Legislature. Under Section 4 if any company fails for six months to operate its road, the proper authorities upon notice may remove the tracks and place the highways in suitable condition for public travel. Any expense incurred the company may be sued for in an action under the statute. Section 5 regulates the payment of a tax upon the gross receipts for the year, which probably will be 4 per cent.

Boston Notes.

The towns located immediately to the north of Boston are in a fair way of being, at a not distant date, as well supplied with electric street railway facilities as any territory in this country. Already several such roads are in successful operation, while many others are projected, and energetic steps are being taken by the promoters for commencing their plans. The shore towns of Stoneham and Wakefield are specially favored in this respect, for there are no less than three rival companies seeking for authority to put their projects through. The names of these companies are respectively the Boston, Malden and Stoneham, and the Mystic Valley Railway Companies. They all desire much the same location for their tracks in Stoneham, and matters are becoming more than a little lively in consequence. The selectmen have given hearings to various petitions, but the local governing body seems to favor the first-named company. Should it secure the authority it seeks, a track will be laid through to Malden, thence to Somerville, and so connect with the West End Railroad of Boston. Such a road will prove a great boon to the entire district, and the general hope is that conflicting interests will not make against the speedy carrying out of the plan.

The subject of rapid transit for this city is again engaging public attention to a degree that has not before been equalled. Elevated and underground systems have each their advocates, and plans innumerable are being submitted and discussed for the solution of the problem. The ever increasing congested condition of the main business thoroughfares, particularly Washington street, is forcing this matter to the front. The public is up in arms against the overhead trolley road through that street—not simply in opposition to electricity, but rather because it is more and more being felt that the West End Railroad ought never to have been allowed to run even horse cars along there, owing to its narrowness and tortuous windings. When the plan that is for all time to solve the problem has been finally agreed upon i.e., the streets to be traversed and whether an elevated or an underground system, electricity is certain to be adopted as the motive power; there appear to be no diversity of opinion on that point in the public mind.

New England electrical enterprises were well represented at the St. Louis Convention. Quite a number of gentlemen from Boston and elsewhere were present, while those who were too busy to leave home and travel so far didn't fail to let it be known in the West that they are still in the business and willing to increase their list of patrons. And it was because business is simply rushing at home that many more did not go, for everybody is just now enjoying a first rate demand for their goods, and indications are that the demand will continue.

The Union Telephone Company's Private Line Telephones.

The Private Line Telephones of the Union Telephone Company are especially adapted for rapid, cheap and direct private communication with offices, banks, stores, mines, factories, warehouses, stables, hotels, hospitals, private dwellings, etc., and do away with the high rentals of the ordinary telephone companies. The Union Company's telephone is said to work perfectly at any distance up to two miles, and as there are no electric batteries or appliances of any kind necessary, it will last a life time. The instruments are sold outright to those desiring them, and thus become the absolute property of the buyer. The accompanying cuts represent the manner of affixing the instruments for operation.

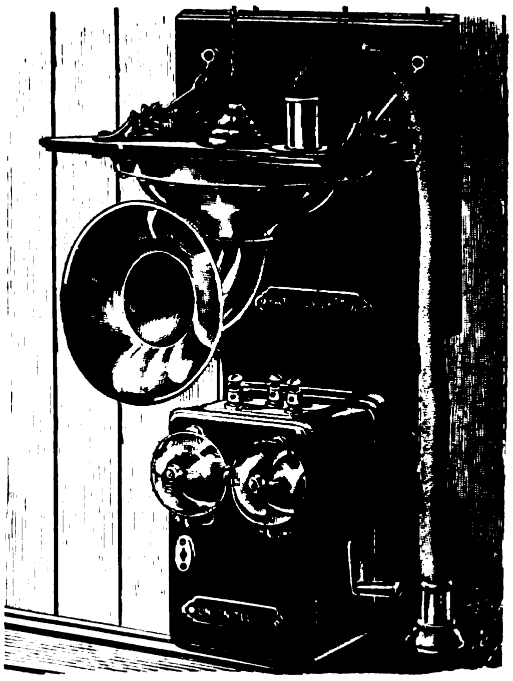


FIG. 1.

Fig. 1 represents the Simpson Acoustic Telephone, horizontal arrangement, with upright mouthpiece, especially adapted to meet the wants of those wishing to place the telephone back from the window, or in any part of an office or hall-way. Fig. 2 shows the main board of the multiple-duplex system, used where several lines from different points are brought together. It will be seen there is a horizontal bar with annunciator drops over the top of each mouthpiece. When a party from a distant point desires to communicate, he simply rings his call bell, when the drop over the corresponding mouthpiece at the central board will fall, indicating exactly which line is being operated. On the other hand, if the party at the main board wishes to call any department, he throws the drop down by hand on the line which he wishes to speak over and rings the bell, when the party so called will be simultaneously notified, without disturbing any of the other lines.

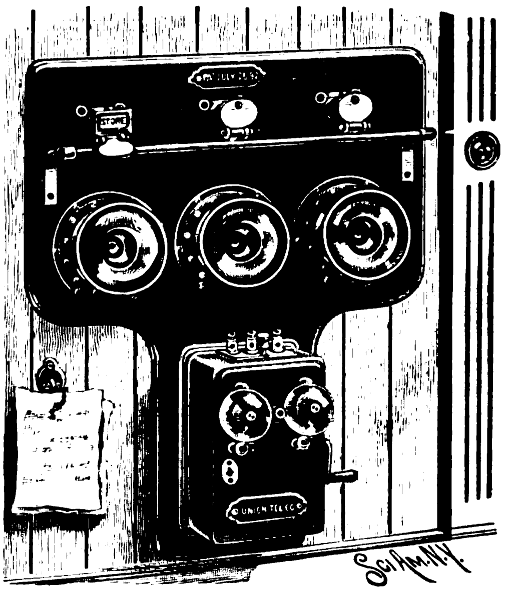

FIG. 2.

These telephones are manufactured by the Union Telephone Company, whose principal office is at 50 Broadway, New York, where the telephones can be seen in practical operation.

COMMERCIAL PARAGRAPHS.

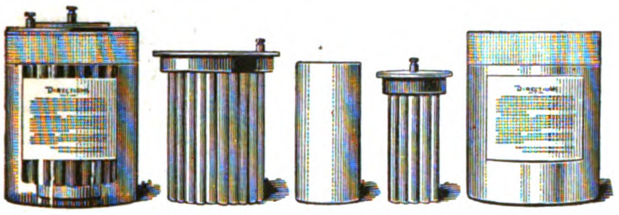
The Mica Insulator Company filed articles of incorporation March 1, 1893, at Elizabeth, N. J., the authorized capital stock being placed at $100,000, all paid in. The company's plant is located at Schenectady, N. Y., while its office and salesroom will be at 218 Water street, New York City. The officers are Eugene Munsell, president; Franklin Brooks, vice-president, and Lewis W. Kingsley, secretary and treasurer. The company will manufacture micanite for electrical insulation, a description of which has appeared in our columns. Through a process controlled by this interest, small scrap mica is now utilized in all forms and shapes for insulating purposes where sheet mica was formerly used, at a much reduced cost, and with no diminution in efficiency.

The New York office of the Eppinger & Russell Creosoting Works, now at 160 Water street, will be removed about April 1 to the Morris Building, corner Broad and Beaver streets, rooms 72, 73 and 74.

The J. T. Case Engine Company, New Britain, Conn., manufacturers of the well-known Case Automatic High Speed Engine, have issued a novel and elegantly printed "folder," illustrated with engravings representing the various types of engines which the company turn out in their extensive works. The "folder" gives a great deal of information relative to their machines which will be useful to customers in making up their orders, and the latter are invited to write for the new illustrated catalogue of the company now in the hands of the printer.

A New Primary Battery.

The accompanying cut shows the various parts of what is known on the market as the High Rock Primary Battery, and is a specialty invented and manufactured by the High Rock Battery and Novelty Company, Lynn, Mass. The makers do not make any claim for any special features in this battery, its construction aiming at strength, durability and efficient service; and in these respects success has been achieved. This battery consists of a glass jar 6 feet x 8 inches, in which fits a cover of birch wood well shellacked. Into the under side of this cover are inserted the ends of twenty-four carbon rods seven inches long and one-half inch in diameter. The usual style of porous cup is placed in the glass jar, and in the cup is placed a cylinder of zinc pencils. This battery has a long life and may be used with either chromic acid or nitrate of potash solution.



The usual objection raised against the unsavory odor emitted from a primary battery does not apply in this case, as the tight-fitting cover prevents any escape of fumes. Quite a demand has sprung up for this battery, so that the company is busy handling this and the novel electric reading and photograph developing lamp it makes.

ELECTRICAL COMPANY ELECTIONS.

The Postal Telegraph Company, Philadelphia. President, Albert R. Chandler; vice-president, Edward C. Platt; secretary, Charles C. Adams; treasurer, George R. Williamson; directors, Albert B. Chandler, Edward C. Platt, Charles C. Adams, George W. Dunn and Wilbur L. Stanger. The same directors were also elected for the Postal Telegraph Cable Company No. 1, No. 2 and No. 3.

Electric Railway Company, Augusta, Ga. President, Malone Wheless; secretary, Peter F. McAnnally; treasurer, Eugene J. O'Connor; directors, Malone Wheless, of Washington, D. C.; Joseph A. Vincent, of Philadelphia; Eugene J. O'Connor, Thomas Murray, Patrick Walsh, A. J. Scheers and Peter F. McAnnally, of Augusta.

Peekskill Surface Railroad Company, Peekskill, N. Y. President, Clark D. Rhinehart; vice-president, Edwin B. Lent; treasurer, George C. Gillully; secretary, Nelson G. Foshay.

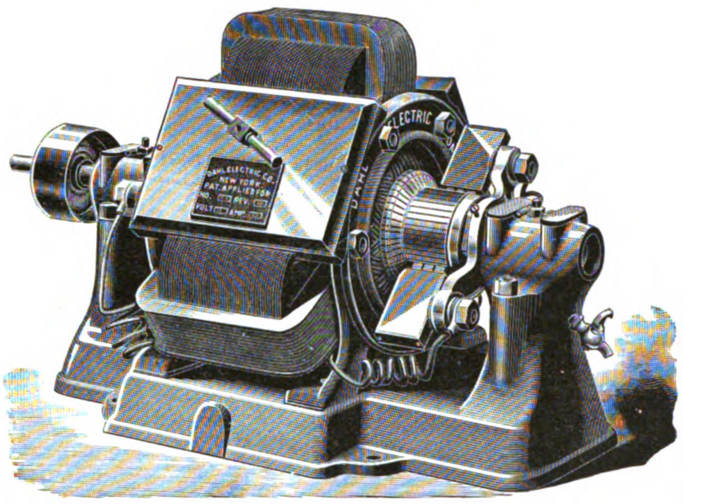
The Street Railway Company of Little Rock, Ark., has been completely reorganized, Col. S. W. Fordyce, president of the St. Louis, Arkansas and Texas Railroad, being elected president.

The Central Electric Railway Company, Baltimore. President, George Blackistone; secretary, Norman Jones; treasurer, Nelson H. Bell; directors, Wesley M. Oler, Miles White, Jr., Charles W. Slagle, Seymour Mandelbaum, George Blakistone, Peter Thomson and David Stewart.

New York and New Jersey Telephone Company. The old officers were re-elected at the annual meeting on the 3d inst. They are as follows: Charles F. Cutler, president; W. D. Sargent, vice-president and general manager; Joel C. Clark, secretary; Union N. Bethell, treasurer; directors, Charles F. Cutler, Alexander Cameron, Morris F. Tyler, Joseph P. Davis, Charles A. Nichols, Joel C. Clark, Hugh Kinnard, William D. Sargent, David B. Powell, George H. Prentiss, John H. Cahill and Union N. Bethell.

George Cutter's Catalogue.

The catalogue of George Cutter, the universally popular dealer in Electric Specialties, who transacts business at No. 329 The Rookery, Chicago, is a handsome and most attractive book throughout from the startling little image of Satan on the first page of the cover to the beautiful switch that serves to adorn the last. It would take several columns more than we can spare to describe the illustrations or the electrical devices illustrated in this catalogue. The index gives the names of about one hundred different articles dealt in by Mr. Cutter, numbers of which are of his own invention. Among these are ammeters, voltmeters, conduit connectors, cutouts of various kinds, combination shades, insulators, globe holders, lightning arresters, sockets, switches, rosettes, pulleys, mast arms, etc., and other articles are Simplex caoutchouc wire, paint and tree insulators, Germania shade holders, hard rubber tubing, awning insulators, cleats, buttons, current-breakers, etc. Some handsome cuts are given in the book of insulators, rosettes and switches made of the celebrated Syracuse china, which is said to be unusually tough. It need scarcely be added that special pains have been taken in the selection of the articles in Mr. Cutter's list, and buyers can therefore depend on their merit. The catalogue, which is very conveniently arranged for speedy inspection, will be forwarded on application at the address given above, 329 The Rookery, Chicago.



Motors for Alternating Currents.

BY F. H. LEONARD, JR.

The alternating system has heretofore been lacking in a very essential feature detracting from the earning capacity of a central station from which it is operated. We have until now seen in practical operation no motor operated from simple single phase alternating current which could be termed a commercial success.

The use of three wires, which is necessary with the multiphase system, not to mention the added parts of the generator, complicates the system, which must be balanced up in much the same manner as the Edison or Hopkinson three-wire system without gaining the advantage in the reduction of copper.

The converters required to operate motors from a multiphase system must have a capacity enormously in excess of what is actually required in watts to perform the work for which the motor is calculated, and when it is desired to operate incandescent lights from the same circuit a special transformer of complicated form is required, and to operate to best advantage this transformer must have both branches equally loaded.

It is doubtful if such a system can be successfully introduced into this country, where the simple single phase alternating system has taken root and branched so rapidly and extensively. Consider what such a change would involve. The present generator must be abandoned, the present system of wiring must be entirely remodeled, and a third wire added. The present converter must also follow the generator to the scrap heap, and the system of inside wiring must be altered to suit the changed conditions.

We might put up with the change in generators alone, for the sake of adding to our income the revenue to be derived from motors, and complacently consider the much evener curve in the ampere output of our central station plant, which would then be earning almost as much during the hours of daylight as during the hours of darkness; but shall we do the rest—shall we abandon our present system entirely, and go down into our pockets for the price of an entirely new equipment? No! We trust we shall never be compelled to, for already in our dreams we see the ideal central station, which we have every reason to believe will be realized in the near future.

Let us briefly sketch this ideal. A central station operating night and day with practically the same output in ampere hours from 6 A. M. to 6 P. M. as from 6 P. M. to 6 A.M., equipped with high pressure boilers, furnishing steam to triple expansion upright engines coupled direct to alternating current generators, without collector rings, commutators, or brushes, or any moving wire, furnishing a simple two-phase current at a primary pressure perhaps not materially different from the present standards, except for special long distance transmission, when by changing armature connections the same generator may produce much higher pressure, or the E. M. F. increased by step-up transformers, the current from these generators transmitted over the same system of distribution as used at present, except where conditions might warrant underground wiring, at the house transformed by one single phase converter, improved as to regulation and leakage loss to a safe pressure for commercial and domestic use, furnishing arc lights, incandescent lights, and power not only for stationary purposes but for locomotive purposes in propelling street cars, suburban railways, and even by sections the trunk lines of the country; and not to forget electro deposition by motor generators furnishing direct currents for plating as well as for charging storage batteries.

Mr. Olof Dahl, of the Dahl Electric Company, has produced such a motor, and a number of them are already in daily use. These motors can be made in any size, from one H. P. upwards, are synchronous, hence *must* run at a uniform speed, provided the generator runs steadily, and are self-exciting, starting with a torque about equal to their normal capacity. They have a commercial efficiency equal to the best direct current motors, the one H. P. size having an efficiency of 75 per cent. and increasing with the size of motor up to over 90 per cent. There is no undue heating in any of the parts, and neither armature nor field coils rise in temperature more than 30 degrees above the surrounding atmosphere under normal load, and there is no heating of the field cores. Should the armature be stalled, and this does not occur till the motor has 50 per cent. overload, the armature is not injured and no serious heating of the coils takes place, the current being choked by the self-induction.

This motor is designed to operate on the alternating system in use at the present time, without any reduction in the number of alternations which is called for in the use of the multiphase, involving as it would more expensive transformers greater in weight proportional to the reduction of alternation.

We can start at once to increase the earnings of our alternating central stations without the slightest change in our system of distribution from the lines already erected; and from the same transformers used for lighting at night motors can be operated in the day time, and both motors and lights at night, if the capacity of the transformer is sufficient.

The Shawmut Fuse Wire.

The proper use of fuse wire in electrical systems is succinctly treated of in a neat little pamphlet sent forth by the Shawmut Fuse Wire Company, 161 High street, Boston, Mass. The diagrams inserted make the meaning of the text clear, and among the facts demonstrated thereby are the fusing points in amperes for length of fuse, diameter of wires, and time required for fusing. It is clearly shown that for lengths above three inches the fusing point is constant, while in very short lengths that point rises rapidly owing to the conduction of the heat from the fuse by the terminals or binding screws.

The Shawmut Company claim for their fuse wire absolute uniformity, and give in their certificate of test the proper length for each size wire, and the fusing point and carrying capacity for this length. If a shorter fuse must be used, the curves show the action of the different sizes, and one may be chosen of such diameter as will fuse at the point required.

INCORPORATIONS.

Articles of incorporation have been filed in Passaic County, N. J., by the Speer Electric Transit Company of Passaic, with a capital of $100.000. The system which the company proposes to test is the invention of Alfred Speer, who claims that by it a speed of from two to three miles a minute can be attained. The tracks are to be elevated and the cars suspended.

The Eastern Lighting and Heating Company, Bangor, Me. Capital stock, $50,000. President, D. M. Yeomans, of Portland; treasurer, Henry McLaughlin, of Bangor. Organized for the purpose of acquiring and dealing in letters patent connected with lighting or heating by the use of oil, gas, electricity, steam, or any combination thereof.

The Marshall Electric Light and Power Company, Marshall, Mo. Capital stock, $80,000. Incorporators: Thomas E. Wardell, Harry M. Ruby and Wm. E. McCully.

The Onondaga Telephone Company. Capital, $200,000. To construct lines of telephone in Onondaga County, N.Y., with the central office in Syracuse.

A stock company has been formed at Georgetown, Col., which embraces the electric light and power company and the gas company, with a capital of $35,000. It is the purpose of this company to keep both systems in vogue and also to run a line to Silver Plume for the purpose of lighting up that town.

The Hancock County Electric Light and Power Company, Peoria, Ill. Capital stock, $15,000. Incorporators: E. B. Hillman, L. T. Bradley and H. T. Hay, who are also incorporators of the Farmington Electric Light and Power Company. Capital stock, $12,000.

A joint stock company, with an authorized capital of $25,000, for the building of a 100-barrel flouring mill and furnishing electricity for power and lighting purposes, has been incorporated in Butte, Boyd County, Neb., with the following officers: President, G. T. Bastedo; vice-president, M. H. Green; secretary, M. Arendt; treasurer, D. W. Forbes; directors, G. T. Bastedo, M. H. Green, J. E. Forbes, S. C. Sample, C. T. Smith, W. T. Wills and George Saunders.

Automatic Electric Light Extinguishing Company, Baltimore. Capital stock, $10 000. Incorporators: G. Milton Hughes, George T. Reed, Thomas M. Dobbins, Bowie H. Bittle and Robert A. Dobbin.

Vicksburg Electric Transit and Lighting Company, Vicksburg, Miss. Capital stock, $200,000. President, John J. Mulligan; secretary and treasurer, Chester R. McFarland; directors: Chester R. McFarland, John J. Mulligan and L. W. Magruder, of Vicksburg; Henry Smith, of Kansas City, Mo., and H. D. Butts, of Valley Falls, Kansas.

The Citizens' Electric Railway Company, Pottsville, Pa. Capital stock, $200,000. Directors: L. R. Keefer, Cressona; R. H. Koch, J. H. Zeibey, P. K. Filbert, C. K. Acker, R. A. Zerberg, Pottsville. The road will be operated by electricity and will be ten miles long. It will run through the streets of the borough of Pottsville, thence to Minersville, through Jonestown, Primrose and adjoining villages.

Electrical Conduit Traction Equipment Company, Newark, N. J. Capital stock, $200,000. Incorporators: John D. Griffen and Joseph C. Pearse, of New York; William C. Burling and A.H. Kearny, of Brooklyn, and Eugene F. Fuller, of East Orange. The certificate sets forth that the company will make and deal in all kinds of electrical appliances, especially those adapted to the use of traction companies.

Alton Electric Street Railroad Company, Alton, Ill. Capital stock, $250,000. Incorporators: Manning Mayfield, Henry G. McPike, John S. McGinniss, J. G. White, A. M. Farnum, E. H. Harrison, G. H. Walbridge and I. H. Porter. The objects of the company are to build, construct and operate street railroads through Alton, Upper Alton, North Alton, Godfrey Township and suburbs, and to construct and operate electric light plants and furnish power to corporations or persons.

The Pacific Sanders Electric Light and Manufacturing Company, San Francisco, Cal. Capital stock, $500,000. Directors: Frank C. Stover, Robert A. Rose, George C. Holbrook, Andrew White, John F. Sanders, Walter C. Lewis, W. C. Stadfeld.

The Mutual Electric Light and Power Company, Chicago. Capital stock, $75,000. Incorporators: Charles D. Wright, William A. Conover and Alfred R. Hechman.

Col. W. N. Woodruff, Judge W. F. Henney and Dr. Geo. S. Miller are organizing a joint stock corporation to be located in Hartford and known as the Green Electric Lamp Company. The inventor of the incandescent lamp to be made by the company, Henry Green, of Hartford, says that it does not interfere with any patents already existing. The company expects to organize with a capital of $100,000.

A charter has been granted at Harrisburg, Pa., to the Royersford and Spring City Street Railway Company of Montgomery County, to run from Royersford to Spring City, Pa. Capital, $12,000. Directors: G. Mortimer Lewis, Wilkesbarre; Henry M. Brownback, Norristown; C. J. Lewis, Philadelphia; Henry G. Kulp, Pottstown; E. L. Hallman, Royersford, and William Albright, Spring City.

The Union Electric Light and Power Company of Waterford, N.Y., (a consolidation of the Union Electric Light and Power Company and the Waterford Electric Light and Power Company). Capital stock, $150,000. Directors: William M. Lea, of Lansingburgh; Charles McKallor, of Waterford; Horace C. Train, of Green Island; William E. Acker, Sumner T. Dunham and E. S. Kaufman, of New York City.

The Essex Illuminating Company, Newark, N. J. Capital stock, $75.000. Incorporators: William H. Powers, Charles W. Anderson, E. M. Harrison, F. J. Drescher, Paul Wilcox, W. W. Egbert. all of Montclair. The company was formed to manufacture and sell electricity.

The Philadelphia and Allentown Electric Trunk Railway Company. Capital stock, $1,000,000. President, W. R. Grace, of New York City; directors: Thomas J. Swift, of Poughkeepsie; W. L. Turner, of New York; John F. Gwinner, N. A. Fulmer and W. F. Pascoe, of Easton, and W. F. Dannyhower, of Norristown, Pa. The line will extend from Allentown to Philadelphia and touch all the principal points between the two cities, including South Bethlehem, Coopersburg and other places.

The Glens Falls Electric Engraving Company. Capital stock, $8,000. Dr. A. H. Phelps, of Glens Falls, N. Y., is the principal stockholder, and the company has been formed to enter upon the business of engraving on glass by means of an electrical machine invented by Dr. Phelps.

The Middletown Street Railway and Power Company, Middletown, N. Y Directors: W. D. Stratton, C. Macardell, F. D. Youngblood, Leander Brink, M. D. Stivers, A. V. Boak, E. A. Brown and T. A. Weller. The purpose is to construct and operate an electric street railway in Middletown.

The Scranton and Carbondale Traction Company, for the purpose of conducting its business in the cities of Scranton and Carbondale and the intervening and adjacent towns and boroughs and in towns and boroughs adjacent thereto in Lackawanna and Luzerne counties. The general office of the company is to be located at Scranton. Capital stock, $10,000. Directors: Alford U. Chandler, Philadelphia; William Walker, Mayfield; John W. Towler, Samuel D. Pettit, Henry H. Sivelly, Scranton.

The Schuylkill Highlands Railway Company, to run through the streets of the boroughs of Conshohocken and West Conshohocken. Capital stock, $100,000. Directors: Frederick Phillips, Villa Nova; Samuel T. Kerr, William M. Kerr, Philadelphia; Clinton Gage, Boston; H. C. Landis, Camden, N. J.

The Ashland Electric Power and Storage Company, Ashland, Wis. Capital stock, $100,000. The company intends to establish works at Ashland and manufacture electric accumulators or storage batteries under the patent secured by Leslie B. Rowley, of Ashland.

The Elwell-Parker Electric Construction Company, at Chicago. Capital stock, $500,000. Incorporators: Frederick C. Phillips, Robert L. Tatham and Charles S. Webster. The company's purpose is to manufacture electrical, steam, hydraulic and pneumatic machinery.

The Panther Valley Electric Light, Heat and Power Company, Lansford, Pa. Capital stock, $10,000. Directors: W. W. Thomas, G. W. Davis, J. E. Dauer, Thomas M. Whilden, J. A. Quinn, J. W. Maloy. W. Drumheller, Lansford.

The Standard Electric Company of Denver, Col., has amended its corporation so that the name of the company is changed to the Electrical Specialty Company and the capital stock is changed to $75,000. P. G. Dodd, Ernest Maltmann, H. A. Triggs, R. P. McDonald and F. T. Cochrane are the new directors selected.

ELECTRICAL PATENT RECORD.

Letters Patent Issued February 28—March 7, 1893.

ELECTRIC RAILWAYS AND APPLIANCES.

492,627. Apparatus for Electrically Propelled Cars. Charles J. Kintner, New York, N. Y. Filed July 30, 1892.

492,659. Electric Railway. Michelangelo Cattori, Rome, Italy. Filed July 23. 1892.

492,737. Conduit Electric Railway. James H. Bates, Hoboken, N. J. Filed Aug. 2, 1892.

492,881. Leading-Piece for Overhead Electric Railways. Henry D. Winton, Wellesley, Mass., assignor to the Hersey Manufacturing Company, of Portland, Me., and of Boston, Mass. Filed June 20, 1892.

492,882. Street Car. John O. Adsit, Hornellsville, N. Y., and Charles H. Wickham, Tioga, Pa. Filed May 14, 1892.

493,089. Truck for Electric Locomotives. John C. Henry, New York, N. Y. Filed Dec. 18, 1891.

493,125. Electric Railroad Danger Signal and Bell. Paul Seller, San Francisco, Cal. Filed July 13, 1892.

493,212. Trolley-Wire Support. Frank E. Head, Toledo, Ohio, assignor of one-half to Elmer E. Kuney, same place. Filed June 13, 1892.

DYNAMOS AND MOTORS.

492,456. Switch for Operating Shunt-Wound Electric Motors. Frederick H. Berry, Milwaukee, Wis. Filed March 3. 1892.

492 493. Automatic Speed Indicator and Recorder. Wendell C. Fletcher, St. Louis, Mo. Filed April 29. 1892.

492,681. Armature for Dynamo-Electric Machines. George Hoare, Newark, N. J. Filed March 24, 1892.

492,524. Electric Motor. Franklin H. Beers, Newark, N. J. Filed April 2, 1892.

492,588. Dynamo-Electric Machine and Motor. Rudolph M. Hunter, Philadelphia, Pa., assignor to the Thomson-Houston Company of Connecticut. Filed Oct. 29, 1892.

493,104. Dynamo-Electric Machine. William M. Mordey, London, England. Filed April 28, 1891.

ELECTRIC LIGHTS AND APPLIANCES.

492,638. Electric Lighting System. Robert W. Rollins, Hartford, Conn. Filed Aug. 16, 1892.

492,650. Electric-Arc Lamp. William P. Wieman, Alleghany, Pa. Filed April 18, 1892.

492,808. Adjustable Lamp Hanger. Nicholas Jenkins, Waterbury, Conn. Filed April 19, 1890.

492.809. Incandescent Lamp. John von der Kammer, Chicago, Ill. Filed Jan. 23, 1893.

492,815. Electric-Arc Lamp. Carl K. MacFadden, Chicago, Ill. Filed Aug. 12, 1892.

492,847. Balanced Electric-Drop-Light Hanger. Truman E. Stevens, Blair, assignor of one-half to W. J. C. Putnam Cramer, Omaha, Neb. Filed June 21, 1892.

492,913. Electric Lamp Lighter. Josephus C. Chambers, Detroit, Mich. Filed Nov. 21, 1892.

493,100. Incandescent-Lamp Socket. James F. McLaughlin, Philadelphia, Pa. Filed Sept. 13, 1892.

TELEPHONE AND TELEGRAPH APPARATUS.

492,467. Long-Distance Electric Telephony. Charles M. Haynes, Omaha, Neb. Filed Jan. 12, 1892.

492,171. System of Combined Telephony and Telegraphy. Frank A. Pickernell, Newark, N. J. Filed April 29, 1892.

492,483. Busy Signal for Telephone Circuits. Edward J. Hall, Morris and Frank A. Pickernell, Newark, N. J. Filed Oct. 13, 1892.

492,484. Telephone Central-Station Circuit. James L. McQuarrie. Boston, Mass. Filed Sept. 8, 1892.

492,789. Speaking Telegraph. Thomas A. Edison. Menlo Park, N. J., assignor to the Western Union Telegraph Company, New York, N. Y. Filed Sept. 5, 1877.

492,883. Telephone Transmitter. Charles T. Bloomer, New York, N. Y. Filed Dec. 14, 1892.

BATTERIES.

492,422. Battery Jar. James F. McLaughlin, Philadelphia, Pa. Filed June 2, 1890.

493,007. Secondary-Battery Electrode. Isaac H. Bartholomew, Northford, Conn. Filed May 31, 1892.

493,221. Apparatus for Transferring Secondary Batteries. Mathias Pfatischer, Philadelphia, Pa., assignor to the Accumulator Company, same place. Filed July 22, 1892.

MISCELLANEOUS.

492,394. Insulator Bracket. William N. Eichnerg, Chicago, Ill. Filed Nov. 28, 1892.

492,398. Closed Electric Conduit for Railways. Adolph Heiser, Chicago, Ill. Filed May 31, 1892.

492,402. Electric Train-Controlling Apparatus. Frank E. Kinsman, Plainfield, N. J. Filed Feb. 24, 1892.

492,403. Means for Operating Throttle-Valves of Steam-Engines. Frank E. Kinsman, Plainfield, N. J. Filed Feb. 24, 1892.

492,457. Electric Railway Block System. Francis O. Blackwell, Boston, Mass. Filed Feb. 15, 1892.

492,478. Electric Burglar Alarm. Charles F. A. Sturts, San Francisco, Cal. Filed Sept. 30, 1891.

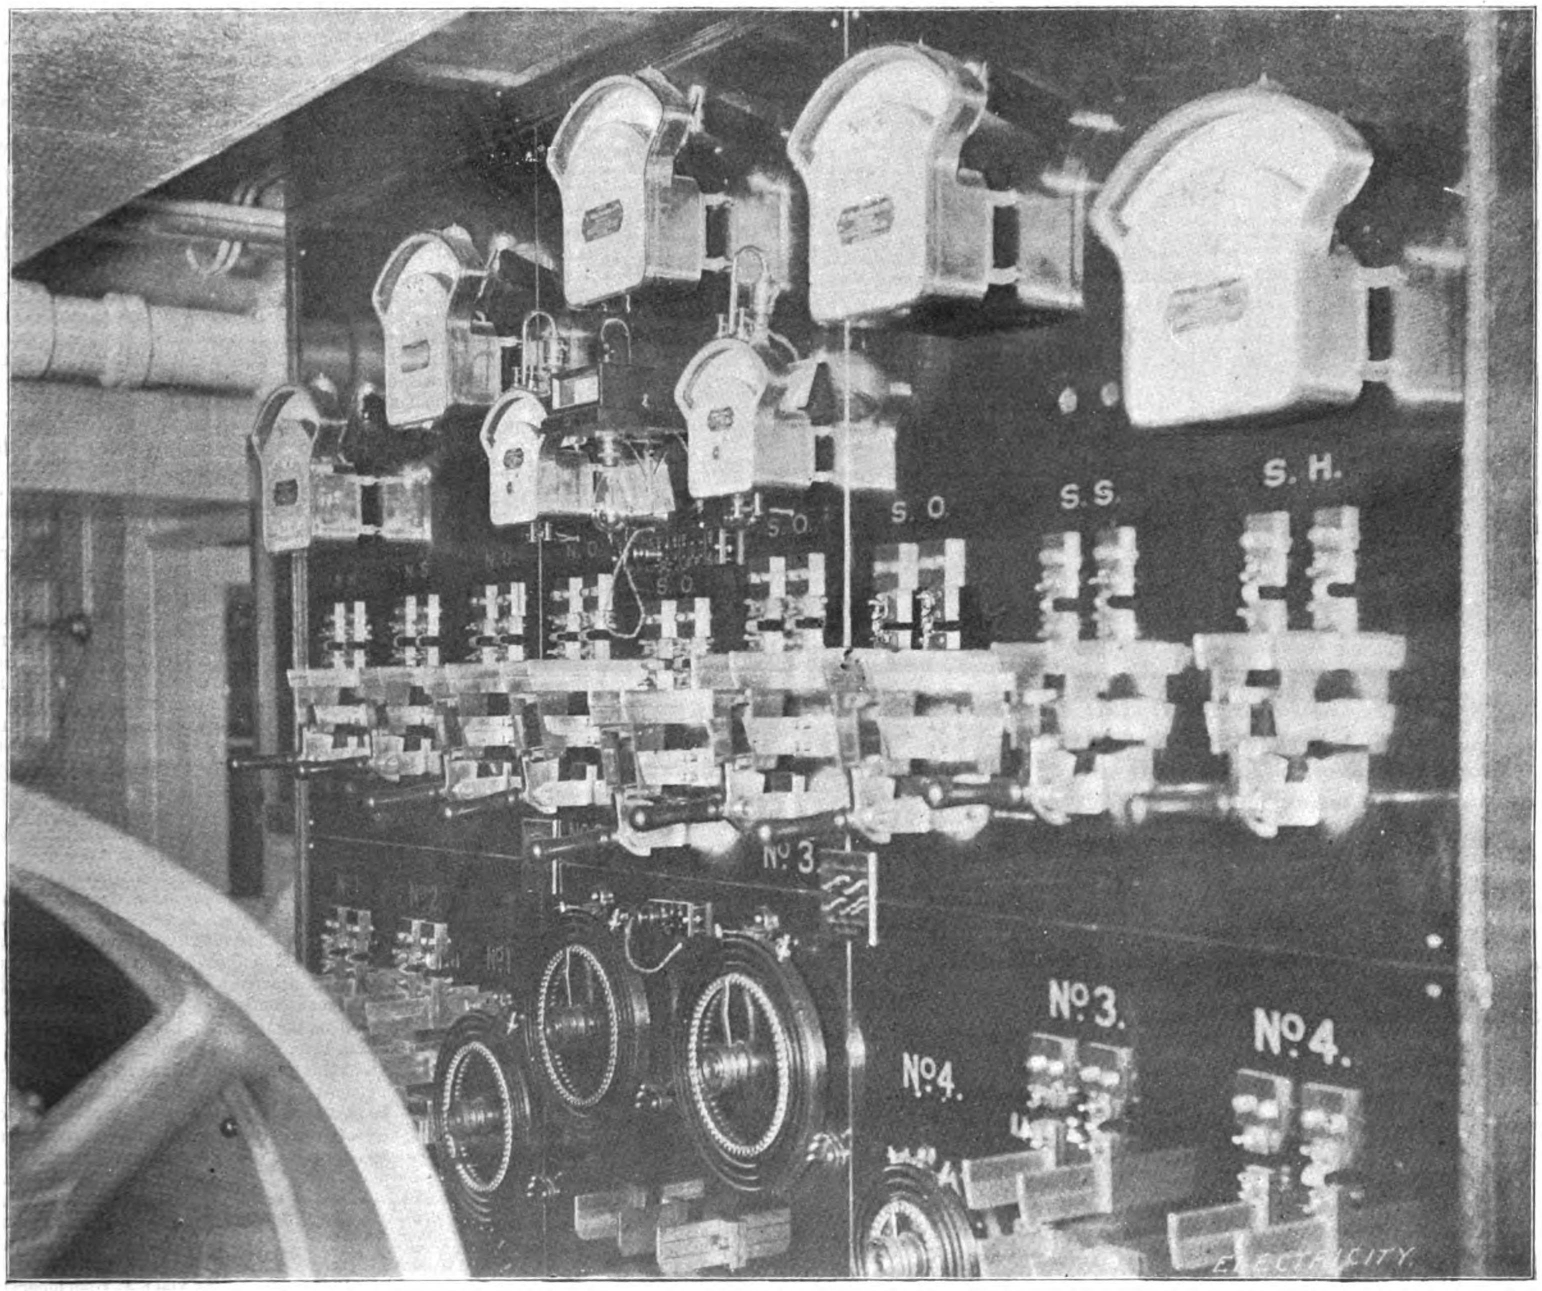
ELECTRICITY.

Vol. IV. New York. MARCH 22, 1893. Chicago. No. 10



SWITCHBOARD, HAVEMEYER BUILDING, NEW YORK. (See Page 126.)

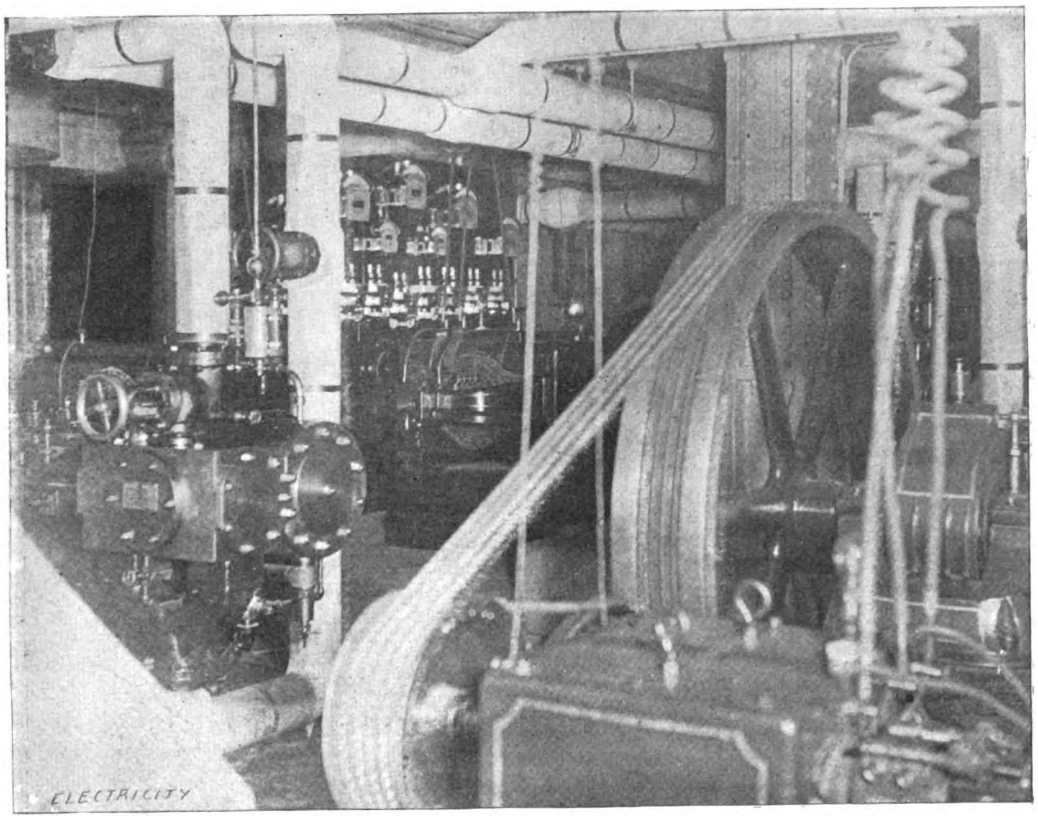
A Compact Plant.

The Electrical Equipment of the Havemeyer Building.

The electric lighting plant at the Havemeyer Building in this city, which has recently gone into operation, deserves more than ordinary attention, as it contains the most recent developments in incandescent electric lighting for isolated plants.

The plant is one of 3,000 lights. There are four McIntosh & Seymour engines and four Eickemeyer dynamos. Three of the engines are of 65 H. P., and directly coupled upon the shaft of each of these engines is a dynamo of 40 K. W. The fourth engine is 20 H. P., and an entirely new and very interesting rope drive connects the engine to a dynamo of 12 K. W. This small engine and dynamo are for use during periods of light load.

The switchboard (shown in our Frontispiece) is of highly polished black marbleized slate, and has mounted upon it all the instruments and switches for the control of the dynamos and of the several feeders leading therefrom to the stores, offices and halls of the building.



Dynamo Room, Havemeyer Building, New York.

The slate is supported at the back by a skeleton frame, and the whole is surrounded by a highly finished cherry frame, which forms an attractive setting for the polished black board, studded with its array of bright instruments and switches.

Mounted upon the board are five ammeters and two voltmeters, made especially for the contractors by the Weston Electrical Instrument Company and of their Central Station Illuminated Dial type. One ammeter is in circuit with each of the four dynamos, while the fifth shows the output of the entire plant.

One of the voltmeters is connected to the bus bars of the system, the second voltmeter being provided with a multiple switch for reading the E. M. F. at the various centres of distribution in the building, and the voltage at the brushes of the different machines, or can be used as a ground detector. When used in the latter capacity it shows not only whether the system may be grounded, but if there is a ground it likewise measures the resistance of the same.

The board is further equipped with a galvanometer for use when throwing the machines in multiple.

Mounted upon the face of the board under the respective ammeters of the several machines are four Carpenter Enamel Rheostats, and their neat appearance and the exceedingly small space occupied by them are most gratifying, especially to one that has formerly been obliged to disfigure an otherwise fine appearing board by mounting a large box rheostat on its face, or by cutting a large hole in it in order to bring the face of a rheostat anywhere near the surface of the board.

There are fourteen Ajax switches upon the switchboard, one for throwing the entire building onto the mains of the Edison Three-Wire Central Station service, one for each dynamo, eight for the office lights of the various floors, and one for the hall lights.

All cables are brought down at the back of the board, and are sweated into copper lugs for connection through the slate board to the switches and instruments.

All cables and connections are well protected by rubber insulation and insulating tubes at the back of the board, so that it would be impossible to cause a short circuit at this point by carelessness in the handling of tools or connecting of additional wires at any future time.

The wiring of the building is done with metal covered interior conduit throughout, the wire used being that of the Habirshaw Company. Edison cut-outs and incandescent lamps are used.

The entire plant was installed by H. Ward Leonard & Company under the supervision of Mr. Frank A. Pattison, the consulting electrical engineer of the architect, Geo. B. Post.

Promptly upon completion the entire plant was subjected to an exhaustive test by Mr. Pattison, lasting two days. The dynamos were subjected to a full load test of ten hours, and operated very perfectly in every way. The rise in temperature was 100 degrees Fahr. at the end of the ten hours run.

Indicator diagrams from the various engines showed a very perfect steam distribution and very close governing. The insulation of the system of conductors was extremely high, being 160,000 ohms with everything in circuit. The plant was immediately passed by the fire underwriters and accepted by the owners.

This plant is the first of its type in this country; that is, one in which bipolar dynamos are operated by being directly connected to standard engines running at 375 revolutions per minute, and the satisfactory results obtained reflect credit upon the contractors, to whom the selection of the apparatus to be used was left.

The extremely small space occupied by the plant, and the entire freedom from all noise and vibration, leave no room for doubt that plants of this nature will soon become almost universal for buildings of this description.

It is a matter of interest to note that the floor space occupied by the entire plant, including the space between the dynamos and surrounding them, is only five square feet per kilowatt.

The Incandescent Lamp from a Commercial Standpoint.

BY EDWARD WESTON.*

In the absence of the information asked for it is impossible to judge of the statements except as they appear in the paper. As I have had some experience in the manufacture of incandescent lamps, I would like to say a few words on the subject; and, Mr President and managers of the Association, if I get tedious or the time of the Association is being taken up without interest to the members, I shall not feel at all hurt if you will kindly notify me.

The modern incandescent lamp consists essentially of three elements—the carbon conductor, the glass envelope, and the leading-in wires. These are the essential elements of the lamp as the art exists to-day. The older incandescent lamps contained these same elements arranged in substantially the same manner; for you will find in nearly every case the carbon conductor or its equivalent, the glass envelope surrounding it and protecting it from the influence of the atmosphere to a certain extent, and thirdly, the leading-in wires or their equivalents, adapted to carry the current to the conductor, to be raised to a high degree of incandescence by the current.

The creators of the art of electric lighting—and I speak in this way because I do not think it fair to disregard the work of everybody who has preceded us—I say that the creators of the art of electric lighting understood the subject a great deal better than a great many people had given them credit for.

The fact that the incandescent lamp played so small a part in practical work until a comparatively recent period, does not warrant us in neglecting to give due credit to the early workers. This is true of all arts, but it is particularly true of the art of electric lighting, since, as a matter of fact, the methods and means now employed in making lamps and producing light by them are very similar to those employed by the early workers, and the essential elements of the present lamps are substantially identical with those of the early workers. Furthermore, the principles upon which the operation of the modern lamp depends, are precisely the same as those involved in the early lamps, notwithstanding recent decisions. Indeed, the fact that no incandescent lamp was commercially used until a recent date is not due to the causes generally ascribed, but to other causes, almost if not wholly overlooked by writers on the subject. The writers on the subject so far may, in my opinion, be divided into two general classes.

1st. Writers who have attained distinction in some other branch of scientific work, many of whom are apt to express their opinions rather hastily and without due consideration of the principles involved, on the possibility or impossibility of the application of some single scientific fact, or a number of such facts, to a useful art. Such writers always abound, and generally express their opinions fully in a very authoritative way whenever a new industry begins to attract attention.

2d. Writers whose opinions are based on sentiment, or who are biased or interested and are therefore frequently unable to look at things fairly or reason logically.

The former class of writers are generally honest, and firmly believe that they have good grounds for the opinions they form and express. Of the other class, those who are influenced by sentiment only deserve our consideration, but those writers who either wilfully close their eyes to the facts in the history of the art, or have no knowledge of the history, or wilfully endeavor to pervert the facts and seek to manufacture history, deserve the fate which will surely befall them.

Among the first class of writers, you may remember that a number of distinguished scientific men expressed very strong opinions on the absolute impossibility of economically sub-dividing the electric light, either arc or incandescent. What they said at that time was accepted by many as Gospel truth. Two notable instances of the kind which will serve to show how unwise it is to prophesy unless you carefully study the subject and take into consideration all the facts, ought to serve to make scientific men more careful. The two instances I refer to are those of the French electrical engineer, Mr. Hippolyte Fontaine, and the well-known English electrician, Mr. H. Preece. The former is well known from his early work in connection with the introduction of the Gramme machine and its use in electric lighting. Mr. Preece has for many years been chief electrician of the English telegraph service.

---

* In discussion of Mr. Townley's paper, read at the St. Louis Convention.

Mr. Fontaine was a strong advocate of the arc light, and of that system which necessitates the use of a separate generator for each lamp, and was engaged in the effort to generally introduce such a system. He had little faith in the success of any other system of arc lighting, and practically none in the possibility of success with the incandescent system.

Mr. Fontaine made a series of experiments on incandescent lamps grouped in series, and also grouped in parallel. The current to operate the lamps was derived from voltaic batteries variously grouped. In these experiments a rough effort appears to have been made to ascertain the strength of the current used with a single lamp, or a number of lamps in circuit, and the value of the illuminating power of the lamps was, apparently, roughly determined under the different conditions of grouping of batteries and lamps. But the experiments were wholly misleading, for several reasons. In the first place, there was no absolute determination of the strength of the current, no determination of the difference of potential at the terminals of the lamps, and consequently no determination of the energy required to bring a single lamp or a group of lamps to a certain candle power.

The experiments were therefore of the crudest character, and wholly insufficient to enable any one to draw any conclusions regarding the economy of the incandescent light, or the possibility or impossibility of economically sub-dividing it.

It may be truly said that the whole of the experiments were misleading, and were evidently conducted without even an elementary knowledge of the simple principles involved in the sub-division of the electric light, whether arc or incandescent.

Mr. Preece attacked the matter from a similar point, and fell into errors fully as great, if not greater, than those made by Fontaine. He wrote an elaborate mathematical paper on the subject, which was published in one of the oldest and best scientific journals in the world, and it was republished in many of the best scientific and engineering journals of the world, and the substance of the paper was embodied in nearly all the books published on the subject of electric lighting, and was endorsed by the authors of such books as an extremely valuable paper. The paper had the approval of many scientific men; it had the stamp of authority, and passed current as sterling gold, so to speak. In it he from dynamical considerations mathematically demonstrated the impossibility of economically sub-dividing the electric light, either arc or incandescent. Notwithstanding this (with all due respect to Mr. Preece), the paper did not embody the truth; on the contrary, the whole mathematical reasoning was founded on error and a misconception of the elementary principles involved in the production of the electric light.

I believe it will serve a useful purpose, and be of some interest, to examine these experiments and conclusions rather closely, and to show where the mistakes of these and other writers of about the same period arose.

Do you conceive it possible that a man will be so foolish as to suppose that if he put a kettle containing two gallons of cold water on the fire it would take no more heat to raise that two gallons of cold water to a temperature of 212 degrees than it would take to raise one gallon to the same temperature? Does it not appear reasonable to suppose that almost any school boy who had passed through the curriculum of one of our high schools would be able to answer that question correctly, and at once without resort to any mathematical formula. Is it not perfectly clear to the mind of any one in this room that it would require at least twice the heat or work to be done on two gallons of water to raise it to a given temperature as would be required to bring one gallon of water to the same temperature? Substitute for water any other form of matter, and is not the answer necessarily the same? Furthermore, substitute for heat any other form of energy, and is not the answer necessarily the same? Of course it is. Simple as these facts may appear, they embody the fundamental principles of the electric light and its sub-divisions, whether it be arc or incandescent.

Substitute for the water and the kettle a mass of carbon equal to 1-10 of an ounce, and so proportioned and disposed as to permit it being brought to a sufficiently high temperature to become highly luminous or incandescent, by heat from any source of energy. Measure the energy expended in maintaining its luminosity or degree of incandescence constant. Now split this 1-10 of an ounce of carbon into ten equal parts, lengthwise or crosswise, and arrange them so that the ten equal parts can be made to constitute ten separate luminous centres. It is manifest that we shall now have ten parts of carbon each equal to a 1-100 of an ounce. Now let them each be subjected to heat from any source of energy sufficient to raise the temperature of each of the ten small masses to the same point as that to which the large mass was raised and which they originally composed. Does it not follow as a matter of necessity that each mass of 1-100 of an ounce will require substantially 1-10 of the energy applied to the large mass to bring it to the same temperature, and that each of the ten small luminous centres will give a light substantially equal to 1-10 of the light of the large mass, and that consequently the light from the whole of the ten small masses will be substantially equal to the light of the large mass which they originally constituted.

If these principles are so simple, how is it that there has been so much mystery and misconception in regard to this subject? How is it possible that men like Mr. Preece should have used such language as appears at the end of the elaborate mathematical paper referred to, language which unquestionably denies the possibility of the economical sub-division of the electric light?

The explanation of the error is, that Mr. Preece assumed that when lamps were introduced in series in the circuit there was an increase in the total resistance of the circuit which diminished the current flowing, and he failed to perceive that to overcome the increased resistance in the series lamps and bring each of the lamps in series to the same degree of luminosity as was the case when only one was in circuit it was only necessary to increase the electromotive force to such an extent as to force through the circuit of two or more lamps in series the same amount of current as was needed to bring a single lamp to its normal degree of brilliancy, or normal candle power, if you prefer it. Surely, if a certain amount of energy was needed to obtain a light of certain candle power, it ought not to require more than *twice* that amount of energy to run two lights, each of the same candle power as the single light, and so on in the same proportion. Mr. Preece utterly failed to grasp the simple fact that if a certain amount of energy was needed to raise a certain lamp to a certain candle power, two such lamps require twice that amount of energy, and if two or more such lamps were put in *series*, it was necessary, in order to deliver the amount of energy required by each lamp to bring it to its normal candle power, to increase the electromotive force of the generator in simple proportion to the number of lamps in circuit in series.

In discussing the multiple arc system, he made an equally serious mistake, and made the remarkable statement, "*The total amount of heat generated in the resistances will vary inversely as the number of the latter in the circuit.*" Now, every one of you knows, and every electrician should know, that just the opposite is necessarily true. For with a suitable battery or dynamo the amount of heat generated in the lamps, or resistances, is directly proportional to the number of lamps put into circuit. Thus with ten lamps in the circuit you necessarily have ten times the heat generated in the circuit that you have with one, and so on for any number, however great or small, provided the same difference of potential be maintained at the terminals of the lamp.

Long before the date of Mr. Fontaine's experiments and Mr. Preece's mathematical demonstration of the impossibility of economically sub-dividing the electric light, it was an accomplished fact in this country.

Careful students and inventors in this country held views entirely different from those of Mr. Fontaine and Mr. Preece; views identical with those I have already referred to in dealing with the simple principles involved in the sub-division of the light. Mr. Brush and myself had already quite economically run arc lights in series. In my early work I looked at the matter more from the point of the simple principles previously referred to, supplemented by the further belief than if one lamp could be run on a machine and yield commercially useful results, (of which there was no doubt,) then there ought to be increased economy in running many lamps from a single machine, whether in multiple arc or in series. Because I believed that the electrical losses could not possibly be relatively greater in a machine adapted to run several lights than in a machine adapted to run one light.

But to return to the incandescent lamp, which was the subject of the paper open for discussion.

I am certain that it was not the conviction of the impossibility of sub-dividing the electric light that restrained its development at a much earlier date. For one, I can say, in perfect truthfulness, that I saw less real, serious difficulties in sub-dividing the incandescent light than in sub-dividing the arc light. But there was the staggering fact of the inefficiency of the incandescent as compared with the arc lamp. From the one it was only possible to obtain a small fraction of the light per unit of power expended that it was possible to obtain from the other; and, as you know, that difficulty has never been overcome.

. I hope I have made clear the fundamental principle that the energy required to raise a definite mass of matter up to a certain temperature and degree of luminosity, and to continuously maintain it at that temperature and degree of luminosity, is fixed and determined for that kind of matter, and is always the same for a given set of conditions. Furthermore, I hope I have also made it clear that if such a definite mass of matter emits a light, say equal to 100 candles, and it is desired to divide it into a series of small lights of ten candle power each, it is only necessary to suitably divide the mass into ten equal parts and to expend 1-10 of the energy on each part to get the number of lights each of the desired candle power.

Following the line of thought in the minds of those denying the possibility of the economical sub-division of the electric light, there was another class of writers who pronounced it impossible to distribute the energy without such an enormous waste or enormous cost for conductors as would render the investment wholly unprofitable. This in my opinion was the most just objection urged to any extensive system of distribution.

They next claimed that there was no system of ammeters which would meet the requirements and avoid enormous loss by escape before reaching the lamps. This objection was just as illusory as the objections to the possibility of sub-dividing the light.

Still another objection was that the light would be so costly as to prohibit it competing with gas. And here let me say that the people engaged in the development of the business were guilty of the worst form of bad faith, on account of the absurd statements made by them concerning the cost of the lights, and the still more outrageous statements of the amount of power required to produce them.

Some quite well known scientific men expressed opinions in a very public manner nearly equally preposterous in the other direction, and claimed that there was no possibility of the light ever competing with gas, because it would be too expensive. Now if we were always guided solely by the question of expense, we should not make much progress in the world. Expense, if not too great, is but a small factor in our modern life.

There are many very expensive things which we could readily dispense with, yet we use them. In general, if one thing is better or more convenient than another, people can be found in sufficient abundance to buy it, and sooner or later the general public willingly pay more for something better than anything they previously used.

Passing over the objections urged against electric lighting and the hasty glance at the principles involved, we will now deal with a matter which I have no doubt will interest you more as business men and station managers, namely, what is the best lamp—that is, the most efficient and most durable lamp?

It might as well be understood at once that efficiency and durability are, so to speak, antagonistic with a given kind of carbon; that is to say, with a given kind of carbon and equal skill in making the lamps, as the efficiency of the lamps is increased the durability or lifetime of the lamps is necessarily decreased. But, as you know, there is a great difference in this respect between lamps made by the various companies. I am aware that many have claimed that the very noticeable difference in the durability of the various lamps is solely due to the differences in their efficiency. But this is not invariably the case, for some lamps which are just as efficient as others with which they may be compared are also much more durable.

As a matter of fact, there are a number of things that affect the efficiency and durability of lamps. Much depends on the care and skill displayed in making lamps; but supposing equal care and skill be employed in making lamps, there will always exist great differences in the efficiency and durability of lamps, due solely to the physical characteristics of the material out of which the carbons are made, and in some instances to the treatment to which the carbons are subjected either before or after they are put in the lamps.

The material from which the carbons used in the modern incandescent lamp are almost invariably made is that substance known to chemists as *cellulose*. This is a general term employed to cover a series of substances of substantially the same chemical composition, and which forms the principal part of most trees and plants. It covers woods generally, such as cane, bamboo and other woods; woody fibre and fibres of plants generally; cotton, linen and similar substances, and material made from them, such as paper, thread, etc.

In a few cases a substance somewhat resembling cellulose is employed, namely, silk.

Mr. Townley in his paper divided the lamps in use into three classes, based on certain characteristics of the carbons. While it is undoubtedly true that all lamps at present in use differ practically only in regard to the physical characteristics of the carbons used, setting aside the question of care and skill exercised in making them, or the slight differences in size and form of the loop yet the classification by Mr. Townley is too restricted to do justice to the subject, because on the physical characteristics of the base from which the carbon is made the practical value of the lamp will largely depend.

In most of the very early forms of incandescent lamps the carbons were made from substantially the same material as the arc-light carbons with which you are so familiar; that is, from powdered coke or powdered gas-retort carbon, mixed into a paste with some cementing substance like sugar, tar or pitch, which serves to bind the particles of pulverized carbon together into a pasty mass capable of being worked into the desired form. The cementing material is, during the operation of baking, decomposed, the volatile constituents escaping and leaving behind some carbon which bind the particles of gas-retort carbon or coke into a porous but quite strong mass.

On examining such a carbon under the microscope, you will find that it has a fine granular structure, the size of the cemented particles being dependent on the fineness of division of the original powdered carbon.

It is generally supposed that such carbon is unsuitable for use as the slender carbons of incandescent lamps. This is an error. If properly prepared, it is very good indeed, much better than two of the carbons used by Mr. Edison in some of his first lamps. It is also quite flexible and quite strong when made as thin as the carbons now generally used.

I would suggest the following classification as being more useful than that proposed by Mr. Townley:

1st. Carbons made from cellulose, the physical characteristics of which have been modified by some process of manufacture which has more or less broken up the fibres or rearranged them and bound them together mechanically. Under this head I would include paper, cotton or linen thread or braid, and as being closely allied I would also include silk thread or braid.

All such bodies have the fibres more or less broken up and interlaced in a more or less irregular fashion, but are not cemented together by cementing material such as binds woody fibres together in their natural condition.

Thus the fibres of paper are not parallel, but lie crisscross in every direction, like the fibres of wool in a felt hat, and the points of contact are uncertain and very irregular.

The fibres of cotton, linen or silk thread are longer, are not parallel, but are twisted in several strands, without any cementing and binding material to unite the strands firmly. 2d. Carbons made from the previously named manufactured products, but which have subsequently been subjected to some chemical process, such as parchmentization to cement more or less perfectly the separate fibres, and thus form a more or less perfect mechanical and chemical union between the interlaced fibres. 3d. Carbons made from wood, by simply splitting the wood in a direction as nearly coincident with the direction of the fibres as possible. 4th. Carbons made from either of the above, but for reasons which I shall presently mention exposed to the flashing process or hydrocarbon treatment. 5th. Carbons made from a perfectly homogeneous base, about which I shall have more to say later on.

To those engaged in the manufacture of lamps it is well known that the structure of the carbon resulting from the use of any one of these primary bases, or substances, out of which the loop is first cut, is precisely the same as the original base.

Thus, if paper be used as a primary base, every fibre and every defect existing in the paper will exist as perfectly after carbonization as before. Examination under a high power lens will disclose the criss-cross interlaced arrangement of the fibres, and the fibres will be as perfect in form and arrangement as they were in the paper. The same is true of carbon made from any other material. That is to say, the carbon preserves with absolute fidelity the arrangement, structure and shape of the substances of which they are made. It follows, therefore, that every defect existing in the material of which the carbon is made, no matter how great or how small, exists also in the carbon.

You as electrical men will readily understand that any defective contact in any part of an electrical circuit causes the appearance of much more heat at that spot than would appear if the defective contact did not exist. You also know that if some section of a conductor carrying a current be thinner than it ought to be much more heat appears at that section than would be the case if the conductor was of the proper cross section throughout. None of you would think for a moment of taking a lot of thin copper wire, cutting it into short lengths, and simply interlacing them together and use them as the bus bars or main conductors for your circuits. You know well enough that such an arrangement would cause you much trouble by defective contacts, and possibly result in fusion or burning of the mains.

Now, untreated carbon made from paper is substantially such a main, and of course it is very defective. Defective, first, because the fibres are not firmly bound together, and secondly, because the paper not being of uniform thickness, nor of uniform density, the carbon is also not of uniform thickness or uniform density. Put such a carbon into an electric lamp, put the lamp in a circuit where you can control the strength of the current, turn on a *very* feeble current at first; if no part of the carbon begins to glow increase the strength of the current very gradually, and you will notice that some part or parts of the carbon begin to glow before the remainder shows any visible signs of heat. Increase the strength of the current again, and you will generally find that some part or parts of the carbon are vividly incandescent before the other parts are above a dull red.

These vividly incandescent spots are the spots of greatest electrical resistance in the loop—the spot at which the loop will fail long before the period of usefulness of the loop as a whole has ceased.

Now what is true of carbons made from paper is more or less true of carbons made from cotton thread, linen thread and silk thread.

The average life of such carbons would probably not exceed 150 hours; somewhat more in the case of thick carbons, and much less in the case of thin ones. With such carbons, I question whether the incandescent light would be in existence as a practical art to-day.

And here I hope you will pardon me if I say a few words in regard to some of my early work on the incandescent lamp. I met with these very difficulties in trying to secure uniform carbons very early in my work on the incandescent lamp. And these difficulties appeared in a very exaggerated form in the kind of carbon I first attempted to use, and with the means then at my disposal to secure them thin and long enough to meet my needs. To overcome these, and some other difficulties I shall refer to later on, set me thinking. I was very familiar with the process of gas manufacture, and had known for years of that bugbear of the gas engineer, namely, the deposition of solid carbon on the inside of gas retorts resulting from the decomposition of the vaporous and gaseous hydrocarbons evolved during the destructive distillation of the coal. I was also aware of the fact that the deposit of solid carbon formed very irregularly inside the retort, and seemed to be greatest where the temperature of the retort was highest. The thought occurred to me that if I placed my defective carbons in a carbon bearing liquid, vapor or gas, and then passed sufficient current through the carbon to at first raise the temperature of the defective spot to a red heat, the carbon would be deposited on the spots of highest electrical resistance and build them up, thus making the very agency potent in the destruction of the carbon serve the purpose of building up and obliterating the defective spots. It worked, and in a short time I brought the hydrocarbon treatment to a degree of perfection which left little more to be done. From my experiments I soon found that it was also very difficult to secure two or more carbons of anywhere near the same electrical resistance. I clearly foresaw that to get uniform lights it was necessary to do just as the gas engineer does. You know if one gas burner has a larger slit than another the one with the larger slit will permit the passage of more gas than the other, so that if a gas engineer wants to secure lights of the same degree of illuminating power he makes the slits in the burners all of one size. If he wants a larger light, he makes the slit larger; if a smaller light, he makes the slit smaller. So with the electrician, if he wants uniform lights he must have practically the same amount of matter in each lamp, and the resistance of the carbon must be substantially the same. With the hydrocarbon process this was easily accomplished by making the carbons all slightly smaller in cross section than was actually needed and then depositing carbon on them in the manner described until the defective spots were all built up, and continuing the process a little longer it was quite easy to make the carbons all of substantially the same electrical resistance, so that with a given electromotive force substantially the same current would pass through all when placed in multiple arc, or if placed in series they would all have substantially the same electrical resistance, and therefore all require substantially the same expenditure of energy to bring them to the same degree of illumination.

Some of you may remember that Messrs. Sawyer & Man were the first to patent this process of treatment, and it was not until some time after the issue of their patent that I filed my application for a patent for the same invention. The case was bitterly and stubbornly fought before every tribunal in the Patent Office, but was invariably decided in my favor. Some time after the issue of the patent, the United States Electric Lighting Company brought suit against the Edison Company for infringement of my patent. No effort was made to push the case on either side for several years and until long after I severed my connection with the United States Electric Lighting Company. Then the United States Electric Lighting Company suddenly decided that the patent was a very valuable one, and decided to push the case vigorously. They applied to me for assistance, which for just reasons was refused, and they went to argument with a case which was essentially weak in every point where it could easily have been made conclusive, for an abundance of irrefutable proof existed of all my early work in this direction.

Your worthy vice-president read a paper on the morals of corporations. I can truly say that I have honestly endeavored to discover the existence of any moral qualities in some electric light companies, and failed to find any. In this particular matter, the course of both parties would bring a blush of shame to the face of an honest man.

So much for that class of carbons covered by the first division.

I will now refer to the characteristics of the second class. In this class some of the defects due to imperfect contact of adjacent fibres are overcome by reason of the fact that the parchmentizing process converts the outer layers of the fibres into a glutinous mass which unites the fibres to form a more or less solid body of cellulose. But this parchmentization of the outer surface of the fibres does not wholly destroy the fibrous character of the mass, nor does it make the cross section uniform throughout the length of the loop. It follows therefore that carbons made from this class of bodies are still very imperfect, and exhibit in use some of the serious defects of the carbons of the first class. Hydrocarbon treatment is nearly as essential with these carbons to obtain satisfactory results as with carbons of the first class, and that because of the existence of defective spots as well as the necessity of equalizing the resistance of the carbons. The parchmentization process appears to yield better results with thread loops than with loops made from paper.

We now come to that class of carbons made from substances I have placed under the 3d head. They are referred to by Mr. Townley as untreated or natural carbons. They are only natural in the sense that they are prepared from a substance found in nature, such as wood, bamboo, cane, or other similar substances the fibres of which are more or less parallel and continuous and bound together by the natural cementing substance between the fibres. The principal objection to these substances as the base for making carbons for incandescent lamps arises from the fact that it is almost impossible to get two samples of wood having the same density, and the great difficulty of splitting the wood into thin long lengths in places parallel to the fibres.

Mr. Edison showed excellent judgment in selecting bamboo as the base from which to make carbons for his lamps. For of all the woods available it is probably the best for the purpose. Its fibres are very straight, and it is quite close grained, and splits admirably. Notwithstanding these advantages, it is not by any means perfect, and there has been much complaint regarding lamps made from it. Most of the lamps under proper test show defective spots in the loops, and few of them die as good lamps ought to. That is to say, they do not gradually die all over, so to speak, but fail at some particular spot which was initially weak.

Moreover, the variations in electrical resistance of the carbons obtained from loops of the same cross section and length is very great even when great care is taken, and unless the carbons are submitted to some subsequent process after the first baking, it is practically impossible to obtain even moderately uniform results. It is not to be expected that it is possible to find a natural product like wood to have the same density or even more than approximately so. Consider for a moment the conditions of growth of plants. Are they not similar in many respects to human beings, products to a large extent of their surroundings? Is it reasonable to suppose that any two trees growing either close together or a long distance apart shall have the same properties exactly? I think not. In other words, there must of necessity be considerable differences in the properties of the wood of such structures, due to climatic and other conditions, as well as those differences which are known to exist in the strength and character of the wood taken from the same tree.

Carbons of the 4th class include carbons made from any of the other three classes already referred to but subsequently subjected to the hydrocarbon process.

There is no doubt about the general correctness of Mr. Townley's views concerning the advantages of treated carbons over untreated carbons. I am quite sure of the absolute necessity of treating carbons of the 1st class, and possibly of the 2d class, in order to get commercially useful results. I am also quite sure that carbons of the 3d class, straight fibre, natural fibre, or bamboo type, or whatever you may choose to call them, are greatly improved by the hydrocarbon treatment properly applied.

I believe enough has been already said on the effect of the physical characteristics of the base on the resulting carbon, and its influence in determining the life and efficiency of lamps, to make it clear that what is really required to secure the perfect lamp is an absolutely homogeneous carbon. With an absolutely homogeneous carbon of uniform cross section from end to end of the loop, the loop will not suddenly fail at a single point long before the principal part has suffered sensible injury by use. Such a carbon will gradually die, so to speak, all over. It cannot fail at some sharply defined spot, because there is no defective spot to be raised to a higher temperature than the other parts of the carbon. Such a carbon, even if subjected to the most searching tests, will exhibit an absolutely uniform degree of incandescence from end to end of the loop, owing to the non-existence of defective spots. This kind of carbon may be raised to a much higher temperature than ordinary carbons, and so be much higher in efficiency, and still give a much greater average life than any other carbon I know of. To obtain such a carbon it is necessary, of course, to secure a base having also a perfectly homogeneous structure. I secured such a base many years ago in several ways, but after securing the base it took several years of work to overcome the difficulties encountered in making carbons from it. But the difficulties were all overcome, and the result amply repaid me for the labor and time expended. The best way of securing the base is fully described in U. S. Patent No. 264.987, dated Sept. 26, 1882.

The characteristics of the carbon and its advantages are set forth in another patent issed to me on Sept. 26, 1882, No. 264,986. Within the past year I have made many improvements in the method of making these carbons.

Such a carbon requires no treatment to make it better adapted for use in an incandescent lamp. If properly made it most perfectly fulfils all the requirements of the art as it exists to-day. It makes the most efficient and durable lamp known—the thing you want. It is cheap. It exists, and yet you cannot get it. Why? Turn to the people who have been conducting the manufacturing branch of this business and ask them that question. Do you think you will get a satisfactory answer? In the struggle for the control of this whole business—and it has been a bitter one, and is still a bitter one—the general interests of you gentlemen as station managers, and the broad interests of the art as a whole, have been largely overlooked. Yes, even the best interests of the manufacturing companies have also been overlooked. I am of the opinion that if the manufacturing companies had turned their attention from the suicidal effort to annihilate each other, and had devoted to other ends some portion of the enormous sums expended in various ways, honest and dishonest, to effect that object of annihilation, the art as a whole would have profited by it, and you in particular. The condition of the incandescent lamp business to-day is a peculiar one and fraught with great interest to you as station managers. There are here to-day the representatives of two of the largest companies engaged in the business, each endeavoring to gain some advantage over the other. The litigation of the incandescent lamp has pretty well terminated. It has been a bitter and in many respects an unjust battle on all sides. I take it that the present paper is the outcome of the existing situation. One has the old lamp to sell, the other has a new lamp to introduce. A new lamp did I say? The glass stopper lamp is not new; the iron wires are not new; the carbon is not new. The absence of the information asked for in regard to what is meant by "super-treated burner" makes me hesitate to say that that is not new, but I think it improbable that those engaged in the use and experimental investigation of the hydro-carbon process left anything to be done in the way of extra treatment in that direction.

If the lamp stands service as Mr. Townley's paper indicates, the result is in a measure new.

Despite the fact of the presence of both these companies, I am sorry to have to say that I do not think that either of them are engaged in giving you the best they can give. I believe that statement is true, and I utter it in all sincerity.

Time alone will settle the question of the practical value of the lamps offered.

I shall not attempt to deal with the formula presented concerning the durability and efficiency of the various lamps referred to. It would take too much of your valuable time, and would probably not interest you; but I will say that with the facts before you you will be able to perceive that it is a simple matter to make a lamp of any efficiency desired. By simply reducing the amount of carbon in the lamp the carbon can be raised to a higher temperature, or a higher degree of luminosity with the expenditure of less energy.

It is claimed that a 2½ watt lamp can be made to give a satisfactory life. I believe that is possible with good low voltage lamps under close regulation. It has been known for many years that a good low voltage lamp will be more efficient and still as durable as a high voltage lamp.

I thank you for your kind attention, and apologize for taking so much of your valuable time

The "Vulcanizing" Process for Preserving and Strengthening Poles, Cross Arms, Ties, etc.

BY HARRY C. MYERS.*

When we consider that the annual consumption of timber in this country equals twice the amount of material supplied by the annual growth of our forests, it is apparent that the subject of wood preservation, wood strengthening and the utilizing of certain woods now considered as worthless, is a most important and vital one.

Wood as it occurs in nature consists of cellulose impregnated with resin, volatile oils, sugar, gum, tannin, protein bodies and the usual mineral constituents of plants. The percentage of these various constituents, of course, depends not only upon the kind of wood, but upon the season of year, locality, nature of the soil, and part of the tree from which any given sample is taken, hence any results or tests would be only approximate ones.

When wood is heated, as in ordinary wood distillation, the cellulose decomposes and a chemical change takes place between it and the natural constituents of the sap, resulting in a most powerful antiseptic mixture containing acetic acid, methyl alcohol, acetone, methyl acetate, tarry matter containing phenol, creosote, carbolic acid and about thirty other chemicals of lesser practical importance.

It must be borne in mind that these chemicals and antiseptics result from the action of *heat* on the natural sap of the wood, and are *entirely different* from the original sap which allows of the attacks of microscopic fungi and decay. Why has it occurred to no one to heat timber at a temperature which would produce the above change, and then to *keep the changed antiseptic mixture there under pressure*, instead of distilling it *out* of the wood? Such is the entirely new and original process known as "wood vulcanizing," viz., heating of wood and timber under great pressure.

Hundreds of processes for preserving wood have been patented, but these are not very effective, and all of them may be divided into two classes: 1. Those in which wood is impregnated with a preservative material by immersion. 2. Those in which a preservative agent is forced into the pores of the wood.

In the process of "vulcanizing," wood is heated in closed cylinders from eight to twelve hours at a temperature ranging from 300 degrees to 500 degrees Fahrenheit, and under a pressure of from 150 to 200 pounds to the square inch. A circulation of superheated and dried compressed air removes the surface moisture and any water that does not take part in the reaction and combine with the woody constituents. Hence, wood or timber, in any condition, may be immediately treated. These cylinders for the treatment are 105 feet long, 6½ feet in diameter and are made of steel. As the treatment penetrates to the heart of the timber, considerable time is required for cooling, which is, of course, done in the cylinder and under pressure. Timber is introduced and treated upon cars which run into the cylinder upon small tracks.

This process apparently makes decay impossible by sealing up the pores of the wood with antiseptic matter which becomes solid and firm on cooling and standing, and which is produced *within* the wood by the action of heat and pressure upon its original sap.

The orignal sap is colorless or pale yellow, and the changed sap very dark or black, hence a most desirable dark antique color may be imparted to oak and other woods.

The Hon. B. F. Tracy, Secretary of the United States Navy, with a view of adopting vulcanized wood in naval construction, appointed a committee who visited the vulcanizing works in New York City, made tests of their own on yellow pine, showing an average increase in strength of 18 per cent. and a decrease in deflection of over 18 per cent.: hence, they reported that vulcanizing increases the durability and strength of timber, and recommended such timber for use as backing in one of the monitors.

Untreated cross arms which had been painted and used by the Bell Telephone Company for from two to three years showed, by actual test, an average *decrease* in strength by exposure of 18.78 per cent. as compared to new untreated cross arms. Other pine cross arms which had been in service on Western Union telegraph poles for three years and over showed an average loss in strength by exposure of 38.12 per cent. The process of vulcanizing seasons all timber, thoroughly preventing any further warping, checking or cracking. Such timber is not influenced by atmospheric agencies, bacteria or spores, and requires no paint for protection, as it is saturated with antiseptic preserving material of its own.

This timber when vulcanized is as durable as ordinary timber and ties used in railway construction. Other woods are seasoned and rendered beautiful by vulcanizing, which produces very desirable colors for interior decoration.

The life of vulcanized timber is not known; none of the timber or ties used in railway construction during the past ten years have been known to decay. I personally examined some 12 x 12 pine timber which had been placed in a machine shop in 1882, part being vulcanized and part untreated. The treated timber is perfectly sound and still in use, while the untreated had completely rotted and crumbled away after five years' use. I also find by personal investigation that timber placed on the Manhattan elevated roads of New York City as far back as 1888 shows no signs of decay, and is as sound and sweet as if fresh from the tree, while untreated timber laid at the same time has rotted away and been replaced.

As vulcanizing changes the sap from the liquid to the solid or semi-solid state, does not char or make the wood brittle, saturates and seals up the pores of timber with solid matter instead of liquid soluble matter which nature provides, considerable strength and durability are added by vulcanizing, the wood being rendered more cohesive, harder and denser. The spike-holding quality is naturally much increased, and even after ten years' service railroad spikes seem to be as firmly imbedded as when just driven.

It is also a curious fact that the electrical resistance of most woods is very greatly increased by vulcanizing.

Morals of Corporations.

BY E. A. ARMSTRONG.†

That there is a popular distrust, if not actual hatred, of corporations as such is undoubtedly true. I suppose a myriad of causes may be found and properly credited as the source of this.

A corporation of to-day, however, is vastly different from those not half a century old. In most of the States I apprehend their creation is very similar to that of my own State, New Jersey. With us corporations are formed under general laws passed for particular classes—lyceums, libraries and miscellaneous business corporations all having their respective acts.

We have often taken occasion to complain of the unfair treatment given companies by municipalities, but too often the treatment has been invited. When a corporation such as ours makes a large investment for public lighting, and while it continues to regard what I have indicated as its duty regarding service and charges, it has the right to expect a continuance of the municipal—patronage, I was about to say—service, I will substitute. Any deviation from this, while not a violation of an express is the violation of an implied contract; something in law just as binding when defined, and therefore, surely ought to be in morals.

I imagine I might amplify this to a considerable extent, but I will not, further than to say what applies to corporations acting with each other and with individuals, as may hereafter be stated, will all apply, and really with more binding force, upon the relation with the municipal or governing corporation. Such a corporation being a part of the governing machinery, it is bound in law, as well as in justice, to treat with absolute fairness every person alike. It is dishonest for it to take anything for public use from its citizens at less than cost. When that is accomplished, that most undesirable of all things, municipal ownership of electric lighting plants, will be undreamed of and unconsidered. No matter how reasonable may seem the idea of the Government doing everything possible, it is the idea most foreign to our notion of government—especially the American idea. Everything possible is to be left to the people, with as little government as possible.

It is the duty of a corporation to use the best methods it knows or can learn, adopt all the improvements, and render the best possible service, and that at as reasonable a figure as it can afford to do it, having a just appreciation of the risk the capital invested sustains, which is entitled to an adequate return. If you can furnish light or power at a less figure than you are now receiving and still pay your stockholders a fair return, it is your bounden duty to voluntarily reduce your prices, so that those who make your business possible may have their share in your prosperity.

As corporations we can do what as individuals would be impossible. The aggregation of the littles will accomplish wonders, just as brick after brick makes the tallest and grandest structure. But the beauty and the strength, and indeed the utility, of the world is absolutely dependent upon the perfection of the single one, the individual.

ELECTRICITY

The Popular Electrical Journal.

GEORGE R. METCALFE, - - - EDITOR.
R. H. WILLOUGHBY, - - ASSOCIATE EDITOR.

B. E. GREENE, Publisher.

PUBLICATION OFFICES:
6 Park Place - New York

CHICAGO:
J. F CONNOR, - - 823 Monadnock Building.

BOSTON:
W. S. KEY, - Room 34, 620 Atlantic Avenue.

ELECTRICITY IS PUBLISHED ON WEDNESDAY OF EACH WEEK

Our columns are open for the discussion of any question in which the interests of the Electrical Industry are at stake. News notes, descriptions of new devices with drawings or photographs, are at all times desired.

SUBSCRIPTION RATES:

UNITED STATES, - - - - -	$2.50
IN CLUBS OF FIVE OR MORE, - - - -	$2.00
FOREIGN COUNTRIES, - - - - - -	$4.50

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

"Electricity," under its present ownership, has never solicited the advertising patronage of the General Electric Company.

I do not know that I can say very much as to the policy to be pursued on this question. I know what mine shall be: that I will never buy one cent's worth of material from the General Electric Company until they do that thing. (Applause.) I shall never buy one cent's worth of supplies from that company that I can possibly buy from an independent concern; and I shall do all in my power to advance the sale of any lamp which is put on the market which can be manufactured without coming under the law of infringement.—*T. Carpenter Smith, of Philadelphia, before the National Electric Light Association.*

THIS is the slogan: No man should buy one dollar's worth of supplies from the Trust which can be purchased elsewhere. Independent concerns should be aided in every practical way, and there is no more practical way than this.

The Incandescent Lamp. We print in another column the remarks of Edward Weston at the St. Louis Convention in regard to the history of the progress of incandescent lamp manufacture and the essential qualifications for a lamp of long life and high efficiency. The fact that a homogeneous structure of perfectly even section throughout its length is desirable for the carbon filaments is too apparent to need argument, and the methods employed by the different manufacturers to attain these ends practically determine the value of the lamp as far as its length of life is concerned.

Besides avoiding the destruction of the filament at certain spots which burn more brilliantly than the rest of the carbon, the hydrocarbon treatment permits the lamps to be turned out with more uniformity as to the candle power of individual lamps, and in this respect considerable discrepancy is now found not only among lamps of different makers but in similarly rated lamps of any one maker. In almost any lot of new lamps labelled 16 C. P. there will be found some which vary as much as three or four C. P. from the normal figure.

The practical value of lamps for central stations is not to be judged by their performance when new, but by their *average* efficiency during their life, as well as the *average* C. P. maintained.

In general the lamps of the highest initial efficiency are not the most economical in the long run. A lamp of this class may be made to consume say three watts per candle at first, and on this basis it is estimated that fifteen 16 C. P. lamps per horse power may be supplied; but after a use of them for two or three hundred hours customers will complain of poor light, and it will be found that the lamps have diminished considerably in candle power. At the end of its life if allowed to burn for six hundred or eight hundred hours, the candle power of such a lamp will not exceed probably fifty per cent. of its normal amount, and instead of three watts per candle it will consume seven or eight watts. As the customers are paying for light and not for watts, trouble naturally ensues, and taking the average consumption of these lamps during their life, it will be found to come nearer five or six watts than three.

On the other hand, it has been shown that lamps of an initial efficiency which starts nearer this average maintain their normal candle power during their life with considerably less variation than occurs with the high efficiency lamps, and for this reason, as the total consumption of current for both is practically the same, the low efficiency lamps are far more satisfactory to the customers and are no more expensive to the central station.

From this it may be concluded that the claim for the greatest number of lamps per horse power is not the principal desideratum. What is needed by the central station manager is a lamp of the highest efficiency consistent with the least variation of candle power.

* * *

Changing Defeat into Victory. A contemporary calls attention to the monumental effrontery displayed by one of the badly defeated parties in the libel suit against the proprietors of the *Electrical Review* of London, noticed in our issue of March 15.

After losing its case on the evidence of Lord Kelvin, Prof. Thompson, Mr. Swinburn and other eminent electricians, who testified to the inefficiency of its electrical apparatus, this company comes out with the following advertisement:

> "Lord Kelvin, President of the Royal Society, and other leading electricians have recently confirmed Mr. Harness's theory—viz., that when the elements in the electropathic belt are properly connected, mild currents of electricity are generated and enter the human body."

This is the most noticeable case of the advantages of notoriety which we have seen, and is probably unique in turning the most damaging kind of evidence into a favorable advertisement. We expect to see this brilliant stroke of business sagacity adopted by the electric quacks on this side of the water as soon as circumstances permit.

* * *

IF the *Electrical Engineer* is estopped, through financial arrangements with one of the leading manufacturing companies, from telling the truth and reporting the actual condition of affairs, it should lose no time in making official announcement of the fact. It would thus free itself, in a large measure, from unfavorable criticism. In any event, until it is at liberty to say *something*, either on one side or the other, it should abolish its so-called editorial page. Electrical men are not all high-rollers, but they are good livers, and do not relish a weekly dose of dishwater.

* * *

THE publication in the *Electrical World* of the statement that the Sawyer-Man Electric Company had filed an application for dissolution was false in every particular; and it would have required little investigation upon the part of the *Electrical World* to have learned this, if it was ignorant of the facts. The truth is, the *Electrical World* does not care to be correct; but it will lose no opportunity of publishing statements, true or false, which will give pleasure to its benefactors, the General Electric Company.

"Out of Darkness Cometh Light." When Henry Villard said to Mr. Charles Ambitious Coffin, "You have bitten off more than you can chew," he uttered no original thought, but in homely language expressed a plain truth.

The capacious maw of the Trust is in a fair way to have its gastronomic powers severely tested at an early date. Opposition is arising which it cannot smother, cannot buy, or bluff, or frighten; opposition which will not be swallowed. Miscalculating its own power to first erect a fence around the whole earth and then appropriate the enclosure, its insane greed has antagonized the good sense of the entire community, while acting as an inspiration to be up and doing to many an enterprising and ingenious mind, with this inevitable result: that in the matter of incandescent lamps, the only device to which the Trust has established its claim to exclusive right, several new inventions are all but ready to be placed on the market.

Thus the only solid foundation which the Trust has ever had will be speedily undermined; and it is only a question of months when the abnormal structure will totter and fall.

It is only a matter of a very few days before the problem now confronting the entire fraternity, as to where the future supply of lamps is to come from, will be settled for all time, and the business of manufacturing incandescent lamps go on as briskly as ever, regardless of the squirming of the tentacles and mandibles of the huge octopus now striving to choke and strangle every fair and honest competitor.

And we make this positive statement, *knowing fully whereof we speak.* It is frozen truth, and our assertion will be borne out to the minutest letter.

It has been our good fortune not only to see, but to examine and to test in the most trying manner, a new and efficient incandescent lamp, which is no mere toy, no mere experiment, but a long-lived, practical, commercial lamp, pronounced by the most eminent patent experts in this country to be entirely beyond and outside the Edison patent which has been sustained in the various suits recently tried.

In the decision on appeal awarding the incandescent lamp to Edison, which was rendered October 4, 1892, the debatable point centered in the second claim of Edison's patent, which runs as follows:

"The combination of carbon filaments with a receiver made entirely of glass, and conductors passing through the glass, and from which receiver the air is exhausted for the purposes set forth."

In the new lamp to which we call attention the foregoing claim is in a most markedly practical and efficient manner rendered of non-effect. The receiver is composed of several parts and various substances, and in view of this fact the device must and will prove an eye-opener to many. It is owned by men who can command millions of undiluted capital, which is more than can be claimed for the Trust; and so certain are they of the value of the patents they own, the efficiency of this lamp and its absolute freedom from every element or suspicion of infringing on any other known lamp—Edison or other make--that they are already laying out large capital in preparing to manufacture on a scale that may be considered almost gigantic.

At the proper time we shall have a little story to tell of the evolution of this new candidate for popular favor, together with some startling figures proving its high efficiency; meantime we beg of all purchasers of incandescent lamps not to allow themselves to be bulldozed, scared or coerced by the bullying Trust or its army of hirelings into signing away their right to purchase in the open market, and carefully to keep their weather eye open for every new movement in the lamp business; and we wager dollars to doughnuts that they will learn something to their advantage before—well, before General Electric reaches 120.

"There's a hen on," and at least one of the brood will be a fighting game cock.

* * *

As we have heretofore stated, it is our opinion that every man who signed Form D or any other long-time contract with the General Electric Company made an ass of himself. The pressure was of course strong, but it should have been remembered that no concern built like the Electric Trust could succeed ultimately. Better have closed down your plants and burned tallow candles than to commit business suicide. Our advice now is to every man or company who signed such a contract:

Ignore it!

Buy your supplies where you see fit, and

Fight it out!

No honest man will say you are not justified; and

You will win!

* * *

Any report that Mr. Coffin will lay down the reins of power, whoever may pose as the President of the General Electric Company, is ridiculous. His name is not yet Charles Ausgespielt Coffin.

* * *

Electricity has positive and authentic information that a number of successful and non-infringing lamps will be on the market before the ides of June.

* * *

With the prospective advent of new lamps, consumers and supply dealers should not forget their duty. The General Electric Company will soon be on its knees begging for trade and for the services of the middle-man in securing it. But *non-infringing lamps should be the only ones used or sold.*

* * *

Threatening some of the leading metropolitan dailies with suits for infringement because they persist in using the lamps that suit them best is one of the latest mistakes of our friends the enemy. Proceed, gentlemen. Electricity is not lonesome, but we really would not object to a little discussion of Trust Methods by our contemporaries. We will supply the points.

* * *

If an independent paper, covering the entire field, is of any value to the independent interest, *it should be supported by every independent concern.*

We believe the Electric Trust is beaten.

* * *

We believe Mr. C. A. Coffin is beaten.

* * *

We believe Lee, Higginson & Company are beaten.

* * *

We believe Monopoly in the Electrical Industry is beaten forever.

The New Lamp.

The Trust is rapidly losing its hold
On the business world; it also lacks gold;
And the stockholders feel that they've been sold,
Because there's a New Lamp.

While the Trust has bulldozed day after day,
Inventive genius has kept on its way,
And 'twill soon receive its well-earned pay
For its New Lamp.

Let the Trust keep gloating—let its bummers sing;
They'll do something else when they see that ring
That solves the problem—the pesky thing!—
On the New Lamp.

Yes, the trade will see darkness dispelled by light,
And find their way out of wrangle and fight,
And the Trust itself sink away out of sight,
When appears the New Lamp.

Light Ahead.

Monopoly's Days Are Numbered.

One New Lamp for the Success of Which "Electricity" Vouches.

A new incandescent lamp will be placed on the market within sixty days which will, without doubt, solve the problem as to whether the General Electric Company owns sole and exclusive rights in a monopoly on lamps and release the community at large from the thrall of this huge Trust.

We have seen this lamp burning, made tests as to its efficiency and length of life by actual service.

We can vouch for its having been submitted for examination to five of the most eminent patent experts in this country, all of whom have given an unqualified opinion that it is a practical and commercial success and is not involved or affected in the slightest way by the Edison patent which has been sustained in the various suits for injunctions that have been tried of late.

We are well aware this will be startling news to the General Electric Company itself, and at the same time particularly gratifying to the trade at large and to the public, which would very soon have been in open revolt against the grasping, grinding impositions of the most vicious, bloodsucking vampire in the commercial world to-day.

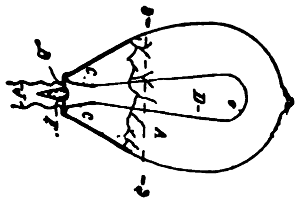
Other Recent Lamp Patents.

Chicago in the Front Rank.

The Von der Kammer Lamp.

John von der Kammer, of Chicago, has received a patent for an incandescent lamp, dated March 7, 1893, for which the application was filed January 23, 1893. The details of this lamp are shown in the accompanying illustration and the claims specified are as follows:

In an incandescent lamp the combination of a substantially flat metallic base composed of two portions in the same plane connected by a bridge of glass or the like to form a flat continuous base with a glass portion rising from about the edge of said base fused upon the edge and outer surface only of such base and forming therewith a receiver or globe, with a filament supported upon



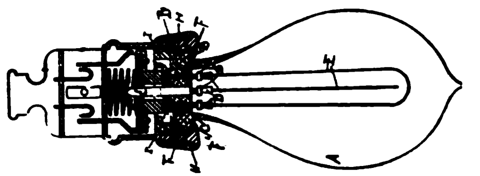
THE VON DER KAMMER LAMP.

such metallic base and conductors leading to or through such metallic base.

In an incandescent lamp, the combination of a receiver made partly of glass and partly of sheets of metal, said sheets at the base of the lamp, a carbon filament within the receiver, conductors leading the current to the sheets in the base of the lamp and upwardly bent portions of the metal sheets to each of which one end of the filament is secured.

The Applegate Lamp.

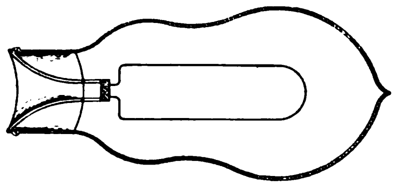
A patent for the lamp illustrated herewith was issued to Eugene W. Applegate, of Omaha, Neb., on December 6, 1892, of which the following description is given: An incandescent lamp of a suitable configuration, provided with a stem-opening and a flanged stock B, the cap C adapted to fit within and upon said opening and stock, and provided with the central tube C′, the projecting carbon clamps D, provided with the nuts D′. The spring-sleeve F is provided with an outwardly-extending groove at its upper and an inwardly-extending flange at its lower end. The lower portion of said sleeve is further interiorly and exteriorly threaded, the sleeves H′ and collar I, in combination with a socket, comprising the shell K, and the spring-actuated contact-arms M M are adapted to be in electrical connection with the carbon clamps D D.



THE APPLEGATE LAMP.

The Green Lamp.

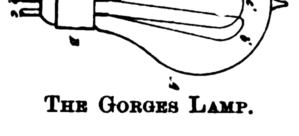
A patent was issued to Henry Green, of Hartford, Conn., on May 24, 1892, which is illustrated in the following cut. The principal claims for this patent read as follows: In an incandescent lamp made entirely of glass, a pair of circuit wires or conductors attached in the usual manner to the platinum wires and trained up the sides of the hollow recess in the neck of the lamp and fastened thereto by fusion of small portions of glass. The neck is provided with a number of bead-like projections to hold the lamp in a socket.



THE GREEN LAMP.

The Gorges Lamp.

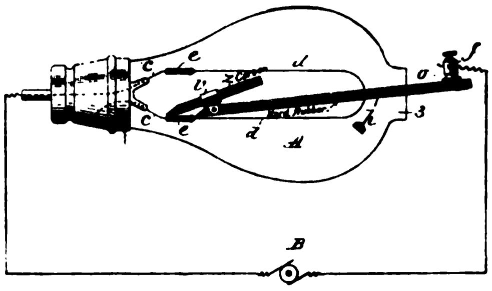
This patent, which was issued to Johannes H. F. Gorges, of Berlin, on November 29, 1892, describes an incandescent lamp provided with three terminals connected with each other through three independent filaments of equal resistance, as illustrated in the following cut. The patent also includes any number of filaments of equal resistance similarly connected.



THE GORGES LAMP.

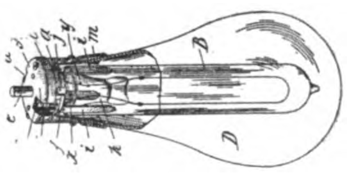
The Frei Lamp.

The Frei lamp is illustrated below, and consists of an incandescent lamp with leading-in or circuit wires consisting of a single tube, one end of which receives an end of the filament, which is secured thereto, and the opposite end receives an end of the leading-in wire to which it is fused. The patent was issued November 22, 1892.



THE FREI LAMP. (FIG. 1.)

Another patent issued to Mr. Frei on December 6, 1892, is illustrated and described as follows: In an electric incandescent lamp, the combination, with a head having the rabbet *a* and the recesses *d d*, the spindle *e*, passed through the head and having the angular extension *f* with the binding-screw 12 in one of the recesses, the ring-plate *g*, having the prongs *i*, and the lug *h*, with the binding-screw 15, located in the other of said recesses, and the lug *j*, extended across the surface of the rabbet, of the globe engaged by said prongs and having the filament and leading-in wires which are detachably connected to the binding-screws and the ferrule *m*, seated in said rabbet and connected to the head and in contact with the lug *j*.



THE FREI LAMP. (FIG. 2.)

More Injunctions.

In the case of the Edison Electric Company vs. the Germania Electric Company, and the Edison Electric Company vs. the Boston Incandescent Lamp Company, which came up before Judge Colt in the United States Circuit Court, Boston, on Friday last, when the court opened Mr. Fish, as counsel for the plaintiff company, informed the Judge that there would be no hearing as both defendants concurred in the application for an injunction and had agreed to accept service of same upon them. These two companies therefore now stand enjoined against making any more incandescent lamps.

The Germania Company Forced to Quit.

Notice has been sent out that the Germania Electric Company, of Boston, has made an assignment for the benefit of its creditors to Mr. Charles A. Williams, 18 Post Office Square, Boston.

The Germania Company has pursued a conservative business policy, and had many friends who will join with ELECTRICITY in regret at the unfortunate turn of affairs.

Two newspapers of Dundee, Scotland, the *Advertiser* and *Evening Telegraph*, are now being printed by electricity. These are the first papers in Scotland to adopt this method.

Electric Installations.

And Some Radical Changes in General Systems of Wiring.

BY C. G. ARMSTRONG.*

It is not my intention this evening to enter into a general discussion of isolated electric installations, but simply to point out some common errors and suggest some remedies that would seem in my judgment to make a better plant.

In planning a building it is true that the designing of the electric plant is left until the last, everything else being considered first.

In my experience I have found it not an unusual thing to be called upon to design a plant, when upon receiving the plans I find that the architect has left room for the plumbers' pipes, has prepared excellent runways for drainage, has looked after his catch basins, has located his elevator pumps and given them plenty of room in the basement, has provided ample space for everything except the electric light plant. There are no raceways in the building, space left for dynamos and engines is totally inadequate, boiler capacity is about half what it ought to be, no place for storage of coal, and yet the most important feature of the entire building is light. It becomes necessary of course to at once make a claim for more space and provide raceways or some substitute therefor. Having obtained all the space possible, the next item that confronts the designing engineer is, how to lay out his plant.

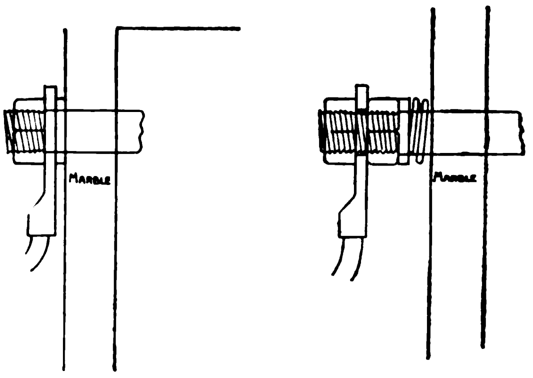


FIG. 1.

One cause of a bad plant is through lack of forethought on the part of the designer of the building, another is, desire to save a little expense on the first cost, third is from force of circumstances.

Generally, when a man has concluded to put in an electric light plant he wants it as soon as he can get it, and although he takes six months or a year to make up his mind, he wants the plant put in at once. I prefer to get dynamos as close together as possible. The only two conditions to be considered are, first, that they will not be reversed in polarity by proximity of like poles, and second, that the armature of any machine can be removed without disturbing the other. A modification of this lay-out could be made where space is very limited by running one of the smaller machines in tandem, but as a general rule I do not like to run in tandem.

On the matter of foundations for dynamos I confess to be something of a crank. I like to have a good foundation under the dynamos. While not as absolutely essential as a good foundation under the engines, yet a concrete or brick foundation, in which the best quality of Portland cement has been used, is a very desirable thing for dynamos. I have handled almost all machines in the market and have never yet found one that runs as well without a good foundation as it did with one.

---

* Abstract of paper read before the Chicago Electric Club, February 20, 1893.

Switchboards are the next item of importance. The switchboard should be placed within six or eight feet of the commutator of the dynamo or as near that as is possible ; a greater distance is unnecessary and a less distance is not so desirable.

There is one precaution which should be taken, however, in all marble switchboards, that is, fastening instruments thereto. From the unyielding properties of either marble or slate, it is advantageous to have a coil spring and that connections should be made somewhat as shown in Fig. 1, otherwise the instruments will soon become loose by jarring of the board. In no case should the wire connections to the instruments be so placed that they can jar loose, as there is great danger of arcing.

It should be the object of all designers of switchboards to get the board as simple as possible; to avoid all complications and yet have the board to accomplish the purpose designed, requires no little ingenuity on the part of the designer.

It often happens in very large buildings that the motor load amounts to quite a considerable per cent. of the light load; when such cases arise I believe in having a third bus bar on the board which shall be used for motor connection. This applies only of course to such plants as have two or more dynamos. Where motor connections are used it is quite desirable to have an ampere meter to measure the amount of current used on the motors. This ampere meter should be "dead-beat" and should have a range equal to all motors in the installation. A careful attendant would know if his motors got into trouble or blew a fuse, and could also tell how his different loads were being handled throughout the building.

As to other meters on this board I would prefer non-polarized, from the fact that they are less liable to get out of calibration. There is one slight disadvantage perhaps, that if a machine should get to running as a motor an attendant might not as quickly understand it, but it is seldom indeed that this would occur, and where it does it does not require much intelligence on the part of the operator to know that the belt is pulling the wrong way; in fact, cases of operating dynamos as motors are also caused by a faulty method of cutting out machines when dynamo tenders attempt to cut the voltage down before pulling out machines. The proper way to disconnect a machine is to pull the switch and let it die a natural death; the same is true of motors.

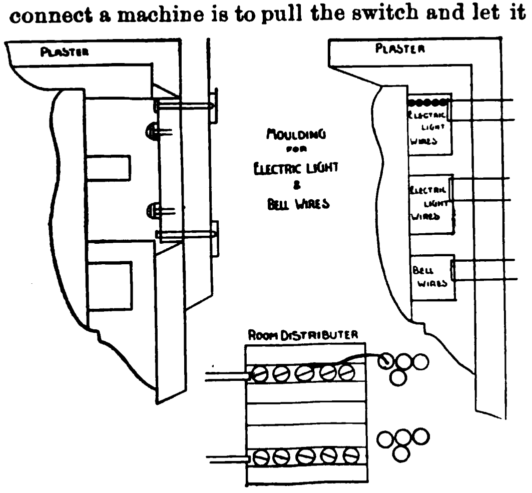

FIG. 2.

Dynamo switches should be made double-throw, one connection being on to the bus bars in such a manner that any or all dynamos can be thrown on to the motor circuit. By closing a switch the motor circuit is placed in multiple with the lighting circuit. By opening this switch and throwing down a dynamo switch a dynamo is connected to the motor circuit.

[At this point Mr. Armstrong displayed a large number of photographic views of various switch boards, typical of the principal lighting systems installed in this city. Space forbids their reproduction and that portion of his speech pertaining to these views is consequently omitted.]

Wire is perhaps dangerous ground to tread upon, for each manufacturer of wire is thoroughly confident that he has the only wire in the market that ought to be used, but there is nothing more important in an installation outside of dynamos than wire. Use always the best wire. Different methods are pursued in ascertaining which is the best. In making tests upon wire I do not believe in soaking it in chloroform, naphtha, sweet spirits of nitre, phenol, amyl, aldehyde or any other nonsensical methods. In the ordinary course of usage wire is not subject to the genial influence of any of the above named substances. The greatest enemy of wire is ammonia, an enemy which is most potent and which is found in any and all plastering.

The present method of running distributing wires in fire-proof buildings is, first, wire placed directly beneath the plastering with cleats; second, all wire being enclosed in interior conduit tubes; third, and the most desirable method, is the running of wires from the cut-out cabinets in moulding to the rooms and then under the plastering in interior conduit tubes to the outlets. This method I use almost exclusively.

Fig. 2 shows one form of corridor moulding which I use. It has three compartments, one for each polarity of the light wire and one for the bell wires. When leaving this moulding, interior conduits carry the wires to the outlets. This is a better method than all interior conduits, as architects are every day limiting the thickness of plastering. Originally one and one quarter inches of plastering was considered just about right, now one-half inch is almost too much; in fact many of them complain bitterly when asked to u e enough plastering to cover one-quarter inch tubing; but the greatest objection to running interior conduits clear back to the cut-out cabinets is that a large number of tubes are brought to one point and it is almost impossible to make the plastering adhere to them.

Many architects think that the only place to place interior conduits is in the flooring. I object to this very seriously because it is almost impossible to lay tubing in the flooring and prevent them from being broken to pieces by the workmen.

I do not wish to be understood by these remarks that I am not favorable to interior conduit, as in 95 per cent. of my work I use it, but I believe in restricting it to its proper place, using it in short runs between outlets and some form of moulding, which moulding will carry the wire back to the cut-out cabinets.

In office and hotel buildings this is especially applicable; the amount of conduit is reduced to a minimum and the liability of breakage from settling of the building is reduced in proportion.

There are three danger points in electric light plants—first, the switchboard; second, the cut-out cabinets, and third, the liability of ground on a circuit.

Grounds can be avoided by the use of good wire, by using insulators to carry all risers and feeders and by distributing in moulding and interior conduit as described.

Fig. 3 shows the common method of insulating fixtures. Electric gas lighting work I would not permit on my fixtures unless they were run with a quality of wire equal to that used in the electric installation. No ground should be permitted in the gas lighting circuit ; no drop cord smaller than No. 16 B. & S. should be used and no wire smaller than No. 14. These suggestions I am satisfied are in the line of better and cheaper construction.

The safety valve of electric lighting is the fuse. The most dangerous current that we can have is known by some as the "sneak" current, and is one that is so slight as not to affect the fuse and open the circuit.

As to the use of the eight amperes on a circuit instead of eight lights as is the present rule in Chicago, I believe there can be no serious objection made. "Lights" is an indefinite term and depends entirely upon the voltage operating for its value in current. The only object of limiting the amount of current on circuits is to reduce the liability to destroy sockets by short-circuiting. A number of experiences have convinced me that eight amperes properly protected by an eight-ampere fuse will not destroy a socket by short-circuiting.

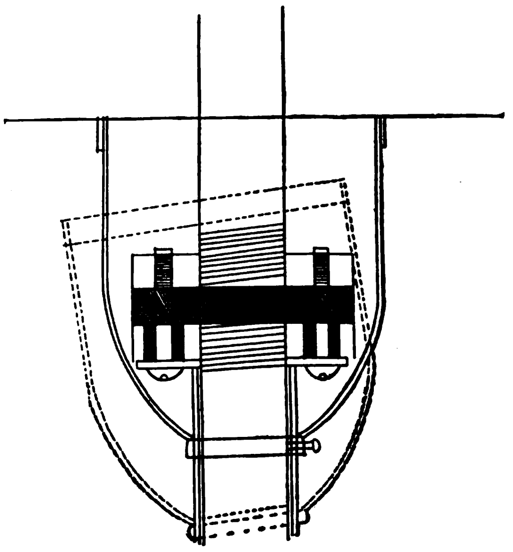

FIG. 3.

A plant should be designed with a small loss at the average load; this loss will vary with the use of the building. Very few buildings operate anywhere near their full capacity at any one time, but if they should for a few minutes in the day require their full capacity the excessive cost for coal expended for that short time would nearly compensate for the interest on the copper, which is a fixed charge against the plant. This method would reduce the cost of running the distributing to a minimum, danger of grounds would be almost entirely removed, and with improved fixture connections I doubt whether a better plant could be devised.

It is true that this plant would not coincide with the city inspection rules of Chicago to-day, but the history of our inspection department has been one of incessant warfare against bad work and in favor of better and safer installations. The gentlemen who compose Prof. Barrett's staff are progressive, active and thoroughly alive to the interest of the electrical profession, and I am satisfied are willing to make any change or alteration in the present rules that would make our work better, safer and more in accordance with good engineering, and we all feel that they are working to accomplish this laudable object.

Thanking you for your kind attention I will leave the paper to the hands of the critics of the club for the post-mortem examination and report.

Personal.

His many friends will be delighted to hear that Dr. F. A. C. Perrine, treasurer and general manager of the Germania Electric Company, has received the honor of an appointment to the chair of Electrical Engineering in the Leland Stanford, Jr., University, at Palo Alto, California. In the enjoyment of a full professorship in that institution, Dr. Perrine will find a congenial sphere. The best wishes of a large circle of acquaintances will go with the doctor when he betakes himself to the Great West next fall.

Correction.

In the article on "Motors for Alternating Currents," by Mr. F. H. Leonard, Jr., in our last issue, the single-phase current is called "two-phase." It should read "single-phase" in each instance.

SOCIETY NEWS.

Buffalo Electrical Society.

"Long Distance Transmission of Power by Direct Currents" was the topic of a talk by Frank Kitton before the Buffalo Electrical Society at a recent meeting.

He stated that the use of direct currents had not lately received the same attention as alternating currents for transmitting power, probably because it was thought by many that they could not be utilized with the same degree of economy in covering great distances; that perhaps the greatest difficulties in this respect appear when considered from a standpoint of constant potential transmission, when such factors as "pressure," "size of conductor," and "loss" appear to "whipsaw" with each other; and that it had not appeared practicable to transmit a large amount of power to a considerable distance with a satisfactory degree of economy by means of direct current at a constant potential, while on the other hand more or less success has been attained with power transmission by direct currents on a constant current system, such systems being in apparently successful operation at home and abroad. It was understood that the proposition to transmit power to the World's Fair at Chicago, obtained from the Falls of Niagara, was based on such a constant current transmission.

Mention was made of a constant potential transmission recently patented by Mr. Charles S. Bradley which presented some novel features that it is claimed will obviate the difficulties referred to. Mr. Bradley proposed to obtain a sufficiently high voltage for his purpose by connecting a number of generators of comparatively low potential in series, thus overcoming the difficulties experienced in constructing commutators, and securing insulation in armatures, which under ordinary conditions will not withstand the excessively high voltage necessary, and at the receiving end placing an equal number of motors in series for reconversion of the electrical energy into mechanical motion.

It is said that this system "involves features for rendering the operation safe, both for the machines themselves and for the operators who attend them"; that "such an invention brings the direct current machine, which has a very high efficiency, into the field of long distance transmission of power—heretofore such machines have been limited to power transmission over short distances"—and "are designed to render practicable the development of a direct current of high potential and its reconversion into power at the end of a transmitting line."

One of the novelties of the system appeared to be the use of series connected generators in a constant potential system of transmission. The question naturally arises, what are the advantages to be derived from transmitting power by such a system under constant pressure that are not already secured in a somewhat similar arrangement of generators for maintaining a constant current with an equally high pressure but which varies with the load.

A lengthy discussion followed, bringing out some interesting facts.

Mr. Frank C. Perkins, who has recently returned from abroad, where he had obtained much information on the subject, said:

"I do not see the novelty of the invention of Mr. Bradley, for the reason that in looking up the principal central stations for transmission of power—Austria, Switzerland, France, Germany and Italy—many different systems were found to be in use with varying success, and a station at Genoa, Italy, was among the most interesting, as it was operated by almost exactly the same arrangement as indicated by Mr. Bradley. The electromotive force used was 8,000 volts, a direct current being used for the transmission. The system is that of R. Thury, electrician of Cuenod, Sautter & Company, Geneva, Switzerland, and is on the same general principle as the plans they submitted for transmission of power by electricity from Niagara to Buffalo, at the request of the Niagara Commission. These plans took the highest prize awarded at that time—undoubtedly because the three-phase alternating system had not at that time been so thoroughly investigated.

"The total distance of transmission at Genoa is 26 kilometres. The company operating the station is 'The Societa Acquedotto Defewari Gallaiera,' with a capital of 5,000,000 francs. The power obtained is from a small stream in the mountains near Isoverda and Pontedicemo.

"The total fall is 450 metres, and there are three stations built up the mountain side, each having a fall of 150 metres, the same water being used over three times. The highest station is called Paccinotti, the second Volta, and the third Galvani.

"From each station there are two conductors running to Genoa, Italy, making three distinct motor circuits, each carrying from 4,000 to 8,000 volts, according to load. The motors are all connected in series and vary from 6 to 60 horse power, a constant current being used of 44 amperes and a variable voltage of from 50 to 1,150 volts for each motor, according to size. The current in the line is constant, and the pressure varies with the load. Each station has five turbines of 140 horse power. The speed of each turbine is 475 revolutions per minute. To each turbine two Thury dynamos are directly coupled, having a capacity of 70 horse power each, with a normal potential of 1,050 volts. The turbines were constructed by Faesch & Piccord, of Geneva, Switzerland, the firm whose plans for the Niagara plant took the Niagara Commission's highest prize for turbines. There are two pipes conducting the water to the turbines for each station, averaging about 250 metres in length and a half a metre in diameter. One of the turbines and two dynamos are held in reserve for use in an emergency.

"These generators are all connected in series, making a total pressure on the line of something over 8,000 volts when the eight machines are running. The line consists of two copper wires 9 millimetres in diameter, and each 26 kilometres long. At a careful test made on a rainy day the loss on the 52 kilometres of line was less than one one-hundredth of one per cent., the electromotive force at the time of the test being 4,000 volts.

"The governor used is an electric one of Mr. Thury's design. Two direct current machines of 150 amperes and 100 volts each are connected directly to a turbine of 15 horse power. One of the dynamos is held in reserve and the other used for regulating the field of the other dynamos. When a large electric motor is thrown out of use in the city of Genoa, the electric governor slows down the small water motor by an electric valve, and the exciter then furnishes less current to the field of the large generators, so that the potential of the line is reduced in proportion to the number of motors thrown out of the circuit. The regulator works very nicely, as was seen at the station Volta, while in operation. The generators have a guaranteed efficiency of 92 per cent., and the motors over 30 horse power also have an efficiency of 92 per cent., while the motors below 30 horse power are stated to have an efficiency of 88 per cent.

"The motors in the city of Genoa are directly connected to incandescent low potential machines and arc machines for distribution throughout the city."

Additions in the Department of Electricity.

The Director General of the World's Fair at Chicago has made an arrangement by which the Department of Electricity has the privilege of adding to the classification originally adopted by the National Commission. A new group has been formed which the officials have endeavored to make general enough to cover everything not heretofore classified. This group is as follows:

Class A—Construction tools, repairing tools, apparatus used in electrical construction.
Class B—Apparatus for transmission of power to electrical generators, (steam, compressed air, turbines, oil, friction, gearing belting, etc., etc.)
Class C—Processes of electro-engraving.
Class D—Carbon and its application.
Class G—Metals and their application in the construction of electrical apparatus.
Class H—The "kinetograph."
Class J—Direct coupled engines and dynamos.
Class K—Electric lubricators.
Class L—Application of electricity in testing and aging liquors.
Class M—Electric tanning.

Boston Notes.

There is one fact well worth bearing in mind in connection with the recent serious conflagrations in this city, that no one has thought to blame the electric wires. A few years ago not an incipient blaze was heard of but the "deadly electric wires" got the blame.

If there is one thing more than another that is influencing the value of General Electric stock, and setting the speculators' tongues a-wagging, it is the fearful inroads which the Westinghouse Electric Company is making into the business of the Trust throughout New England. Contract after contract for railway motors and generators are falling into the lap of the Pittsburg people. We have seen such an array of these contracts within the last few days that the wonder is how the Trust can stand it. Of course the Westinghouse Company is supremely happy; not so the other fellow.

The Hartford, Conn., Electric Light Company, after installing a big electric power plant for the operation of which the waterfall at Tariffville is utilized, has found the demand for service so much greater than was at first expected that it has determined to put in more generators, and has in contemplation the erection of a similar plant at another waterfall about the same distance from Hartford—ten miles.

The lecture on "The Movements of Atoms and Molecules" which was delivered a few evenings ago by Professor A. E. Dolbeare of Tufts College before the members of the Thomson Scientific Club at Lynn, was one of the rarest intellectual treats of the season.

The funeral service over the remains of the late Mr. D. A. Andrews, which was held in Trinity Church on Wednesday, was attended by a large number of friends, including many electrical men, who by their presence showed the esteem and respect in which the deceased was held by all.

The subject of rapid transit is still engaging a large share of public attention in this city, and the Council seems bent on having something of a practical character carried out. There is no sort of doubt that whether the scheme to be finally adopted be overhead or underground, electricity will be the motive power.

Chicago Notes.

At the last regular meeting of the Chicago Electrical Association a very interesting paper, on the "Practical Operation of the Storage Battery," was read by Mr. Fred L. Merrill.

Mr. Gustave Mourath has opened an office in room 1,602 Monadnock Building and established himself as an electrical engineer and contractor for electric light and power transmission. Mr. Mourath expects to make long distance transmission and high potential currents a specialty.

Mr. J. H. Dean, a well known electrical engineer in the Northwest, has been appointed to the position of superintendent of the West Side Electric Company of St. Paul.

Owing to ill health Mr. C. A. Daigh has resigned his position as manager of the National Electric Company and has taken charge of the Chicago office. Mr. F. A. Young has been appointed as his assistant.

Mr. E. F. Seixas, of the Chicago and St. Louis Railroad Company, left Chicago last Wednesday on a business trip to Europe.

Mr. Geo. Conover, purchasing agent, and Mr. Chas. Wirt, electrician of the Ansonia Electric Company, have gone East on a business trip.

The Western Electric Company, through their attorneys, Barton & Brown, have entered suit against the Brush Electric Company to restrain them from using or making an instrument known as the Rudd patent ground detector.

Sir Henry Wood, secretary of the British Royal Commission to the Fair, in a recent interview is reported as saying that he believes the electrical section of the exhibit from Great Britain will be a disappointment to most of the visitors of the Exposition. As an explanation, he said that the English manufacturers of electrical machinery and supplies realized that, except in the case of a few special electrical instruments, they could not hope to compete with the American manufacturers and therefore were somewhat discouraged in making a display.

The construction work on the elevated electric road that is to nearly encircle Jackson Park is almost completed. The workmen are at present employed in laying the rails. Work has begun on the stations, which will be located about every two blocks.

S. A. Carr has resigned his position as assistant manager of the electrical construction department at the Fair to enter the employment of the Consolidated Electric Light and Street Railway Company of Schenectady. Mr. C. T. Schovil has been appointed to fill the position vacated.

Five of the Westinghouse 15,000-light machines have arrived at Jackson Park and are being placed on their foundations. The armature of each machine required a standard 34-foot flat car to transport it from the factory.

One carload of Brush arc lamps arrived on the grounds last week. These lamps are now being placed in position in the different buildings. Three hundred have already been hung in the Agriculture building.

General News.

What is Going on in the Electrical World.

Waverley, N. Y.—Work will soon begin on the electric street railway.

Kissimmee, Fla.—There is talk of establishing an electric light plant here.

Danbury, Conn.—The trolley system is to be introduced on the street railways this summer.

Walla Walla, Wash.—The owners of the street-car line intend to substitute electricity for their horses.

Milwaukee, Wis.—The street car mule has totally disappeared, electricity having complete control of all our railway lines.

Lansing, Mich.—The experiment of municipal lighting in this city shows good results for the first quarter, ending February 28.

Cincinnati.—The extension of the new electric road to Fort Thomas, the Government post back of Newport, will be completed May 1.

St. John, N. B.—Electricity will take the place of animal power on the street railway as soon as the electric plant is completed.

Mount Vernon, Ill.—The electric light plant owned by Evans & Tanner, including four dynamos, was destroyed by fire on the 12th inst.

Oakland, Cal.—Mayor Chapman has approved the ordinance granting the Alameda, Oakland and Piedmont Railway Company a franchise.

Fall River, Mass.—The Electric Light Company has decided to petition the Legislature for permission to supply power as well as light.

Wabash, Ind.—George Webster, of Marion, has sold a half interest in the Wabash Electric Light Company to Thomas McNamee, of this city.

Bath, N. Y.—It is reported that a corporation is to be organized here for the purpose of building an electric railway between Bath and Kanona.

Goshen, Ind.—The Indiana Electric Power Company has been granted a franchise to build and maintain a street railway system within the city limits.

Toledo, Ohio.—The Toledo Electric Company has again raised its capital, and now it is $500,000. The raise is made to increase its facilities for electric lighting.

Columbus, Tex.—The firm of Towell & Shaw have been granted a franchise permitting them to establish and maintain an electric lighting system in Columbus.

Oshkosh, Wis.—The contracts for city lighting having expired, the council is considering whether the city would profit by establishing an electric light plant of its own.

Long Island City, N. Y.—Ex-Mayor Gleason has put a number of men at work on a new electric road from Hunter's Point to Flushing for which he claims to have a franchise.

Kingston, N. Y.—The United Columbian Electric Company of Philadelphia have leased a building in Prince street here, where they will manufacture their new patent electric motor.

Danbury, Conn.—The board of aldermen has concurred with the common council in granting permission for the use of the trolley on the street railways and the system will be applied at once.

Canon City, Col.—The Canon City Electric Light and Power Company has purchased a lot of new machinery, and will double the capacity of the plant to meet the growing demands of the city.

Fostoria, Ohio.—A large factory for the manufacture of electric light carbons is to be established here by Tremaine & Crouse, of Cleveland. The factory will cost $50,000 and will start with 100 men.

New Brunswick, N. J.—A new electrical road enterprise has appeared here. The new concern has secured the right of way from the property-owners on the Cranberry Turnpike from New Brunswick to Milltown.

Jamaica, L. I., N. Y.—The county clerk's office here is open to receive bids for lighting the following villages with electric lights: Morris Park, Woodhaven Junction, Chester Park, Brooklyn Hills and Clarenceville.

Toronto, Can.—Seventy three miles of additional track is to be laid during the coming summer in our street-railway systems, all of it for electric service. There are at present 55 miles of electric roads and 200 cars.

Hoosick Falls, Mass.—The owners of the electric-light plant at Hoosick Falls have in contemplation the building of a railroad from that enterprising village through North Hoosick and Walloonsac to Bennington, Vt.

Toledo, Ohio.—Electric street cars will ply between Toledo and Maumee this summer. A street railway line will be commenced within sixty days and completed by August or September. T. P. Brown is at the head of the enterprise.

Manchester, Va.—The supervisors of Chesterfield County have given the right of way to Col. William H. Palmer, T. William Pemberton, Col. T. M. R. Talcott and George H. Jewett to build an electric road from Manchester to Petersburg.

Albuquerque, N. M.—The city election occurs in April, and the *Citizen* urges the people to elect a mayor who believes in electric lights, new sidewalks, etc. A mayor who doesn't "believe in electric lights" would be a bad thing for Albuquerque.

Dayton, O.—The Dayton Electric Light Company's plant has been sold to New York parties. It is understood that a reorganization of the old company will be made and a new company formed The capital stock of the new company will be $500,000.

Seattle, Wash.—D. T. Denny & Sons have acquired a controlling interest in the consolidated electric railway system of the city by purchasing 8,550 shares at $100 a share—$855,500. The company will be reorganized and President Blunck will retire permanently from the road.

Tacoma, Wash.—The Point Defiance Street Railway Company is building a fifty-six foot steamer to be propelled by means of a storage battery, the invention of Nickolas Lawson. The boat, if successful, is to be the leader of a number to be placed on the Puget Sound routes.

Indianapolis, Ind.—The *Sentinel* states that the Verner-McKee syndicate have assumed control of the property of the Citizens' Street Railroad Company, and are now in absolute possession. The transfer of the stock occurred at Chicago, the last payment of $500,000 being made.

Baltimore, Md.—The *News* says that within a few days the Baltimore and Washington Boulevard and Tramway Company, as it is officially known, will be reorganized and plans will be adopted for building the connecting boulevard and electric railway between Washington and Baltimore.

St. Charles, Ill.—The Crown Electrical Manufacturing Company of Elgin have just completed an extensive factory here, which is now in full running order. St. Charles is on the Fox River, about twenty-five miles from the limits of Chicago. The water power at that point is the best on the river.

Bellaire, Ohio.—A company of Pennsylvania capitalists, including J. R. Jolly, of Pittsburg, and A. R. Leyda, of Beaver Falls, has purchased the street railway operated by J. Felix, and this is believed to mean the opening up eventually of 113 miles of electric railway passing through five counties in Eastern Ohio.

Utica, N. Y.—A scheme to utilize the water power at Trenton Falls in the production of electricity is reported here. It is to be hoped that whoever undertakes this enterprise will plan his work so as not to destroy the scenic beauty of the falls, which has attracted thousands of tourists from all parts of the world.

Albany, N. Y.—In a recent act passed by the Legislature and signed by Governor Flower, granting $258,000 for certain improvements on the State canals, it is stipulated that $10,000 of that amount may be expended in conducting experiments to determine whether electricity can be effectively and economically applied as a motive power on the canals.

Providence, R.I.—A new corporation, said to be the United Traction and Electric Company, has acquired control of the Union Railroad. Senator Aldrich is the reputed president of the new company, and the stockholders include Frederick P. Alcott and William C. Whitney, of New York; Lee, Higginson & Co., of Boston, and Marsden J. Perry, of Providence.

Denver, Col.—A Denver man has a patent on an electric conduit which is claimed to be serviceable for side streets, though it would not do for a great number of wires. It is a continuous insulated metallic box which takes the place of a curbstone and is said to be strong enough to answer all the purposes of a curbstone while it makes the wires very easy of access.

Bloomington, Ill.—Ex-Senator W. H. Patterson, of Mifflintown, Pa., is said to be at the head of a scheme to build an electric railway to connect Bloomington with Lexington, twenty miles away, and a similar road between here and Leroy, also twenty miles from Bloomington. The cost is put at $500,000. The company will furnish light and power as well as operate the railway.

Louisiana, Mo.—A St. Louis syndicate represented by Col. James O. Broadhead, W. J. Dougherty and O. C. Brison has been granted a franchise for the construction of an electric railroad on the Louisiana and Middleton gravel road between Louisiana and Ashley, a distance of eighteen miles. Work will be begun without delay, and the road is expected to be in running order by September.

Windsor, Conn.—The Eddy Electric Manufacturing Company has shipped one of the 250-horse-power generators that have for some months past been in the works, to the World's Fair at Chicago. The other of the same build is being tested and will go forward in a few days. Other machines of less power are also nearly ready for shipment. The entire force of employees is working overtime, and yet the company is behind its orders.

Jersey City, N. J.—The Crimmins street railway syndicate has been duly incorporated and has completed its organization. The principal incorporators are E. F. C. Young, president of the First National Bank, Jersey City, representing the Hudson County lines; Bernard Naighton, the Elizabeth lines, and Jeremiah O'Rourke, the Essex County lines. The field of operations of this mammoth corporation is of great extent, and besides covering populous cities and towns includes the several routes converging toward the Empire City.

Schenectady, N. Y.—An ice gorge in the Mohawk River at the Fitchburg Railroad bridge caused the water to overflow the banks, flooding that part of the city in which the Edison General Electric Company's works are situated. All the exhibits which the company was preparing for the World's Fair were practically destroyed by the water, as was also most of the machinery and stock on the ground floors of the buildings. Other factories in that section also suffered, and about 4,000 men were temporarily laid off. The damage done by the overflow was estimated at over a million dollars.

Chicago.—An injunction suit has been brought by the Western Electric Company against the Brush Electric Company of Cleveland, in the United States Circuit Court, to restrain the latter from manufacturing and using certain instruments for electrical testing which were invented by C. H. Rudd.—The Enamel Insulator Company of Chicago has filed a bill of complaint in the United States Circuit Court against the Carpenter Enamel Rheostat Company of Bridgeport, Conn. The bill alleges an infringement of an improvement in electric insulators. An injunction and accounting are prayed for.

Willimantic, Conn.—At the Woman's Club meeting a few evenings ago, "after a song by Mrs. Morrill," says the local paper, "the subject of electricity was introduced by Mrs. Nellie Crane in a talk illustrative of some of the earlier methods of producing electricity. Miss Page illustrated other methods of generating electricity—by the dynamo, galvanic battery and other apparatus. Mrs. Arthur I. Bill read a paper embodying the history of experiments in electricity, including most of those which Miss Page had illustrated. Mrs. Alice Crane continued the topic by reading an article on Prof. Morse and the telegraph."

Bethlehem, Pa.—The *Times* says: "The recent chartering of several long distance electric car lines in Pennsylvania is the beginning of a revolution in transit facilities. There are numerous isolated villages and extensive tracts of country which the steam railroads have not reached. In these secluded places land brings the lowest prices, and here the discontent of the farming population is most decided. The cheap electric lines, which scale hills and plunge into valleys with little or no grading, which need no expensive stations, engine houses, etc., will eventually find their way to and open up these regions."

New York.—Cary Smith, the yacht designer, has received an order for a 70-foot schooner which will have not only full sail power, but will be fitted with an electric storage battery. She is designed for cruising in Florida waters, and when the wind fails her battery will enable her to keep moving at a six-knot speed.—The Electric Power Company, which brought an action against the Metropolitan Telephone and Telegraph Company for cutting its wires on certain housetops in the city, got a verdict for $2.565.88.—The statement of the Edison Electric Illuminating Company, of New York, for February shows gross earnings of $105.778, against $77.344 last year; operating expenses $50,795, against $36,853, and net $54,983, against $40,490. From January 1 to March 1 the net earnings were $121,183, against $87,257.

Brooklyn, N. Y.—The Brooklyn City Railroad Company has ordered one hundred new open electric cars for summer traffic on its various lines. The company will also have four hundred cars altered and made into open electric cars.—Trolley cars have begun running on Fifth and Atlantic avenues to South, Wall and Fulton ferries.—The old bell-punch, which made conductors on the street cars lament their fate, is soon to disappear. An automatic contrivance on the electric cars relieves the conductor of keeping tally of the fares, and so far lessens his responsibility.—The Nassau Electric Railroad Company has petitioned the board of aldermen for the right to build a double-track surface railroad on Ninth avenue from Union street to Twentieth street; Rogers avenue from the city line to Bergen street, Nostrand avenue and Atlantic avenue, to New York avenue, Liberty avenue, East New York avenue, Douglass street, Ninth avenue, Union street and Hamilton avenue to Ferry place; Marcy avenue from North Second street to Fulton street, and a route from the foot of Marcy avenue, South Fifth street, Union avenue, Johnson avenue, Morgan avenue and Hamburg avenue to the Evergreens Cemetery.

We have received, too late for reproduction, a photograph of the exhibit case of the Norwich Insulated Wire Company, which attracted a great deal of attention at the St. Louis Convention.

Queen & Company.

Queen & Company, Incorporated, Philadelphia, reports a steady demand for their Standard Portable Resistance Sets, which enjoy a national reputation and are used in foreign countries.

This applies especially to "No. T 805" which is recognized as the most efficient portable apparatus for practical work on the market.

It can be used anywhere and everywhere, and is absolutely invaluable in locating faults or grounds in electric light, telegraph or telephone wires. An enthusiastic purchaser writes: ". . . it is the best portable set I have ever used or worked with, and consider any electric light or railway plant incomplete without one. The galvanometer I find works well even in close proximity to the intense magnetic fields of our dynamos."

Descriptive circular No. 430 will be mailed by the makers upon application.

Special Announcement.

To our Customers and Friends:

Desiring to take advantage of the opportunity offered by the World's Fair to evince our appreciation of favors in the past, received in such abundance from our customers and friends, and realizing that the demands of our business are such as to make it impossible for those actually engaged in its everyday transactions to extend to our customers and friends such courtesies as we should be pleased to have them receive from us, we beg to announce that for this and other purposes in connection with the Great Exposition we have organized a separate department, or World's Fair bureau, and have concluded arrangements to place this department in charge of Hon. Geo. B. Shaw, who has been recently elected to Congress and is well known in electrical circles through his former connection with the National Electric Manufacturing Company as its general manager.

It will be a pleasure to us to hear from our friends and to render them any possible assistance either before or during their visit to the Fair.

Trusting that we shall find that we may be of service to them, we remain, very cordially,

THE ANSONIA ELECTRIC CO.,
F. S. TERRY, Manager.

INCORPORATIONS.

The Madera Electric Light Company, Madera, Cal. Capital stock, $100,000. Incorporators: R. L. Hargrove, Sol Lazar, A. B. Ganyard, J. E. Newman and D. M. Tomblin.

The Edison Electric Illuminating Company, of Brooklyn, N. Y., has filed a certificate of an increase in the amount of its capital stock from $1,500,000 to $2,500,000. The purpose of the increase is to extend the company's business.

The Home Medical Electric Company, at Chicago. Capital stock, $5,000. Incorporators: C. O. Lindstrom, Theodore Paine and John P. Olson. The company will manufacture electric batteries.

South Milwaukee Light and Power Company, South Milwaukee, Wis. Capital stock, $15,000. Incorporators: Frank H. Brice, Wm. W. Williams and A. W. Bell.

At Harrisburg, Pa., charters were recently granted to the Columbia Traction Company, of Columbia, Pa., capital $10.000, and the Reading Traction Company, of Reading, Pa., capital $100,000.

The Forest Hill Electric Railway Company, of Kansas City, Mo., has applied for a charter. The capital stock is $150,000. Directors: C. H. Hammett, L. E. Davidson, George Law and others. The road proposed will be six miles long and will run to Waldo Park race track.

The Portable Electric and Power Company, Peoria, Ill. Capital stock, $250,000. Incorporators: Anson C. Tichenor, Robert H. Walker, Isador Mantz and Frank Covey. The purpose is to manufacture electrical inventions.

The Electric Propeller Company, Chicago. Capital stock, $200.000. Incorporators: William C. Marshall, David C. Kling and Louis C. de Proft.

The Springfield, Jacksonville and Winchester Electric Railway Company, Jacksonville, Ill. Capital stock, $1,000,000. Incorporators: James T. Self. George Huffaker and Warren Case, of Jacksonville; John Gibbs and Samuel G. Dewees. The purpose of the company is to construct an electric railway from Springfield to Winchester by the way of Jacksonville.

The Direct Acting Electric Gong Company, of New York City. Capital stock, $15,000. Directors: Thomas Butler, George P. West, Edwin G. Bates and E. A. Footman, of New York City: Henry B. Oakman and James F. Kelley, of Brooklyn.

A charter has been granted at Harrisburg, Pa., to the Pen Argyl, Bangor and Water Gap Electric Railway Company, to run from Wind Gap to Pen Argyl, West Bangor, East Bangor, Johnsville, Williamsburg, Middle Village, Portland, through the Delaware Water Gap to East Stroudsburg. Capital stock, $300,000. The president is A. J. Stroh, of Sunbury.

The Citizens' Electric Power and Street Railway Company, San Antonio, Tex. Capital stock, $30,000. Incorporators: A. H. Dillard, C. E. Harris, W. J. Clark, F. A. Barnaby, F. C. Dow, H. E. Barnard and C. C. Cisson.

Pacific Electric Regulator Company, San Francisco, Cal. Capital stock, $500,000. Directors: H. W. Chase, J. P. Moore, J. R. Hanify, William C. Stair and John P. Muller.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MARCH 14, 1893.

ELECTRIC RAILWAYS AND APPLIANCES.

493,618. Electric-Railway Conduit and Contact. Joel Davis and Reuben M. Huntington, Denver, Colo. Filed Oct. 2, 1891.

493,623. Electric-Railway System. Thomas Harris, Detroit, Mich., assignor, by mesne assignments, to the Harris Electrical Propulsion Company, Limited, same place. Filed Jan. 8, 1892.

ELECTRIC LIGHTS AND APPLIANCES.

493,358. Electric Search-Light. Rudolph M. Hunter, Philadelphia, Pa., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Sept. 16, 1891.

493,359. Electric-Arc Lamp. Rudolph M. Hunter, Philadelphia, Pa., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed 1, 1892.

493,360. Electric Arc-Lamp. Rudolph M. Hunter, Philadelphia, Pa., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Oct. 14, 1892.

493,411. Base for Electric-Light Brackets. James T. Robb, Mount Vernon, assignor to the Edison General Electric Company, New York, N. Y. Filed Feb 24, 1891.

493,446. Support for Electric Lamps. John R. Protzman, Streator, Ill. Filed Sept. 17, 1891.

493,578. Electric-Lamp Supporter. Alvin G. De Witt, Detroit, Mich. Filed Feb. 7, 1891.

493,609. Lamp-Socket. Henry P. Ball and Amandus Metzger, Schenectady, assignors to the General Electric Company, New York, N. Y. Filed Aug. 3, 1892.

DYNAMOS AND MOTORS.

493,318. Dynamo-Electric Machine. Elihu Thomson, Swampscott, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed July 28, 1891.

493,337. Armature for Dynamo-Electric Machines. Horace F. Parshall, Lynn, assignor to the Thomson-Houston Electric Company, Boston, Mass. Filed Sept. 15, 1892.

493,349. Armature for Motors and Generators. Norman C. Bassett, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed July 9, 1891.

493,361. Switch for Electric Motors. Moritz Immisch, London, England, assignor to the Immisch Electric Navigation and Power Company, of New Jersey. Filed Nov. 21, 1891.

493,375. Balanced Armature for Dynamo-Electric Machines or Electric Motors and Method of Balancing Same. Gano S. Dunn, New York, N. Y., assignor to the Crocker-Wheeler Electric Company, same place. Filed June 6, 1892.

493,425. Electric Locomotive. Thomas A. Edison, Llewellyn Park, N. J. Filed Jan. 19, 1891.

493,431. Electric Motor for Dental Work. Jeremiah Kellar, Canton, Ohio. Filed June 6, 1892.

493,439. Commutator for Dynamo-Electric Machines and Method of Constructing Same. Alexander W. Meston, St. Louis, Mo., assignor to the Emerson Electric Manufacturing Company, of Missouri. Filed Sept. 12, 1892.

493,447. Armature Connection for Dynamo-Electric Machines. George A. Rollins, Chicago, Ill. Filed Feb. 16, 1892.

TELEPHONE AND TELEGRAPH APPARATUS.

493,245. Ear Attachment for Telephones. George McC. Brown, Nashville, Tenn., assignor of one-half to Edward James Cahill, La Salle, Ill. Filed June 23, 1892.

493,253. Signaling-Telegraph. William E. Decrow, Boston, Mass. Filed Nov. 14, 1892.

493,297. Acoustic Telephone. Thomas B. Rogers, Brooklyn, N. Y. Filed June 3, 1892.

493,304. Telephone Index. Stillman L. Shaffer, Worcester, Mass. Filed Oct. 25, 1892.

493,620. Telephone-Relay. Samuel P. Freir, East Orange, N. J., assignor to the Western Union Telegraph Company, of New York. Filed Dec. 15, 1891.

MISCELLANEOUS.

493,243. Electric Switch. William F. Bossert, Utica, N.Y., assignor to the Utica Electrical Manufacturing and Supply Company, same place. Filed Feb. 17, 1892.

493,277. Method of Electro-Depositing Metals. Orazio Lugo, New York, N. Y., assignor to the Cosmic Alloy and Metal Depositing Company, of New Jersey. Filed Jan. 8, 1892.

493,314. Lightning-Arrester. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company, of New York. Filed Oct. 28, 1892.

493,328. Multiple Terminal Cut-Out. Lark P. Bonebrake, Maryville, Mo. Filed Nov. 10, 1892.

493,346. Personal-Equation Chronograph. Lionel De L. Wells, London, England. Filed June 17, 1892.

493,369. Electric Switch. Alfred Stromberg, Chicago, Ill. Filed Nov. 1, 1892.

493,380. Combined Cut-Out and Lightning-Arrester. Ernst F. Hammarstrom, Stockholm, Sweden, assignor of one-fifth to Axel Jungmarker, Worcester, Mass. Filed June 3, 1892.

493,422. Electrically-Heated Vessel. John V. Capek, New York, N. Y., assignor of one-half to Edward H. Johnson, same place. Filed Dec. 14, 1891.

493,485. Electric Switch. Andrew M. Coyle, Baltimore, Md., assignor to the Standard Screw Elevator Manufacturing Company, same place. Filed March 3, 1892.

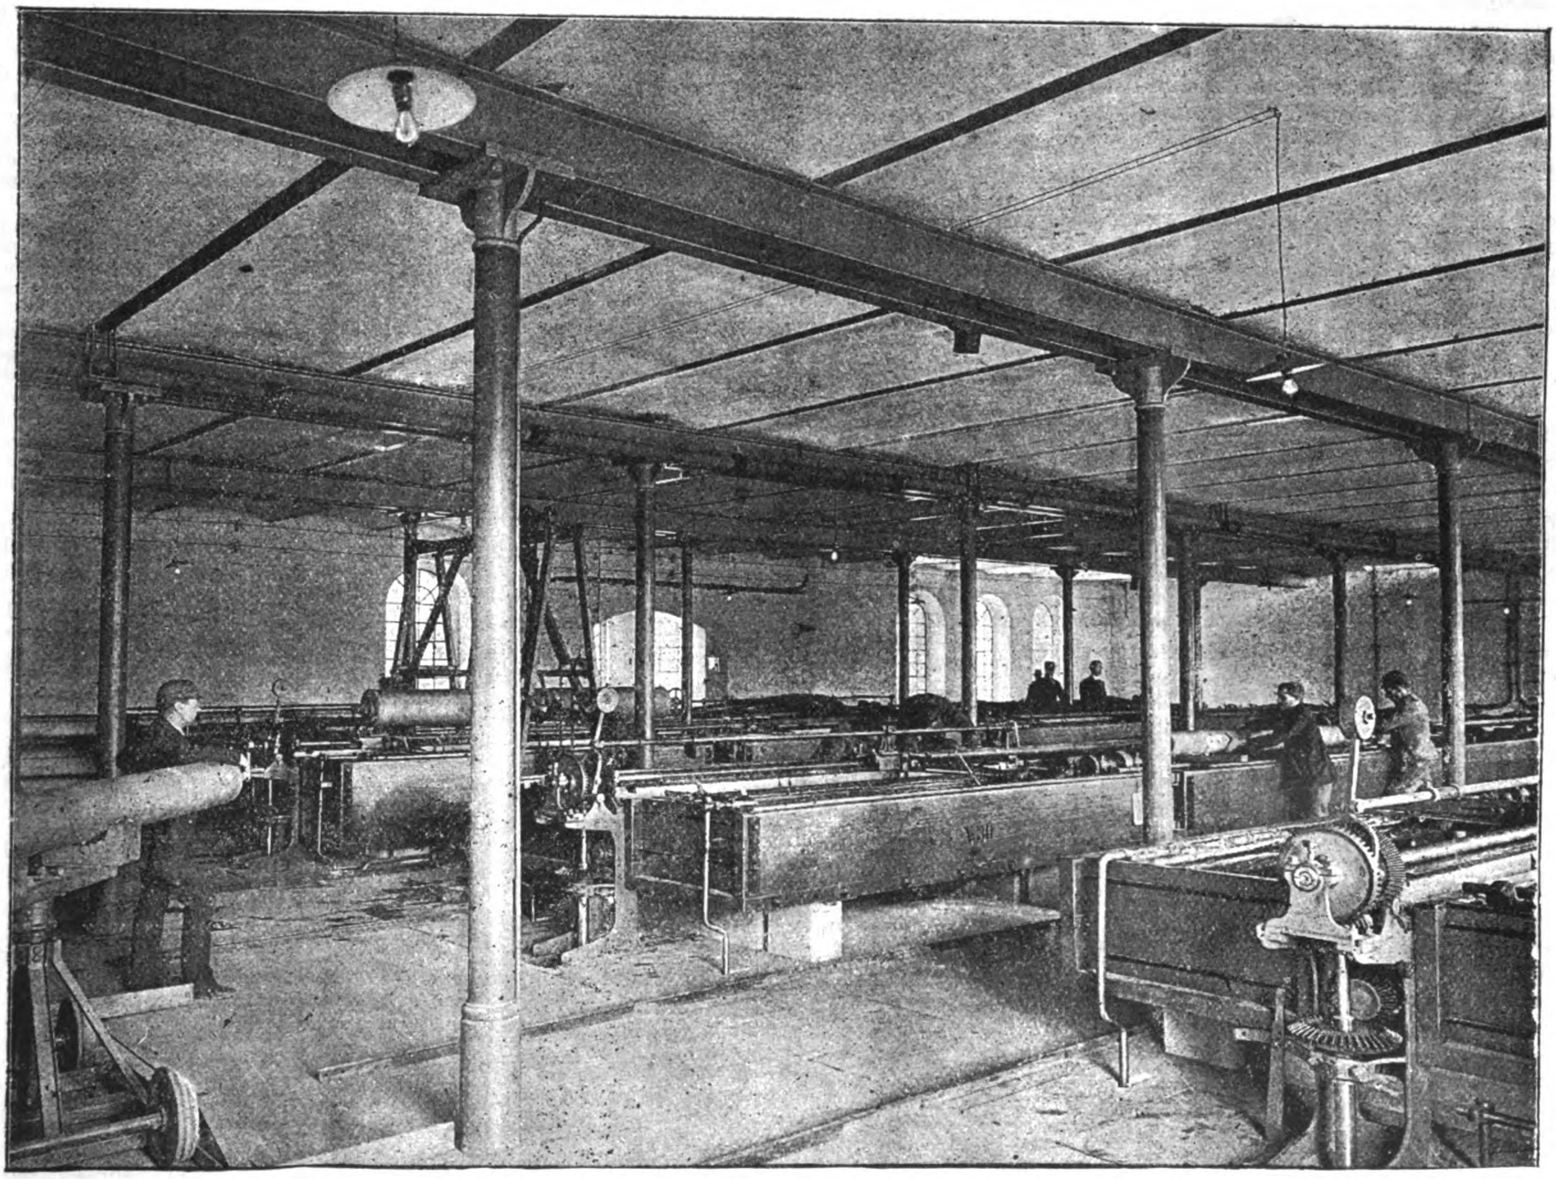
493,558. Telethermometer. Leroy S. Norton and Frank S. Hoffman, Alpena, Mich.; said Hoffman assignor to said Norton. Filed Oct. 31, 1892.

493,601. Thermostat. Thomas W. Shepherd, Peabody, Mass. Filed Aug. 6, 1891.

493,602. Electric Controlling Device. Thomas W. Shepherd, Peabody, Mass. Filed Oct. 24, 1891.

ELECTRICITY.

VOL. IV. NEW YORK. MARCH 29, 1893. CHICAGO. No. 11



TANK ROOM—GERMAN ELMORE WORKS. (SEE PAGE 133.)

The German Elmore Works.

BY CLARENCE P. FELDMANN.*

The newly erected works of the Elmore's Metall Aktiengesellschaft are situated at Schladern, Rhenish Prussia, about 40 miles from Cologne, on the left bank of the Sieg, and not more than 300 yards from the railway station. The Sieg, which flows into the Rhine, winds its way in several large and nearly closed curves through the hills, and is able to furnish about 720 cubic feet of water per second. By negotiating one of these curves, and driving two 250 ft. tunnels, it was possible to get a total fall of 18½ feet, which, as the whole mass of water can be utilized, renders a total of 1,200 H. P. available.

Of the total available water power of 1,200 H.P. only 550 H. P. have been made use of so far. Two Knap turbines, by Messrs. Briegleb, Hansen & Company, of Gotha, have been laid down, and the power is transmitted by rope gearing to a common shafting in such a way that one or the other or both turbines may be coupled or disconnected by means of suitable couplings. Great care has been given to the bearings of the shafting, which are all provided with loosely-revolving lubricating rings. In spite of the rather high number of 160 revolutions per minute one of the wall bearings, which cannot be controlled during active service, made a record run of three months' continuous running, and was found to be quite intact when it was refilled with oil. This feature, small as it may seem to be, is an essential one, as with the Elmore process interruptions or disturbances might prove disastrous. From the common shafting the dynamos are driven by belts. They are four-pole Helios Company dynamos, running at 230 revolutions per minute, and having an output of 1,200 amperes at 50 volts. The main shafting also drives a small dynamo, which lights the building, and provides, by means of other auxiliary shafting, the necessary power for the tank rooms. The engine room has been designed for eight large dynamos and for one or more steam engines, which might possibly become necessary in very dry summers.

The tank rooms (see Frontispiece) are intended for 200 tanks corresponding to a total output of 85 tons a week. At present only 40 tanks are at work, and a second set of 40 tanks is just being put down. The tanks, similar to those of the Leeds works, allow of the production of tubes of 10 feet 8 inches in length and 22 inches diameter. All 40 tanks are connected in series. A room near the turbine house contains very large tanks, the special tanks, in which tubes of 15 feet length and 5 inches diameter can be made. This room also contains the cyaniding tank in which all the iron cylinders, hydraulic rams, etc., get the first thin layer of copper before they are passed into the tanks containing the sulphate of copper solution. Small electric motors drive rotating pumps, which produce the circulation of the liquor in the tanks; other electric motors are directly coupled to circular tube saws and polishing discs. A powerful testing machine, fitted up in a special room on the first floor, is in continuous use. Not a single tube is sent away, the qualities of which with regard to tensile strength, elongation and contraction have not been carefully tested and registered. These figures, together with a most complete system of daily reports, allow a very complete control of the whole output, and the origin of every tube, and all circumstances connected therewith, can be traced back at any time.

The greater proportion of the work done at Schladern is devoted to the production of tubes and the thickening up of calico rollers. Just lately another branch of the process has become of great importance, namely, the coating of seamless wrought-iron tubes. These tubes are first turned true on the lathe, and then covered with a firmly adhering copper deposit, varying in thickness from $\frac{1}{32}$ inch to ½ inch. The compound rollers obtained in this way are mostly employed in paper machines and in textile machines. They possess higher tensile strength than pure copper rollers without losing the advantages of the latter. It was also stated that large orders have come in lately for coating iron tubes for mining purposes inside and outside with a thin copper deposit, in order to protect them from oxidation. The adherence of the deposit to the rough iron surface is secured by a special process.

The situation of the works, which have been planned, built and are managed by Mr. Ernest Preschlin, in the most busy part of industrial Germany and close to the West Prussian Copper Mines, not only secures them skilled workmen and cheap raw material, but the selling facilities for their products are increased to a great extent by the close vicinity of all the large German calico printers' establishments and paper mills. However, the splendid water-power is the main advantage which these works possess compared with their associated companies in other countries.

† *London Electrician.*

The Cost of Steam Power Produced With Engines of Different Types Under Practical Conditions; with Supplement Relating to Water Power.

BY CHAS. E. EMERY, PH. D.*

The paper of the writer on "The Cost of Steam Power," published in Vol. XII, Trans. Am. Soc. C. E., November, 1883, seemed to supply information desired on the general subject by many engineers not practising in that branch of the profession, and the writer has often been urged to modify the paper to suit more recent conditions. The prices of engines and boilers employed were higher than the ruling prices to-day, but these form a small percentage of the total capitalized values. The price of coal employed was also higher than the ruling prices in many localities at present, which directly affects the results, but it is evidently impossible to assume any price for coal which will apply to all locations. For these reasons it is believed that the table can still be employed with advantage by any one sufficiently familiar with the subject to make the necessary corrections for different conditions.

It has been decided at the present time, instead of revising the former tables, to compare the cost of developing a given amount of power with several of the different kinds of steam engines now in general use. A unit of 500 net horse power has been selected for the purpose, though some of the comparisons are on the basis that several such plants are in the same station. In order to make the comparison at the same speed, it is assumed in all cases that the power is delivered at a speed of 250 to 350 revolutions per minute, corresponding to the jack shaft speed of slow engines and the actual speed of high speed engines.

It will be attempted in this presentation to examine all the principal causes which affect the cost of steam power in engines of different types operated under practical conditions, but the substantial equalization of the cost of the power developed with engines of different types and different degrees of economy, when expenses independent of the coal consumed are considered, will necessarily form a prominent feature of the discussion, for the reason that such expenses have frequently been neglected or inadequately discussed, so that their very important bearing on the results is not generally understood. It will be shown that such additional expenses are fairly constant, independent of the type of engine, and that without considering interest or dividends they will in some cases equal the cost of coal. It will be seen, therefore, in comparing two engines of which both are good, so that one, for instance, will only affect a saving of coal compared to the other of say 12½ per cent., making the relative costs of fuel as 8 to 7, that, if additional costs equal to the former be added to *both*, the relative economies will be as 16 to 15, and the saving reduced to 6¼ per cent. simply by the summation of costs. If then we assume that all expenditures should pay 10 per cent. interest or dividends on capital invested and 10 per cent. of the difference in first cost of the engines equals an amount which represents a saving of 6¼ per cent. of fuel, then the cost to the owner of the steam plant will be exactly the same in the two cases, since in one case he will pay in additional interest or dividends or the capital invested the same sum as he will pay for additional fuel if he uses the cheaper engine.

In general it will be found, as in the above illustration, that the mere cumulation of costs, other than for fuel or interest, has the greatest effect in reducing the percentage of saving due to a more economical consumption of fuel, and that a consideration of interest and dividends may simply neutralize or reverse percentages that were already made very small from the first named cause.

The original cost of the plant is evidently of great importance where on one hand money is dear or on the other coal is cheap or the work irregular. When the interest or dividend charges and others akin thereto are duly considered, it will readily be seen that the number of hours an engine operates in a year has a very important influence on the question of first cost, as such charges for a given steam machinery will be exactly the same whether the latter be operated one hour per day during part of the year or twenty-four hours per day for the entire year, and the interest will also be the same whether the coal used cost $1.00 or $10.00 per ton. The saving in the total cost of coal consumed, either during the short hours or at the low price per ton, will evidently not be such as to warrant the adoption of high priced steam machinery.

It should be observed that various conditions in addition to those previously named operate to equalize the total cost of different kinds of steam machinery. For instance, with more economical engines smaller boilers are required, so the saving in the cost of the boilers partly compensates for the higher cost of the engines. Again, coal is at the present time cheap compared with former prices, and this is true also of steam engines of ordinary construction, which facts tend to maintain former conditions. On the contrary, steam machinery designed to secure economy, though lower than formerly, is still relatively high.

Principally to obtain uniformity of expression we may preliminarily state, on a somewhat elementary basis, that steam engines at the present time may be divided into two general classes, distinguished as high speed and low speed engines, and though most low speed engines are operated at higher speeds than were employed years ago, there is still a definite distinction, although in many cases the gradations not only appear to reach, but perhaps cross each other. The high speed engines are best distinguished by the fact that they are of comparatively short stroke and develop approximately the same piston speed as long stroke engines by an increased number of revolutions.

We have also simple, compound and triple compound engines of both the high and low speed types, and either of them may be horizontal or vertical. Most low speed engines of the power proposed are of the Corliss type, or at least have much the same general proportions and some means of automatically cutting off the steam by the action of the governor to produce regulation of speed.

Either of the above engines may also be operated with the steam escaping into the atmosphere or to a condenser, and in the latter case an air pump may or may not be used. The first class of engines can no longer be distinguished as "high pressure engines." They are referred to herein as "non-condensing engines." Those of the second class are called "high pressure condensing, without vacuum," while the term "condensing engines" is a general one applied to those in which the steam is condensed and a vacuum formed.

Table I, submitted herewith, shows in detail the cost of one horse power per year developed in engines of different kinds when operated for 10 hours per day for 308 days in the year and

---

*Read at the Seventy-fifth Meeting of the American Institute of Electrical Engineers, New York, March 21, 1893.

TABLE I.—Showing the Comparative Cost of Steam Power Developed in Engines of Different Types.

BY CHAS. E. EMERY, PH. D., NEW YORK, 1893.

for 20 hours per day for every day in the year, with columns showing the results in each case for coal costing $2, $3, $4 and $5 per ton. The results are at first presented on the basis that the power required is comparatively steady so that no surplus machinery is required. A second presentation shows the results for electric light and other plants in case 50 per cent. surplus machinery be provided to supply the maximum power during certain portions of the day, and the power for the remainder of the day is sufficiently low to maintain the average.

In column *b* of Table I will be found the designation of the several types of engines compared, arranged by the amount of fuel required to produce one horse power. Distinguishing letters are provided at the left in column *a* for convenience of reference. In general the kind of engine employed will be understood from the names at a glance. They are presented on different lines of the table, simple, high and low speed engines, both condensing and non-condensing, compound high and low speed engines, both condensing and non-condensing, high speed triple compound engines, condensing and non-condensing. There are also three lines devoted to low speed condensing triple compound engines. Of these line *J* shows the probable results with machinery designed to secure economy in construction rather than the highest economy of fuel. Line *K* refers to a low speed triple compound engine more expensively constructed, for which the economy is assumed lower than in the other case and for which the results are believed to be the best that can be secured under ordinary average practice even with the best machinery. There has, however, for comparison, been added another line, *L*, assumed to be operated at still lower economy by the use of boilers of unusual economy and careful attention to the details of operation, for which purpose $1 per day is added to the labor account. The results shown in this line are believed to be the maximum which can be obtained under the conditions of unusually good practice with the best care available.

Column *c* shows the indicated horse power required to produce 500 net horse power. As previously stated the net power is assumed as delivered to a shaft revolving at a speed of 250 to 350 revolutions per minute, such for instance as the main shaft of a so-called high speed engine, or the jack shaft of a low speed engine, consequently the indicated power of the latter must be increased sufficiently to overcome the frictional resistance developed in transmitting the power to the jack shaft. The total loss due to the friction of the engine and jack shaft of the slow speed engine is considered to be ten per cent., without reference to its distribution, which is substantially what has been obtained by experiment under average conditions. The friction of the high speed engines is fixed at 8 per cent, which may appear somewhat high for such large engines, but it is believed to be warranted by the short stroke, large bearings and high velocities necessarily employed, although it will undoubtedly show smaller in particular engines. In this way 542 is fixed as the indicated horse power of the high speed engines and 556 as the indicated horse power of the low speed engines.

Column *d* shows the assumed steam pressures as shown by gauge. The pressure regularly carried has been somewhat increased of late years, so that none of the engines are assumed to operate at a less pressure than 100 pounds, and for all the triple compound engines the pressure is assumed to be from 150 to 170 pounds.

Columns *e* and *f* relate to the feed water per indicated horse power per hour; column *e* showing the probable limits within which the feed water required will vary for engines of the types stated when constructed by different manufacturers or operated under different conditions. The lower limit is believed to have been fixed in each case at the minimum result which has been obtained by reliable experiments with the class of engines referred to; these figures are therefore too low for average practice. The larger figures in column *e* represent results which in the opinion of the writer may be obtained under less favorable but practical circumstances, and of course still larger costs would result from the use of apparatus imperfectly designed or improperly operated. Column *f* shows the feed water per indicated horse power per hour assumed for comparison. The figures in this column are not intended to be averages of those given in column *e*, but those which can be safely depended upon under conditions of practice, with the load varying between considerable limits, thereby affecting somewhat the economy. It should be stated that the desire to have these figures decrease progressively where possible has somewhat influenced the values selected as well as the above considerations, which should be borne in mind in making the comparisons. In cases where the conditions are especially favorable, the results for a type of engine written in one line may be taken from the line below or by an average of the results written opposite the name of such engine and those on the line below. It is believed, however, from a careful consideration of all the evidence available on the subject that the figures given are all that can be depended upon under average conditions of practice. Engines operating cotton mills or large numbers of small machines of any kind under conditions securing a substantially uniform load will necessarily give nearer the minimum results shown in column *e*, but engines generating electric current for electric railways or subject to variable loads of any kind will rarely show economies as low as has been assumed for comparison in column *f*.

Column *g* shows the commercial horse power of the boilers required to furnish steam to engines of the indicated power shown in column *c*. The power of a boiler is really represented by the quantity of water it will evaporate under normal conditions. Its rating should not be based on the maximum quantity it will evaporate, for in such case the steam pressure would fall during the operation of replenishing or cleaning the fires. There is really no such thing as an absolute boiler horse power, for the reason that the quantity of feed water evaporated required by different engines varies through such wide limits. It is, therefore, necessary to arbitrarily fix the rating for boilers based on the evaporation of a definite quantity of water under definite conditions. In the report of the judges of Group XX, Cent. Exh., the writer called attention to the fact that for economical engines the boilers were generally designed as part of the plant; that for portable engines the boiler and engine were generally attached together, and he suggested that the rated horse power of a boiler could properly be fixed by the quantity of water required for engines of a class then most largely in use, to wit, automatic cut-off high pressure engines of 80 to 100 horse power. He therefore based the calculation relating to the tests of boilers at the Exhibition on the basis that the commercial horse power of a boiler should be fixed at thirty pounds of water evaporated at seventy pounds pressure at a temperature of 100 degrees. This rating was adopted by the judges at the time and has since been adopted by a committee of the American Society of Mechanical Engineers. The increased duty required by the boiler to evaporate the water at an increased steam pressure is small and may ordinarily be neglected. The assumed temperature of feed water, to wit, 100 degs., can be readily obtained even with condensing engines, so the commercial horse power of boilers for the different engines has been found by simply taking the product of the several indicated horse powers in column *c* and of the water per indicated horse power in column *f* and dividing each by thirty, or the number of pounds of water per horse power assumed for the rating of boilers. It will be interesting to observe that the high speed non-condensing engines in line *A* require 596 boiler horse power to produce 500 net horse power, and that the power of the boilers continually diminishes with the reduction in feed water per horsepower, so that for the case last named, line *L*, only 250 boilers or commercial horse power is required.

While on the subject of boilers we proceed at once to the cost of the boilers given in column *i*. As shown by the heading, the prices stated not only include the original cost of the boilers proper but the erection and connection of the same, which may add a considerable sum to the original cost, particularly where the work is of such character that steam pressure must be maintained either on one boiler or another at all times during the hours of operation as is desirable in all kinds of manufacture and necessary where public interests are at stake as in electric work. All steam apparatus needs more or less repair. Stop valves will get off the stems occasionally or obstructions get upon the seats so that they cannot be shut; packing will blow out here and there, joints will become loosened and leaky; in fact there are numbers of petty difficulties that are likely to arise which will require a particular boiler to be shut off pending repairs, independent of the regular suspension of operations for the purposes of inspection and cleaning. To provide for such contingencies it is necessary to insert plenty of valves in the pipes so that one boiler may be shut off independently of another. As accidents are likely to arise at the valves themselves so as to require shutting off main steam pipes occasionally, the writer felt that it was warranted when building the plant for the New York Steam Company to provide duplicate connections to each boiler so that the main steam pipes themselves could be repaired without suspending operations. It was done in that case by the use of smaller pipes for the duplicates, and during the time they were used exclusively the steam pressure was carried higher. Very many electric light plants have, however, been made since that time, in which every connection has been duplicated of full size, and valves placed in every branch where it was possibly thought any difficulty would arise likely to cause a suspension of operation. In such case the water feed pipes are also duplicated in the same way. In the work of the writer above referred to, the duplication of the feed pipes was provided for by arranging blow-off valves which could also be used as check valves by leaving slack in the connection of the stems to the valves and then making connections from the pumps to the blow-off pipes. This arrangement answered the purpose perfectly and in fact proved of greater importance than the auxiliary system of steam pipes. It will be interesting to mention that the latter were kept in operation all the time and used like what is called the "donkey system" on board ship to supply the pumps and auxiliary connections.

There has been some embarrassment in selecting a type of boilers for this comparison on account of the very considerable difference in cost. It has been decided to use a price sufficiently high to cover the cost of the better class of what are termed "safety boilers," or those in which the water is contained in tubes, small chambers or comparatively small shells of unusual strength compared to the large shells of ordinary boilers. Tubular boilers, either of the horizontal or vertical type, are undoubtedly cheaper in the first place, and since, with equally good combustion in different cases, the economy obtainable is increased slightly by increasing the heating surface available for a given power, ordinary tubular boilers are selected when large ratios of heating surface to grate are desired or boilers of the sectional type employed with economizers at the base of the chimney. Increased surface in tubular boilers chokes the draft. It follows, therefore, that generally the tubular boilers do not have the surplus power of the better class of boilers of the sectional type and that therefore when the power varies greatly and the machinery is to be forced for several hours per day to its utmost, as in electric railway work, a greater H. P. of boilers of the tubular type must in general be provided than of the sectional type. Again, some forms of tubular boilers, although showing high economies under the special condition of steady work and careful attention, are not calculated from their construction to run for a considerable time without attention, and any emergency which prevents regular cleaning chokes them up so that their performance is very much reduced and inadequacy of boiler power soon becomes evident. This is particularly the case with the cheap, and, under certain conditions, very efficient vertical boilers with small tubes. In the earlier form of sectional boilers all parts of the boiler were composed of tubes of small sections which would leak at the joints and relieve the pressure much below the explosive limit of the sections. This kind involved difficulties in the way of disengagement of steam and were inconvenient to repair, so that in the more recent modified type, selected for comparison, all the water exposed to the direct heat of the fire is contained in tubes or small cells and disengagement of the steam takes place in drums at some distance from the fire. With this form of boiler, dangerous explosions are impossible, even when the water is low, and the cost of maintenance has proved to be very much less than for the ordinary types of boilers. It is thought, therefore, that though boiler explosions are rare, the small risk of an accident is sufficient, particularly when repairs are considered, to warrant the use of an apparatus with which a general disaster is impossible. A comparison is, however, made in Table II for cheaper boilers, which shows that the final result is not due to the price of the boilers selected. It has been assumed that sectional boilers for pressures not exceeding 125 pounds can be purchased and erected in place complete with necessary attachments, furnaces, brick walls, connections to chimney, steam and blow pipes and other connections, with fire tools and fire room fittings in place ready for regular use for $22 per commercial horse power; similarly the price for boilers erected and connected complete to carry regularly 150 pounds and upward has been fixed at $25 per commercial horse power.

In column *i* the above prices have been reduced to the prices per net horse power by multiplying the ratio of the commercial horse power given in column *g* to 500 net horse power by $22 or $25 in the several cases, when, as would be expected, it will be seen that the price per net horse power reduces as the economy increases in the same proportion as the commercial horse power of the boilers required.

We now return to column *h*, which shows the cost of engines erected and connected ready for operation. It has been somewhat difficult to obtain satisfactory information for this column. Circulars were issued to different engine manufacturers, and although all responded and some took special pains to furnish all the information in their power, the resulting data was nevertheless very incomplete, for the reason that few of the makers were prepared to manufacture high speed engines of 500 horse power, and none of them could give prices throughout the whole list. Again there appeared to be a difference of opinion among the manufacturers as to the *kind* of prices which should be given for such a purpose. Some undoubtedly added a percentage to those for which they regularly sell the same engines in the market, while others evidently stated prices lower than would be furnished under strict specifications. Few of the manufacturers replied to questions as to the cost of erection, stating that such cost would vary greatly with conditions at each location. In some cases, however, the costs of plants complete, including erection, have been obtained which checked well with estimates made up in detail in substantially the following manner: The costs of the engines at the shop, as furnished by manufacturers, were arranged in order, and the shop price adopted fixed not only by averaging different prices for engines of the same power, but by comparison with prices for engines of different sizes, and in some cases of different types, it being attempted to make a gradation in price from one type to another as nearly as the circumstances warranted. This method is the only practical one, for one manufacturer will quote prices for the same engine to develop either 400 or 500 horse power, and perhaps in another case at lower pressure or reduced speed even for 300 horse power. Several engines of different sizes are in some cases made by using the same frame and general details and simply changing the size of the cylinder so that the cost is not greatly modified for quite a range of power. In some cases it was necessary to consider double engines to produce 500 horse power. The price of engines at the shop had therefore to be derived by digesting all the data based on the several conditions. To these prices were added the cost of foundations as calculated from drawings in some of the circulars, and an allowance was made for pipes, felting and the numerous incidentals which are always required in erecting an engine. The final results, though more accurate on the average for different parts of the country than would be obtained by a less careful study of the subject, cannot be depended upon for special conditions. It would be the business of any engine manufacturer to claim that he would furnish machinery of a given kind for less than stated, and he could do it by using smaller engines or higher speeds than is customary, or in a variety of ways. The difference in price between an engine at the shop and one fully erected and in operation should in all cases be duly considered, and when a large number of engines are grouped on one system of piping for steam and another for exhaust, with condensing apparatus, air pumps and perhaps circulating pumps, the several items of cost mount up quite rapidly. There has been added to the cost of slow speed engines the cost of the main belt and a certain portion of the jack shaft, so as to put the high and low speed types on the same basis. The allowance will not, however, include the expensive clutches frequently employed. The prices for high speed non-condensing engines with boilers complete check very well with those collected by Mr. Wm. M. Schlesinger for a book he is preparing with Mr. T. C. Martin, of the *Electrical Engineer*, of which advance sheets have been kindly loaned me. Mr. Schlesinger gives the prices of six plants, varying from 250 to 1,200 H. P., with high speed engines of various kinds and tubular boilers of various sizes. The total cost varies from $50.40 to $61 per H. P., and averages $53.70 per H. P., which checks well with the $58.90 given in Table I for such engines with sectional boilers. A comparison for lower priced boilers is however given in Table II. The price given for triple compound engines with boilers, buildings and details complete, checks well with prices kindly furnished by F. S. Pearson, Esq., engineer of the West End Railway, Boston, for the large plant erected by that company. Mr. Pearson considers that $75.00 per H. P. will be sufficient to complete that work, which includes surface condensers not considered in the table.

TABLE II—SHOWING THE EFFECT ON THE COMPARISON IN TABLE I, DUE TO REDUCING THE COST OF THE BOILERS $5.00 PER COMMERCIAL HORSE POWER.

Column *j* shows the approximate cost per net horse power of the chimney and the buildings required for the steam machinery. These have been based upon the actual cost of various chimneys in actual practice and upon the cost of comparatively cheap buildings to cover the engines and boilers. The prices could be reduced by using very cheap wooden buildings, but are insufficient to provide for elaborate buildings designed to secure architectural effect.

(*To be continued.*)

Legal Notes.

The Edison Electric Light Company of New York have filed a bill of complaint in the United States Court at Hartford, Conn., against the Connecticut Glass Company of that city. The suit is brought for the alleged infringement of a patent in making glass bulbs for incandescent lights.

Augusta, Ga.—The Augusta Electric Railway Company will probably extend its lines to Aiken, the South Carolina health resort.

The Morality of the Patent System.

BY FREDERIC A. C. PERRINE, D. SC.

Of the various questions which have arisen in relation to the late decision of the courts on the Edison Lamp Patent and the use of that decision made by the General Electric Company, no one is of more importance to us and to our Government than the question of the moral status of the patent and the use which has been made of the decision.

As is well known at the present time the lamp in Edison's mind at the date of his application for a patent was rather an ideality than an actuality. The true carbon which was to revolutionize the whole world—not merely electric lighting, since the application of this lamp has effected a commercial revolution—had not yet been manufactured. However distinctly its requirements were in the mind of the inventor the practical carbon was not at that time a concrete fact; the carbon described in the specifications was not a commercial success, and it was only several years after the application that the bamboo filament, on which the immense fabric of this business has been erected, was developed as a commercial product.

The moral question, therefore, is the one of the right to individual property in an idea and is a question far wider than the right for use and abuse of a particular conception.

The grand effort of civilization has been toward defining rights and duties—the rights we may demand and the duties which are demanded of us. Barbarism held that the only right was the right of the strongest and that there were no duties one was bound to perform towards his fellow. His herds, his lands, his wife, his children, himself, we might each appropriate to our own use were we but the stronger and could we maintain our rights by force of arms. Egoism pure and simple was the moving principle of the savage, only gradually developed into altruism as the race has advanced towards civilization.

An advance made through the tribal and national consolidation which we have been taught to feel was the truest self-seeking. We attempt to elevate the poor in our cities, the downtrodden in all lands, from the feeling that the highest peace of mind, the easiest life together, is to be brought about by religiously performing our duties towards our fellows and raising them to the pitch of fellow-feeling when no one of us will fear robbery or oppression from another.

Personal slavery of mankind we have abolished, and on every side we see the moving forces which are tending to eliminate its last traces in oppression towards workers or peoples. Personally we are untouched by the oppression which exists in Russia, but that any people is downtrodden we feel is an injury to the race, and, as a common humanity, we protest against the last vestiges of oppression.

In the case before us does the right to property in an idea infringe the rights of our fellows which as correlative duties we are bound to respect?

As I have said, we are not from this standpoint discussing one patent or its manipulation, but that custom of granting monopolies in ideas which has been handed down from the Middle Ages in the form of the patent system. Nations in the past have granted monopolies of trade and processes, have given territorial rights to companies and persons, and it is only within the present century that these grants have been confined to the commercial development of special ideas already perfected. As late as 1798 the Legislature of New York granted to Chancellor Livingston the exclusive right to steam navigation on the waters of the State for a period of twenty years, provided that within a twelvemonth he should produce a boat capable of steaming four miles an hour, and on his failure to do so granted again in 1803 the same right to Livingston and Fulton. Such patents to-day are considered hostile to the best interests of the community.

At that time was beginning the age of mechanical development which has so vastly changed the characteristics of the civilized world, and it seemed to the statesmen of the period that such official encouragements were necessary to turn men's minds toward the development of their commercial and mechanical ideas. To-day we have found the fallacy of such a fancied necessity, but with true conservatism have yet held that by both expediency and right a man should be protected in the possession of the results of his ingenuity for a period of fourteen or seventeen years.

But has the history of the past hundred years proven to us the right or necessity of such protection?

Has the existence of the patent laws encouraged the discovery of new facts, and is the world further advanced in civilization than would have been the case without the existence of such laws?

Truly, it is as difficult to recall the past and, eliminating from it some important element, to say what would have been if this element had not existed as it is to-day to predict the far distant future; but we may at least pass in review the advance the world has made, and ascertain, within certain limits, the causes acting to produce these effects.

In our own science of electricity certain names—as indeed in all other sciences—both in discovery and application stand before the world as landmarks of progress. Ampere, Gramme, Faraday, Thomson, Henry, Morse, Edison and Bell represent each great steps in the wonderful development of the science and art.

All of these men leave behind them a world richer for their genius, some reaping in riches their rewards and others obtaining only honor and consideration. All have worked in the days of the patent monopoly and only some of them have sought its protection.

In January, 1832, at the end of his description of the discovery of the continuous production of electricity from magnetism, and after describing a machine which in 1884 created a furor as a new dynamo, Faraday adds: "I have rather, however, been desirous of discovering new facts and new relations dependent on magneto-electric induction than of exalting the force of those already obtained, being assured that the latter would find their full development hereafter," and turning again to his studies and his experiments, completed the great work of his life, carefully describing his successes and his failures in the three volumes from which Clerk Maxwell derived his great work, "Electricity and Magnetism," and toward which to the present day the inventor and investigator turn for inspiration.

Do we owe less to Faraday for his study of the law of ohm than to Edison for his application of its principles to his lamp?

Henry, working in his laboratory at the High School in Albany, and again at Princeton, studied this same law and explained to Morse its application to the magnet; taught him the necessary arrangement of his wires and batteries for long distance transmission, showing at the same time an actual signalling system in operation. Has Thomson derived the benefit of his studies and discoveries on the Atlantic cable which have been freely given to the world and have made the ocean telegraph a possibility, and has the work of Bell on the development of the telephone been grander and of more honor to him than his work upon the human ear and his development of a system by which the deaf and dumb both speak and hear?

And yet these, all alike, inventions and discoveries, are ideas and the work of a man's brain in which we would claim for some the right of property.

It is no reply to this reasoning to state that the common opportunity was open to all to obtain proprietary rights by application, for that these rights were not applied for and obtained makes the true force of the argument itself. Through the whole history of the world its great investigators have been engaged upon the discovery of nature's hidden secrets, and having once found them have gladly granted us the coveted knowledge of the world in which we live, and have so armed us to fight our battles against the elements that they have enabled us to turn the terrors of the unknown environment into friendly, familiar servants, while it has been the work of the inventors, using these truths so made free, to conquer some problem of living; and should we reward them beyond the measure of the advantage which their brains have already given them in the commercial competition?

The struggle in business life is to-day to win in the fight of competition; this makes riches and makes them honestly. If we are ahead and keep ahead, our fortune is made as easily as ought to be the case. But to reward a man for one step in advance by confirming to his use some share of the common property of the world's knowledge is to grant him a right of oppression over others to whom he is under no legal obligation to perform his social duties.

Thus reviewing the past, we cannot fail but see that the great discoveries have been made by men who, in the common fight against nature's oppression, have given us their services for the glory of winning for us all, without any thought of personal riches to be gained by a governmental monopoly in the truths they have made known.

We thus see that in the past the patent system has not produced the discoveries, and it remains for us to question whether it has encouraged all to do their best work for the cause of civilization, and on this point we may turn more profitably to the kindred system of the copyright, as in this field the character of growth in the past one hundred years is more noticeable. The writer from being a poor despised wretch, hardly better than a servant in some great family, has risen to dignity and consideration, and often even to riches. We have the system of copyright in different lands, but not until lately an international arrangement; besides this, a book may not be brought out anew as a plagiarism, but only as a pirated edition.

Now let us see what books have cost labor, and what books have brought riches, what books have been pirated and without the system would have yielded no profit, what books would have paid an author in any event.

Turning to the nearest bookstore, or recalling from memory the names of those seen and known, the answer is not far to seek.

The scientific, thoughtful books, costing a lifetime of labor, have often scarcely yielded the expense of their printing. The best of all kinds of books have won their way slowly, and yielded fair returns, but have offered no temptation to the greedy and unprincipled, while the great sales of froth and ephemeral, easy writing, have yielded the fortune which without a governmental protection would have been impossible; and can it be said, as one casts about amongst the writers of to-day, that such possible gains have not often turned men capable of better work in other fields into this for a livelihood?

While the results are not so apparent, it is nevertheless true that the same causes acting in the patent system have produced much the same effects, and so far from encouraging the investigator, these artificial rewards have turned men's minds from the great field of discovery towards that lower but more profitable one of invention and has filled our land, as all others of civilized society, with men striving for that illusive and undue reward of an artificial monopoly. Truly we have made great strides in the development of our resources, and have not neglected altogether the field of investigation, but this proves rather that no check or artificial bar can hinder the advancing tide of intellectual development and turn aside altogether the inquiring mind from its search for truth, a search destined to become more and more active as we advance in love for our fellow-man and as the grand altruistic tendency of humanity asserts itself more and more strongly.

Perhaps in the beginnings of the past such monopolies have tended to a development otherwise impossible, but to-day, in the full tide of advancing competition, nothing is necessary to turn the mind of the mechanical or commercial genius towards such improvements as will yield to it an advantage in the race for markets and earnings.

Nor is the reward by a monopoly longer necessary for the disclosure of a process since it cannot be said that our sciences are so far undeveloped as to allow the details of a process to remain long undiscovered by more than a single genius, and should it so remain concealed is proof enough that the inventor has made an advance entitling him to extraordinary gains.

For these reasons, then, it is my settled belief that the system of granting patents and copyrights is condemned by the grand definition of right, that which extends the length and breadth of life, and fits it better for its environment, and is accordingly to be classed amongst the erroneous legislation of the past which a more developed sense of the race's advancement calls immoral.

While the history of the electrical patents of the last twenty years lends to this argument much of its force, it is rather from the character of the field, with its hosts of investigator and its scientific methods, that the principles are apparent, than that in the electrical field there has been any dishonesty or undue shrewdness on the part of the various patentees; and while one may there feel most the sting of the injustice, we may not truly say that in this field alone has the world or the community been the sufferer from its own faulty system.

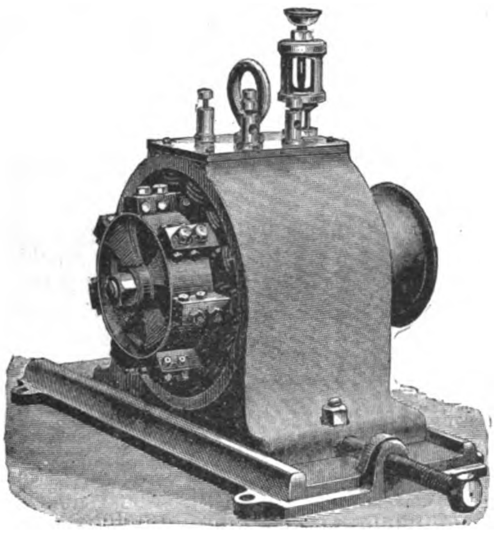
Ayer and Tesla Honored.

At the recent meeting of the National Electric Light Association at St. Louis, Nikola Tesla and James I. Ayer were elected to honorary membership. The name of Cornelius Herz was dropped by unanimous consent. The Association roll of honor now stands as follows:

Crompton, R. E., London, England.
Deprez, Marcel, Membre de l'Institut, Paris, France.
Forbes, George D., London, England.
Fujioka, Prof. I., Tokio, Japan.
Gramme, Z. T., Paris, France.
Hopkinson, Dr. John, London, England.
Hospitalier, Edouard, Paris, France.
Nichols, Dr. E. L., Cornell University, Ithaca, N. Y.
Rothschild, Baron Alphonse de, Paris, France.
Sprague, John T., Birmingham, England.
Swan, Joseph W., Lauriston, Bromley, Kent, England.
Thompson, Prof. Silvanus P., Technical College, Finsbury, London, England.
Yashima, Prof., Tokio, Japan.
Thomson, Sir William, Glasgow, Scotland.
Rowland, Prof. Henry A., Johns Hopkins University, Baltimore, Md.
Brush, Charles F., Cleveland, Ohio.
Edison, Thomas A., Orange, N. J.
Thomson, Prof. Elihu, Lynn, Mass.
Sprague, Frank J., New York.
Bowen, George S., New York.
Weston, Edward, Newark, N. J.
Dawson, Sir William, Montreal, Can.
Redpath, Frank R., Montreal Can.
Bevery, Prof. Henry T., McGill University, Montreal, Can.
Lockwood, Thomas D., Boston, Mass.
Ayer, James I., St. Louis, Mo.
Tesla, Nikola, New York City.

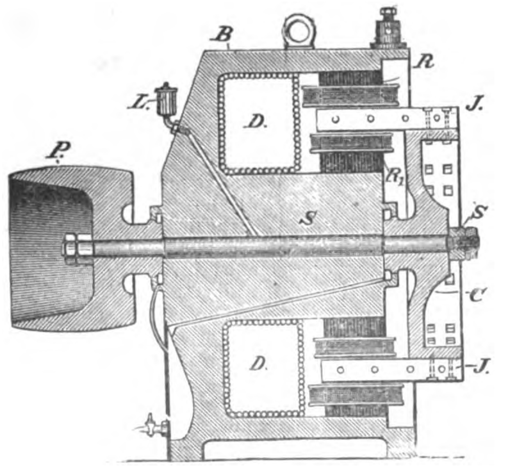
Lighting by Phosphorescent Tubes.[*]

High-tension work generally has developed with leaps and bounds, rotary current has stepped into the field, high-frequency currents have yielded results seemingly magical, and in all this those most antique pieces of apparatus, the Leyden jar and the Ruhmkorff coil, have played an important, and ever-increasingly important, part. The Geissler tubes, invented in the very early days at Bonn, having long served as the standing wonder of gaping crowds at popular lectures when whizzed around in circles and displayed in letters of phosphorescent light, or discoursed upon by scientists in lecture theatres in fascinatingly interesting considerations of molecular bombardment, these tubes now are receiving the earnest attention of electrical experimenters with the fond and not chimerical hope that in the illumination of the tubes lies the desired secret of practical lighting by glowworm or phosphorescent light--light without heat. 'Tis a consummation devoutly to be wished ; and the rich reward that is promised to the inventor of true "glow" lamps is certainly not less than awaits the inventor of "electricity direct from heat."



Pyke & Harris Inductor Dynamo.

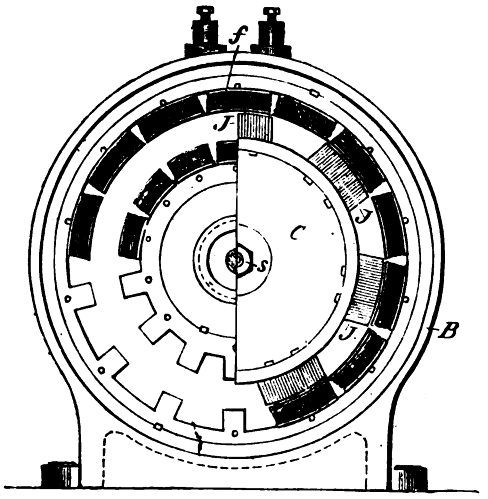
Amongst the experimenters who have done much in a quiet and persistent way in the domain of extreme high-tension and vacuum-tube research are Messrs. Pyke and Harris, who, together with Sir David Salomons, have carried out the practical utilization of phosphorescent tube lighting to a degree which, if it cannot be said to solve the long-discussed problem, is yet attended with very suggestive and satisfactory results. At various Royal Society and other *conversazioni* displays of phosphorescent tube lighting of some extent have been made, and it is with interest that we have learned particulars of vacuum-tube lighting for both theatres and private houses that have been carried out on the system thus brought forward. Mr. Pyke, in conjunction with Sir David Salomons, has been carrying out a number of experiments in this interesting and enticing field of research. Quite a large glass-blowing laboratory is kept going for the production of all kinds of vacuum tubes—a very favorite form now adopted being that of a closed coil, or spiral of thin glass tube, between two small bulbs. This coil, when made phosphorescent, gives out a fairly brilliant cool light, using, it is calculated, about one watt per foot of tube lighted.



Pyke & Harris Inductor Dynamo. Section.

The difficulty with these tubes is that when brilliantly phosphoresced they become heated, and there is trouble from melting of the glass after some interval of use. A further difficulty has been the necessity for the use of condensers to properly light the tubes, and condensers are both frail and cumbrous. In any case the light is never very brilliant—not sufficiently so, for instance, to take the place of ordinary incandescent lamps, though for the lighting of conservatories, where a soft and moonlight effect is desired, the groups of phosphorescent tubes produce an admirable effect, and many houses are now having such "glow" lamps added to the other lighting.

Before alluding to improvements that have recently been made in this class of lighting, it may be interesting to explain the principles upon which the lighting of these tubes has been carried out in experimental form.



Pyke & Harris Inductor Dynamo. Section.

An alternating current is, of course, necessary, and the inductor machine recently patented by Pyke and Harris is a very convenient form of dynamo to be used for private installations, being small, cheap and compact, though for town houses the alternate currents from the supply mains can be used. This inductor dynamo is herewith illustrated, and is worth the attention of engineers. The cut represents a machine, which will light 60 16-c. p. lamps, though but 20 in. by 15 in. by 21 in., and weighing 7 cwt. In the figure, B represents the magnetic mass forming an annular space for the inducing coil, D is the inducing coil, R and R are laminated rings with polar projections wound with armature coils, J J are laminated inductors which alone rotate, and the completion of the magnetic circuit causes the current. It will be noticed that the whole arrangement of the machine is far more solid than any other dynamo as yet in use, and for the same space occupied is the most energetic. The whole machine consists of two castings, some iron stampings and wire coils, and is thus very cheap to construct. Like machines worked on the inductor principle, it has the advantage of no rotating wire; and a further advantage is that, in case of the failure of one or several of the coils, there is a fuse arrangement attached to each connection which melts before the current from the active coils passes into the defective one.

To light the vacuum tubes, a tension of 50,000 or 100,000 volts is desired, and this is produced by a specially-wound transformer in oil, of the type that Messrs. Pyke and Harris patented and have produced for some years. This transformer is plunged in dehydrated oil, which is kept in circulation by an arrangement of tubes like those in hot-water heaters. These transformers are expensive, and have been lately replaced by a different arrangement.

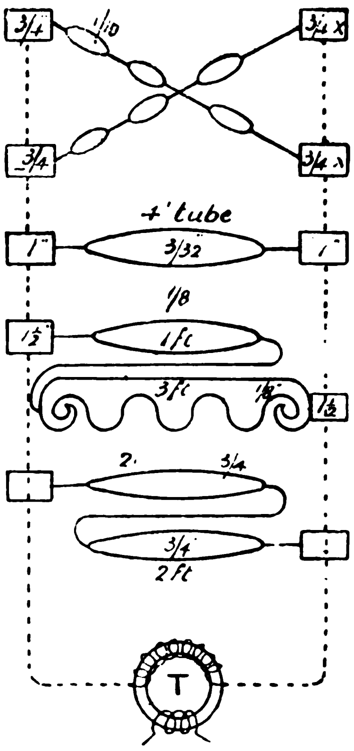


Diagram of Connections for Phosphorescent Tubes.

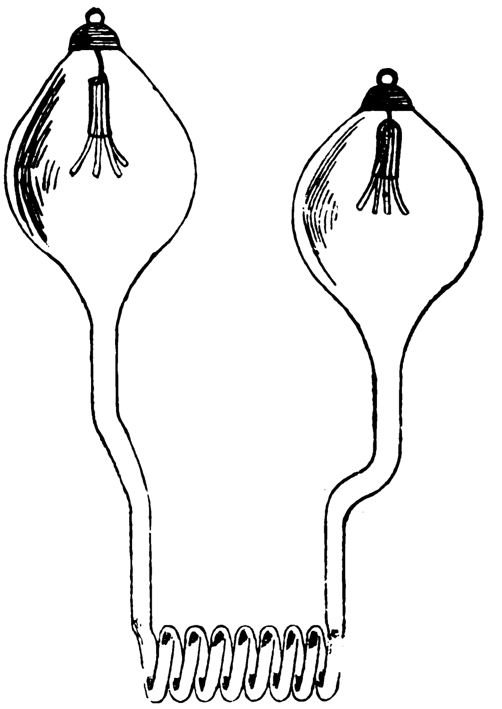
Having the current at high pressure, the next question is the arrangement most desirable in practice for connecting the tubes. The tubes are lighted by induction effects, and the peculiar arrangement of connecting the condensers in parallel and the tubes in series are here illustrated for the first time. Mr. Pyke has made careful experiments, and finds that to properly phosphoresce tubes of one inch internal diameter one square foot of tinfoil condenser is required. To light tubes of $\frac{1}{16}$ in. diameter, which have



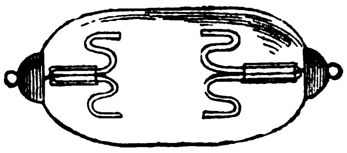
Phosphorescent Tube Lamp.

---

[*] *The Electrical Engineer*, London.

been generally employed, condenser sheets ¾ in. square are therefore required to give the desired effect.

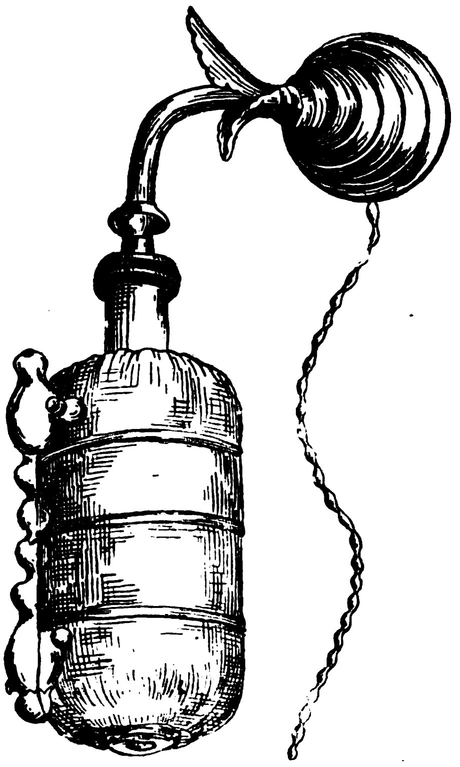
On one side of a glass plate a number of condenser sheets are arranged of the size desired, and these are all connected in parallel to the high-tension circuit, as shown by dotted lines on the figure, the dotted lines representing the under side of the sheet of glass. On the upper side the vacuum tubes are connected from one condenser plate to another, several in series, tubes of the same kind only on any wire, usually to make a total of one foot of tube. The whole of these tubes then light up on turning on the current, it being understood that they are lighted by induction condenser oscillations.



URANIUM SPRAY LAMP.

The following are the practical directions for vacuum-tube work of this kind:

Directions.—Class the tubes in average minimum internal diameter. Arrange that each tube or series of tubes in the various circuits have the same length. Tubes in each class only must be worked in series. Imagine the tubes electrically connected, then arrange the inductors with one square foot of foil ($\frac{1}{16}$ glass) to each square inch of diameter. Above one inch the current should be graduated more by the surface of the aluminium wire. Any difficulty may be overcome by cutting off one or adding to both inductors.



PYKE & SALOMONS' COMBINATION 5,000-VOLT TRANSFORMER.

So far with the methods hitherto used, now to be discarded. The difficulties are apparent—special dynamo, expensive transformer, cumbrous condensers. Experiments have been made to do without the condensers, and to construct a small but powerful transformer which can be used direct. A small closed-circuit transformer has been designed by Sir David Salomons and Mr. Pkye for use in conjunction with the supply companies' alternating-current circuits, intended to raise the potential from 100 to 5,000 volts. This is probably the smallest closed-circuit transformer yet made, and is very cheap to make, as it is capable of being sold for £1 for ordinary and experimental use. The illustration shows it attached to ordinary 100-volt mains.

The quantity of current which it furnishes at this potential is sufficient to very brilliantly illuminate vacuum tubes. Indeed, so bright are they that the photograph from which the above illustration is reproduced was taken solely by the light of the tubes suspended from the secondary terminals. The transformer, it will be seen, is provided with an attachment in the form of the usual "B. C." lampholder, the primary winding being connected to the brass contact-plates. This is a great convenience, as the connection is made, and the transformer securely held, in any conveniently placed lampholder.

We understand that Sir David Salomons intends proceeding further in the same direction, and will shortly introduce a combination similar to the above, but with the vacuum tubes permanently fixed thereon, and arranged to form an ornamental illuminating device which can be used in conservatories and other places where beauty is of more importance than a very brilliant illumination.

The curled phosphorescent-tube lamp used in these experiments is here illustrated. In practice the two bulbs are hidden, the glass spiral only being visible, and several of these lamps may be easily arranged to form letters or words. A newer form of uranium tube is also illustrated, in which the electrodes are in the form of a spray. A large number of these tubes can be connected in series, and lighted from the combination transformer.

The transformers are made by winding three primary circuits of No. 22 wire—one at each end and one in the middle—over boxwood bobbins, with the secondary of No. 40 wire in between. The whole is then wound longitudinally over and over with fine iron wire till the central core is filled, making a small and solid bundle which can be suitably covered with velvet or other material. The vacuum tubes can be mounted thereon. One very convenient point is that, as they are furnished with an ordinary lampholder bayonet joint, current at 5,000, or perhaps even 10,000, volts will be within the reach of ordinary experimentalists at a mere nominal cost. The current going into these transformers is only ½ ampere at 100 volts, and the current at the higher voltage is therefore infinitesimal—not sufficient, in fact, to give more than a slight shock.

It will be evident that high-tension currents are now within the reach of all, and we may expect further developments in this fascinating field of phosphorescent tube lighting.

The Telautograph.

Professor Elisha Gray, whose numerous inventions for communication by electricity are well known, has perfected the Telautograph, or long distance writing machine, illustrated below.

This consists of a transmitter and a receiver associated for use at one station. The structure of these instruments is remarkably simple and devoid of complication, and the mode of operation is in all respects direct and positive. The methods for transmitting the electric impulses to the line, and then converting them in the receiver into the corresponding movements of the automatic pen, are of a positive character, and are therefore not dependent upon accidental changes in conditions.

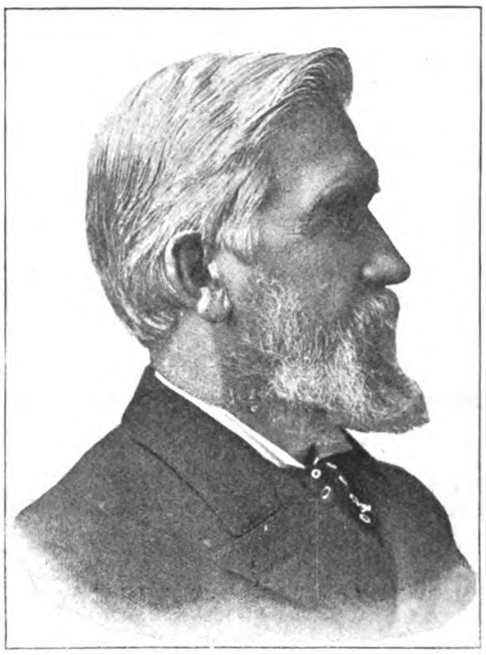
An ordinary lead pencil is used on the transmitter near the point of which two silk cords are fastened at right angles to each other. These cords connect with the instrument, and, following the motions of the pencil, regulate the current impulses which control the receiving pen at the distant station.

A lever at the left is so moved by the hand as to shift the paper forward mechanically at the transmitter and electrically at the receiver.

The receiving pen is a capillary glass tube placed at the junction of two aluminum arms. This glass pen is supplied with ink which flows from a reservoir through a small rubber tube placed in one of these arms.

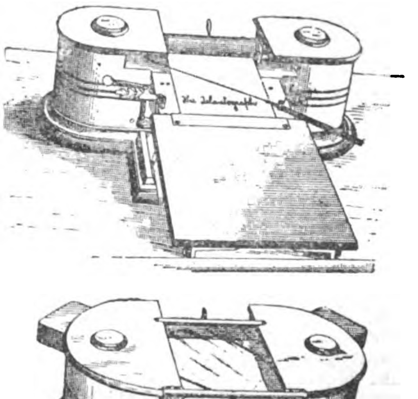
The electrical impulses coming over the wire move the pen of the receiver simultaneously with the movements of the pencil in the hand of the sender.

As the pen passes over the paper an ink tracing is left, which is always a fac-simile of the sender's motions, whether in the formation of words, figures or sketches.



PROF. ELISHA GRAY.

The Telautograph instruments are at present manufactured by the Gray Electric Company, who have erected a handsome and capacious brick building about one mile south of Highland Park, Ill., on the line of the Chicago and Northwestern Railway. This company was organized expressly to manufacture the apparatus for the Gray National Telautograph Company and has already invested $125,000 on its building and equipment. It owns a tract of fifty acres and has constructed a number of cottages for its employees. The machinery is the best procurable and the instruments turned out are samples of superior workmanship.



TRANSMITTING AND RECEIVING INSTRUMENTS.

The main office of this company is at No. 80 Broadway, New York. Its officers are as follows: T. M. Logan, president; Jno. W. Johnston, general manager; W. H. Eckert, general superintendent, and Jos. E. Cox, secretary.

ELECTRICITY IS PUBLISHED ON WEDNESDAY OF EACH WEEK

Our columns are open for the discussion of any question in which the interests of the Electrical Industry are at stake. News notes, descriptions of new devices with drawings or photographs, are at all times desired.

SUBSCRIPTION RATES:

UNITED STATES, - - - - -	$2.50
IN CLUBS OF FIVE OR MORE, - - -	$2.00
FOREIGN COUNTRIES, - - - - - -	$4.50

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily appreciated. Rates will be sent on application.

Changes for advertisements should reach the office not later than the Saturday preceding the date of publication.

ENTERED AT THE N. Y. POST OFFICE AS MAIL MATTER OF THE SECOND-CLASS.

TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY,
THE WESTERN NEWS COMPANY,
And their Agencies in all Principal Cities.

"Electricity," under its present ownership, has never solicited the advertising patronage of the General Electric Company.

Proposed Socialistic Legislation.

The comprehensive bill for the regulation of the prices for electrical current, just introduced in the Assembly by Mr. Finnegan, of Rockland County, seems to imply a necessity for additional facilities for the enlightenment of the population of that section in the field of electrical engineering. The plan proposed contemplates the establishment of uniform prices for electricity in cities of certain sizes throughout the State, without reference to the cost of production of the current, or any consideration of the conditions in various localities which affect the running expenses of a central station. It is satisfactory to note, however, that the bill contains one suggestion of common sense which evidently crept in through some oversight. The prices are fixed to apply to cities of a certain number of inhabitants.

The idea of the Legislature's fixing a uniform price for electric current is suggestive of the advantages which would ensue from a similar bill in regard to real estate, and possibly this principle might be extended to include fruits and vegetables. A consideration of fixed prices for the last-named articles might do more toward convincing our rural reformers of the fallacy of socialistic legislation than any experiments in the direction of electrical problems would, as they are undoubtedly more familiar with the former subjects.

For these legislators whose sense of duty compels them to grapple with the problem of the cost of electrical current, we earnestly commend a careful study of ELECTRICITY, which will reveal the fact that a station operating by water power where labor is cheap can sell its current for less than one requiring an expensive steam plant, and where coal and labor may be dear.

The following sample may be of interest:

> "In towns and cities of 15,000 population and under the rate of charge for electric energy for illuminating shall not be more than ten cents per 1,000 watts. The rate of charge for electric energy for power shall not be more than seven cents per 1,000 watts. In cities of over 15.000 population the rate of charge for electric energy for illuminating shall not be more than seven cents per 1,000 watts, and the rate of charge for electric energy for power shall not be more than four cents per 1.000 watts."

This certainly disposes of the matter in a very simple manner, but we fear these prices would discourage electrical progress in many localities. If a uniform price for illumination is desirable, we would suggest some amendments providing for the prices of gas, kerosene and candles.

* * *

Economic Steam Power Engineering.

It has been said, and not without reason, that the education of the electrical engineer should be nine parts mechanical and one part electrical in order to fit him to successfully cope with the engineering problems which he is called upon to solve, and this view of the case receives a strong indorsement in the valuable and suggestive paper read before the American Institute of Electrical Engineers by Dr. Emery at its last meeting. As suggested by its title, "The Cost of Steam Power Produced with Engines of Different Types under Practical Conditions," the paper treats exclusively of the mechanical engineering side of the subject, which nevertheless, is of paramount importance for the economic operation of electric central stations.

Some of the conclusions which Mr. Emery deduces are somewhat unexpected to the engineering fraternity, who have not followed this branch of the business closely, and the fact that in the most elaborately equipped stations the interest charges on the first cost of the equipment are liable to more than counterbalance the saving due to increased efficiency has escaped general notice.

Another important point is also made conspicuous in this connection. The paper shows the superior economy of operation when a plant is run continuously for the reason that the fixed charges such as interest, dividends, etc., are not proportional to the work done but are fixed for a certain definate time whether the plant runs all or only a fraction of the time.

The figures given in Table I show the compound triple expansion engines working at high pressure to be the best mode of operation for some cases, especially where coal is dear, but with coal at an ordinary price the compound condensing engine seems to show the best economy. A noticeable fact is that the high speed non-condensing engine, which has been developed through the demands of electrical central station requirements, makes the poorest showing of any of the different types of engines.

These results, however, cannot be considered as a criticism on any particular type of engine as Table I shows a decided variation in the maximum economy of different engines according to the cost of coal and the hours per day during which the plant is in operation. The value of engines of sufficient speed for direct coupling to the dynamos cannot in many cases be questioned.

The most important point which Dr. Emery's paper suggests is a careful study of the local conditions surrounding a station by the electrical engineer before prescribing any special design of steam plant, and it shows clearly the fact that no iron-clad rule can be adopted to cover every case.

* * *

"The Lamp Situation."

By methods of journalism known only to itself, the *Electrical World* has started a feeble discussion on the lamp situation in its columns. This discussion is of course not participated in by the *World* itself, but is carried on so far chiefly by anonymous writers, and by an able representative of the Bread and Butter Brigade over his own name.

The *Electrical World* has no opinions to offer on any subject except its own greatness; it is cocksure that it is the biggest freak known to trade journalism, and we agree with it.

But its opinions on the subject of the Electrical Trust, which has been recognized as of vital importance by every man in the trade for eight months, are as great a mystery to its readers as are the hieroglyphics on the Obelisk to the goats in Central Park.

The *Electrical World* long since forfeited all title to the respect of decent men. No one expected that at this late day it would begin to fulfil its obligations to the trade which has made it all that it is. It has played the coward and sneak successfully (according to its own ideas of success, which are strictly financial.) and cannot be looked to now for better things.

The numerous readers of ELECTRICITY, who number nine out of every ten men in the trade, arrived at definite conclusions on this subject some time ago.

We know of no reason, however, why it should not be discussed now in the columns of the *Electrical World*.

And when it has been thoroughly thrashed out a few times more, we suggest to our belated contemporary the following as other appropriate topics for discussion in its columns:

What was the foreign policy of Alexander the Great?

Has the monopoly of Russia in Poland been a beneficent thing for the Poles?

* * *

THE REFERENCE to the doings of the discredited Whiskey Trust by our Boston contemporary suggests the following questions: Did the Whiskey Trust take lessons in financiering from the Electric Trust? or did the Electric Trust take lessons in financiering from the Whiskey Trust? Further investigation must be awaited.

* * *

Was not Ferdinand Ward, *before his exposure*, looked upon as the shrewdest financier of his day?

* * *

Facts Cannot Be Longer Concealed. For years the stock gamblers who have controlled the fortunes of the Thomson-Houston Company have carried out their schemes in the dark. By methods known best to themselves they have muzzled the daily press of Boston, and their operations were of little interest outside of New England.

Many an entertaining story has been handed in by an unsophisticated newspaper hustler, only to be thrown in the waste-basket by the better-instructed city editor.

There is good ground for believing that this state of affairs is drawing to a close. We cite in evidence the article on "General Electric" which we reproduce in condensed form in another column.

At least one Boston newspaper has made a good start towards performing its duty. All honor to the Boston *Commercial Bulletin*; and if the *Herald*, *Traveler*, and *Advertiser* still decline to take the matter up, it will be for one reason and one reason only. We do not believe the management of these papers is for sale, but if they allow subordinates to smother this matter for a consideration, they themselves are almost equally culpable.

Passing over the matter of Mr. Edison's stock arrangements with the Lynn crowd, we come to something of wider interest—something which, probed to the bottom, reveals the rottenness of the whole Trust scheme.

That the banks of New England have been munificent backers of the Thomson-Houston and General Electric Companies is no news. An exposé of the METHODS, however, by which *bank officials* have been drawn in, and held tighter and tighter in the coils of the serpent until escape is impossible, would be news to the multitude.

The facility with which the Trust has raised immense sums of money has been looked upon as marvellous by electrical men. They know the "fishy" character of the reports given out from time to time; they know the business done, and can estimate the profits—or could if there were any. They know the value of the Trust plants is not above $12,000,000 to $14,000.000, and that the price of the stock and bonds in the market to-day is not affected at all by the actual value or *bona fide* assets. They know the problematical nature of the various stocks and bonds of local companies with which the Boston and New England banks are all but swamped, and with which the United Electric Securities Company was driven to a standstill. They do not need to be told why new financing companies are organized.

The investing public of New England, however, do not know all these things.

The daily press of Boston has a duty to perform. Its postponement will not only add to its unpleasantness, but will prove conclusively that the newspaper men of Boston are not free agents.

If these newspaper men are laboring under the delusion that the Trust can pull itself out, if let alone, and that the publication of facts will precipitate a disaster which may be avoided, they are mistaken. The disaster may be postponed; it cannot be averted.

The public has a right to know the facts, and to be its own judge as to whether it is safe to continue its investments. It has a right to know *what banks* are in beyond their depth.

The newspaper man who neglects to dig out the facts, or who withholds them from publication, has no place in the profession.

The annual statement of the General Electric Company is due on April 11. It will not be an honest statement. It will not be a statement that would satisfy any $100 stockholder in any respectable newspaper company in the country. It should be looked into.

It will show as assets the following items:

Local companies' stock.
Local companies' bonds.
Manufacturing companies' stock.
Construction companies' stock.
United Securities Company's stock.

These items should be analyzed. How many Syracuse bonds are there among the "local companies'" bonds? How much stock and bonds of local companies which are on the verge of bankruptcy? How much stock and bonds of the Brush Company, which will probably soon be closed up for good, or of the Short Company, already shelved?

All the financial arrangements of this concern may be beyond criticism. If so, why should they not be laid wide open to the public which is asked to invest its good money?

Why should an electric company more than a railroad company be allowed to conduct its business under a blanket?

There is good newspaper matter in all this.

The Boston press should also give us the names of the banks which are loaded almost to the sinking point with these "cats and dogs." They should give us the lists of the bonds of various local companies which are held as collateral by the United Securities Company against its several series of bonds. *What are they*, and what is the record and future lookout of the local companies? All humbug and "financiering" aside, this is where their values rest: on the plants themselves.

When the Boston newspaper men have gone to the bottom of this matter, and not till then, they can hold up their heads in the company of the honest and conscientious members of their profession.

General Electric.

Boston is Growing Suspicious, and Investigates.

When the consolidation of the Edison Thomson-Houston was brought about and Edison and his friends were rooted out of their soft places and fat salaries, Edison was left with 35,000 of stock. He offered it for sale at $90 per share, and on his being refused he threatened to throw it on the market. The Lynn contingent were given three days in which to arrange for its purchase.

After great pressure on the part of J. Pierpont Morgan, Edison agreed to hold his stock until April 1, 1893, upon the guarantee that it should be taken off his hands at par. The guarantee was signed by three of the prominent Lynn holders.

At the time the agreement was made, it was shown to Edison that before April, 1893, the stock would be put to 150 and he should have the benefit of the rise, and a pool was formed for that purpose. In the meantime Edison's ore concentrating scheme in New Jersey called for all the money he expected to receive for his stock. This he was enabled to borrow through the help of Villard and the guarantee of the Lynn magnates. In borrowing, Villard was careful to use only institutions, which by a strange coincidence, were largely controlled by those who were heavily interested in the Westinghouse Company.

In the middle of February, Edison through his friend and co-worker, Villard, was gently reminded that on April 1st the loans must be paid, and as they amounted to the tidy sum of $3,000,000 he had better be prepared.

In the meantime Wall Street began to be flooded with stories of bear raids, engineered by enemies who were to be punished when they began to buy back short stock; also stories of big earnings and surplus. At the same time there came a steady sale of stock which was explained on the ground of short sales; simultaneously bids were freely offered on Wall Street of 1-32 and 1-16 of 1 per cent. to borrow the stock one night, which was heralded over the country as evidence of large short interest. To show the genuineness of these bids, we are able to state that the parties who were so anxious to borrow it at a premium were at the same time offering 8 per cent. in Boston for loans on the same stock in lots of 1,000 to 5,000 shares. In fact, a certain wealthy estate not far from the Sears Building were paid 8½ per cent. for $220,000 for thirty days, secured by 3,000 shares.

The facts in regard to the short sales are these: One portion of the crowd, seeing that before April Edison stock must be sold and under circumstances that would prove disastrous to the price, began to fill all buying orders, and at the same time, by every device known to the sharpest manipulators of to-day, to keep a market upon which to sell. So well has this been accomplished that the rank and file of the old Lynn party have taken thousands of shares supposing they were buying the short stock of bad bears. To set at rest the story of the rise which is coming when the bears begin to buy back the stock they have sold, we will state that we can produce a party high up in the affairs of this big Trust who will pay a big commission to any one who will pay $100 a share for 25,000 shares.

We are also able to state, and this is of the greatest importance to the business public outside of stocks, that there are certain banking institutions in Boston that are loaning in the aggregate over $6,000,000 upon this stock.

There are outside of Boston, and inside of New England, other banks that are loaning over $2,500,000 to practically the same people, although through dummy names, or over seven times, and in one case, over thirteen times the legal limit.

To show the desperation of the people who are handling this gigantic stock-jobbing scheme, the company itself is loaning to the brokerage houses who are buying the stock and carrying it on margin enormous sums upon collateral that cannot be used in any bank in Boston at twenty cents on the dollar of the figure at which it is pledged, and the same money which they are loaning is what stockholders suppose has been used in paying merchandise bills which remain unpaid.

The case of the Whiskey Trust in using its rebate voucher cash is as nothing compared with it.

We can also state that the latest scheme for getting money out of the investing public (The $5,000.000 Electric Corporation) has been used to buy General Electric stock, but even that concern are getting so anxious to find some one to help them out of the hole they will be in when the Edison loans become due that they are trying to form a pool to buy the stock, which they are pledged to take but do not want.—*Boston Cowmercial Bulletin.*

The Brush Works.

An Order to Close Them Which Was Countermanded.

Private advices from Cleveland state that an order was recently received there to close up the Brush Works for good, but that the order was subsequently countermanded by wire.

It is understood that the reconsideration of this order was brought about in short order by Charles F. Brush who threatened if it was carried out to at once go into the manufacture of incandescent lamps on a large scale.

The inevitable must come, however, and Mr. Brush will not be able ultimately to protect the plant which bears his name.

This order explains some previous orders to the Brush Company and its various local agencies.

Not long ago it was directed that all the old machines at the Brush works be overhauled and put into salable condition; agents were commanded to *sell them*, and were for the time being given a preference over the other sub-companies' agents. It is understood that the new Illinois Central depot in Chicago got one of these bargains.

ELECTRICITY predicted some time ago that the closing of the Brush works was only a matter of a few months, and is not at all surprised.

THIS is the slogan: No man should buy one dollar's worth of supplies from the Trust which can be purchased elsewhere. Independent concerns should be aided in every practical way, and there is no more practical way than this.

"Will the Closed Conduit Supercede the Trolley in Large Cities?"

BY F. C. PERKINS.[*]

It would be folly for any one to assert that the trolley system for operating electric railways will be thrown out of use in small cities, villages and rural districts; and until some efficient, practical and reliable closed conduit system is brought before the public, the trolley will still continue to be used in the large cities as well.

A conduit system, however simple, could not compete with the trolley in the country, where long lines are necessary, and where wooden poles and a comparatively cheap line construction gives good satisfaction to the railway company and is not seriously objected to by the public.

In large cities, however, where the trolley system is so greatly objected to on account of the so-called "unsightly overhead wires," the conduit system, when perfected, will find many advocates, and be readily adopted by street railway companies interested. After looking at a street crossing in Boston with its network of wires as used in the trolley system, and then noticing the entire absence of overhead conductors in the city of Buda-Pesth, Hungary, one is impressed with the advantages of the conduit system, as well as the great difficulties under which our firemen have to work.

Regarding the cost of construction, a conduit system would compare very favorably with the trolley in cities where the authorities insist on the feeder wires being placed in underground conduits, and where an expensive line construction with iron poles, guard wires, etc., is required.

The systems now in use for operating electric railways are, first, the trolley, and second, the open slot conduit. Every one is so familiar with the trolley system that to go into details regarding its operation would be a waste of time; but we are not so familiar with the open slot conduit as it not in general use at present.

The Siemens & Halske system has been in use for some time in Buda-Pesth, Hungary. The Love system is now in operation in Chicago, and the Bentley-Knight system was operated a short time in Boston, but has not been in use for several years.

The greatest difficulty the companies using the open slot conduits have to contend with is maintaining a good insulation for the main conductors, the loss of current through leakage in wet weather being sometimes very great.

Many methods have been proposed whereby closed conduits might be used, thus avoiding the misuse of the conduit for a sewer, as is often the case with open conduits.

The Closed Conduit System is the one we wish to discuss this evening. Many patents have been granted in this line of work, and it will be interesting to study some of them.

The conduits may be divided into two groups: first, those operated electrically, such as the Lineff, Smith, Harding, Heron, Dewey and others; second, those operated mechanically, such as those of Van Depoele, Thomson, Brain and others.

The objects of the closed conduit are to do away with slotted channels, and to shut in the conductor so that neither dirt nor water can reach it and form a source of leakage.

An English patent was granted Alexander Lineff, of London, July 11, 1888. The characteristic feature of his invention is that a magnet on the car as it travels keeps attracting or drawing up fresh portions of an iron band, and thus puts the conductor proper in electrical connection with one or two sections of an upper rail, from which the current can be collected by a trolley wheel in the usual manner for driving the car. In case the connection is broken, a battery must be kept on the car to energize the magnet, in order to again pick up the iron band or conductor within the conduit.

Mr. H. W. Smith, of Newark, New Jersey, was granted United States patents March 5, 1889, for a system using a closed sectional conduit, in which the connection was made from the main bare conductor inside the conduit to the surface sections by means of small armatures mounted on bearings within the conduit. These armatures were attracted and drawn up by permanent and electro magnets mounted on the frame of the car. The permanent magnets were undoubtedly used to avoid carrying storage batteries on the car in case the connections were broken between the main conductor and the sections of the conduit. The current is conveyed to the car by means of brushes.

(*To be continued.*)

The Most Economical Age of Incandescent Lamps.[*]

COMMUNICATIONS.

Prof. Benjamin F. Thomas—I am indebted to Mr. Hering for the copy of his very interesting and valuable paper and for the opportunity to contribute a little to its discussion. All who are interested in any way in incandescent lighting must, with me, feel under obligation to Mr. Hering for the application of the O'Keenan analysis to the data of the Ohio test, and for his skilful interpretation of the results. The original paper and its discussion at Chicago established the fact that lamps last altogether too long for economical results, and also the fact that the lamp of highest initial efficiency is not always the most economical. Mr. Hering's paper now turns the conclusions there expressed in general terms into a complete demonstration, and adds other facts which will doubtless prove quite surprising to many who have made lamp questions a study. If the results are properly understood and applied, they must prove to be of great value to the lamp manufacturer, the station manager and his customers, and all who have anything to do with incandescent lamps. To the owners of isolated plants, Mr. Hering has demonstrated the importance of renewing lamps when they reach the point of minimum cost. (Why not call it the O. K. point?) It hardly seems right, however, to advise any one to run the lamps until they "die a natural death" when the amount of light afforded is not important. Economy considered, it is better to use, in such place, lamps of the lowest allowable candle power, and to renew them as elsewhere. Central station managers who furnish lamps to their patrons without specific charge for lamp renews, and who charge by meter record, will, of course, find it pays best to run the lamps just as long as they can, without causing enough dissatisfaction to seriously affect the number of customers they have. A rough calculation shows that even this class may profit by the deductions of Mr. Hering. The manager who runs a lamp 1,200 hours, instead of renewing at 400 hours, loses 12 cents of profit which he would have made on the larger current which would have passed through the lamp and meter if he had renewed at the proper time. The strength of the current which flows through the lamp diminishes as the lamp grows old, and therefore the watt hours which will be recorded will be less during the last half of the natural life of the lamp than during the first half. This is, of course, equivalent to decreasing the station output when lamps are burned as long as they will last. If we ever have lamps produced and sold at about 15 cents it will then be best for station managers of the class supposed to renew at the 400 or 500 hour point.

It is interesting to note that the man who is a customer of such a centrel station will find it profitable to buy his own lamps, even though no deduction be made in the price charged by the station. The higher average candle power of the lamps when renewed each 400 hours will enable him to light his premises equally well with a smaller number of lamps, and the saving in his meter bill will more than pay for all the lamps used, and he will have a more uniform and more satisfactory light. It seems not improbable that the central station of the future will limit itself to supplying current through its mains, the one who buys current furnishing his own lamps, fixtures, wiring, etc., and the fact last considered ought to be helpful in bringing about that state of things.

---

[*] Paper read before the Buffalo Electrical Society, March 6, 1893.

[*] Paper read before the American Institute of Electrical Engineers. See ELECTRICITY, March 15, 1893.

Mr. Hering's Fig. 8 furnishes a very striking view of the relative values of several lamps as money savers. At 400 hours, lamps A, K, F and M are very close together, the extreme difference in cost of 1,000 candle hours being only 1 cent. Where the difference in cost of light is so small, it matters little which lamp be chosen, unless the the user of the light is particular about uniformity of candle power during the 400 hours.

Referring to Table IV of the paper read at Chicago,† the percentages of original candle power were, at 400 hours, for A, 74 per cent.; for F, 77 per cent.; for K, 78 per cent., and for M, 90 per cent. The M lamp is therefore best when uniformity of candle power is deemed important.

It must be borne in mind, however, that the number of lamps of each make tested was too small to base a sound judgment of relative merit on, and the above comparison must be considered as an illustration only.

Prof. Elihu Thomson—I have received the advance proofs of Mr. Hering's paper on incandescent lamps. I have very little time at present to add anything to the discussion of the matter. I think his points are well taken, but I also think he is quite right in pointing out that they are theoretical rather than practical. I think his practical rule for the running of lamps, which, as stated by the paper, is to run them until the diminution of incandescence becomes noticeable and then discard them, is a very good one. Whether to break them or not is another question. They are of course still capable of being run at a high incandescence for a short time if the voltage be increased. In fact, looking at the matter again from a purely theoretical standpoint, it strikes me that the ideal condition for running is to start the lamp at the potential for which it is made and gradually increase the potential so as to keep up a fair or uniform light efficiency regardless of the life of the lamp, letting the lamp go when it will. Of course this is not practical in most systems, but can be approximated by putting the older lamps on parts of the system which have the highest potential where there exist differences of potential. It also strikes me that the calculations will need to be varied with every change in the time of running of a lamp; in other words, if out of a set of lamps there are some which only run a short time for each day while others run a much longer time, the time for discarding a lamp will vary, theoretically, in this case. The short time lamps demand, theoretically, a higher light efficiency throughout their use.

It still remains after the discussion that we should not relax our efforts to obtain a lamp with long life, and one having an economical efficiency during that life. Furthermore, it is evident that the longer the life of the lamp, if the economy of the light production is maintained, the less in proportion becomes the cost of renewal to the other expenses. There is something to be said also on the score of the convenience of use of the long life lamps as against a lamp which runs down rapidly, which in a discussion like this is liable to be left out of the question. Where lamps require to be renewed very frequently and are somewhat inaccessible in their placing, the long life lamps have an advantage in the saving of labor.

In my opinion, the development of the manufacture of incandescent lamps will give rise to the production of lamps of short and long life to suit the varying conditions in practice and the relative cost of power to cost of lamp renewals.

Prof. E. P. Roberts—It was my intention to attend the meeting of February 21st; having, however, changed my plans and being very much rushed, I only have time to drop you the following brief memoranda:

1st. An instructive line of investigation, following the method of Mr. Hering's valuable paper, would be to determine the comparative value of lamps "L" 3.8 watts at start, 5.5 at 500 hours and "M" 4.8 at start and 5.1 at 500 hours.

2d. Undoubtedly, blackened lamps should be either destroyed or used where amount of light is of little consequence, or used for resistance racks.

3d. That as long as lamps have a 90 per cent. probability of being operated anywhere from 2 per cent. below normal voltage to from 10 per cent. and upwards above that, the practical rule, "Smash blackened lamps," should be supplemented by, "Pay the interest on $75.00 for a first-class portable voltmeter; use same frequently and systematically all over circuits and give the medicine called for by the diagnosis," which might be further supplemented by, "If, after knowing the disease, you will not pay for the medicine necessary to make a cure, do not complain if patients die young."

DISCUSSION.

Mr. W. D. Weaver—The paper of Mr. Hering is one of unusual value, not only on account of the matter contained but also from the important practical bearing of the subject.

The graphical method which Mr. Hering adopts is very interesting, and the curves enable one to easily follow and thoroughly understand the steps that lead to results that at first sight are rather startling. In this respect the graphical method is superior to an analytical one, but it has the misfortune in this case of being extremely laborious in application, and lacking in accuracy unless the curves are laid down on a large scale.

An inspection of Prof. Thomas's table giving the variation of watts with the life of a lamp shows that the rate is remarkably uniform in the majority of the tests and numerically equal to an increment of .3 watts per candle power per hundred hours. The regularity in these cases enables an analytical method of remarkable simplicity to be applied to the solution of the various problems considered graphically by Mr. Hering, the development of which is as follows:

Let T=total cost of one-candle power of light for a given number of hours.
" Y = average hourly cost during the same period.
" a = cost of lamps per candle power.
" b = cost of one electrical horse power per hour delivered at the lamp.
" w = initial watts per candle power.
" k = increase of watts per candle power for each hour of the life of the lamp.
" x = hours that the lamp is used.

Assuming that the increase in watts per candle power is by equal increments for equal increments of the time the lamp is burning, the watts being used at the time x are $w - k\,x$, and the total watts used up to the time x are

$$\int (w + k\,x)\,d\,x = w\,x + \frac{k\,x^2}{2}$$

The total cost, including the lamp cost, is therefore

$$T = a + \frac{b\,w\,x}{764} + \frac{b\,k\,x^2}{2 \times 746}$$

The average cost is

$$y = \frac{T}{x} = \frac{a}{x} + \frac{b\,w}{746} + \frac{b\,k\,x}{2 \times 746}$$

which is a minimum when

$$x = \sqrt{\frac{2\,a \times 746}{b\,k}}$$

If A is the cost of a 16-candle power lamp and K the increase of watts per hour for a 16-candle lamp, the formula becomes

$$x = \sqrt{\frac{1492\,A}{b\,k}}$$

The value of k from Professor Thomas's experiments is .003 and consequently $K = .048$; substituting we have finally for the life, L, or the "smashing point,"

$$L = 176 \sqrt{\frac{A}{b}}$$

By substituting the corresponding values of a and b, the minimum values of the life measured from the final curves laid down in the graphical method are at once obtained from this formula, and it is remarkable that such a simple equation can replace a graphical method so unusually involved. The accuracy of the method of course depends upon the assumption in regard to the arithmetical increase of watts with the life of the lamp, but an inspection of Table I shows that in most cases an error in this respect is less likely to cause a serious error in the final result than the graphical method, unless the scale of the latter is large.

A singular deduction from the formula is that the "smashing point" does not vary with the watt efficiency of the lamp. Consideration, however, shows that the factors of the question of efficiency are merely the relation between the hourly lamp cost at a given time and the increment of lamp energy at the same time, and as this is independent of the watt efficiency of the lamp, the latter does not enter.

As the most economical life varies directly as the square root of the cost of the lamp and inversely as the square root of the cost of the power, considerable variations in these values will not introduce large ones in the value of L, as the following table shows:

VALUES OF L.

	$b=$ 10 cents.	$b=$ 4 cents.
A 35 cents..........................	383	510
A 45 "	370	590
A – 55 "	404	650

The formula just deduced is based upon a constant value of K. Where this value varies materially, the following arithmetical method enables the "smashing point" to be determined, and also gives the ordinates of the curve showing the variation of the average cost of the unit light, the same that Mr. Hering constructs graphically.

In the tables below, which are based on lamps A and M of Prof. Thomas's experiments, the hours the lamp has been used are in column A, and the watts at the end of each 100 hours in column B. The increase for each 100 hours is in column C, and the total increase at the end of a given period in column D. The cost of this increase at 15 cents per 1,000 watt hours is given in column E, and the average cost per 100 hours in column F, while column G gives the corresponding average cost of the lamp per C. P. per hundred hours, the cost of a 16 C. P. lamp being assumed 45 cents. Column *H* gives the gain per c. p. per hundred hours from the continued use of the lamp, and column *I* the loss, these quantities being the sums of the values in columns *F* and *G*, and corresponding to the ordinates of Mr. Hering's curve E.

---

† Transactions, American Institute, Vol. IX., p. 271.

Referring to the first table, it will be seen that at 300 hours the average cost of the increased watts required to maintain the unit length is .8 cent per hundred hours, while an average of .94 cent is saved by continuing the use of the lamp; at the end of 400 hours, however, these quantities are 1.031 and .7 respectively, showing that the cost of the increased power has become greater than the saving from the continued use of the lamp. The exact time when the average increased power cost is equal to the average lamp cost is the "smashing point," and may be determined approximately by a proportion between the quantities for 300 and 400 hours.

The following formula enables the quantities in column *D* to be quickly calculated :

$$D=\left(na+(n-1)b+(n-2)c+d+\right)-\frac{a+b+c+d+}{2},$$

where n = the hours in hundreds and a, b, c, d, etc., the values for 100, 200, 300, 400, etc., hours from column *C*.

Minimum at 680 hours.

Mr. Hering—The formula given by Mr. Weaver is certainly very interesting. I have not had an opportunity to examine it carefully, but if it is correct, which I do not doubt, it certainly is a valuable formula. But it seems to me that it is applicable only in a general way, that is, it might not show all the characteristics of the different lamps, because it is based on a uniform rate of variation in the efficiency of a lamp. It does not seem to be correct for the two ends of the curve, but that is perhaps of little importance as long as it is correct in the neighborhood of the minimum point and as long as its application is limited to that point only and not to any other parts of the curve. It seems to me that by using this formula the characteristics of the curves of different lamps, which are caused to a great extent by their different rates of increase of the watts per candle power, would be lost, or in other words, curves constructed for different lamps would probably be parallel; but as the important part is the minimum point, this objection may not be of much importance. I am very glad to see such a simple algebraic formula for determining this point, as it makes such deductions as these much more valuable. It should be remembered, however, that it is to be used only in the neighborhood of the minimum point. Before endorsing the formula, however, it would be well to see how closely the results for each of the different lamps agree with those in Fig. 3. The arithmetical calculations are not as tedious as might at first seem; a curve could probably be calculated in ten or fifteen minutes.

The method which I used for calculating the results is purely arithmetical and not graphical; it is merely the final result which is given graphically because it shows so much more than a column of figures would. Although Mr. Weaver's second method of calculation, shown in the tabulated matter, is interesting, it involves more calculations and more work than the simple arithmetical methods which I used; besides, curves appeal to one much more than a column of figures do, particularly when two sets of similar figures are compared with each other. As there is no need of great accuracy in determining the best age, it is not unlikely that the purely arithmetical method used in the paper might after all be the simplest, especially when the data is not given in as convenient a form as in Prof. Thomas's paper.

Mr. George Hill—We should all feel grateful to Mr. Hering for again calling attention to this important subject, and those of us who have to look after clients' interests predict probable results and the like should appreciate these simple curves that will enable us to reach approximate results with considerable accuracy, while the formula that it called forth in the discussion will enable us to come still closer.

Apart from the perhaps insufficient data on which the conclusions were based, which were insufficient for very exact results or broad generalizations as to costs, but were ample for the underlying truths, the matter of interest should have been considered as one easily introduced, and under certain conditions materially affecting the result.

For example, take the case of a factory running the lamps a few hours per day during nine months in the year—say the lamps cost $0.35, the power $0.04 per K. W. hour, 16 C. P. lamps, and life of 500 hours, current would cost $2.27 and interest $0.136, making the total $2.41; this is, of course, 6 per cent. per annum, which is too much to neglect. Or take an office building with some of the lights burning the same number of hours as those just noted, then with power costing $0.15 per K. W. we should have the total cost, including interest at 6 per cent., $8.00 for the 500 hour life, while in the same building there would be lamps burning 9 hours every day, and, as a consequence, being renewed every 55 days for a 500 hour life, the cost of which, taking interest into account, would be for the first $7.62; for the fifth, at the end of the year say, $7.90, and for the eleventh, or the second year, $8.35; a gain at the end of two years of $0.73, or 9½ per cent. The investigation could be carried along this line much farther with interest, but it is not the line from which the best results can be obtained.

No one who has kept posted has been willing to deny that there was an economical limit or "smashing point" in the life of the lamp, and many have thought that it was about 400 to 600 hours ; in fact, two years ago I wrote a specification for a plant that we were installing calling for an initial efficiency of three watts per candle and a life of 600 hours, which was hardly commercially possible then, although one manufacturer thought that he could comply with the conditions. This was done simply as the result of something that I heard or read and does not deserve any particular credit.

The point that is most desirable of solution in my mind is : How can we take advantage of this knowledge in a practical way in the operation of our plants ? How can the manager of the small central station replace the lamps that are not doing their full duty or are taking too much current? In my own house I have some lamps that have been unchanged for nearly five years, burning an average of two hours per day for 270 days in the year, which would be a life of about 2,700 hours. They have been satisfactory, as they are all hall lights and not easily reached and have never been changed.

There should be, first, a new curve plotted, or a new formula deduced, with the element of the wages of a lamp collector added so as to get a new economical life, and then, second, some form of apparatus devised that would make it easy to determine the efficiency of each lamp. Possibly the candle power test spoken of by Mr. Hering if applied as a photometric test by the station management would be the simplest, but if we wait until there are complaints about the light we shall certainly run the lamps far beyond the economic point. Under such conditions we could call for a testing apparatus in each installation and instruct those who were to run it in its use, so as to do the best that present knowledge permits of for our clients.

Prof. Thomas's conclusion from Mr. Hering's paper is that the development of the future will be in the line of the central station furnishing so many watts of energy to the consumer to do as he pleases with, and he may be right for central station cases, although I am disposed to think that it would be found to be economy to exercise an oversight in these matters, the station taking away the lamps every few months, replacing them with new ones, testing those taken away, rating them and using them on circuits of known duty, and instead of charging for the renewals, lumping it in the charge for current. For the isolated plant, especially in large office buildings, the owner as a matter of course supplies the tenant with light, and there he must look after the lamps himself or waste much energy, since he is only required to supply a certain amount of light, and if the lamps are dull there will be more turned on until finally all the lamps are in use and then when they are insufficient there will be a complaint and an increase in the output of current of about ten per cent. Keeping in mind then the lesson of the paper, it will be seen how necessary it is to have some way of watching the lamps that is quickly applied; then the engineer of the building would each month change all of the lamps, test them, put those that are nearly used up in the halls, and new ones in the offices, so keeping them always under supervision, and smashing them when the proper time comes.

Mr. Townsend Wolcott—Mr. Howell read a paper[†] before the Institute April 10th, 1888, in which it was assumed that the watts per candle power for a given lamp were constant during its life. Yet, notwithstanding this assumption, it was pointed out in the discussion that a lamp could live too long, its efficiency being impaired by blackening. Mr. Howell stated that the relation between cost of power and first cost determined the most economical life of lamps; that is, the greater the cost of power in relation to the first cost, the hotter we can afford to burn the lamps. The cost of lamp manufacture (or at all events the selling price of lamps) has been reduced since that time, while that of power has not, and it ought to pay to burn them hotter, and I should be glad to see that done. I do not consider that a bottled angleworm is a suitable light. The incandescent lamp lacks just a little of being a beautiful light : just when every one begins to admire the light we find that we are away above the voltage marked on the lamp. In some places where lamps are run from existing power, or where the cost of power is not considered, they think more of the cost of lamps than anything else. In one place I have in mind 112 volt lamps are run from a dynamo which does not give above 110 volts. Where a good light is required the tendency is to use them up quicker. Although Mr. Hering's paper starts from a very different basis from Mr. Howell's, it leads to the same conclusion so far as the most important point is considered, namely, that we can afford to have better light than we have been getting.

[†] TRANSACTIONS, Vol. V., p. 237.

The Present Status of the Storage Battery.

BY JAMES K. PUMPELLY AND C. SORLEY.*

In order to put before you in a concise form the status of the storage battery at this date, it is necessary to go somewhat into its past history. Planté in 1860 published to the world the fact that he had discovered a method of storing electricity by using certain metals immersed in certain solutions, and that he had obtained the best results from sheet lead immersed in dilute sulphuric acid and subjected to a long process of alternately charging, discharging and reversing for the purpose of forming a layer of active material upon the surface of said sheet lead; unfortunately this process of forming the active material was very costly, owing to the great length of time required.

In 1881 Faure brought out a battery in which he used the same material; namely, lead and dilute sulphuric acid, but instead of making the active material out of the plate itself as Planté did, he applied active materials or materials to become active to the plates, in the form of a paste, paint or cement. This was a great advance so far as cost of production is concerned, but not when viewed from other standpoints, as it introduced some very serious defects, the greatest of which was the liability of the active material to scale off, or in other words to become detached from the plate. This would only cause loss of capacity, due to loss of active material, but these scales were liable to lodge between the plates and short-circuit the battery. The aim therefore of all makers of storage batteries since the Faure battery came out has been to so construct a battery that it should be impossible for the active material to fall off the plates. This has been accomplished in various ways, but almost invariably the result has been the introduction of another serious defect, namely, greater internal resistance and therefore less efficiency, for if the internal resistance is increased it will necessarily take a greater E. M. F. to put a given quantity of current through the battery, while in discharging this internal resistance will be added to the external resistance of the circuit and cause a corresponding loss in the discharge.

One of the greatest stumbling-blocks in the way of inventors who have tried to find a means of keeping the active material from falling off the plates has been the universally accepted idea that it is absolutely necessary to have a free circulation of the solution. Mr. Sorley and I after a long series of experiments have found that this is not necessary, providing a porous and also absorbent substance (capable of absorbing the sulphuric acid as fast as it is made in charging) has been placed between the plates.

This is a very important discovery, for it not only makes it impossible for the active material to fall off or out of the plates, but it enables us to jam the plates up close together, and so make one solid compact mass of the element, without any free solution to spill over everything when the battery is used for traction and other analogous purposes, and it also adds a number of years to the lifetime of the battery, for when the positive plates have become peroxidized nearly through, and would not be able to support their own weight (if made in the old way where every plate stands alone) by this method, the negative plates which never wear out will support them, and it also enables us to lower the internal resistance by bringing the positive and negative plates much closer together.

We have also found that no matter how well a battery may be constructed it is not possible to get as good results from one constructed upon the Faure principle (that is to say, with a mechanically applied oxide) as can be obtained from one made on the Planté principle. This brings us down to the question, can a Planté battery be made a commercial success? that is to say, can the electro chemical process of forming the active materials out of the plates itself be shortened from several months to a few days or hours?

We are glad to be able to answer that question with an emphatic "yes." By a process discovered by Mr. Sorley, and which after seven long months of costly experimenting by Mr. Sorley and myself, we have succeeded in developing a Planté battery in which the active material is made electro-chemically in one hour and fifty minutes. We are glad to produce before you one of the batteries containing all the latest improvements as I have described them.

It has been said that storage batteries will never do for street-car work, owing to the fact that when a car is climbing a heavy grade the demand on the battery for current is so great that it will not maintain its E. M. F., and that consequently when you exceed a certain number of amperes the voltage falls in proportion and you do not get any more watts, or in other words, although you are discharging the battery at a greater rate you do not get any more energy. Now this is true to a certain extent of a battery made with a mechanically applied oxide, but not of one wherein the active material is electro-chemically made, as Mr. Sorley will illustrate to you with the battery before you, which contains an element that only measures 6" × 6" × 6½", but which has a capacity of 177.7 ampere hours at a discharge rate of twenty-three amperes. He will show you that it is possible to discharge it as high as 75 to 85 amperes for say twenty minutes, which is ample time to climb a grade, and that this discharge of say 80 amperes for twenty minutes will not lower the voltage more than one 5-100 of a volt, that is to say, the E. M. F. during this large discharge from so small a cell will remain constant at 1.95 volts.

Now this E. M. F., with the usual number of cells that are placed in a street-car series, would produce at the terminals of the motor (at the above discharge rate of 80 amperes) nearly 21 horse power, or accurately 20.9 H. P.

Allowing that the test is to a great extent convincing to you, you will naturally ask, how do you know that this form of Planté battery will be any more durable, or that the plates will remain firm and intact any longer than the pasted or mechanically applied oxide plate.

In answering such a question we have to judge by our experience and our knowledge of the chemical action on the plates. The constant tendency of this chemical action on the pasted plate is that of slow disintegration caused largely in our opinion by the impurities that are introduced into the plate in the oxides of lead which are mechanically applied, whereas all the impurities which may be in the lead plate itself are dissolved out, and remain in the first solution, and consequently the peroxide and spongy lead that are subsequently formed are made out of perfectly pure lead, and there are no longer any chances of disintegration arising from local action. While on the subject of rolled lead, it would be proper to mention that the plate in this cell before you is made from one integral sheet of lead ⅜ of an inch thick and prepared for treatment by a new method patented by us, which does away with all joints or soldering, thus avoiding any chance for local action.

And aside from this, the process greatly cheapens the cost of making the plate.

One fact we have learned to aid us to a further conclusion, and that is, that when pure rolled lead (such as this battery is made of) is used for the electrodes the plates are far more durable than when constructed of cast lead, even when the active material is mechanically applied, and we know of plates so constructed that have lasted for five years. In conclusion we wish to say, for lighting purposes where weight is not an objection there is no reason why a storage battery should not be made that would last for twenty years, and this being the case there is no reason why storage batteries should not take the place for electricity that the gasometer now takes for gas, that is, act as a reservoir from which to distribute current from central stations.

---

* Read before the Chicago Electric Club.

Personal.

Mr. Robb Mackie, city electrician of Cincinnati, has resigned that office to accept the position of chief engineer of the C. & C. Electric Company's factory and construction works in New York.

Mr. Elliott O. Johnson, who enjoys a wide acquaintance throughout the electrical field, is now located in a cosy office, 620 Atlantic avenue, Boston, as agent of the Redding Electric Company, Boston; Heinze Electric Company, Lynn; Holmes, Booth & Hayden, Waterbury, Conn., and other leading firms.

Mr. Orlando W. Hart, whose electrical inventions have brought him into prominence, has been appointed New England agent of the Ford-Washburn Storelectro Company, Cleveland, Ohio, and is now located in Room 33, 620 Atlantic avenue, Boston.

Mr. J. H. Rothamel, President of the Columbia Lamp Company of St. Louis, was in town last week. Mr. Rothamel expressed great confidence in the favorable outcome of the suit against his company, which comes up for hearing on April 11.

Mr. George A. McKinlock, treasurer of the Central Electric Company of Chicago, was in New York last week on a business trip, and has returned to Chicago.

A San Francisco Man Has One.

Another incandescent lamp is about to be launched upon the market by a San Francisco man who sends us the following description but withholds the details of the device pending the issue of his patents therefor. Of this he says: "I can, however, state to you that in my lamp, which is an entirely different light from the two systems now in existence, the carbon pencils burn in direct contact with one another and feed by gravity. These carbon pencils are, however, smaller in diameter than the arc light carbon pencils. The lamp is much smaller than arc lamps and readily admits of lights from 100 C. P. to 1,500 C. P. per light. The light is absolutely steady, with a steady current, as you may readily conceive from the actual contact of the pencil points. This gives a perfectly white light and a light which is quite agreeable to the eyes, even more so than our present incandescent light. In fact the light in question is an electro-chemical light. It requires an E. M. F. of from 3 to 6 volts and from 5 to 50 amperes according to the C. P. required. For instance, I have attained as one of my best results a 300 C. P. light with 5 volts and 12 amperes (60 watts), or 5 C. P. per watt. This result was attained with the direct current."

"From all the tests so far made it is apparent that the above system of lights and lamps is much better adapted for the alternating current. With this we obtained a light of 500 c. p. with a current of 5 volts and 15 amperes (75 watts), or 6.6 c. p. per watt.

"The lamp run from the alternating current is perfectly noiseless and steady, exactly the same as from the direct current. One of the reasons why the alternating current gives better results is that both carbon points burn equally and give an equal amount of light, while in the direct current the upper or positive carbon burns more and gives the most light of the two."

Boston Notes.

It is a long time since those engaged in the electrical business in and around Boston had their curiosity so aroused by an announcement as was the case with the unique query on inside cover of ELECTRICITY this week, "Who said a New Lamp?" "There's a Hen on" tickled the boys' risibilities and made them titillate till their sides expanded to well nigh bursting point. Judging from the way our office was besieged by messenger boys with orders for copies of ELECTRICITY, the entire fraternity might have been notified by wire over night to look out for a startling announcement concerning a new lamp. They were not disappointed, and all stand at this moment ready to doff their hats and exclaim, "Hail to the new lamp!"

An electric device has been invented by a Lynn man for turning over the leaves of a piece of music during its performance. A company, largely composed of piano manufacturers, is being organized in Philadelphia for placing this device on the market.

Next to the excitement caused by our own *exclusive* intimation about a new lamp, the subject of overcharges in the price of gas by the Bay State Gas Company is agitating everybody's mind from the Mayor down. Vulgarly speaking, the City Fathers, including Mayor Matthews, have got their dander up and before their wrath abates the big Gas Trust may find itself compelled to take a tumble in price.

One of the councilmen in the City of Lynn, Mr. G. B. Grant, connected with the factories of the General Electric Company of Lynn, has been discussing the question of how to introduce electric fire engines into that city. He is of opinion that the city could supply itself with many powerful fire engines by making use of the street railway tracks and electric power. A suitable railway truck could be fitted with pumps of great capacity, propelled quickly to the scene of a fire, and throw streams far exceeding in efficiency those of the steam engines now in use. He suggests a Knowles, Blake, Worthington or other type of pump, which, operated by electric power, could be made to throw at least nine times the quantity of water an ordinary steam pump throws.

The Electrical Corporation, which was organized a few days ago in Boston, includes some of the wealthiest men in Massachusetts. Of course it is but another limb of the General Electric Company, as is proven by the names of Mr. C. A. Coffin and Mr. J. R. McKee, as well as several others being in the list of incorporators.

At the annual dinner of the Oxford Club, Lynn, on Tuesday evening, Professor Elihu Thomson was one of the speakers and on his name being announced it was received with loud applause, the toastmaster introducing him as a man whose genius was only exceeded by his accomplishments and modesty. Professor Thomson then briefly reviewed the early days of electrical science and works. Michael Faraday, he said, laid the basis of the achievements of the last fifteen years. Could Faraday come back to-day and see the dynamo machines now constructed and built on the principles he laid down, he would most likely say: "What a giant my infant has become." The day may come when it will be possible to produce the electric light with a fraction of the energy now expended. From the incandescent lamp there was now being obtained much less result from the power expended, and the same might be said of the arc light, than may be the case in the future. There were many wonders yet to be disclosed, many phenomena yet to be explained, but the greatest mystery man had yet to encounter was the mystery of our own thought and mind—the mystery that enabled him to say, I am here."

Chicago Notes.

Henry L. Walker, secretary and treasurer of the Detroit Dynamo Company, was in the city for a few days this week.

Lucius E. Marple has joined the official staff of the Chicago-St. Louis Electric Railroad.

Mr. B. F. Harris, Jr., president of the Urbana and Champaign Electric Street Railway, was in the city this week, and left a few orders among the supply houses.

Mr. Floyd Short, until recently with the Remington Typewriter Company, has accepted a position as advertising representative of *Electrical Industries.*

W. H. McIntyre, the leading spirit of the electric light plants at Garrett and Auburn, Ind., was among the week's visitors in Chicago.

The Chicago City Council has passed several ordinances granting charters for extensions and additions to the different electric railways located in the southern and western portions of the city.

Flattering reports are made on the Westinghouse stopper lamps which are now in use in this city. They are reported to be fully equal to the lamp formerly made by the Sawyer-Man Company.

General News.

What Is Going on in the Electrical World.

Peterboro, Can.—The Canadian General Electric Company has been granted the franchise for an electric street railway in this city.

Norfolk, Neb.—A new electric light company is being organized here which proposes to do cheaper lighting than the old company.

Spring Valley, Minn.—An electric light company has been organized here, with D. F. Farmer president and John Leuthold secretary.

Ottawa, Can.—An English syndicate, it is reported, are taking steps to buy up and amalgamate all the gas and electric light companies in Canada.

Nashville, Tenn.—Not a single bid was received by the Board of Public Works in response to their call for proposals for furnishing public lights for the city.

Manchester, Va.—The proposed electric road between Petersburg and Manchester will certainly be built if the Manchester council grants the franchise asked for.

Kingston, Jamaica.—A contract has been entered into with the local branch of the Thomson-Houston Electric Light Company to light the city with electricity.

Atlanta, Ga.—The Atlanta City Railroad Company and the East Lake and Decatur Street Railway Company have united and the name of the latter company is dropped.

Texarkana, Tex.—Judge B. T. Estes has been elected president of the Gas and Electric Light Company, Geo. Fouke vice-president and Wm. Enfield secretary and treasurer.

Garfield, Wash.—The population of this town is slightly over 1,000, but the people are spirited and are going to have a new water system, electric lights and other modern improvements.

Celina, Ohio.—P. C. Burns, of Peru, Ind., has leased the Lock Factory building, and will begin at once the manufacture of all kinds of electrical supplies. One hundred hands will be employed.

Staten Island, N. Y.—The State Railroad Commission has approved the application of the Staten Island Belt Line Railroad Company for a change of motive power from horses to electricity.

Albany, N. Y.—Mr. Cahill has introduced a bill in the House to reduce telegraph rates inside the State to 15 cents for ten-word messages during the day and the same price for twenty words at night.

Woonsocket, R. I.—The Blackstone Valley Electric Railway Company intend to construct an electric line through Northbridge to Whitins. The line will connect with the Millbury and Worcester road.

Jackson, Mich.—The Jackson Electric Light Company have begun the erection of new buildings and are making extensive additions to their plant to meet the demands for additional power for the new electric line, etc.

Oxford, Pa.—There is a strong demand for an electric railway line between Oxford and Newark, Del. The distance is sixteen miles, and the proposed line would unite several villages and would be of great advantage to farmers along the route.

Niagara Falls, N. Y.—A large party of students from Cornell University, accompanied by Prof. Carpenter, last week visited the plant of the Cataract Construction Company and inspected the wheel pits and tunnel for the electrical plant.

Homestead, Pa.—All of the old machinery in certain mills of the Homestead steel works is being torn out and new machinery to be operated by electricity is being substituted. The new system will do away with the services of many employees known as "hookers."

Hoboken, N. J.—The new power station of the Hudson Electric Company has been completed at a cost of $250,000. The opening of the station occurred on the 18th, and a feature of the celebration was the running of the first trolley cars over the Fifteenth street extension.

Trenton, N. J.—A Philadelphia dispatch states that a syndicate in which Colonel E. de V. Morrell is a leader is about to apply for a charter for an electrical trolley road to extend from Philadelphia to Trenton. The towns between the two cities will form links in the system.

Rome, Italy.—The streets of this city are shortly to be lighted throughout by electric lamps supplied with current from dynamos located at a cascade at Tibur, in the Alban hills, twenty miles from Rome. The plant is known as the Tivoli long-distance power transmission system.

Coatesville, Pa.—Coatesville has been selected as a site for the power plant for the new Philadelphia and Lancaster electric railway. The council in granting the company the right to operate a road through the town made this a provision of the ordinance. The works will cover several acres of ground and will cost over $400,000.

Cardington, Ohio.—B. F. Jackson, of Chesterville; Harry True, of Marion, and Henry Cassell, of Fredericktown, have in contemplation the building of an electric railway from Marion to Mt. Vernon, by way of Mt. Gilead, Chesterville and Fredericktown. Electrical engineers have been consulted in regard to the route and have reported favorably.

New Paltz, N. Y.—There is talk of building an electric railroad between New Paltz and the Hudson River this spring, with possibly an extension to Lake Mohonk. B. Van Steenburgh, of New York, who has bought the stock of the New Paltz Turnpike Company and has just completed an electric light plant in the town, is at the head of the movement.

Youngstown, Ohio.—The Youngstown Electric Street Railway Company have awarded contracts for the construction of a belt line of electric railway around the city.—The right of way has already been secured for a line from here to connect with the Niles and Mineral Ridge line, and stock is being raised for an electric road to run from Canfield to Youngstown. Citizens of Poland and Hubbard are also agitating the question of electric railway communication with Youngstown.

New Orleans.—Isaac N. Seligman, of the banking house of Seligman & Company, New York, on his arrival here a few days ago, was interviewed by a reporter who quotes him as saying that he came to New Orleans "for the purpose of looking after the large interest which our firm and friends control in the street railway system of New Orleans, as well as in its electric light system. . . . We expect to spend between five and six million dollars in this city the next two years, the greater part of which will be expended in the conversion of the present mule system to the electric system."

Glens Falls, N. Y.—Interest is aroused here in a project which will probably be carried into effect if the men reported to be concerned in it take hold. The scheme is to build a dam across the Hudson a few miles above this place, and use the water power thus obtained to operate an electric plant to be established there, to furnish Glens Falls, Sandy Hill, Fort Edward, Saratoga, Fort Ann and Lake George with electricity for street and house lighting and power for running small motors, etc. Among the men mentioned in connection with this scheme are H. R. Leavens, M. O. Brown, E. B. and O. S. Potter and T. S. Cooledge.

Boston, Mass.—The president of the Germania Electric Company, Leopold L. Schlegelmich, says that if the company's business had not been hampered by injunctions the assets would exceed the liabilities two dollars to one. The injunctions have for the present caused the company to cease the manufacture of lamps, and as this was an important part of the articles manufactured it has been a serious drawback to the company. The company had been running about three years, having been organized under the laws of Maine in 1890, with an authorized capital of $250,000. It succeeded the Schafer Electric Manufacturing Company of Cambridgeport and removed the plant to Marlboro.

New York.—At the annual meeting of the Commercial Cable Company on the 20th inst. the report of the president was presented showing gross earnings for the year 1892 of $1,890,377; the net revenue was $1,099,587, an increase of $14,263 over the preceding year. The board of directors were unanimously re-elected as follows: James Gordon Bennett, A. B. Chandler, George S. Coe, C. R. Hosmer, G. G. Howland, R. Irvin, Jr., J. W. Mackay, J. W. Mackay, Jr., E. C. Platt, T. Skinner, Sir D. A. Smith, W. C. Van Horne and George G. Ward.—The Commissioners of Charities and Correction advertise for bids for electric light plants for the insane asylums and other buildings on Ward's Island and Central Islip.

Cleveland, Ohio.—There is talk here of a plan to construct an elevated road, operated by electricity, from the Public Square to Lakeview Cemetery, five miles distant. The line would compete directly with two electric surface roads. New York capitalists are credited with the conception.—At the annual meeting of the Brush Electric Company the following officers were elected for the ensuing year: W. H. Lawrence, president; John S. Bartlett, first vice-president; C. A. Coffin, second vice-president; W. B. Bolton, general counsel; B. F. Miles, treasurer; A. H. Hough, assistant treasurer; S. M. Hamill, secretary; L. B. LeVake, assistant secretary; J. F. Hughes, auditor, and S. M. Hamill, general manager. The executive committee will be composed of W. H. Lawrence, C. A. Coffin and J. S. Bartlett.

Newark, N. J.—Boston and Cincinnati capitalists have completed the purchase of all the capital stock of the Orange Cross Town Railroad, and the line is to be extended to Montclair on the north and to near South Orange avenue on the south and equipped with electricity. A number of branch lines will eventually be built.—A fire at the United States Electric Light works on Wednesday last caused a loss of about $10,000.—The certificate of organization of the New Jersey Light and Heat Company says the business of the company is to manufacture, purchase and sell machinery, apparatus, devices and materials required to be used for making and using gas and electricity for light, heat, power and all other purposes, etc. In New Jersey the places of business given are Jersey City, Newark, Hoboken, Paterson, Orange, Elizabeth, Trenton, Camden and Harrison.

Detroit, Mich.—The Detroit electric lighting bill, recently passed by the Legislature, provides as follows: Detroit's public lighting shall be in the hands of six commissioners to be appointed by the mayor and confirmed by the common council. If the council so determines and the people concur, a plant may be bought for not over $800,000, the commission doing all the business of buying and running it. The commission shall not engage in commercial lighting. If the council determines to light the city by contract, or to buy a plant or part of a plant to be leased to the contractor, the commission shall have charge of the business. The commission shall have charge of all electric lighting wires in the city, and a penalty is imposed for cutting or tampering with them. The city may issue bonds to buy a lighting plant.—J. W. Johnston, of Colorado, has bought the controlling interest in the stock of the Standard Electric Company of Detroit.

Milwaukee, Wis.—The *Wisconsin* says the project to construct an electric road between Milwaukee and Chicago shows signs of activity. The right of way from Milwaukee to the State line has been secured, and the Chicago and Eastern parties interested have not only secured the right of way from and through Chicago to the State line, but have started on the work of construction, and it will be running as far as Evanston by June. The Milwaukee gentlemen most directly interested in the project are Henry C. Payne and C. C. Rogers. "A company," says the *Wisconsin*, "has been organized which stands ready to put $10,000,000 into the enterprise. One of the great objects of the gigantic enterprise is to secure positive rapid transit, at frequent intervals, between this city and Chicago. Trains of two or three cars each will run at intervals of every half hour or hour, and they will, it is claimed by those interested, make the through run in one hour and twenty minutes. The road will be as nearly a bee line as possible, and it will take in Cudahy, South Milwaukee, Racine, Kenosha, Waukesha, Evanston and South Evanston, and will land passengers in the heart of Chicago."

The Ries Improved Universal Base Regulating Socket.

BY ELIAS E. RIES.

The rapid extension of incandescent lighting service that has taken place within recent years, and especially since the advent of the alternating current system of electrical distribution, has not been wholly produced by the electric lamp itself, but is largely traceable to the various auxiliary devices that have from time to time been brought forth for the purpose of rendering the incandescent light more economical, safe and reliable, and for better adapting it to the practical requirements of popular everyday use.

Among the many valuable devices that have been recently produced is the well-known Ries Regulating Socket. Since this made its first public appearance at the Montreal Convention of the National Electric Light Association, in August, 1891, it has largely extended the sphere of the incandescent electric lamp.

The Ries Regulating Socket is so constructed as to permit the incandescent electric light to be turned up and down from a faint glow to the full candle power of the lamp, in the same way as has long been common with gas and oil lamps. This important result is effected without the introduction into the lamp circuit of a "resistance" or any other current-wasting medium, and is accomplished by means of a small and peculiarly constructed "reaction coil" placed within the lamp socket, which, when used on an alternating current circuit, sets up a *variable counter electromotive force* that cuts down the electromotive force supplied to the lamp, and consequently also the current flowing through the lamp, in accordance with the degree of light desired. In addition to the regulation of the light, the Ries Regulating Socket has the important advantage that it reduces the strain on the lamp filaments not only in the act of turning on and off the light, which in this socket is performed gradually instead of suddenly, but also in the regular use of the lamps at such times when less than the full candle power of the light is needed, thereby very materially prolonging the useful life of the lamps with which the regulating socket is used.

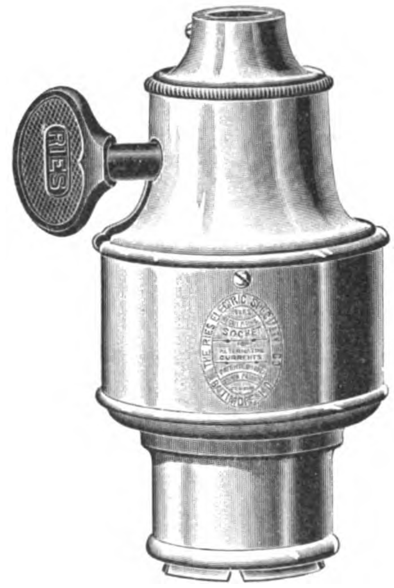

FIG. 1.

The Ries Regulating Socket has since its first introduction made rapid strides toward final perfection. As now manufactured by the Ries Electric Specialty Company, it embraces a number of important improvements that render it far superior in every way to those first placed upon the market.

By referring to Figs. 1 and 2, which illustrate an outside and inside view of the improved socket respectively, it will be seen that the socket comprises among other things the reaction coil, by means of which the opposing or regulating counter electromotive force is generated, the insulating block or support containing the contacts representing the coil terminals, the operating key, switch arm and binding screw connections for the leading-in wires, and the enclosing shell, the latter made in two separable parts.

The mechanical problem of providing an effective, permanent, and thoroughly safe and reliable supporting block that would permit of making the necessary frictional connections between the contact pins and the delicate terminal wires of the reaction coil was one that presented numerous difficulties. These contact blocks were originally made of wood, which although of a sufficiently yielding character to permit of making the required connections, had a number of objectionable features, and after numerous preliminary experiments with various moulded compositions and other insulating materials the writer finally succeeded in devising a porcelain block, together with a method of making the necessary contacts therein, so constructed as to fully meet every requirement.

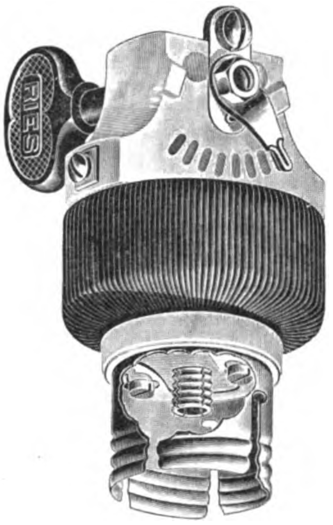

FIG. 2.

The reaction coil used in this socket consists of a small finely laminated annular iron core evenly wound with a silk insulated cable composed of seven separately insulated copper wires varying in size according to the maximum current that each is required to carry. The ends of this cable, after it is wound upon the core, are then bared, and the extremities of the individual wires, each with part of its insulation removed, are threaded through a double series of holes in the porcelain supporting block in such a manner that when the copper contact or terminal pins are driven home and clinched at the back of the block all of the several wires of the cable are connected in series the winding being divided by the contact pins into seven sections of equal length.

The operating key of the socket, which has its bearing in the porcelain block and projects through an opening in the enclosing shell, is provided with a contact arm that moves over the series of terminal pins on the working face of the block, and by including a fewer or greater number of the coil sections in the lamp filament circuit, diminishes or increases the counter electromotive force developed by the coil, and thus raises or lowers the light.

The operating key moves through an angle of 90 degrees, and its position indicates the extent to which the lamp is turned on. The contact pins are slightly depressed below the hardened glazed face of the porcelain block, so as to form a seat for the end of the contact arm and thus insure its proper electrical engagement with the pins and prevent accidental displacement. This arrangement also prevents all possibility of short-circuiting and consequent heating of a coil section that might otherwise be produced by the bridging of two adjacent terminal pins at the same time.

The advantages presented by this coil are: First, the magnetic circuit is very short, unbroken and of exceedingly low resistance. Second, the seven wires comprising the coil are wound upon the core simultaneously and in such a manner that each wire is distributed evenly around the core at the same uniform distance, so that the entire core is uniformly energized by each active section of the winding. Third, the winding is so proportioned with respect to the maximum current flowing through the same at the different stages of light, and with respect to the iron core, that a very low and practically uniform C^2R loss per unit length is obtained and a maximum induction produced in the iron core throughout nearly the whole range of regulation.

When the lamp is burning at lowest rate on an ordinary fifty volt alternating current circuit (the lamp being of standard 16 candle power), it will consume just one-fifth of an ampere at an electromotive force of ten volts, or a total energy of two watts, as against fifty watts when burning its normal candle power.

In the new universal base shown in Fig. 2 it will be observed that the centre contact is a hollow slotted stud provided with the standard Thomson-Houston lamp-thread upon its outer surface, its interior being of the proper diameter to receive the centre pin of the standard Sawyer-Man or Westinghouse base lamps, while its exposed end is arranged to bear against the centre disk of the standard Edison lamp base. The slots in the projecting portion of the centre stud give it sufficient elasticity to make good electrical contact and to accommodate itself readily to variations in the diameter of the contact pins or threads that are often found in lamps of different makes. It is also capable of a slight vertical movement to accommodate variations in lamp bases.

It may be well to state, in order to avoid misconception, that while the socket is designed for Edison or any other type of *lamp*, it is not adapted for such lamps on direct or continuous current circuits, but can only be used as a *regulating* socket on alternating circuits. The total ohmic resistance of the winding on the reaction coil is so low that it does not make an appreciable difference in the brilliancy of the lamp if used on the continuous current circuit. This fact in itself proves that the regulation of the light is not due to resistance as has been alleged by those unfamiliar with its construction.

Vulcanized Mud.

The Delaware Hard Fibre Company, of Wilmington, Del., has just issued a card calling the attention of electrical manufacturers to the fact that the low prices which prevail for fibre have tempted some manufacturers of that material to introduce impurities in their goods. They state that this can be done in the same way that rubber goods are adulterated.

In samples which they have recently examined they found large percentages of red clay and chloride of zinc and calcium. In one case nearly 50 per cent. by weight of the "fibre' was composed of these impurities.

The presence of such ingredients makes the fibre brittle, easily split and causes it to swell and shrink under atmospheric changes besides utterly destroying its insulating properties. Such material is wholly unfit for electrical work. This "mud fibre" can be sold for from one-half (depending upon the available supply of clay) to one-quarter of the price of the genuine article.

COMMERCIAL PARAGRAPHS.

The Mason Electric Company, 10 and 12 Vandewater street, New York, send out a neat and comprehensive catalogue of their specialties, which include surgical and dental outfits, reading lamps, fan motors, motors for sewing machines, etc., with the well known Mason battery for supplying current. The company will soon issue a valuable book, "Wonders of Primary Batteries; What Can be Done with Them, and How Best to Use and Care for Them."

The Simpson Electric Company of Chicago report an excellent business in their small electric motors. They are now manufacturing motors up to five horse power capacity. They are also getting a large stock of small fan motors ready for the summer trade.

The Chicago office of the National Electric Company has recently secured the contract for furnishing the complete electric plant for the Chicago Beach, one of the largest World's Fair hotels.

The Jenney Electric Motor Company have recently opened an office in the Monadnock Building, Chicago, and expect to carry a full line of electric motors and supplies. Mr. A. H. Goode, until recently with the General Electric Company, has been placed in charge.

Mr. Harry Bishop, Western agent for the Massachusetts Chemical Company, is continuing his remarkable success in introducing Insullac in the West.

The Calumet Electric Manufacturing and Engineering Company has recently been organized in Chicago by Messrs. L. A. Hine. L. J. Otis and G. E. Dorman, for the purpose of manufacturing a line of dynamos and motors invented by Mr. Dorman. The company expect to build a large number of small fan motors for the summer trade, and will make a specialty of 500 volt motors. Mr. G. E. Dorman, the electrician of the company, is well known through his numerous electrical patents, and also through his connection with the Standard Electric Company of Chicago.

The Atwood Electric and Manufacturing Company of Chicago have been receiving a large number of orders since they placed their new incandescent arc lamp on the market. Their new lamp for alternating circuits is also in good demand.

The Knapp Electric Company of Chicago report the sale of a large amount of house supplies to the contractors for the new World's Fair hotels that are being built in the neighborhood of the Exposition grounds. The orders for Knapp Annunciators have been exceptionally large.

The Intramural Railway Company at Chicag, has decided to use Simplex Wire for feeders. George Cutter is the recipient of the order.

INCORPORATIONS.

Alexandria Electric Light and Power Company, Alexandria, Ind. Capital stock, $30,000. Directors: James M. Barton, Cassius Greenlee, J. E. Jeffries, S. E. Young and A. E. Harlan. The company has been empowered by the Alexandria City Council to build a street railway, and will probably extend it to Anderson.

A certificate of consolidation of the Greenwich Electric Light and Power Company and the Cambridge Electric Light and Power Company, forming the Consolidated Electric Company of Greenwich, Washington County, New York, has been filed at Albany. The capital of the new company is $35,000 and the directors are: Henry Gray, Le Roy Thompson, James Lavake, John Brooks, Mortimer R. Teffts, Harry C. Gray, Greenwich, and Jerome B. Rice, Andrew B. McNish and John L. Agan, of Cambridge. The company's operations will be carried on in the towns of White Creek, Cambridge, Jackson, Easton and Greenwich, Washington County, and the town of Schuylerville, Saratoga County.

The Hudson and Bergen Traction Company has filed a certificate of organization in the Secretary of State's office at Trenton, N. J. Myles Tierney, of New York. Theophilus Butts, of Hoboken, and Albert C. Wall, of East Orange, are the incorporators. The capital stock is $5,000,000. The company proposes to operate electric roads in Bergen and Hudson Counties and through the Oranges.

The Consolidated Traction Company of New Jersey, having filed its certificate of incorporation, has elected the following officers: Edward F. C. Young, president of the First National Bank of Jersey City, president; Thomas J. George, of Newark, secretary and treasurer; David Young, of Newark, chief engineer.

The Rahway Electric Street Railway Company, Rahway, N. J. Incorporators: C. W. Boynton, Henry Mauerer, Henry G. Wolcott, William Howard, N. E. Mead, Jr., D. K. Ryno and Jackson Jaques. The route of the proposed road is through the principal streets of Rahway, and to Wood Bridge and Boynton Beach on Staten Island Sound.

The Peoria and Pekin Electric Railway Company. Peoria, Ill. Capital stock, $200,000, equally divided between John J. Patterson and E. A. Demange. The articles provide for the construction and maintenance of an electric railway between Peoria and Pekin, and the construction of a bridge over the Illinois River at Pekin.

The Mt. Vernon Electric Light and Street Railway Company, Mt. Vernon, Ohio. Capital stock, $400,000. This company, it is understood, will absorb the Mt. Vernon Electric Light Company, and begin the construction of electric railways in Mt. Vernon, and thence to towns in the neighborhood.

Articles of incorporation of the Stockton Power Transmission Company have been filed by San Francisco and Stockton men, with a capital of $1,000,000. The company will generate electricity with water power on the Mokelumne River, forty-two miles from Stockton, and transmit it for sale to manufactories. The company will also supply electricity for a railroad between Stockton and Lodi.

The Consolidated Street Railway Company, Bay City, Mich. Capital stock, $1,000,000. Officers: President, W. B. McKinley, Chicago; vice-president, R. S. Hunter, Philadelphia; secretary, H. H. Norrington, West Bay City; treasurer, D. W. Slack, Philadelphia. assistant treasurer, H. Norrington.

The Norwalk, Fairfield and Southern Railroad Company, Norwalk, N. Y. Capital stock, $50,000. Incorporators: Charles P. Wickham, T. F. Hildreth, Jay F. Laning, Harry H. Hoyt, S. E. Crawford, Frank H. Evans and John A. Williams. Organized to build a line to be operated by steam or electricity between Norwalk and North Fairfield in Hudson County.

Articles of incorporation have been filed in the Camden County Clerk's office by the Treichler Water and Light Company. The objects of the corporation are to supply water, water power and electricity. The capital stock of the company is $100,000. The incorporators are M. K. Treichler, of Philadelphia; B. Smith, of Wenonah, and Isaac Moffett, of Glassboro, N. J.

The Spring Valley Electric Light Company, Peoria, Ill. Capital stock, $25,000. Incorporators E. B. Hillman, H. T. Hays and L. B. Bradley.

The Wyoming Electric Light and Power Company. Peoria, Ill. Capital stock, $15,000. Incorporators: E. B. Hillman, H. T. Mays and L. B. Bradley.

The Citizens' Street Railroad Company of Indianapolis has been reorganized, and the new officers chosen are: President, Augustus L. Mason; vice-president, William L. Elder; directors, Murray A. Verner, E. Sellers McKee and Richard W. Clay, Chicago; H. C. Clay, New York; Augustus L. Mason, William Lines Elder, W. J. Holliday and Dr. Henry Jameson.

The New Jersey Light and Heat Company, Newark, N. J. Capital stock, $2,000,000. It is understood that the object is to consolidate the Newark and Citizens' Gas Companies and the Newark Electric Light Company under one management.

The Peru Street Railway Company, Peru, Ind. Capital stock. $50,000. President, R. A. Edwards; vice-president, W. S. Mercer; secretary, R. H. Bonsteog; treasurer, C. H. Brownell. The company has been granted a franchise for an electric street railway in Peru.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MARCH 21, 1893.

ELECTRIC RAILWAYS AND APPLIANCES.

493.695. Conduit Electric Railway. Henry P. Feltrow, Columbus, Ohio, assignor of one-half to Richmond R. Brown, same place. Filed March 4, 1891.

493,713. Insulator for Trolley-Wires. Merrill H. Hathaway, Springfield, Mass., and John Kellener, Manchester, N. H.; Adele L. Hathaway administratrix of said Merrill H. Hathaway, deceased. Filed April 2, 1892.

493,716 Conduit System for Electric Railways. Elias Hazelton, Lansing, Mich., assignor of one-half to Harley Ingersoll, same place. Filed Feb. 15, 1892.

493,789. Trolley for Electric Railways. John F. Saltz, Baldwin, Allegheny County, assignor of two-thirds to Thomas A. Noble, Pittsburg, and Frederick G. Kay, Allegheny, Pa. Filed June 18, 1891.

493,914. Converter System for Railways. Alard du Bois-Reymond, Charlottenburg, assignor to Siemens & Halske, Berlin, Germany. Filed Feb. 3, 1892.

493,948. Closed Conduit for Electric Railways. George W. von Siemens, Berlin, Germany, assignor to Siemens & Halske, same place. Filed June 24, 1892.

493,969. Electric Car. Charles Brown, Basle, Switzerland, assignor to the Maschinenbau Gesellschaft, same place. Filed March 8, 1892.

ELECTRIC LIGHTS AND APPLIANCES.

493,629. Thermal Cut-Out for Electric Lamps. Hermann Lemp and Merle J. Wightman, Hartford, Conn., assignors to the Schuyler Electric Company of Connecticut. Filed Aug. 27, 1886.

493,739. Electric-Arc Lamp. Elihu Thomson, Lynn, Mass., assignor to the Thomson-Houston Electric Company of Connecticut. Filed June 30, 1886.

493,842. Electric-Lighting System. Samuel W. Rushmore, Brooklyn, N. Y. Filed Feb. 7, 1891.

493,868. Switch for Electric-Light Fixtures. Joseph Hutchinson, New York, N. Y. Filed April 8, 1892.

DYNAMOS AND MOTORS.

493,679. Dynamo-Electric Machine and Motor. Harold P. Brown, New York, N. Y. Filed Dec. 10, 1891.

493,718. Dynamo-Electric Machine. Santa Hellebrandt, Przemysl, Austria-Hungary. Filed May 25, 1892.

493,745. Dynamo-Electric Machine. Foree Bain, Chicago, Ill. Filed Dec. 21, 1891.

493,942. Electric Locomotive. Alexander Philipsborn, Berlin, Germany, assignor to Siemens & Halske, same place. Filed April 21, 1892.

493,943. Electric Locomotive. Alexander Philipsborn, Berlin, Germany, assignor to Siemens & Halske, same place. Filed May 17, 1892.

494,042. System of Winding Armatures for Dynamo-Electric Machines. William M. Thomas, Grand Rapids, assignor to Louis Warfield, Detroit, Mich. Filed Jan. 29, 1892.

BATTERIES.

493,817. Secondary Battery. Lars Bristol, London, England. Filed Aug. 28, 1890. Renewed Feb. 13, 1892.

494,062. Secondary-Battery Electrode. William W. Donaldson and Roderick Macrae, Baltimore, Md. Filed March 4, 1892.

TELEPHONE AND TELEGRAPH APPARATUS.

493,704. Listening and Ringing Key for Telephone Switchboards. William M. Goodridge, Highland Park, assignor to the Western Electric Company, Chicago, Ill. Filed July 19, 1890.

493,907. Telephone. Charles T. Bloomer, New York, N. Y. Filed Nov. 28, 1892.

MISCELLANEOUS.

493,672. Automatic Electric Cut-Out. Francis B. Badt, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 6, 1889.

493,673. System for Transmitting Electric Current. Edward Baines, Brooklyn, N. Y., assignor to himself and Edward J. Mitchell, same place, and Adolph L. Mitchell, Rockville, N. Y. Filed March 21, 1892.

493,678. Electric Railway-Signal. Jefferson Bradford and James P. Williams, Boston Station, Ky. Filed June 23, 1892.

493,754. Electric Connector and Cut-Out. Charles H. Crockett and Chancellor C. Allen, Boston. Filed April 8, 1892.

493,755. Electric Cut-Out. Charles H. Crockett and Chancellor C. Allen, Boston, Mass. Filed April 8, 1892.

493,777. Electric Clock Striking Mechanism. William Kaisling, Allegheny, Pa. Filed April 4, 1892.

493,809. Apparatus for Purifying Liquors by Electrolysis. John Becker, Kymulga, Ala. Filed March 12, 1892.

493,883. Insulating-Coupling. Ernest Ballett, Bordeaux, France. Filed Oct. 31, 1892.

493,918. Electrically-Operated Railway Switch. Powell Evans, Philadelphia, Pa. Filed Dec. 7, 1891.

493,926. Lightning-Arrester. Hermann O. Henneberg, Berlin, Germany, assignor to Siemens & Halske, same place. Filed Dec. 9, 1892.

493,935. Electric Railway-Signal. Henry V. Miller, Bloomington, and Alexander C. Miller, Aurora, Ill. Filed Nov. 8, 1892.

493,881. Rosette Cut-Out. Charles E. Barry, New York, N. Y. Filed Aug. 16, 1892

493,997 Electrical Attachment for Rocking-Chairs. Charles E. Hartellus, Bay Ridge, N. Y. Filed Nov. 22, 1892.

494,007. Block-Signal System. John La Burt, New York, N. Y., assignor, by direct and mesne assignments, to the La Burt Automatic Electric Block Signal System and Car Coupler Company, same place. Filed June 16, 1892.

494,043. Theatrical Stage Appliance. David I. Towers, New York, N. Y., assignor to Neilson Burgess, Highlands, N. J. Filed Feb 5, 1891.

494,053. Reciprocating Electric Drill. William A. G. Birkin, Nottingham, England. Filed April 23, 1892.

494.966. Marine Railway. Edward Kaye, Phillipsburg, Pa. Filed Dec. 9, 1892.

494,077. Railway Block-Signal. Robert D. Peters, Winamac, Ind., assignor of one-half to Charles L. Wait, same place. Filed July 11, 1892.

494,080. Sanding Device for Cars. Edward H. Pinkham, Haverhill, Mass. Filed July 12, 1892.

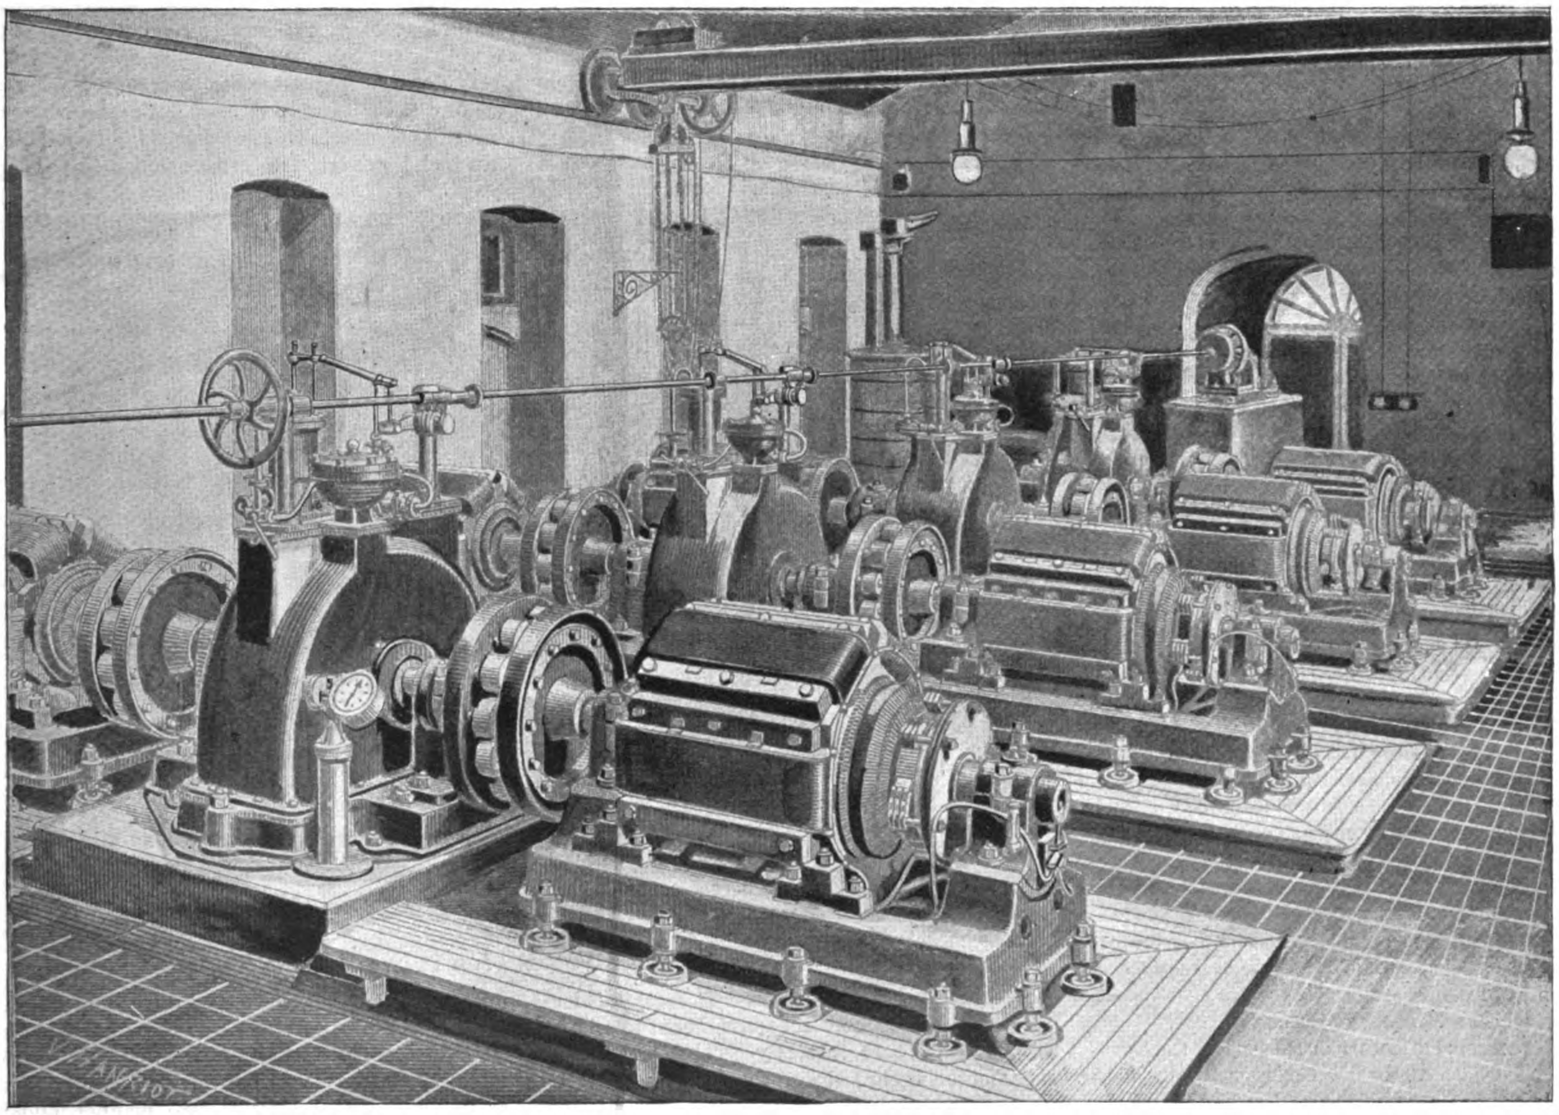
494,091. Electric Cigar-Lighter. William M. Thomas, Chicago, Ill., assignor to Louis Warfield, Detroit, Mich. Filed Oct. 26, 1892.

494,098. Electrical Appliance. Charles H. Folger, Cincinnati, Ohio, assignor, by direct and mesne assignments, to the Cincinnati Novelty Company, same place. Filed Sept. 5, 1892.

494,111. Electrical Railway-Signal. Samuel W. Miller and Alexander C. Miller, Aurora, and Henry V. Miller, Bloomington, Ill.; said Samuel W. Miller assignor to said Alexander C. Miller and Henry V. Miller. Filed April 4, 1892.

ELECTRICITY.

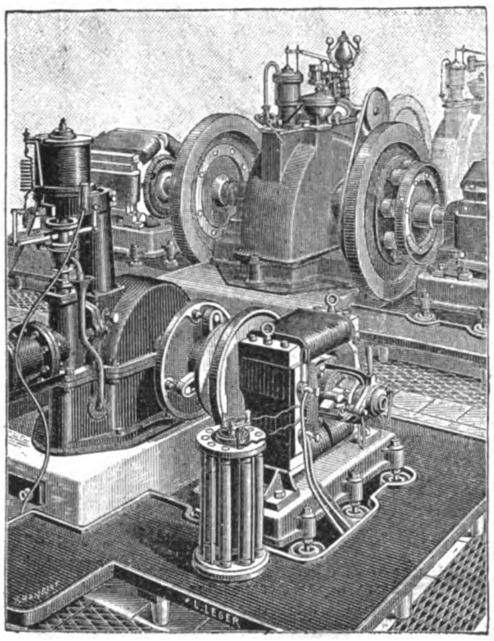
VOL. IV. NEW YORK. APRIL 5, 1893. CHICAGO. No. 12



GENERAL VIEW OF THE STATION "PACINOTTI." (SEE PAGE 154.)

The Distribution of Electrical Energy.

An interesting description of several French central stations has appeared in *Électricité* from the pen of M. Anney. The station Volta, shown in part in Fig. 1, has been in operation since December, 1891, and notwithstanding several novel elements which it contains has from the start given entire satisfaction. It comprises four groups of machines, each having a turbine of 140 H. P., and eight dynamos giving 47 amperes at 1,000 volts. These were installed by the Compagnie de l'Industrie Électrique, and are of the Thury type, although they contain some novel points which were imposed by the special conditions in this plant.



PARTIAL VIEW OF THE STATION "VOLTA." (FIG. 1.)

The generators run at a constant speed and the regulation of the voltage is accomplished by means of an automatic regulator which varies the exciting current. This is done by changing the speed of the turbine which drives the exciter, both of which are independent machines without mechanical connection to the main generators. This arrangement has the advantage of regulating the pressure of the entire station with but one regulator, no matter how many machines may be in use, and in this respect is a very desirable feature and is entirely automatic. On the other hand it introduced some serious difficulties, as it was found necessary to change the construction and winding of the generators and to provide turbines of excellent regulation without which its successful operation would be impossible.

These turbines were supplied by MM. Faesch & Piccard, of Geneva, and have been found to amply fulfil every requirement in the line of automatic regulation. They have a horizontal axis and the water enters at the centre of the wheel and escapes at its periphery. The distributor, which is supplied with orifices which vary their amount of opening, regulates the supply of water to the wheel according to the speed.

The principal difficulty on the part of the dynamos relates to their insulation. As the field windings are all connected in the circuit of the separate exciter, these windings must be insulated so as to stand the total voltage furnished by the machines without damage, that is to say, from 6,000 to 8,000 volts or more.

This result is effected by placing a supplementary insulation between the magnets and the frame, and as it was feared that a spark might pass from the windings to the pole pieces the entire magnet was covered with a heavy, compact insulation in the form of a screen.

There is but a slight heating of the magnets and this insulation has given no trouble on that score.

The frames of the dynamos are mounted on bolts imbedded in strong porcelain insulators provided with a circular shelf which is filled with oil in order to avoid surface leakage, which was feared on account of the moisture in that locality.

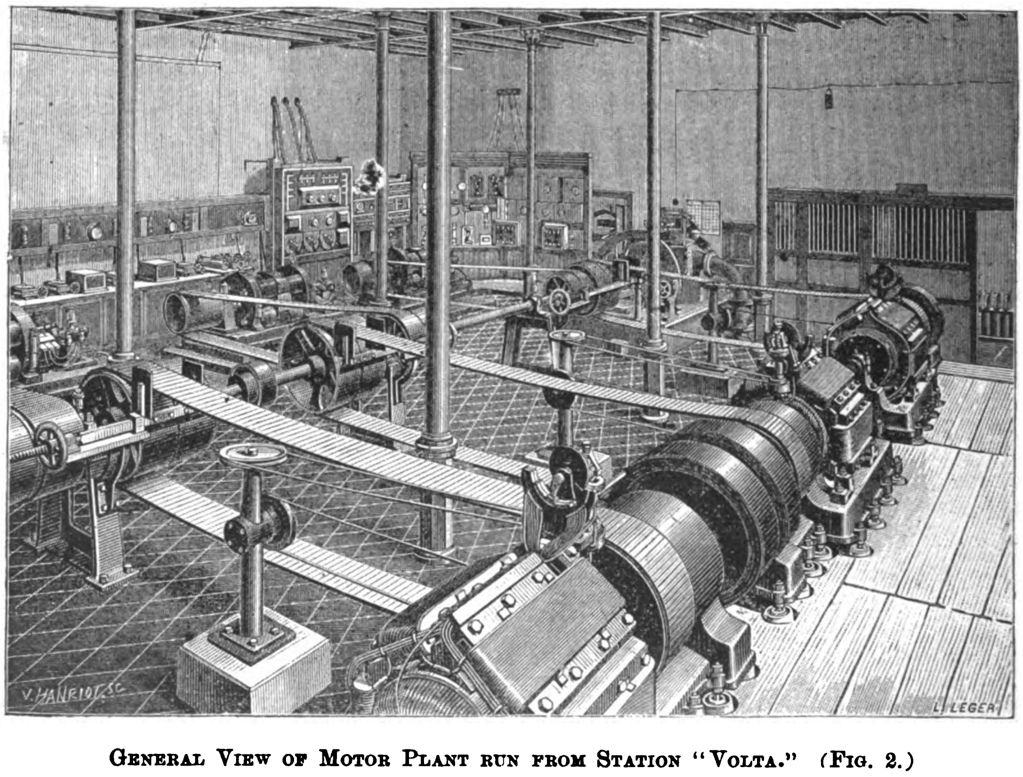
The total insulation is so high that it cannot be determined by the ordinary measuring instruments.

These precautions, though simple, have been entirely sufficient for the pressure of 5,000 volts, and not a single mishap has so far occurred. This points to the suggestion that this pressure can be increased considerably without danger. Another feature inherent in separately excited machines is the tendency to sparking at the brushes when working under full load, owing to the reduction of the magnetic density.

To avoid this a very strong field is employed which contains a section adapted to be easily wound, and further, special carbon brushes of unusual density are used in which, however, the conductivity is sufficiently low to reduce the tendency to sparking.

Practically, the dynamos may be run on short circuit at their maximum current and speed with an inappreciable exciting current without any trace of sparking at the commutators or any necessity for repairing the contacts. The carbon brushes last indefinitely and show no appreciable wear after many months of use, during which time they have required no special attention. The commutators are also highly polished and have never been repaired or oiled.

The precise regulation of the voltage was a most difficult matter to adjust. In fact, the electromotive force varies at each moment to a large extent, and almost instantly. Thus when a 60 H. P. motor is shut down, the brushes must be suddenly short-circuited by the movement of a switch, and the 1,200 volts which it consumes must be dissipated or the pressure throughout the system will be greatly increased, especially if the motor forms a large part of the load. This makes it essential for the regulator to instantly correct wide variations which would be impossible if the turbine driving the exciter did not respond instantly to the action of the regulator.



GENERAL VIEW OF MOTOR PLANT RUN FROM STATION "VOLTA." (FIG. 2.)

The single exciter common to all the generators is coupled directly to a 12 H. P. turbine which has no fly-wheel, and whose moment of inertia is reduced to a minimum. The exciter has a field of high magnetic density and the armature is extremely light, being but 180 millimetres in diameter. For this reason the weight of the moving parts is but little, and their inertia is practically negligible. In order to secure a sufficiently stable magnetic field under all conditions the exciter is also separately excited by a small machine from which the lights in the station are run.

The station "Pacinotti," shown in our Frontispiece, was started on the 23d of November last. It is designed to contain six groups of machines, of which at present four are in full operation. These groups are of the same character as those of the former station, having a Piccard turbine of 140 H. P. which drives two Thury dynamos of 1,000 volts and 45 amperes at 475 revolutions per minute. All the dynamos are connected in series and are self-excited. The method of speed regulation differs from that of the former station and is much simpler. Only one regulator is used for the whole station.

The fly-wheels of the turbines have been discarded, and the armatures of the generators have as little inertia as possible. By this arrangement the regulation is partly effected, as when the current diminishes the generators absorb less power and the turbines increase their speed, thus partially correcting the error. The field magnets work at low magnetic density, which facilitates this automatic regulation considerably.

The current regulator has then only to correct small differences, and it need not necessarily act instantaneously. This consists of a Thury motor in which there are two armature windings, permitting it to work in either direction without reversal. This drives an arrangement that regulates the supply of water to the turbines. The motor is started in either direction by an iron armature moved by an electro magnet, and a relay carries the current to either armature winding according as the current increases or diminishes in the main circuit. In this way the speed of the turbines is varied as required.

General Electric's Dividend.

The Directors of the General Electric Company met on Friday, March 31, and declared a quarterly dividend of 2 per cent. payable May 1.

The Cost of Steam Power Produced With Engines of Different Types Under Practical Conditions; with Supplement Relating to Water Power.

BY CHAS. E. EMERY, PH. D.[*]

[Concluded.]

Column *k*[†] shows the aggregate cost per net horse power of the engines, boilers, buildings and chimney as given in the three previous columns.

Column *l* shows the amount in column *k* augmented 2½ per cent for inspection and 6 per cent. for loss of interest during construction, a total of 8½ per cent., which is designed to cover the expenses of the kind indicated and other contingencies incidental to the construction of a large steam plant or other important work. In starting a company there must be an organization formed in connection with raising the money, procuring the charter and initiating the construction, involving the salaries of several individuals. The engineers to take charge of the work must also be selected before the work is completed and in general very much of the expense must be incurred a considerable time before the plant is put in operation; and even after operation commences a long time intervenes before everything is working on a sufficiently large scale to secure economy in operation and a return therefrom. Frequently these items are not considered in making estimates. Some of them are of a kind which are not necessarily included in those made by an engineer. Eventually, however, all these expenses must be charged in some way on the books and will usually be placed in the construction account, and it is, therefore, proper to make this charge of 8½ per cent in excess of the ordinary preliminary charges for designs naturally included in construction, with the belief that it will in rare instances be sufficient to provide for the several contingencies referred to.

An inspection of column *l* shows unexpectedly small differences in the total cost of steam machinery of different types when everything is considered. It is a curious fact that the machinery which as a whole costs least originally is that of fairly good economy. The total cost of non-condensing steam machinery is, on the basis of performance assumed, higher than for more economical condensing engines, on account of the increased cost of the additional boilers, buildings and chimney made necessary by such reduced economy. If it be considered that the feed water per indicated horse power per hour for the non-condensing engines is higher than would be obtained in particular cases, a comparison with the minimum quantities in column *e* shows that an assumption of the best possible results will not equalize the total cost of non-condensing and condensing engines of similar construction. The more economical engines near the bottom of the table are comparatively so high priced that even when the reduced cost of boilers is considered the total price is greater than for the steam machinery of reasonable economy shown near the middle of the table.

In column *m* is shown the weight of water which it is assumed will be evaporated per pound of coal. The assumption is 8½ pounds, except in the last case where it has been fixed at 9½ pounds. Although 9 and 9½ pounds evaporated can be obtained under actual conditions readily with boilers of good proportion and construction, it is thought that 8½ pounds is as much as can be depended upon in average practice. It is in fact greater than is obtained in most cases, though less than is claimed in exceptional ones. This rate must be considered somewhat in relation to the price of coal. If cheap coal is to be used which will not give 8½ pounds evaporation, the results must be sought in the column of the table applying to coal of a higher price.

Column *n* shows the coal per indicated horse power per hour, which is simply deduced by dividing the feed water per horse power, column *f*, by the feed water evaporated per pound of coal, column *m*. We notice that the coal per indicated horse power per hour decreases from 3.88 to 1.47 lbs., which is about what should be expected for the various conditions heretofore discussed.

We next have in columns *o* and *p* the number of tons of coal, of 2,240 pounds, required under the conditions stated; column *o* referring to a working day of 10 hours, and column *p* to a working day of 20 hours, with coal for one hour added in each case for starting and stopping fires.

We have next in columns *q* to *x* inclusive the cost of coal per horse power per year at the rates of $2, $3, $4 and $5 per ton; first on the basis of 308 days of 10 hours each, and second on the basis of 365 days of 20 hours each.

We have next in columns *y* and *z* the cost per net horse power per year of supplies and average repairs. There has been allowed 12 cents per day of 10 hours for supplies and 29 cents for repairs, or 41 cents total for a 500 H. P. slow speed engine. These costs are based on testimony in the Fall River suit mentioned in the paper previously referred to. This amount has been increased to 48 cents for the high speed engines, which will probably be insufficient in many cases but has been assumed correct for the better types.

We next have in columns *A* and *B* the cost per net horse power per year for wages based on $3 per day of 10 hours for an engineer and $4 per day for 500 commercial or boiler horse power for fireman and the labor incidental to passing the coal and disposing of the ashes. The latter amount has been entered fractionally, for although this would be impossible for a single unit it is the only way to obtain a correct progression when considering each unit as a part of a much larger plant. The cost amounts to $4.77 per day for simple engine in line *A* and $2.22 for compound engine in line *K*.

In column *C* is given the cost of insurance, taxes and renewals per horse power per year. This is obtained on a basis of ½ of 1 per cent for insurance, which is too low for an electric light plant, and in fact too low for other manufacturing operations except those insured on a mutual plan. Taxes have been assumed at $15 per thousand on three-fourths of the total cost, equivalent to 1.2 per cent. The renewals for engines, boilers and buildings all averaged together have been assumed at 3.3 per cent., making a total of 5 per cent. The several percentages are believed to be low for general practice, but have been used in the first part of Table I so as to keep within bounds the influence which quantities proportioned to cost have on the result.

We have in column *D* the amount per horse power per year to be provided for interest and dividends which has been fixed at the moderate rate of ten per cent. on the capital invested. It should be realized that the interest account should not simply cover the interest on money borrowed or invested to do the work, but a percentage sufficient to pay expected dividends on the capital; in fact, interest and dividends must be considered together. In this country at least, active business men demand at least 10 per cent. on their investments. It may be that they will borrow the money actually required to do the greater part of the work at a comparatively low rate of interest, say 5 per cent to 6 per cent., which the business is expected to pay in addition to a dividend of an equal or greater amount to recompense the promoters for their trouble and responsibility in the matter, so that 10 per cent. allowance for interest and dividends is none too much in a growing country. Indeed, it is altogether too small for operations in which the actual value of the plant is represented by a greatly increased face value of securities. Evidently the payment of 5 per cent. interest on a bonded issue equal to the cost of construction and 5 per cent. dividends on an equal amount of stock to control the company, or any similar financial scheme based on the same total, is equivalent to an allowance of 10 per cent for interest and dividends, which is the basis assumed for comparison, and this percentage must of course be paid on all expenditures, including everything relating not only to the purchase but the erection of the various details of the steam machinery.

Columns *E* and *F* merely sum up the cost per horse power per year of all operating, current and interest expenditures, except coal, and include therefore the cost of wages, columns *A* and *B*; cost of insurance, taxes and renewals, column *C*; and the interest or dividends, column *D*.

We next have in columns *G* to *N* inclusive the *total* cost per net horse power per year on the basis shown in the previous columns, for coal at $2, $3, $4 and $5 per ton, first for 308 days of 10 hours each, and second for 365 days of 20 hours each. An examination of the several columns shows clearly that for cheap fuel and short hours the engines of fair economy and least cost give the most economical results when both the cost of fuel and collateral and interest charges are considered. Such a result would be anticipated in comparison with non-condensing engines, but *it is somewhat surprising to find that the compound engines of comparatively moderate price show better economy, everything considered, than the higher priced triple compound engines*, if we reject the results shown in the last line, which, as already stated, it is believed cannot be obtained in average practice. For the 10 hours day, with coal at $2 per ton, the lowest result is, for the assumed conditions, shown on line *I*, referring to special triple compound high speed condensing engines. Unfortunately more conditions have had to be assumed in relation to this type of engine than for any of the others. They are being made specially for electrical purposes of extra weight and with extra length of bearings, and the prices available would with proper allowance for erection give prices higher than stated. However, the result is very little different from that shown in lines *G* and *H* for compound engines high and low speed, or even for the simple low speed condensing engine, line *F*, on the one hand, or the triple compound, lines *J* and *K*, on the other hand. This similarity in final cost is certainly very interesting, and examining columns *H*, *I* and *J*, referring to coal at $3, $4 and $5 per ton, we find that although the total cost per year increases, the relative cost for engines of different kinds varies but little. At the $5 rate the high speed compound engine, line *G*, has fallen $1.43 per horse power per year behind the low speed compound engine, line *H*, and $2.67 behind the high speed triple compound, line *I*, on basis assumed, but the latter with its lower assumed original price and higher coal consumption is holding its own substantially with the higher priced compound engine, line *J*. The same relations practically hold for 20 hours per day with cheap coal, and it is not until we reach column *N* for 20 hours per day and coal at $5 per ton that the higher priced engines (rejecting as before line *L*) show any decided superiority, and even under these circumstances the difference is comparatively not great.

We next examine columns *O* and *V* inclusive, which show the total cost per net horse power per year for electric railroad and other variable work requiring 50 per cent. extra plant to obtain on the average 500 horse power. That is, it must be supposed that a 750 horse power plant, or the larger portion of the same, leaving one unit, perhaps, for emergencies, is employed during the times of heavy traffic, and that at other times the power is less than 500 horse power, so as to maintain the average. In making this comparison the cost of fuel and labor per average horse power has not been increased. Very great variations of load would certainly change these items, but as all conditions cannot be provided for in one table it may be assumed that the charge for fuel in the first part of the table is rather high for uniform loads and that charges for both fuel and labor have not been exceeded for the conditions involving surplus plant in the second part of table. The insurance in the latter case has, however, been increased to 1½ per cent. as an average on engines, boilers and buildings. The engine renewals have also been increased to 4 per cent. and the boiler renewals to 5 per cent. These latter allowances are believed to be more nearly correct than those first assumed for many kinds of work. There are individual cases of boilers and engines lasting a long time, but in many cases the necessary changes in the character of the work done requires a change of steam plant, so it is safer to charge off for renewals a sufficient sum to provide for conditions other than the actual wearing out of the apparatus. In any case we think it will be granted that these allowances are none too large for electric light plants. The comparisons are as before on the basis of coal costing $2, $3, $4 and $5 per ton, first for 308 days of 10 hours each and second for 365 days of 20 hours each.

Examining columns *O* to *V*, we are surprised at once to find that, although the costs have necessarily all been raised, the general relations for the different engines have been very little modified. For short hours and low priced coal the medium priced engines show, if anything, still better results than on the previous basis, and the higher priced engines only show to advantage for long hours and high priced coal, as shown in column *V*. The results even in this column for the engines referred to in the last four lines (excluding *L* as before) are remarkably near uniformity.

---

[*] Read at the Seventy-fifth Meeting of the American Institute of Electrical Engineers, New York, March 21, 1893.

[†] For Tables see ELECTRICITY for March 29, 1893, Vol. IV., No. 11.

Before drawing further conclusions, it is desirable to ascertain the effect that will be had on the results by the use of cheap boilers. As has been stated, it is well known that boilers are to be had in the market at a cheaper rate per horse power than the safety boilers which have been assumed. A mere examination of quoted prices would make it appear that such boilers can be purchased for $10 less per horse power than the safety boilers, but the better types of the latter have much more surplus power than ordinary types of boilers, so much so in fact that no allowance has been made in previous calculations for a greater boiler power than is required to supply engines with steam, as it is believed that the better class of safety boilers have so much surplus power that in large plants one or two can be laid off for cleaning purposes and the others take up the load. Even less than the rated power can be purchased in starting a plant and no injury followed from forcing such boilers so as to obtain the power desired. When, however, boilers with small tubes, which furnish heating surface very rapidly at reduced cost, are employed, in general a higher rated horse power must be furnished for a particular case, either originally or soon after operations are started. Moreover, the cost of extra steam and water connections and valves will be as high as in the previous case, and in general higher, for the reason that the units for such boilers are customarily smaller. It has been decided to make the comparison shown in Table II on the basis that boilers will be employed costing $5 per horse power less than those referred to in Table I and from the modification thus shown the effect of a further reduction if found possible can be estimated.

Table II shows in columns *H*, *L*, *P* and *T* the total costs per horse power per year shown in columns of corresponding numbers in Table I, all being on the basis of coal at $3 per ton; the first two named being for the 10 hours and 20 hours day without surplus power, and the last two named being for the 10 hours and 20 hours day with surplus power. In connection with these columns and distinguished by the same letters marked sub-1 are corresponding columns showing the costs per net horse power per year with the interest and other charges affected by the first cost reduced proportionally to a reduction of $5 per commercial horse power on the original cost of the boilers. An examination of the parallel columns shows at once that the effect has been to favor the engines requiring the use of most fuel, for the evident reason that, as they require more boiler power for a given net power, the reduction for them is proportionally greater than for the higher priced engines. The differences are comparatively not great, but sufficient to show the effect of reduction in this direction. The same effect would result from reducing not only the cost of coal as previously stated, but the cost of handling and firing the same.

Evidently, however, any decrease found possible in the cost of engines or of the numerous attachments and appurtenances necessary or claimed to be necessary in connection with a steam plant, and which do not increase in cost proportionally to the commercial horse power, will decrease the interest charges in a higher proportion for the more economical engines and thus secure economy both by saving of fuel and by saving of interest. These considerations, though not governing ones, since interest is only one item of expense, show the desirability of exercising careful judgment in the details of a steam plant. There will be no economy in selecting poor material or in hurrying matters so as to secure cheap work. Everything must be of the best in the sense of being the best adapted for the purpose. The tendency to put in numerous details, each by itself of small cost, needs, however, to be checked, as such items amount in the aggregate to a large sum. It is recommended that the purchase of the various devices which are being urged upon the owners of steam plants should not be consummated unless they will surely save say 25 per cent. of their cost annually. It will be observed that the columns of the table foot up a percentage proportioned to more than two-thirds of this, and as the attention and repairs of miscellaneous apparatus are great the additional percentage is not only thought to be warranted but to be perhaps insufficient in some cases.

The rules adopted for calculating the various columns of Table I are shown by algebraic formulæ, the notation being in terms of the letters designating the several columns.

The comparison shows the non-condensing engines inferior at every point to condensing engines, and even if better results be obtained for the former in certain cases, still, as has been referred to before, the principal difference will be found by causing the quantities in column *f*, Table I, to approximate more nearly to the minimum quantities in column *e*. Some forms of engines undoubtedly accomplish this, but it is believed that the quantities stated are nearly correct for average good practice, with variable loads. Non-condensing engines are wasteful of fuel when heavily loaded on account of low expansion and at light loads the back pressure forms a large proportion of the total resistance, whereas condensing engines will maintain their economy through a wider range on account of the reduction of the back pressure. The back pressure must particularly affect the economy of the new triple compound engines when used non-condensing. It does not seem possible that such engines used non-condensing can for irregular loads show any economy over well designed compound engines operated non-condensing, unless the steam pressure is carried to 200 pounds or upward and the size of the cylinders carefully proportioned to the average load.

It may be claimed that it is unnecessary to add 10 per cent. for interest and dividends, for the reason that nearly every large owner of steam machinery can borrow a large proportion of the money required to construct the plant at a much lower rate of interest. This reasoning is good in some cases and not in others. If the manufacturer can in his regular business pay 10 per cent. or more on the capital invested, it is more economical for him to use his credit and borrow money to extend his business than to put such money into a steam plant at a lower rate. For such conditions there is no question but that every expenditure should be charged at 10 per cent. or upward. The case is different with municipalities which can borrow money at 3 per cent. and 4 per cent., but this after all will not make a great difference in the results, as interest is only one of several items of cost independent of coal. If instead of adding 10 per cent. for interest and dividends in column *D* we add only 5 per cent., the difference between the amounts so added for different engines is very small; for instance, it would make only 42 cents per horse power per year difference in engines in lines *I* and *J*, which is exactly the difference between the total cost per horse power per year for these engines with coal at $3 per ton as shown by column *H*. That is, for this particular comparison the cheaper of the two engines is 42 cents per horse power per year more economical when 10 per cent. is added and of the same economy when only 5 per cent. is added. If we compare the engines referred to on lines *I* and *K* in column *H*, we find that the cost per horse power per year is 47 cents less for the former with 10 per cent. added for interest and dividends, and that the latter is 20 cents per horse power per year more economical if only 5 per cent. be added for interest and dividends.

It is true also that the 8½ per cent. added for inspection and loss of interest during construction, in column *l*, would probably not be expended in making additions to a whole plant, though rather insufficient than otherwise for original construction. The rejection of this item will not, however, make a great difference. It has not been included in ascertaining the cost of insurance, taxes and renewals shown in column *C*, and if 10 per cent. of the increase be charged in column *D* it is only 10 per cent. of 8½ per cent. or .85 of 1 per cent., and so would affect the result only about one-sixth as much as the former presentation.

A little more careful examination of the table shows, as was substantially stated at the outset, that it is not the interest charges which principally cause equalization of total costs in the operation of engines of different kinds. The principal difference is due to the fact that all the other expenses except coal and interest are very nearly constant and the interest intensifies the difference by directly neutralizing, so far as it goes, the economy due to decreased coal consumption. This is made more clear by the following tabular presentation. (See next column.)

The table shows that the collateral charges, line (2), excepting interest, are substantially the same, and about equal to cost of coal, Col. (1), for the economical engines, and that the slight increase of interest, line (4), for the more economical engines tends to neutralize the slight increase of economy of coal shown on line 1, so that, though the costs for engine *I* still remain less than those for engine *G*, they are also less than for the more economical engine *K*.

In conclusion we will say that when this investigation was instituted it was believed, as had indeed been hinted by others and proved for extreme cases, that under some conditions as to the relative prices of economical types of steam machinery compared to price of coal and number of hours operation, the saving in fuel would not warrant the increase of first cost, but it was not known that this would occur within the limits of ordinary practice as the comparison shows. It is hoped that the conclusions and the facts upon which they are based will be very closely examined by engineers and manufacturers, and any facts or reasons confirming or varying such conclusions be fully presented and discussed.

This paper should not be considered a criticism of the practice or views of others or serve to discourage the higher development of the steam engine. On the contrary, an investigation of this kind, whatever the result, is calculated to broaden the view by taking into consideration more of the conditions of the problem, and thereby enabling the engineer to secure the best results for each particular case. The tables do show for short hours or low priced coal, or both, that types of steam machinery to secure the greatest economy of fuel are not warranted, but by the same tables it is found that for longer hours and the higher prices of coal considered, the more expensive machinery begins to show a commercial advantage which evidently increases as the price of fuel increases. In some cases other conditions must be included for a complete solution of the problem. For instance, in large steamers making long voyages economical machinery secures in addition to the saving in the cost of fuel a saving in the space required to carry the machinery and fuel, and thus increases almost in a geometrical ratio the efficiency of the ships. This may not be true for vessels making very short trips or stopping a large proportion of the time in port. The very large expenditures made by some mining companies to save fuel by the use of expensive steam machinery of special design has been fully warranted by the long hours and the high price of coal. The enormous mechanical operations at the Calumet & Hecla mines gave the profession unequalled opportunities, which have been grasped in the most creditable manner by our distinguished co-laborer in the engineering field, Mr. E. D. Leavitt, who has reared there a series of remarkable monuments of engineering skill with an expense warranted, doubtless, by the conditions. The development of the great West is, however, now so modifying the conditions that a change of policy may be initiated even at the Calumet & Hecla mines in the near future. During a recent business investigation with an electrical outlook, the writer ascertained that the prices of coal in Duluth and Superior, beyond the Calumet & Hecla peninsula, are even now reduced nearly to those ruling on the seaboard, which result has been brought about by the construction and operation of large whaleback steamers which take wheat eastward and coal on their return trips.

	Simple High Speed Non-Condensing.	Compound High Speed Condensing.	Special Triple Compound High Speed Condensing.	Triple Compound Slow Speed Condensing.
LINES OF TABLE I.	*A*	*G*	*I*	*K*
(1) The costs of coal at $3.00 per ton, Col. *r*, for a ten hours day are for engines stated in the headings at the right...	$19.09	$11.57	$9.84	$8.91
(2) The collateral operating expenses, excluding interest, are (Line *E*—Line *D*).....	10.69	9.18	9.06	9.11
(3) The interest charges, Col. *D*, are...............	6.39	5.61	5.95	7.30
(4) The total costs, Col. *H*, are....................	36.17	26.36	24.85	25.32

Until quite recently the construction of pumping engines of special design and expensive construction was warranted, even for locations near lines of communication with coal fields. At present, however, pumping engines of good economy are being manufactured regularly, as a business, at a comparative cost that will make the still more economical but much more expensive machinery less in demand than formerly. The further perfection of the steam engine will not be hindered by these facts, for with the development of our mining industries at great distances from the coal fields, the closest economy in the use of fuel will secure the best commercial results. In order, however, to secure such results for our growing enterprises, electrical and otherwise, in the cities and towns along lines of communication already established, it is believed that the field will be occupied by cheaper engines of simple construction, which, though not securing the maximum economy of fuel, will so reduce the capital upon which interest and dividends are to be paid as on the whole to represent not only better commercial policy but better engineering, because based on more complete conditions.

SUPPLEMENT RELATING TO WATER POWER.

It will be impossible in this connection to make a satisfactory comparison of the relative advantages of steam and water power under different conditions. The cost of steam power has, however, in the previous pages, been considered on a somewhat different basis than has heretofore been customary, particularly by including the interest and certain miscellaneous charges in the operating expenses, making the minimum practicable cost per horse power per year appear higher than has been stated by others, so if the cost of water power calculated on the ordinary basis were compared with this increased cost of steam power it would cause the water power to show an unwarranted advantage. It therefore appears necessary to make a brief examination in the form of an inquiry as to what amount can be paid for the development of a water power in competition with steam power. To do this we cannot select examples where Nature has specially favored the development of water powers at a nominal cost, as may be found at various sites throughout the country, nor can we consider a case like that at the Falls of St. Anthony, where an enormous water power was developed at a minimum expense amid surroundings apparently permanent to those who had not studied former recessions. In due time, however, the water undermined the hard limestone cap defining the falls, which had already been worn through above, and started a new channel through the underlying sandstone, thereby threatening to change the falls into a series of rapids extending miles up stream, when by the intervention of the General Government and the use of large appropriations, on the plea of preserving navigation, with some private contributions, a concrete dike or dam was built in a cross tunnel in the sand rock back of the falls, from a firm foundation up to the limestone cap, and the falls and incidentally the water power saved. Ordinarily such disasters must be provided for from the accumulations of an ample depreciation account. We must rather deal, therefore, with more general conditions, such as have been developed on the Merrimac.

Prof. Swain has stated in the Census Reports the costs of several of the principal structures at Lawrence and Lowell, aggregating $650,000 at the former place and $752,000 at the latter place. There are wing dams and probably other improvements apparently not included at Lawrence, and the costs of the greater portion of the canals at Lowell are not mentioned. In addition to the above items must be added the original cost of the land and large expenditures which have been made by the several mill owners jointly for works to control and regulate the flow from several large lakes on the watershed and thereby help the low water flow of the stream. The testimony of the mill owners in various suits relative to water power shows that the original costs of development on the Merrimac were so high that it has been customary to gradually "charge off" from year to year a portion of the cost so that the final results would show better interest on the apparent capital invested. It is believed to be safe to assume that the original costs in connection with the Lawrence water power have been about $1,000,000, which is less than the amount stated to have been originally paid in, and that those for Lowell have been considerably more. The original costs at Manchester could not have varied greatly from those at Lawrence. Additional hydraulic plant has, however, been put in all these places to utilize "surplus water" or that flowing in excess of the assumed low water capacity of the stream, and steam plants are also employed to keep up the power when the stream is low. The work is principally of a kind that requires steam for manufacturing purposes, independent of power, the year around for slashing, dyeing, etc., and steam also is necessarily required in the winter to heat the buildings. These other uses somewhat offset the cost of a steam plant, while the expenditures for surplus power by raising the average power developed on the stream really lower the average cost per horse power of the general expenditures which have been made to utilize it. There were originally sold at Lawrence 128 mill powers aggregating 8,700 net horse power and a little more power at Lowell where the fall is higher. The leases permitted the use of the water for 15 or 16 hours per day. In practice, however, but little water is used during more than 60 hours per week and the dams are so large that during low water little water is wasted and a larger power on a 10-hour basis is utilized, which fact together with the use of surplus water when available probably brings the net power available at Lawrence up to 13,000 horse power on a 10-hour basis throughout the year and somewhat more at Lowell.

On the basis of a cost of $1,000,000 the general plant at Lawrence has therefore cost about $77 per horse power and somewhat more at Lowell. Independent of this the mill owners have incurred large expenses in erecting turbines and hydraulic connections from the head canals to the lower levels. These costs have been estimated by Mr. Main at $45 per horse power, including provision for surplus water on an average of $65 per horse power for the average power utilized.† Adding this to $77, the general cost stated above, we find that the total cost of developing the water power on the Merrimac has been about $142 per horse power, which it will be shown is about the limit of cost at which water power can be developed in competition with steam. The Merrimac owners are, however, obliged to add to this cost the greater part of the cost of a steam plant for use when there is no surplus water, which still further increases the capital account.

It has long been known that the water power on the Merrimac had cost so much for development that could the expenditures be recalled it would be more economical to locate where coal can be obtained at cheaper rates and steam power used exclusively. This was true before mill engines were constructed as economically as at present. Now the preponderance is so great that unavoidable errors of fact as to the details of the original costs will not change the illustrative value of the presentation. It is true, notwithstanding these facts, that a new water power is being developed at Sewall Falls, near Concord, N. H., but it appears to be limited to the low water flow of the stream and it is not known whether it will assume part of the original cost of the reservoir systems.

The highest allowable cost for the complete development of water power from the dam to the jack shaft appears to be about $140 per horse power utilized on a 10 hour basis. If we consider that accidents are liable to happen to the best constructed hydraulic work, we should charge at least 2½ per cent. of the original cost for depreciation, say 1¼ per cent. for repairs and about 1¼ per cent. for taxes, or about 5 per cent. independent of interest account. If then on the principles above developed we charge 10 per cent. to an account for interest and dividends and allow 2 per cent. for operating expenses, the total annual charge becomes 17 per cent. of the original expenditure. At an original cost of $140 per horse power, 17 per cent. represents an annual cost of $23.80 per horse power per year, or about the same as shown in the tables with economical engines and coal between $2 and $3 per ton. Generally, however, there will be one company to furnish water power and others to utilize it, which will have the effect of increasing this 17 per cent. so as to make the balance in favor of steam somewhat greater. This statement of course only applies to conditions where simply power is required and no large quantity of water is necessary for purposes other than for power. When the power is used for 24 hours per day instead of 10 hours, a much greater original cost is permissible.

When the power of a waterfall is to be delivered at a distance, the allowable cost of actually developing the power must be decreased by that necessary to transmit the power and actually deliver it to a jack shaft at a given distance. An electric transmission is undoubtedly the most economical for such a purpose. If we add to the cost of the electric dynamos that of the buildings, of the hydraulic connections to the canals, of the turbines, of the line and of the installation, and finally add the cost of the motors, so that the power is according to the assumption delivered to a jack shaft, the total cost of what may be called the "electrical transmission plant" cannot probably at present prices be put in for $140 for each net horse power delivered, so on a 10 hour basis no expenditure could be allowed for the general development of the water power, but only for the simplest hydraulic connections to existing canals, etc. If, however, power can be sold throughout the whole 24 hours, more than double the price can be obtained for the same, and this will warrant doubling the total cost of development unless a greater percentage of income is desired. As the cost of the electrical plant remains the same, the whole allowable increase may be applied to the development of the hydraulic plant, thereby entirely changing the conditions.

The writer has not hesitated to recommend an original expenditure of $200 per horse power for a combined hydraulic and electric plant near large cities, where not only the customary income due to incandescent and arc lighting and the use of small motors at high rates would be available for comparatively short hours, but where the industries were such that large units of power could be sold at remunerative prices on a 24 hour basis. Even higher costs for development would appear to be warranted in some locations, but there is no general rule on the subject. The allowable expenditure in a particular case can only be determined from calculations based on the actual conditions.

Storage Batteries for Propelling Vehicles.

In the discussion of the paper on "The Present Status of the Storage Battery," read before the Chicago Electric Club (see ELECTRICITY, Vol. IV, No. 11), Mr. Deganhart gave some interesting facts in connection with the electrically propelled vehicle with which he has been experimenting for some time in Chicago. Speaking of the batteries he said: "During the past two years Mr. Keller and myself have conducted experiments with the view of perfecting a vehicle for carrying passengers about the city for pleasure and also for profit. Our experiments led us in a slightly different direction from that of the work ordinarily carried on in traction methods as applied to street cars. The work as applied to street cars calls for unusual conditions; the loads are varying, the tax on the battery is very great at intervals, the frequent stops necessitating hard usage of the battery; so that the use of a storage battery on a vehicle is peculiar in the respect that you must have small space and large capacity, which you are liable to be called on for at unusual intervals. I mean by that that in traversing a city like Chicago we encounter grades, as at the bridges. While it was our aim in our experimental work to confine the voltage to as low a point as possible, that is about 12 volts, we found it necessary to use a battery which would come to the rescue when we were climbing grades and propel the vehicle up those grades without the loss of horse power. The pasted batteries, that is, the batteries in which the plates have received the oxides by pasting, were found to be very weak as a rule. Without going into particulars as to manufacturers, or giving the names of them, I would say that generally the pasted batteries were weak. We discovered early in our work that there was a shortness of the fibres. By that I mean where the paste was applied it was evident that the molecules were finally broken up in pasting; while there was an adhesiveness in the method of pasting, still the molecules were so fine that when subjected to rough usage, such as going over cobblestones and uneven surfaces, the paste was gradually jarred loose. Consequently we were introducing an element not fitted for that kind of a battery. We also found that in hard usage the plates would buckle. Later on in our experimental work we were brought in contact with a battery made much on the lines of this cell, I gather from the explanations by Mr. Pompelly, as it was made electrolitically; that is, the plates were formed quickly by a secret process under a current.

"An examination of the plates of the battery which we use, manufactured 'practically' on the lines that Mr. Pompelly has adopted, disclosed the fact that there was a flocculent condition of the lead which the pasted battery did not possess. A close observation of this led me to the conclusion that it was due to the fibres of the lead interlacing, as it were, instead of being broken up into small particles, as in the paste. This flocculent condition was brought about by an interlacing of the particles as the oxide was formed, consequently giving a tenacity which the paste itself did not possess. It was our pleasure to find that there was practically no falling off of the oxide; that is, we did not find any to speak of at the bottom of the cell, nothing that would injure the life of the cell.

---

† "The Value of a Water Power," by Chas. T. Main, Vol. XIII Trans. Am. Soc. M. E. The price stated seems high, but should be known to Mr. Main, who resided at Lawrence when the paper was written. He has, however, overlooked the items of cost of development referred to above, not mentioned by Prof. Swain, and therefore gives $130 as the total cost, instead of $142 as stated in the text.

"Another very important fact brought out in our research by the use of that cell was that there was no buckling of the plates. A very necessary quality in such a cell, as you all know, is the ability of retaining its voltage. A reading taken from a large number of pasted cells showed us that the voltage at first fell away very slightly, a trifle less than the voltage of this type of cells of which I now speak. However, as we progressed with our work the line of reading fell away gradually, and finally it dropped right off. While the readings taken from the cell, which was manufactured, as I think, much on these lines, that is, by this peculiar process, the reading extended almost in a direct line until the final moment, when the cell collapsed altogther; that is, the electrical energy had given out, and it dropped abruptly. That of course is a very desirable thing in all traction work; that is, the maintenance of a high voltage; for without that high pressure it is an absolute impossibility, in my judgment, to climb grades and get the efficiency from the battery that you must naturally expect if you intend to do the work of moving vehicles.

"A curious feature enters into the propulsion of vehicles which is not unlike the severe test that a car subjects the battery to. In the case of a car you move along on a plane surface, but you stop frequently, and there are varying loads on the car; that is, there are more or less passengers getting on and off. Sometimes you may carry fifty passengers and then again you will only carry ten; and it is the logical conclusion that in overcoming the inertia of a mass representing fifty passengers you call for more energy than you do in overcoming the inertia represented by ten passengers. However, in the case of a vehicle for street use we early discovered a very peculiar circumstance: that the road over which we traveled had much to do with taxing the energy of the battery. Without a rubber tired vehicle we learned that an ordinary dirt road, a macadamized road, was the most desirable for the propulsion of the vehicle, the economy of the battery, and the best all-around condition for vehicular travel. When we got on to the asphalt pavement we naturally supposed that we had a perfect condition. We were mistaken. A series of experiments demonstrated to us in a very short time that it required no less than 21 per cent. additional energy to move the vehicle over the asphaltum pavement. That seems almost preposterous at first glance; but when you recall the fact that the pavement is of a spongy character, and your wheels, four of them, indent themselves into the asphaltum, you find that you are continually climbing a grade, imperceptible perhaps to the eye, but nevertheless you are climbing a grade with four wheels all the time. Now wood pavements have objections, because they present varying conditions of surface. The same thing applies to the Belgium block pavement out here. Now when you introduce the rubber tire of course a great percentage of that is reduced. You move along freely over the asphaltum road. And therein again comes the desirability of having a battery which will maintain its high voltage until the battery is really unfit for service by the discharge, and moreover the desirability of having a battery which will retain its oxide in position. I mean by that that it must hold itself up; there must be no breaking down of the structural portion of the battery; the oxide must not fall to the bottom, because it is self-apparent that in handling the vehicles you must have your battery so constructed that if you have relay batteries, that is, if you propose to run your vehicle for five hours at its maximum capacity of speed, then you must perforce have some place where you can renew the battery quickly, where it will be subjected to the rough usage that the ordinary man about some stations will put it to. It is not to be supposed that he is going to handle it like a piece of china. He yanks it out of the wagon, slaps it on the ground and puts in the other cell, connects it up and you start off, over the rubble pavement perhaps, and you can clearly see that you want a battery which will hold up, which is strong and won't buckle and won't drop its oxide to the bottom of the cell. Our experience over those two years has brought us to the conclusion and the firm conviction that this type of battery, this form preferably of rolled lead, is the best for the propulsion of vehicles; and I do not think I am claiming too much when I say that if this cell holds up as the demonstrations have shown us would lead me to suppose it would at that voltage, then we have the ideal battery in that type. I imagine that the difference between the use of cast lead and rolled lead comes in again much in the way that I have explained—the use of the oxides. There is a broken-up condition in a cast lead, there is not a homogeneous condition of affairs from which the molecules by melting have become separated to a certain extent; but in the rolled lead there is a sort of interlacing of the molecules, and consequently when the oxide is formed there is an original interlacing of the molecules through the rolling process, and by that means the oxide is held firmly in place.

"I may say in experience in the last two years that various batteries were tried, and that it has never been my pleasure to meet with a cell before of this character; while it is true that the cells, multiple series cells, that we used on our vehicle exhibited much the same characteristics; that is, the voltage held up well. In starting your load the voltage is taxed, of course. You start in with a high rate of discharge in amperes, and almost at once, as you get under motion, the ampere current descends to the average, and your voltage is kept up all the time. You tax your voltage—that is, on this apparatus that we have used, simply because we required fully twelve volts, enough to provide for any excess demand, and consequently we had a good opportunity to judge whether we needed any extra pressure for it; and I am free to say that you do need a reserve force of pressure. It is the pressure that maintains your speed after you have got under way.

"I just recall a test made on that vehicle. In starting up we required as high as 39 amperes. We were carrying about 1,250 pounds dead weight. When we got under way on a dirt road we used 27 amperes at 12 volts. When we struck the asphaltum we used 32.4 amperes and required that amount of current at 12 volts to move us along that road at four and a half miles an hour. We had plain iron tired wheels."

The Trust was Not In It.

The Westinghouse Company have closed a contract with the Atlantic Avenue line in Brooklyn for one hundred car equipments. The total value of the contract is over $1,000,000. Westinghouse business for the month of March was the largest in the history of the company.

The Present and Future Competition Between Gas and Electricity.

BY JOSEPH GWYNN.*

The above subject was assigned me by the Executive Committee of the Ohio Gas Light Association, and at the urgent request of our worthy secretary I consented against my own judgment to prepare a paper on the subject. My reasons for objecting were that I did not consider it a proper subject to come before a strictly gas association, and last, but not least, my grave doubts as to my ability to add anything to what has already been written in papers read before this Association some years ago. I feel confident that the subject treated will not please what is termed strictly a gas man, as his whole heart, soul and energy, if he is a wide-awake gas manager, are bent upon his gas business; and as most of you are aware, everything in the illuminating line is inferior, unreliable and impracticable as compared with gas; that is, looking at it from his standpoint. But none the less, electricity is in our midst and with its rapid strides is advancing with unparalleled rapidity in all directions. Never in the history of the civilized world has any one invention or discovery made the rapid strides and advancement that has electricity. It has been and is being daily pushed by unlimited capital and energy. As I stated at our Dayton meeting several years ago, electricity has come to stay and my advice to all live gas managers is not to follow in the footsteps of Rip Van Winkle, but to wake up and take hold at the helm and be at your posts ready to meet all emergencies as they come and be in shape to give the public whatever kind of light they demand. That electricity is a full-fledged competitor of gas in all that the word implies I think there can be no doubt. It has, practically speaking, an unlimited field to fill and more opportunity for rapid strides and advancement than has gas; and while it has some disadvantages to gas, looking at it from an illuminating standpoint, yet on the other hand it has some advantages over gas.

In order to get at the inwardness of both branches of the industry and to treat them fairly from an unbiased standpoint and produce a paper based on actual facts and figures, and not one written from my own views on the subject, I communicated with upwards of two hundred gas and electric companies in different parts of the United States, in order to obtain as reliable data as possible on the subject to be treated. In order to give each one opportunity to consider the subject for himself and to rely on his own judgment as to the best course to pursue in the future. I append a few figures in order to fully show the advancement of both branches of the business. To show the rapid advancement of one branch of the electric business, which is arc lighting, I append the following figures, showing the growth of the carbon business. Upon the introduction of the arc lighting business from the year 1879 to the year 1881 only a small amount of carbons were manufactured, and from what data I can obtain the total sales of carbons would not exceed one million per annum, with prices ranging from $120 to $150 per thousand. From 1881 to January 1, 1892, the amount of carbons manufactured and sold in the United States has gradually increased until to-day there are upwards of 145,000,000 of carbons being manufactured and sold annually, with prices ranging from $9 to $10 per thousand. From the above figures it will be seen that the arc lighting business has shown an average advancement of over twelve per cent. per annum for the past twelve years. While the arc lighting business has shown a rapid advancement for mainly public lighting, what effect do we find this has had upon public lighting by gas companies. To-day out of over 928 gas companies in the United States we find of that number only 435 have contracts for street lighting and 493 have lost the street lighting business entirely which has been displaced by arc and some few incandescent lights, while on the other hand a great many of the gas companies who still do street lighting do only a limited business in this line as street lighting by gas is being gradually displaced by electricity and will eventually be a thing of the past. Let us again consider the two great competitors from a commercial lighting standpoint and what are the results? The aggregate gain in output of twenty-seven gas companies for the year 1891 is 6.56 per cent. and for the year 1892 6.61 per cent., or a net gain of 13.17 per cent. for the output of 1892 over that of 1890. For comparison, I will now show the aggregate gain of the commercial electric lighting business. In 1891 the aggregate number of incandescent lamps then installed by fourteen electric companies was 16,475 and in 1892 the aggregate number of lamps then installed had reached 33,238, showing a net gain of over one hundred per cent. in the past year. From the above figures it will be plainly seen that the net increase of commercial incandescent lighting for the past year over gas is ninety-three per cent. In addition to the incandescent lighting business of the above electric companies, I find that in 1890 they had then installed 1,047 commercial arc lights and in 1891 they had increased to 1,149 and in 1892 to a total of 1,620 lights, showing a net gain in the past two years of over fifty-four per cent.

---

* Read before the Ohio Gas Light Association, March 15.

Again, let us look at the lighting question. It has been claimed by most gas managers that electricity could not compete against gas for day lighting as the business was not sufficient to justify an electric company to operate day circuits only in large cities. In this respect, I wish to say they have been mistaken, for I find that quite a number of electric companies in cities of 20,000 population and under are operating day circuits, or, in other words, are operating their plant for the full twenty-four hours. I am asked how they can afford to operate a day circuit without continual loss. I wish to reply to this question by saying that in addition to what lights are required the constant demand for ventilating fan motors, from which a good revenue is derived, enables an electric company to operate a day circuit at a small profit. To give you an idea of the growth and prosperity of the ventilating fan motor business, which is being rapidly introduced by electric companies, I append a few figures obtained from the manufacturers as to the sale of fan motors for the years 1891 and 1892. In 1891 the sale of fan motors by four of the principal electric companies was 2,012. In 1892 the sale of fan motors by the same companies was 5,093 and the companies above referred to stated in their report to me that from the present outlook the sales of fan motors for the year 1893 will be fifty per cent. greater than for the previous year. In order to further enlighten you on the possibilities of electric companies operating day circuits, I wish to call your attention to the following figures showing the enormous increase in the sales of motors used for isolated purposes and independent of street-car use. In the year 1889 the sales were, practically speaking, nothing, as the reports obtained show an aggregate sale of 175 horse power. In 1890 the aggregate sales of motors of five of the principal electric companies show 6,584 horse power. In 1891 the aggregate sales of motors by six of the principal electric companies were 9,657 horse power and for the year 1892 the aggregate sales of seven of the principal electric companies were 19.216 horse power, or, in other words, the total sales of motors for the past three years by seven of the leading electric companies show an aggregate of 35,457 horse power. This branch of the business, if you will stop to think, comes in competition with the gas engine business, and while I have no figures to show the aggregate horse power of gas engines sold for the same period, yet at the same time I venture the assertion that twenty-five per cent. of the sales of motors would be a fair estimate for the sales of gas engines. This branch of the motor business, looking at it from an electric standpoint, is not as easy to handle, and possibly not as profitable as is the gas engine business to gas companies. While the gas company can furnish the gas required for gas engines through the same line that is used for illuminating purposes and without increased expense, it is impossible for electric companies to furnish current for motor use from the same circuit used for lighting. As I stated above, fan motors can be operated on the electric lighting circuits, but when an electric company undertakes to operate anything larger than fan motors from a lighting circuit, the continual stopping and starting of the motor will cause a variance in the lights.

There is no doubt but that electricity has made rapid advancement over gas in the past, and while it will continue to advance possibly more rapidly than will gas, yet at the same time, in the future, the advancement will be somewhat checked as the novelty has worn off. Yet, on the other hand, the continued improvements, which are many and great, in electrical appliances will continue to make the electric business more simple and reliable, and will still hasten its progress rapidly on for some years to come. In conclusion I wish to make mention of a few facts that may be of interest to gas companies. My advice to all is to stand firm and push your business with all the vitality you have. Strive to make a good quality of gas as is possible at a minimum cost and sell at the lowest price possible to give a fair return on the capital invested. Again, let me urge upon you the necessity of pushing your gas heating and cooking business as rapidly as possible, as this is an almost unlimited field for gas companies, and one that is not likely to be disturbed in the near future by your co-competitor, the electric light company.

The Edison Feeder Patent Sustained.

Full Text of Judge Green's Decision Not Yet Given Out.

The Associated Press on Monday, March 27, reported that Judge Green, in the United States Circuit Court at Trenton, had decided for the plaintiff in the suit of the Edison Electric Light Company vs. Westinghouse, Church, Kerr & Company for infringement of the Edison feeder patent.

An air of mystery has surrounded the matter since the first announcement, and no one, so far as we can learn, knows just what points the decision covered. The statement, however, from General Electric officials, that the sustainment was broad enough to cover a majority of the incandescent light and street-railway plants in the country has been used industriously in the financial papers, and has had a favorable effect on the stock market. Whether the decision, when published, will prove these claims remains to be seen.

The feeder and main system to which this patent refers provides for keeping the voltage as nearly equal as possible at every point on the distributing system. This is effected by running mains throughout the system of distribution and taking off the branch lines for service from them.

These mains form a network over the whole system and are calculated to carry the current from the centres of distribution, or feeder ends, to the service wires.

The feeders connecting this system with the station are led to different points on the mains, and each feeder supplies current for a certain territory which is distributed by the mains.

The mains are generally calculated for a very small drop in potential—about two per cent.—and the principal loss is in the feeders. By keeping the voltage at the different feeder ends equal, the pressure on the mains is kept practically even throughout the whole system.

The Trenton station involved in the suit was one of those originally installed by Westinghouse, Church, Kerr & Company to use the Byllesby three-wire system. The Edison Company brought eight suits, based on various patent claims, against the local company and Westinghouse, Church, Kerr & Company. Some of the points covered were the three-wire system proper, the feeder system, the use of a bank of lamps in throwing in dynamos, the connection of the field circuits with a switch, and several minor ones. The system was taken out when the alternating system was introduced. It was the original intention of the Edison Company to get a verdict on the three-wire patent to use against the Thomson-Houston Company, who have been the chief infringers of that patent.

The present case will naturally be carried to a higher court, and it will probably require a year or so to get another decision. It is admitted by every one except the General Electric Company that the patent has only one more year to run.

A broad sustainment of the patent would cover practically all central stations and isolated plants for direct-current incandescent lighting, and every electric railroad in the country of any consequence. Of course the Westinghouse lighting plants using the alternating current would not be affected.

The present case has been strenuously contested by the Westinghouse Company. Able counsel were employed, and eminent electricians were examined as experts on both sides of the case. In support of Mr. Edison's claims, Sir William Thomson, Prof. Chandler, Mr. Henry L. Brevoort, and William J. Jenks were examined as experts, and on behalf of the Westinghouse Company Prof. Morton of the Stevens Institute of Technology, Mr. Franklin L. Pope, Mr. Edward Weston and others. The taking of testimony occupied nearly five years, and involved an expense of probably not less than $100,000.

All the numerous contributions to electric science by such well known writers and patentees as Lane-Fox, Werdemann, Khotinsky, Sawyer and Man, and others, were cited and relied upon.

The case was argued in May, 1892, by Frederic H. Betts on behalf of the Edison Company (Betts, Atterbury, Hyde & Betts and Eaton & Lewis representing the Edison Company), and Messrs. Kerr & Curtis, William Bakewell, and Edmund Wetmore appearing for the Westinghouse Company.

The Bird is Now in Training.

The mystery surrounding the new lamp the forthcoming appearance of which was announced exclusively in Electricity is no nearer solution by our esteemed contemporaries, or by the public generally, than it was when our announcement first appeared. Nevertheless, most satisfactory progress is being made with the arrangements for placing it on the market in large quantities, and we hope to be in a position in our next issue to finally allay the anxiety of everybody whose nervous system is at present on the rack because of inability to find out just where and when the new light is going to break on the horizon of the doubters and sceptics. The representatives of our electrical contemporaries are assuming knowing airs, and professing familiarity with every detail, and just as soon as we come out with a full story—illustrated of course—of the new lamp, why, of course, our journalist friends will exclaim, as they always do when they want everybody to believe they haven't been left—"We told you so."

An Innovation in Street Cars.

The street railway syndicate that have obtained control of the street car lines in Hudson and Essex Counties, N. J., intend, it is understood, to introduce a novel feature in their new electric cars, somewhat similar to the English system. The new cars are to be much longer than the present horse cars and will be divided into two compartments, one of which will be reserved for women and children, though men may be admitted. The fare in the reserved compartment will be six cents, in the other five cents. It is thought that this arrangement will have the effect of secluding the cleaner and better dressed passengers from contact with the unsavory and unkempt travelers of unacclimated habits, who it is expected will prefer the cheaper compartment not only to save the extra cent but to avoid mortifying comparisons between their own coarse and dirty garments and those of their better groomed fellow passengers.

Personal.

John Cabot, lately in the employ of the Edison Company of New York, has been elected city electrician of Cincinnati to succeed Robert Mackie, whose resignation we have chronicled.

New York Telephone Rates.

The long standing struggle of the Business Men's Protective Association against the extortionate rates for telephone service in New York City has again been revived and is being conducted in the manner which has proved so entirely ineffective in former years. The list of bills which have been defeated, smothered in committees or left unconsidered by previous Legislatures is too great to give much encouragement for the passage of the latest one, that recently introduced by Senator Walker, which fixes the prices for telephones at rates proportional to the sizes of the cities in which they are used. The mileage charges are limited to ten cents and are only to apply to distances over five miles.

While there is no question that the rates in this city are exorbitant—being considerably higher than those of any other city in the United States—and admitting the propriety of the Walker bill, the chances of its becoming a law are very doubtful. Moreover, the matter can be adjusted by the subscribers themselves, and quite effectively, without recourse to legislation. A few years ago the same conditions existed in the city of Rochester and at the third attempt to advance the rentals for telephones the citizens made a strong protest, which, however, was unheeded by the telephone company. Finding remonstrance to be unavailing in reducing the prices, every telephone subscriber ordered his instrument out on a certain day, and for over six months not a single telephone was in use in that city. At the end of this time, however, the telephone company was glad to meet the demands of the public, and the telephones were replaced at the rates for which the subscribers had contended.

This same remedy is open to New York or any other city, and if thoroughly carried out is impossible of failure. While the telephone has grown to be an important adjunct of most business offices, there are comparatively few places where it is absolutely indispensable, and the inconvenience caused by such a course of action would be pretty sure to be but temporary.

In Buffalo a telephone subscribers' association has just been organized to effect a reduction in the rates in that city, and the question of following Rochester's example is under consideration. Although enjoying lower rates than New York City, the profits of this Buffalo company, as shown by the report of a recent legislative committee appointed to make an investigation into the affairs of the company, were shown to be about 50 per cent. on the actual investment for the year 1886.

The large variation in rates for cities of equal population show conclusively that there has been considerable extortion practised in many cases, but there is also no question but that the subscribers have a remedy if they care to use it, as the business of the telephone companies depends entirely upon the patronage of the public.

* * *

THE sustainment of the Edison lamp patent sinks into insignificance when compared with the effects of a full establishment of the Trust's claims to the feeder system.

A Common Source.

The exchange reader on a metropolitan daily paper, who is expected to glean from perhaps a hundred publications every day, has often been impressed with the similarity, not only in ideas but in the language itself, of editorials appearing the same morning in publications so widely separated as to preclude the possibility of a discussion of the particular subject by the various supposed writers. During national political campaigns this similarity is particularly striking, and often goes so far that scores of editorials appearing in cities hundreds of miles apart, on a given day, are exactly the same, word for word.

The novice might marvel at this, but not the old timer. He knows the reason, the common source of this outflow of wisdom.

Hence when we counted recently upwards of forty editorials on the marvellous progress made by the promoters of the Chicago-St. Louis electric road—the possibilities of the new era which the completion of this road would mark—clipped from as many different journals from all parts of the country, identical in ideas, in diction, even in punctuation, we did not marvel—except at the childish faith of the editors.

We knew that the boomers of the through-by-lightning fake were making another spurt in the sale of stock, and that the Press Bureau had another bill to charge to Promoting Account.

* * *

The Telephone Patents.

A decision of considerable importance as affecting the telephone patents in this country was rendered on March 27 by the United States Supreme Court. The law upon which this decision is based reads: "Every patent granted for an invention which has previously been patented in a foreign country shall be so limited as to expire at the same time with the foreign patent."

In this connection the question has been raised whether a foreign patent limiting the duration of an American patent should be prior to the date of issue or prior to the date of application for the latter. The former is in accordance with a strict interpretation of the law, but the question still remains to be settled in the courts. If this view is upheld the Telephone Company will have only the Berliner patent left, and as the validity of the latter is in question there is a reasonable prospect that the entire telephone system may at no distant date be thrown open to the public.

* * *

THE General Electric Company, when it recently sent a $1,000 contribution to the New York Press Club, wasted its money. The desired object will not be accomplished. One thousand dollars is not enough to smother even the most disreputable of the New York dailies. And as for the best papers, they cannot be bought for any price. It may not be amiss to remind Mr. Coffin that George Jones once declined a million dollars in currency which could have been his in consideration of his withholding the facts which his young men had gathered in regard to the Tweed ring. Furthermore, the New York Press Club is not composed of the men who direct the policy of the daily press.

Tightening Their Grip. In the absence of definite information on the subject, it is impossible to discuss intelligently the effects of the sustainment of the Edison feeder and main patent by Judge Green, of the United States Circuit Court. The withholding of the facts in the case for so many days gives some ground for the belief that the decision was not so broad as is claimed by officials of the General Electric Company.

The possibilities involved, however, in a final broad decision in favor of this patent are worthy of thoughtful consideration.

The advantage gained by the Trust in the establishment of the validity of the lamp patent would be as nothing compared to a like final decision in this case, provided the decision comes before the patent expires.

However plausible may be the statements of Mr. Fish as to the future policy of the Trust, the trade knows what has been the policy in the past few months, and that it has little to expect in the way of justice or fair treatment. And while non-infringing lamps will soon be on the market in sufficient quantities to meet all requirements, it is difficult to conceive of any method by which to avoid the claims of the feeder patent.

It behooves every man who has the best interests of the trade at heart to put forth his best efforts. The fight now on is one for existence.

ELECTRICITY has already suggested one means of redress which independent concerns can bring about, and which could not fail of success. A thorough Congressional investigation would riddle the common enemy, and leave him without a legal leg to stand on. This, however, cannot be accomplished for several months to come. Meantime ELECTRICITY will not be idle. We shall endeavor before the summer is over to lay before our readers a fair idea of the actual financial condition of the Trust—and we shall not rely on the annual statement of the company.

* * *

"The Lamp Situation." In its last issue the *Electrical World* publishes another instalment of "discussion" of a subject which is as dead as Kelsey's cat.

No one believes that the Electric Trust *can* do what it started out to do; no one, except the members of the Bread and Butter Brigade (represented this week by Mr. Wilmerding and Mr. Fish), believes that the success of the Trust, if possible, means aught else than ruin to scores of independent concerns, and a standstill in the development of the art.

The methods adopted by the *Electrical World* to start this discussion are on record. When it seems advisable to do so, we shall print documentary proof that this paper has violated all journalistic courtesy, decency and common honesty.

Meantime, the only point brought out which is worthy of notice in these columns is the sickly whine of the *Electrical World* itself, that it has not been able to induce others to do the work which it should have long ago undertaken on its own responsibility.

"How exceedingly non-committal those are who have thus far given their views on this subject must be generally remarked. Several who thought their business would be injured as a result of the lamp decisions gave it as their opinion that electrical journals should speak very frankly to the General Electric Company, and point out to it the course it was expected to pursue in this matter. When the suggestion of discussing the subject in the *Electrical World* was made, each of these was invited by letter to give his views, either over his own signature or otherwise, and, strange as it may seem, *not one of them responded, except to the effect that he had nothing to say for publication.*"

Following this is an humble apology for its friend and patron, the General Electric Company, and a little gratuitous advice to the trade, which it has insulted regularly in every issue for eight months.

The concern that sits down now to "let matters take their own course" may sit there till doomsday. There will never be any occasion for it to arise.

* * *

Alternating Current Arc Lighting. We print elsewhere an estimate furnished by Mr. Frank B. Rae for an arc lighting plant for the city of Detroit which is based on a system entirely novel in this country. Although there have been a few arc lamps used here on alternating currents, they have not been entirely satisfactory. Within the last few months, however, a lamp of German design has been introduced by a Philadelphia company which promises thorough success.

American arc lighting practice has, in fact, been considerably outstripped by European engineers, and alternating current arc lighting has been developed abroad with excellent results. Besides being more flexible in permitting the use of incandescent lighting from the same circuit, the alternating current can be used at its highest efficiency for arc lighting as the load is practically constant during the entire run. The efficiency of the converters is well known to fall off considerably as the load decreases, but by having a constant load, as in this case, they may be run at their maximum capacity with a loss of not more than three or four per cent.

By running the high pressure lines to the converters underground, which is proposed in this case, the element of danger is greatly reduced as all the wires within possible reach are no more dangerous than those of the ordinary incandescent lighting systems. While the type of plant suggested in this estimate would undoubtedly be an economical one to operate, the cost per lamp per year would be pretty sure to exceed the figure given. The cost of coal is figured at $2.00 per ton, and if this price is correct Detroit has considerable advantage over the majority of cities owning municipal plants. The item of repairs and depreciation, which is put at four per cent., is likely to be considerably exceeded in practice. There should also be included the items of taxes and water rates, as these would accrue to the city if such a plant were to be operated by a private company. There are, however, some excellent suggestions in this estimate which would enable a central station company to furnish arc lights at a still more economical figure, as the production of a satisfactory alternating current arc lamp makes it feasible to run the street lamps on an ordinary incandescent house lighting system of the alternating type and further increase the economy of operation by using still larger station units, avoiding the running of extra lines and decreasing proportionally the cost of labor and attendance.

* * *

WE recommend to the consideration of the New York *Sun* the leading article in the *Electrical World* of last week, copied verbatim from the *Sun* of Tuesday, March 28. Not only was the news matter stolen, but the Edison interview with a *Sun* reporter was made to appear as if secured by the *Electrical World* itself. The printing of 22 or even 220 pages of this kind of matter is no cause for "self-gratulation," no proof of enterprise. The only requisites are industry with the shears, a total lack of conscience, and enough money wheedled out of the trade under false pretenses to pay the printer's bill.

* * *

A PROMINENT electrical man in the West writes as follows:

"I was very much amused at your article on the Man from Oshkosh visiting New York. I was ground through this mill myself about a year ago, and all I have to show for it up to the present writing is a notice of interference in the Patent Office upon an invention which they were surprised 'so young a man' should have had brains enough to perfect."

This mill is not so well supplied with grist as it was a month ago.

* * *

A SUBSTANTIAL increase in salary was awarded to the Controller of the General Electric Company recently—just about the time, in fact, that work was begun on the preparation of the annual statement.

* * *

IF THE *Electrical Engineer* had made the request, we would have cheerfully loaned it the illustration to accompany the item "An Electric Safety Curtain," the text of which it borrowed from our issue of February 22 without permission and without acknowledgment.

* * *

WE HAVE strong assurances that our argument for the admission of supply men to full voting privileges in the National Electric Light Association has borne fruit, and that at the next session they will be admitted. They will have a vote simultaneously with the twenty-five or thirty gentlemen whose dues were paid by the Trust's lobby at the St. Louis meeting. The money was wasted.

* * *

BY reference to our advertising pages it will be noticed that the Buckeye Electric Company have discontinued manufacturing incandescent lamps, and have ceased to take orders or make shipments.

"Self-Gratulation."

Uriah Heep Enjoys His Seat on the Fence, and Shakes Hands With Himself.

(*From the Electrical World.*)

We have in recent numbers taken occasion to felicitate ourselves and our friends upon the prosperous condition of the *Electrical World* as evidenced by its large and rapidly increasing circulation, the extensive use made by our patrons of its advertising columns, and the DIGNIFIED COURSE which we have been able to maintain under slanderous attacks from envious contemporaries and under more trying conditions of trade than the electrical interests have ever before been called upon to meet.

Detroit Lighting Matters.

Estimates For a City Plant.

Mayor Pingree has succeeded in getting a bill through the Michigan Legislature authorizing the city of Detroit to build a municipal plant. Mr. Pingree wisely called on Mr. Frank B. Rae to prepare estimates of the cost of a new plant equipped with modern apparatus. The city is now in shape to demand its rights, but is not compelled to build a plant unless it seems best.

The high standing of Mr. Rae in his profession renders his estimates on the cost of a plant of general interest.

The following is a summary of estimate No. 1, which is of the greatest interest owing to the novelty of the design proposed:

FOR 2,000 ARC-LIGHT PLANT COMPLETE WITH FIRE PROOF BUILDING, DIRECT COUPLED ENGINES AND DYNAMOS.

TOTAL COST OF STATION.

Real estate and buildings including chimney...	$35,000
Boilers and appurtenances at $22 per horse power...	44.000
Engines and connections at $28 per horse power.	58,800
Dynamos and station electrical appliances at $33.25 per horse power...	70,000
Contingent, 5 per cent...	10,090
	$217,890
Lamps, lines, etc...	$320,000

TOTAL INVESTMENT.

Station and power plant...	$217,890
Lamps, lines, etc...	320,000
	$537,890

COST OF OPERATION AND MAINTENANCE PER YEAR, STATION TO RUN TWELVE HOURS PER DAY AT 2,000 HORSE POWER.

Expenses of Commissioner's office, including City Electrician, secretary, clerks, etc...	$6.000
Employees' salaries...	11 540
Fuel, maintenance, etc...	55,942

Cost per H. P. per year delivered to line:
55,942 ÷ 2,000 = $27.97.

Cost of maintaining lamps and lights per year, 2,000 lights...	$62,250
Cost per lamp per year for line and lamp maintenance...	31.12

TOTAL COST PER YEAR.

Expense of Commissioners' office per year...	$6.000
Cost of 2,000 horse power...	55,924
Cost of maintaining lamps and lines...	62.250
	$124,174

TOTAL COST PER LAMP PER YEAR.

Expense of Commissioners' office per lamp per year...	$3 00
Cost of power delivered to line per year...	27.97
Cost of lamp and line maintenance per year...	31.12
	$62.09

This estimate provides for dynamos of the alternating current type, having a potential of about 2,000 volts, arranged to be operated together upon one set of mains. A system of distribution from the main station either to large converters at convenient centres of distribution or individual converters for each lamp or group of lamps.

The engine room to contain three vertical, compound condensing engines of about 700 H. P. each, or four of 500 H. P. each, with dynamo machines of like capacity, having the armature mounted directly upon the engine shafts.

The total output of the station may be carried upon a single set of main conductors, and the conduit system thus reduced to two ducts and a single pair of wires. When it shall become necessary to increase the capacity of the station for added lights, such increase can be made without altering the underground mains by raising the pressure upon them with converters.

The First Direct-Connected Machines for Isolated Plants.

The electric light plant in the Havemeyer Building, recently described in ELECTRICITY, was, we are advised, incorrectly credited with the first use of direct-connected engines and bipolar dynamos for an isolated plant.

Mr. Newton L. Schloss has called our attention to a similar plant previously erected by him for the New York Biscuit Company while manager Thos. H. Dallett & Company, of Philadelphia.

CORRESPONDENCE.

Photograph of "Ribbon" Lightning.

To the Editor of ELECTRICITY.

DEAR SIR: Referring to the letter of Prof. Elihu Thomson which appears in your issue of March 15, explaining the cause of the "so-called ribbon lightning," a photograph of which was produced in ELECTRICITY of March 1st, instant, I do not agree with Prof. Thomson that the broadening of the band is due to camera movement, as I have obtained photographs of "ribbon" lightning when the camera has been firmly anchored and there could be no possible movement of the lens tube.*

I distinctly *saw* this identical flash in all its details as a broad wavy ribbon; at the same time I caught a clear, instantaneous view of the railroad ties close up to the end of the moving train.

Neither do I think a part of the photograph represents the effect of "the gradual cooling of the hot stream of air particles," for in such a case the line of light would be shaded from one side to the other, owing to the gradual loss of actinic power, which effect my picture does not show.

I saw hundreds of lightning flashes that night, blazing up on all sides, but with a single exception they consisted of sinuous *lines*, not ribbons.

This broad band looked to me more like a vivid section of the "Northern Lights" than an ordinary lightning flash.

Very truly yours,
W. N. JENNINGS.

Historical Exhibits at the Official Headquarters of the American Institute of Electrical Engineers at the World's Fair.

To the Editor of ELECTRICITY.

DEAR SIR: At the last meeting of the Council of the American Institute of Electrical Engineers, the Committee on Ways and Means, who have charge of matters pertaining to the official headquarters of that body at the World's Fair, presented a report and the committee was instructed to insert a notice in the technical papers calling attention to the fact that the Institute had secured through the co-operation of the authorities at the World's Fair two rooms adjoining the offices of the Electrical Department in the Electricity Building. These headquarters are now being furnished and the secretary of the Institute, Mr. Ralph W. Pope, will be in general charge of the headquarters during the Exhibition, and the committee, on behalf of the council, wish to extend an invitation, not only to the members of the American Institute of Electrical Engineers, but to any and all of our foreign friends of the electrical profession who may visit our shores during the coming World's Fair, to use these rooms as their headquarters. Letters may be addressed in the care of the secretary at the headquarters. In the furnishing of the rooms, facilities will be given for writing letters, meeting friends, reading technical papers, which will be placed on file, leaving their parcels and securing general information upon the Electrical Congress and other meetings and World's Fair matters generally. The rooms will be equipped with a long-distance telephone and telegraph service, fire protection, and the authorities have promised to place one or more members of the Columbian Guard at the headquarters. The Institute has decided to place in these rooms various objects of great scientific and historical interest, such as photographs, pictures, autograph letters, rare electrical books, models, instruments, etc. These things will be properly classified and arranged, and the committee request that all persons having objects which would prove of interest or value in this connection to communicate with the secretary, Mr. Pope, at the headquarters of the Institute, No. 12 West Thirty-first street, New York City, or with the chairman of the committee, Mr. William J. Hammer, 527 Temple Court, New York City. As we are somewhat limited for space, the committee will be compelled to select only objects which are not too bulky and which are of great interest and value, and they propose to make the headquarters of the Institute one of the most interesting features of the Electrical Department of the World's Fair. As the time is very limited, the committee trust that a prompt response will be given to this call, and that all the members of the Institute will feel a personal interest in seeing that the exhibit made shall be as full and as valuable as possible. The secretary was instructed by the council at the last meeting to extend an official invitation to the foreign electrical societies to avail themselves of the privileges of the Institute.

WM. J. HAMMER, }
FRANCIS R. UPTON, } Committee.
W. A. KRIEDLER, }
New York, March 29, 1893.

BOOK NOTICES.

Two Trade Directories.

THE "ELECTRICIAN" ELECTRICAL TRADES DIRECTORY AND HANDBOOK FOR 1893. (Eleventh Year.) THE "ELECTRICIAN" PRINTING AND PUBLISHING COMPANY, LTD., London. Price 7s. 6d.

JOHNSTON'S ELECTRICAL AND STREET RAILWAY DIRECTORY. THE W. J. JOHNSTON PUBLISHING COMPANY, New York. Price $5.

The "Electrician" Directory for 1893 shows the same painstaking care which has been evident in the previous volumes. It has long since become the standard directory of the electrical trade throughout the world. It is a directory, and more than a directory—it is practically an encyclopædia of general information. The table of contents would itself fill one of our columns, and there are no useless departments—no padding. The work comprises about 600 pages of directorial matter and 400 pages of handbook information.

For concerns doing foreign business it is well nigh invaluable, and working electricians will find it a great time-saver as a work of reference on many subjects.

We regret that equally high praise cannot be given to "Johnston's Electrical and Street Railway Directory." This latter work is, of course, not intended to fill the same field as the one just mentioned, but is a directory only. It, however, contains so many errors and inaccuracies that it falls far short of perfection. It is valuable inasmuch as it is the only directory we have; and it may be forgiven many faults in this its first issue. But we recommend in this case direct copying of English custom, and trust that the W. J. Johnston Publishing Company will not be eleven years in giving us a directory and handbook which will be at least on a par with the "Electrician's."

ALTERNATING CURRENTS. BY DRS. FREDERICK BEDELL AND ALBERT C. CREHORE. THE W. J. JOHNSTON COMPANY, LTD., New York. 325 pp., 112 illustrations. Price $2.50.

Notwithstanding the prominent position which the alternating current has attained in the solution of a large class of modern electrical engineering problems, most of the literature on this now important branch of the industry has been of a desultory character, generally treating of special applications and ignoring the fundamental principles from which the results are deduced.

The present work is the first book that treats the subject in a connected, logical and complete manner. The principles are gradually and logically developed from the elementary experiments upon which they are based, and in a manner so clear and simple as to make the book easily read by any one having even a limited knowledge of the mathematics involved. By this method the student becomes familiar with every step of the process of development, and the mysteries usually associated with the theory of alternating currents are found to be rather the result of unsatisfactory treatment than due to any inherent difficulty.

---

* *Photographic Times*, New York, May 16, 1890, and *Journal Franklin Institute*, January, 1892.

The first fourteen chapters contain the analytical development, commencing with circuits containing resistance and self-induction only, resistance and capacity only, and proceeding to more complex circuits containing resistance, self-induction and capacity, and resistance and distributed capacity. A feature is the numerical calculations given as illustrations.

The remaining chapters are devoted to the graphical consideration of the same subjects, enabling a reader with a little mathematical knowledge to follow the authors, with extensions to cases that are better treated by the graphical than the analytical method.

Electric Welding.

There is at present building at the General Electric Company's factory, Lynn, a machine for electrically welding together either street or steam railway rails. The machine can be used either at one particular point or can be mounted on a flat car and moved from place to place. The current can be taken from the trolley wire overhead; the joints can be made after the rails are laid, and it has been proved that in about eight minutes welds can be made which are the strongest parts of the rails.

"Will the Closed Conduit Supercede the Trolley in Large Cities?"

BY F. C. PERKINS.*

(*Concluded.*)

Mr. Chas. Harding, of Atlantic, Iowa, was granted English patents April 15, 1891, for a sectional closed conduit system in which each section of the conduit was connected to the main conductor within, automatically as the car passed, by means of electro magnetic switches or contact devices placed in sealed boxes, one for each section.

Mr. Wm. B. Heron, of Brooklyn, was granted American patents August 18, 1891. His plan is to use a magnet on the car and a " traveling armature " on wheels within the sectional conduit. As the car moves along, the traveling armature is attracted or drawn along by the magnet on the car.

It is not stated how the traveling armature is picked up again should it wander away from the car.

An American patent was issued to Mr. Mark W. Dewey recently on an induction system using alternating currents, the arrangement of the transformers being such that the primary circuit is underneath the road-bed while the secondary is carried upon the car, so that there is no metallic connection between the car and the main circuit from which the current is derived.

Mr. Dewey's plan is to place the primary coils wound upon U-shaped iron cores in the roadbed between the rails, at equal distances apart and at intervals corresponding to the length of the car. The apparatus carried on the car constitutes the other half of the transformer. Each motor has an inverted U-shaped or straight iron core, upon which one or more secondary coils are wound. When a good alternating current motor is placed on the market, this system will undoubtedly receive greater attention than it has heretofore.

Mr. C. J. Van Depoele has invented a system which works mechanically, and is in reality an open slot conduit with a rubber or other flexible guard, which is pressed open as the plow moves along and closes the conduit after the car has passed.

Mr. Elihu Thomson invented a similar closed conduit, using a brush or broom as a guard, instead of rubber, to close the slot.

February 7th, 1893, the writer was granted a United States patent for a closed conduit system for electric railways, consisting of a bare conductor mounted on an insulating support in a conduit, the top of which is rendered elastic by being formed of sheet metal adapted to be pressed into contact with the supply conductor by a motor car.

It may be well to consider the surface leakage from sectional conduit systems operating say fifty cars. The only data obtainable at once is from experiments made by Mr. Gisbert Kapp, author of " Electrical Transmission of Energy." In a paper read by him before the British Association, September, 1890, in reference to the loss from leakage of sections of the Lineff system, he says: "To ascertain the surface leakage I applied the voltmeter test, and found the following insulation resistances of three charged sections of the magnetic rail of the closed conduit: With the line clear and moist, 4,183 ohms; with the line very wet and covered with mud and water, 980 ohms. Taking 2,000 ohms as an average, the loss of power at 300 volts by surface leakage per car amounts to 45 watts."

Taking Mr. Kapp's figures for a basis of calculation for fifty cars, the surface leakage would be 2,250 watts, or about three horse power.

Now as the potential universally used here is 500 volts, the loss by surface leakage for three sections would be 125 watts per car, or 6,250 watts for fifty cars. This would amount to about eight horse power.

It is therefore safe to conclude, if Mr. Kapp's data and experiments are correct, that the surface leakage would not be serious in the sectional conduit systems.

World's Fair Notes.

Everything within the power of the construction department of the World's Fair is being done to have the buildings in shape and all the apparatus installed in time for the opening on May 1st. A combination of circumstances has operated to make a number of delays which will require strong effort to place the exhibits in position at the appointed time.

The 2,000 horse power Allis engine which is to be used in driving the large 10,000 light Westinghouse dynamos arrived on the grounds last week. On inspection it was found that the electric traveling cranes were of too small a capacity to carry its parts from the cars to its position on the floor of the Machinery Hall. It therefore required the laying of two tracks nearly half the length of the building to get it into position.

The Yale and Towne Manufacturing Company is placing a number of traveling cranes over each of the Westinghouse dynamos to facilitate in erecting them and also to make it easier to take out or put in the armature or field coils. The cranes each have a capacity of 44,000 pounds.

The contract for the plant for charging the storage batteries to run the electric launches was given to the General Electric Company. The plant will be the largest ever erected in this country for this purpose. All the batteries are to be charged at night and will therefore be connected in series and charged from the same circuit. The plant will consist of over 4,500 storage cells, and will be installed on sixty launches which will be run under the control of the Electric Launch and Navigation Company.

The installing of exhibits in the Electricity Building has begun in earnest. Last week several carloads of the Germania exhibit were placed on the floor and are being unpacked and placed in position. The Bell Telephone Company's booth is nearly completed and will be ready for the reception of exhibits. The Western Electric Company are having a model theatre building on a small scale constructed at the north end of the building to show their method of wiring and lighting this class of buildings. The workmen have been engaged for over a week in erecting the Edison tower which is to be located in the centre of the building and which is to contain 3,000 incandescent lamps at an elevation of 82 feet.

Mr. A. D. Newton, manager of the Eddy Electric Company, was a visitor at the grounds this week in the interest of his company, as was General Barney, of the Electric Launch and Navigation Company.

Mr. J. A. Kennedy has been appointed to the position of electric power inspector of the Exposition.

Legal Notes.

The Common Council of Detroit having granted permission for the removal of a building across the tracks of the Fort Wayne and Belle Isle Rail road Company, an electric road, an injunction was obtained by the railway company to prevent the Council giving permits for such removals. The Council thereupon sought to have the injunction dissolved, but Judge Hosmer denied the motion, and the Council will now take the case to the Supreme Court. During the arguments in the case the counsel for the railway company presented an affidavit made by C. E. Collins, an electrician in charge of the railway's electrical apparatus, to the effect that every splice, no matter how well made, increased the resistance in the path of the electrical current.

The American Telephone and Telegraph Company of Syracuse, N. Y., has brought an action for damages against the Consolidated Street Railway Company of the same city to recover $4,000 for property destroyed through the act of the defendant company in attaching its wires to the telephone poles so that the current from its wires traversed those of the plaintiff and entered the test house, igniting some wood in the structure, and before it could be extinguished the place was burned to the ground.

The Westinghouse Electric and Manufacturing Company have filed a complaint at Indianapolis against the Fort Wayne Electric Light Company, asking for an injunction and damages for the alleged infringement of a meter for measuring alternating currents of electricity.

General News.

What is Going on in the Electrical World.

Hudson, N. Y.—The route of a proposed electric road between Hudson and Stottville has been laid out.

Tyler, Tex.—Some Denver capitalists have submitted a proposition to construct an electric railway in this town.

Manistee, Mich.—The Manistee, Filer City and Eastlake electric street railway was opened for business last week.

Portsmouth, N. H. – Shafting is being placed in the Morley button factory for the new Electric Fan Company.

North Attleboro, Mass.—At a meeting here it was the general expression that the town wants electric lights and wants a plant of its own.

Martin's Ferry, Ohio.—A company which proposes to build an electric railway connecting this city and Bellaire has been granted a franchise.

Waverly, N. Y.—Work has been begun on the new electric railway, and will be pushed, Mr. Broadhead says, to the earliest possible finish.

Kenton, O.—The city council has granted a franchise for the construction of an electric street railway to Daniel Flanagan, editor of the *Democrat.*

Ontonagon, Mich.—The State Legislature has passed the bill authorizing this village to issue $30,000 for water works and electric lighting.

Tallahassee, Fla.—The plant of the Tallahassee Gas and Electric Lighting Company has been leased to W. P. Munro, of Eufaula, Ala., for twenty years.

---

* Paper read before the Buffalo Electrical Society, March 6, 1893.

Louisville, Ky.—Electric cars will be running in Broadway to Twenty-second street by May 1, and later the line will be extended to the new Base Ball Park.

Madison, Wis.—The Four Lakes Light and Power Company have issued a circular announcing reductions in their rates for both arc and incandescent lights.

New Albany, Ind.—The New Albany Street Railway Company have been legally authorized to substitute electricity for animal power on their entire system in this city.

Thomasville, Ga.—The contract for the building of Thomasville's electric street railway has been let to W. A. Robinson, representing the Thomson-Houston Company.

Providence, R. I.—The Union Railroad Company has been granted exclusive rights to operate the trolley system in North Providence, and will extend its present line to Centredale.

Spokane, Wash.—The contemplated electric railroad from Spokane to Cœur d'Alene City has not been abandoned, as was thought, but will be built during the coming summer and fall.

New Castle, Del.—The legislative bill authorizing the construction of an electric railway between New Castle and Wilmington having passed, work will begin on the route in a few weeks.

Tonawanda, N. Y.—A survey has been made for an electric railroad to run from North Tonawanda to Pekin, to be known as the North Tonawanda, Bergholtz and Pekin Electric Railroad.

Springfield, Mass.—The Postal Telegraph Company are to construct a line from Springfield to Montreal, opening stations at White River Junction, Montpelier, Burlington and possibly Barre, Vt.

Philadelphia.—The Mayor has signed all the trolley ordinances that awaited his signature, and now nearly every passenger railway company in Philadelphia has obtained permission to use the trolley.

Lancaster, Pa.—The entire property of the Lancaster and Columbia Electric Railway has been purchased by the Lancaster Traction Company who will operate the line in connection with the city lines.

Easton, Pa.—The Easton Transit Company has opened as an electric road what was formerly the Easton, South Easton and West End Horse Car line. Its capital is $300,000. It will rebuild the College Hill road.

Kennett Square, Pa.—The Electric Light and Power Company are seeking to extend their field of operations to Toughkenamon, Avondale, West Grove and Unionville and will probably include Hamorton and Hockessin. The alternating system will be used.

Dayton, Ohio.—A company has been organized and incorporated for the purpose of constructing an electric road between Harshmanville, Dayton and Cincinnati. This makes the third company in the contest for an electric road between here and Cincinnati.

Jersey City, N. J.—The Jersey City and Bergen Railroad has been converted into a trolley system. The cars run from Cortlandt street ferry to West Bergen, and connection will be made with the new line over the Plank Road to Newark, now nearing completion.

Indianapolis, Ind.—The *Journal* in describing the new electric light plant which is being built by the Indianapolis Light and Power Company, grows enthusiastic over its dimensions and the quality of the apparatus, and says it will surpass "any like construction in the United States."

New Orleans.—Superintendent Haile of the electric railway says of the increase of business on the Napoleon avenue line, that while 500 fares were formerly a fair day's collection for that line the average is now 5,000.—The conductors and motormen of the new Carrollton road are on strike for more wages and fewer hours.

Gloversville, N. Y.—The Cayudetta Electric Railroad Company have purchased a controlling interest in the Johnstown and Gloversville street railroad, recently equipped for electricity. The two companies have been in open warfare for some time, and this deal makes the Cayudetta company master of the field.

Woonsocket, R. I.—The stockholders of the Woonsocket Electric Machine and Power Company have voted to increase the capital stock from $250,000 to $400,000, with the object of extending its service from Woonsocket as a distributing centre to neighboring towns and villages in Massachusetts and Rhode Island.

McKeesport, Pa.—The McKeesport Electric Light Company's plant was totally destroyed by fire on Friday last. The loss will be from $75,000 to $100,000. The Duquesne Electric Railway and Citizens' Electric Railway, which were provided with power from the light company's plant, were obliged to suspend running.

Norfolk, Va.—Great preparations are in progress at Hampton Roads, Old Point and Norfolk for the approaching naval rendezvous. An attempt is being made to perfect a uniform system of signals for vessels of all nations. This will embrace an electric display of search-lights. The feature is expected to be a beautiful and novel one.

Muncie, Ind.—An Eastern syndicate which owns the lines at Laporte, Michigan City, Marion, Gas City, Elwood and Richmond has purchased the Muncie Street Railway property. It is the purpose of the corporation to connect all of the cities named by electric lines, with a probable extension from Richmond to Cincinnati and from Michigan City to Chicago.

Brooklyn, N. Y.—The Brooklyn, Bath and West End Railroad Company have under consideration a change of the motive power of their road from steam to electricity.—The Westinghouse Electric Company has just concluded a contract to supply the Atlantic Avenue Railroad Company with all the motors that will be needed in the operation of its trolley cars and for its electric generators.

Richmond, Ind.—The Richmond City Railway has been sold to a company of local and St. Louis capitalists, and there has been an entire change in the management. The new board of directors is composed of Col. John F. Miller, Henry C. Starr and R. A. Jackson. It is the intention of the new management to build about four miles of new track this summer and purchase a number of new cars. Isaac A. Gorman, now in the employ of the Pennsylvania Railway, is to be the superintendent.

Syracuse, N. Y.—The *Courier* says: "The organization of a telegraph company of prominent business men of this city is about to be formed, and it is thought that a franchise will soon be asked for. The names of Charles M. Warner, George M. Barnes and Frank H. Hiscock are mentioned in connection with the company. The capital stock will be between $200,000 and $300,000."—A branch of the Order of Commercial Telegraphers has been organized here with thirty members.

New York.—The stockho'ders of the Edison Electric Illuminating Company have voted to increase the capital stock of the company from $6,500,000 to $10,000,000.—At a meeting of the Park Commissioners a resolution was offered by Commissioner Gray to illuminate the Washington Arch with electricity at night.—The General Electric Company has declared a quarterly dividend of 2 per cent. on the common stock, payable May 1, 1893. Transfer books close April 18 and reopen May 2.

Topeka, Kan.—The *Capital* says: "No city the size of Topeka in the country can boast of as fine a street-car system as we have in the capital city of Kansas at this time. The service is regular and reliable, the cars large and clean, and the speed all that can be asked consistent with safety. The company is officered by men of financial standing and business ability who have a commendable pride in keeping up the system and giving our people cheap and rapid transportation."

Owego, N. Y.—In a talk about the proposed electric railway, Col. E. W. Dorwin said: "We propose to connect Binghamton and Owego by electric railway before long. We also propose eventually to build a branch road from Newark Valley to Owego and another from Spedsville to Owego. We have secured a franchise from the village of Owego and a charter from the State, and at present I can conceive of nothing which will hinder the construction of the proposed road in Owego."

Boston.—At the annual meeting of the American Bell Telephone Company, held on Tuesday of last week, it was unanimously decided to increase the stock from $17,500,000 to $20,000,000. The directors' report showed a largely increased business during the past year. The following officers were elected: Clerk, Charles Eustis Hubbard; treasurer, Wm. R. Driver; directors, Thomas B. Bailey, Francis Blake, Chas. P. Bowditch, George L. Bradley, Alexander Cochrane, W. D. Forbes, H. S. Howe, C. Eustis Hubbard, Gard. G. Hubbard, J. E. Hudson, C. E. Perkins, Thomas Sanders.

Buffalo, N. Y.—At the annual election of the Buffalo, North Main Street and Tonawanda Electric Railroad Company the following officers were elected: President, L. F. W. Arend; vice-president, Albert T. Fancher; secretary, Edward Rutherford; treasurer, Charles C. Mead; directors in addition to the above: Frank D. Smith, Anson W. Stone, Clark H. Timmerman, Henry A. Holden, George N. Kneeland and Jefferson Farrar.—The Board of Works propose to fit up a laboratory in the Municipal Building for testing the gas and electric lights furnished the city.

Allentown, Pa.—The Mayor has signed the ordinance giving the Lehigh Valley Traction Company and the Philadelphia and Allentown Trunk Railway Company permission to use certain streets for electric railways. The Traction Company will build a mammoth power station in Allentown. The road is to be built from that city north to Coplay and Egypt and south to Bethlehem. Next year the line is to be extended to Slatington and Easton, making the line eighty-seven miles long. The Philadelphia and Allentown Trunk Railway will have its terminus in Allentown.

Omaha, Neb.—A petition has been put in circulation here by "business men's associations and workingmen's trade and labor unions" against "the grant of a new patent to this great monopoly (the American Bell Telephone Company of Boston, Mass.,) who have raised their rates from $60, when competition existed, to $180 and $240 per year, when the rates charged for the same instruments in Europe, where the patent has also expired, but was not renewed by a corrupt official, is from $18 to $20 yer year."

Kansas City, Mo.—H. C. Eddy, agent of the Western Electric Company of Chicago, proposes to lay before the city council an offer to sell the city an electric light plant of 800 lights on the instalment plan. He proposes to so arrange the 800 lights that the city shall be far better lighted than it ever has been before and that nearly all of the electric, gas and gasoline lamps now in use will be displaced. For the plant and its maintenance for three years he wants $300,000 in three annual instalments; that is to say, he proposes to build the plant, bear all the expenses of maintenance for three years at $100,000 a year and turn the plant over to the city in good condition.

Boston Notes.

An electric road twenty-five miles long to run from Southbridge, Mass., to a point in Windham County, Conn., is projected for construction in the spring.

The Boston and Quincy Street Railway Company is to purchase the property of the Quincy and Manet Beach Railway Company. Both roads are operated by electricity and are very successful. Work will soon be resumed on the track to connect the towns of Weymouth and Hingham.

Patents on valuable electrical devices are granted almost weekly to Professor Elihu Thomson. The last two were for a new type of dynamo and a lightning arrester. Many of the employees of the General Electric Company in Lynn are also patenting various devices.

The Old Colony Trust Company of this city has accepted as security for a loan of $240,000 the entire property of the Nova Scotia Power Company, Halifax, N. S., and with this capital the entire railway system of that city will be equipped with electricity.

The Lynn and Boston Railroad, recently equipped with electricity, is considered the most extensive system of electric road in Massachusetts outside of Boston. It is preparing for an immense business the coming summer. Forty new open cars of the "jumbo" pattern, carrying fifty passengers each, have been ordered. Not only are the cities of Salem, Lynn and Boston connected, but several popular summer resorts such as Beverly, Marblehead, Swampscott and Salem Willows are in the circuit.

The Westinghouse Electric Company continues booking orders for its railway motors at a lively rate throughout New England. Within the last few days contracts have been made with the Westinghouse Company by the New Bedford Street Railway Company for twenty-five car equipments; with the Winchester Avenue Railway Company, New Haven, Conn., for twelve cars; with the North End Railway Company, Worcester, for six cars, and with the Hartford Street Railway Company for thirty-three cars.

What is to be the next move made by the management of the West End Railway is interesting everybody. It appears to be the foregone conclusion that the announcement will soon be made that the entire system has been bought by the Electric Corporation, the corporate name assumed by a number of gentlemen, mostly trustees of the General Electric Company. For several years the most intimate relations have existed between the West End and Thomson-Houston Electric Company, and the general supposition was that the latter really controlled the former. Present appearances justify the belief that if it has not controlled it hitherto, it will do so in future.

ORNAMENTAL ELECTRIC FIXTURES—NEW JERSEY LAMP AND BRONZE WORKS.

The New Jersey Lamp and Bronze Works.

The foregoing illustrations of electric fixtures are from the New Jersey Lamp and Bronze Works, New Brunswick, N. J., a corporation which has recently added a large gas and electric fixture factory to its extensive plant, covering four acres of ground and employing nearly eight hundred hands. For many years the company has made sockets, cutouts, switches, dynamo and motor work to order for large electric light apparatus makers, and its capacity is taxed to the utmost in filling orders for special electrical work requiring delicate and scientific manipulation. The factory contains several departments not usually found in industrial establishments, as a complete printing office in which catalogues and information for the hands are printed, also a large library of technical and electrical books and papers which are issued to the employees, many of whom are graduates of the best technical schools. Several copies of ELECTRICITY are on file in the reading room and after a week's use are bound for future reference. Mr. Ralph W. Booth, Manager, and Mr. G. Wilfred Pearce, the Superintendent, are of the opinion that the men should be informed of all new inventions and see what is being done by others in the same line, and to this end parties of men are taken at the expense of the company to see novelties in the large cities. The platers and fine art metal workers are regularly taken to the fine retail jewelry shops and art stores. The utmost good feeling prevails throughout the works, and all the men have ready access to the Manager's or Superintendent's offices, where grievances are promptly settled.

The invention of new goods by the hands is fostered and encouraged, and a visitor to the works cannot fail to observe the personal interest which all employees are taking in their work. The company prides itself upon its cordial relations with other firms in the same line, and never copies nor cuts goods made by others.

A Compact Driving System.

The L. P. & D. system of driving dynamos had been designed with a view to economize the floor space occupied by electric plants by avoiding the necessarily long distance between the driving and driven pulleys where direct belting is used. The illustration, Fig. 1, explains graphically the details of this system, being the plant in operation at Siegel & Cooper's store at Chicago.

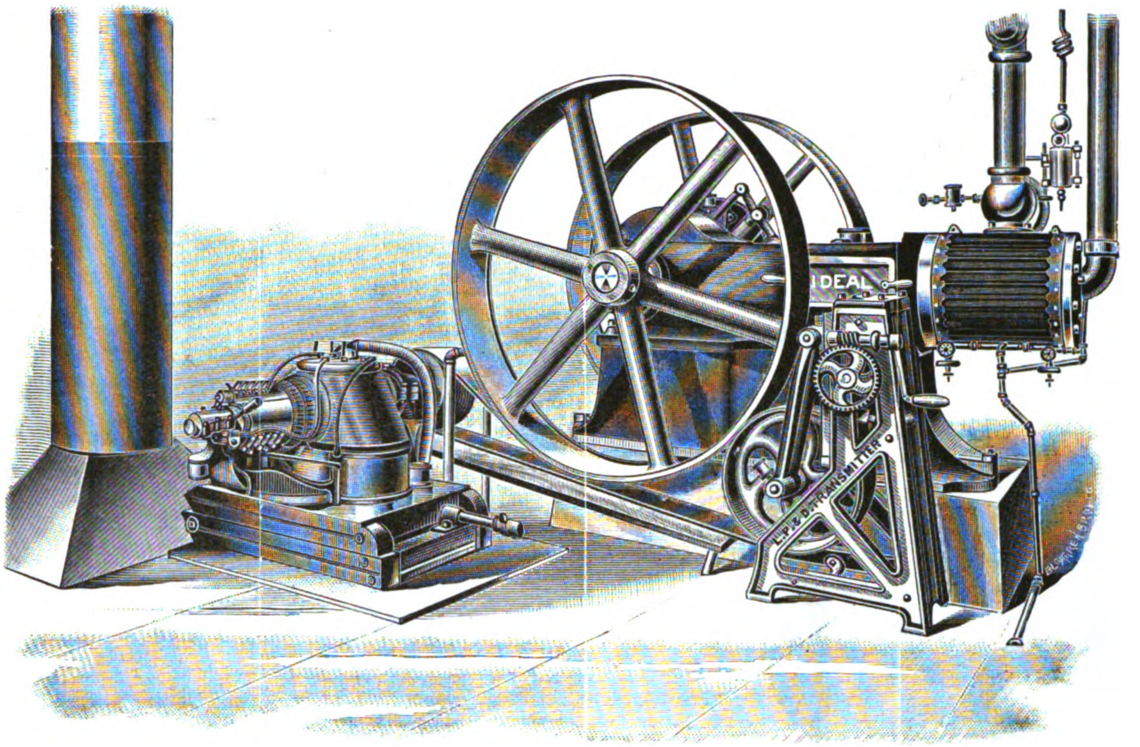

FIG. 1.

The dynamo is a 400-light machine of the Western Electric Company's make connected to the engine, as shown, by an 8-inch belt. The floor space occupied by the combination is but 8 feet by 11 feet.

Fig. 2 shows diagrammatically the mode of applying this system to the pulleys of jack shafts and the saving in space effected, and clearly shows the principles of the system in detail. From this it will be seen that the length of belt in contact with the driving pulley is greater than that in contact with the driven pulley, while the contact on the driven pulley is greater than is found in common systems of belt transmission. It is easily applied to any plant, all that is necessary being to fasten the transmitter so that its pulley will be about two inches from the floor and one-half inch from the driving pulley. The pulley of the driving machine should be placed as near the driving pulley as possible.

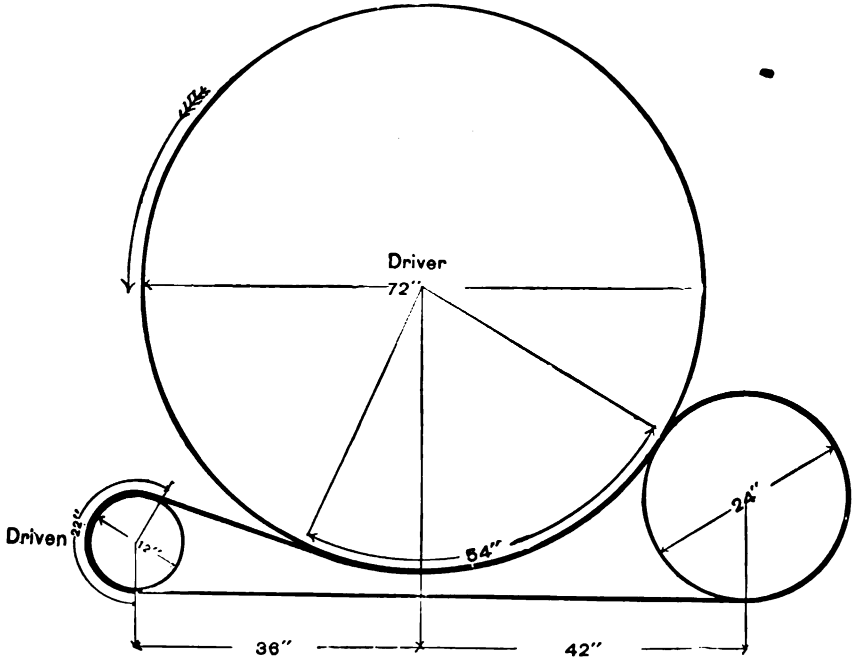

FIG. 2.

The use of this device will often increase the driving power, because a greater contact between the belt and driven pulley can always be obtained than with ordinary belting, and the contact of belt upon the driver will still be greater than that upon the driven pulley.

Chicago Notes.

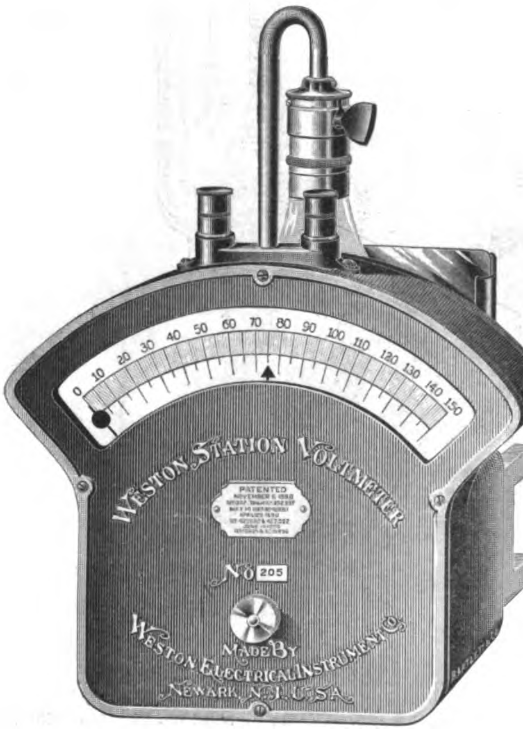
Mr. W. C. H. Noble, formerly with the Electrical Construction and Supply Company of Pittsburg, has been appointed to the position of auditor of the Ansonia Electric Company.

C. A. Baldwin, president of the Massachusetts Chemical Company, made a business and pleasure trip to Chicago last week.

Owing to the increase in their business the firm of Taylor, Goodhue & Ames have decided to remove their office from the Monadnock Building about the first of May. The firm have secured large and commodious quarters on the ground floor at 348 Dearborn street, where they expect to carry a largely increased stock of electrical supplies for retail trade.

The A. H. Atwood Arc Lamp Company have sold their patents and all the machinery for manufacturing the arc lamp recently placed on the market by them to the F. P. Little Manufacturing Company of Buffalo, who will hereafter manufacture and sell the lamp.

Mr. C. E. Schillinglaw, until recently the electrician of the Armour Packing Company, has accepted a position as traveling salesman for the American Circular Loom Company. Mr. Schillinglaw has been connected with the former company in the capacity of electrician for over fourteen years.



Weston Standard Measuring Instruments.

The growing refinements in the regulation of central station machinery have called for a constant improvement in the usual measuring instruments employed, and this demand has been met with unexpected success by the Weston Instrument Company's goods, which are now in general use in all well equipped stations and with all makers of electrical machinery.

In the old type of instruments the use of moving parts of soft iron was general and this possessed inherent difficulties which could not be entirely overcome. The magnetic lag of the iron made the indications vary with the ascending and descending scales, and the weight of the moving parts was such as to make the *dead-beat* quality, so essential to rapid indications, impossible. The principle embodied in the Weston instruments consists in the simple movement of a small coil through a uniform magnetic field against the opposing force of a very light spring. By avoiding the use of all moving iron parts magnetic lag is entirely eliminated, and besides being extremely *dead-beat* and showing an absence of magnetic lag, the correct electrical proportioning of these instruments leaves them extremely free from heating errors even where allowed to remain in circuit continuously.

The illuminated dial station ammeter made by this company is based upon the same general principle as their regular standard portable direct current ammeters, but is much larger and the working parts are enclosed in a neatly designed cast-iron case. This case is dust-proof, to protect the working parts from mechanical injury. It also effectively shields the instrument from disturbing influences of external magnetic fields.

The instrument depends for its operation upon the fall of potential between two points of the circuit carrying the main current, and requires a difference of only about .03 volt to give the full scale deflection, at which time it is taking only .07 ampere, no matter what the total capacity of the instrument may be. Unlike the regular portable instruments, the shunt required to secure the necessary fall of potential is not included in the case, but is separate from it, and is designed to be placed at the back of the switchboard. In most cases a special shunt can be dispensed with and a short section of the mains on the switchboard, or the mains leading from the dynamo, can be used instead. In either case only very thin wires are necessary to carry the extremely small current required to operate the instrument, No. 12 or No. 16 B. & S. gauge being sufficient in nearly all cases.

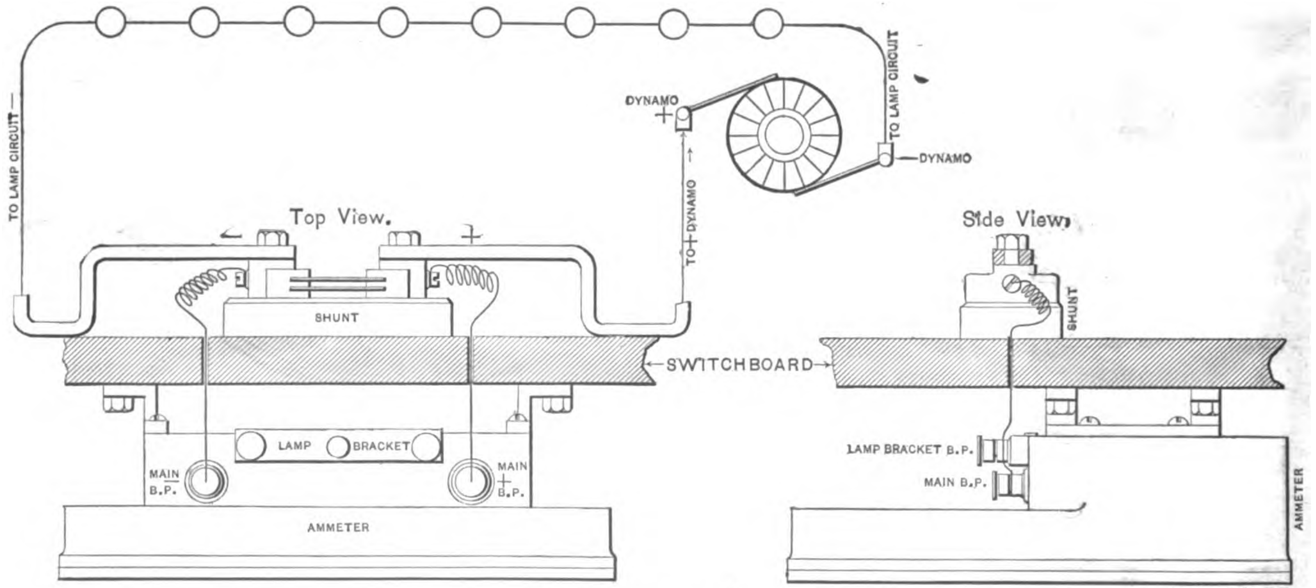
From this it will be seen that these instruments require but a minute current for their operation, and for this reason are extremely economical.

Another important advantage possessed by them is that if the station capacity be increased the same instrument will be found adequate as it is only necessary to recalibrate it in order to adjust it to any range.

The illuminated dial voltmeters, a cut of which is shown below, are equally free from "magnetic lag," and are almost absolutely free from temperature error. No effort has been spared to make them durable, permanent and perfect. They are dead-beat and are considered the very best and most reliable instruments ever made for the purpose intended. They are very high resistance instruments, and are consequently extraordinarily economical of power, while the coils are amply large enough to permit of the instruments being left in circuit continuously without material rise in temperature. They are pivoted and jeweled in just the same manner as the ammeters, and are sufficiently sensitive to show a change of one-twentieth of one per cent. in the voltage.

The diagram shown in Fig. 3 illustrates the method of connecting the ammeters to the lines on the switchboard, and is sufficiently in detail to be self-explanatory.

The shunt used with these ammeters, as shown in this diagram, are preferably placed as far from the instrument as possible.



Bartlett & Co., N.Y.

DIAGRAM SHOWING CONNECTIONS
BETWEEN
AMMETER AND SHUNT

Current Items.

F. A. Dolphin has invented a machine for post office use by which a hundred postmarks can be stereotyped in a minute, making it possible at the end of each hour to cast away the old die and start in with a new one. The new machine will also pick up the letters and will postmark them at the rate of 10,000 an hour. Two of the machines have been accepted for the postal exhibit at the World's Fair.

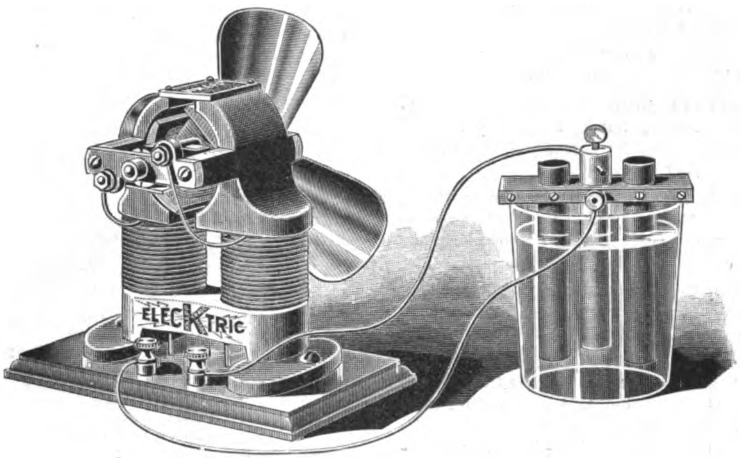
Over forty miles of wire will be used on board each of the two new big Cunarders, Campania and Lucania, for the electric lighting equipment. Each ship is to have a powerful search-light and about 1,350 sixteen candle power incandescent electric lamps.

Touching the life of submarine cables an electrical expert says: "The total mileage in 1852 was 87 miles; January 1, 1893, it was 139,539 miles, exclusive of inland cables. Perhaps the most remarkable history of an ocean cable is that of the light cable laid in 1853 between England and Holland. It was picked up in 1859; part of it was used for the Isle of Man cable, where it remained until 1885. It was taken up and relaid in 1886 in the Hebrides, where it is now doing as good work as forty years ago. The cable laid between England and Dieppe, France, in 1861 is still working. Therefore, it can fairly be claimed that the durability of submarine cable property is unsurpassed by that of any other commercial plant, be it railways, bridges, steamships or machinery."

Berlin has a novelty in the shape of a cab moved by electricity. In order to give the experiment a fair trial several races between ordinary one-horse cabs and the electric vehicle were run, and proved throughout the superiority of the latter.

Knapp's Electric Motors.

The motors and batteries manufactured by the Knapp Electric and Novelty Company, 34 Warren street, New York, have a reputation in the electrical trade entirely satisfactory to the company, whose sales keep pace with the rapidly increasing demands for electrical apparatus. A very efficient product of the company is Knapp's Electric Motor No. 1, a cut of which is given below. This motor is of the same design and finish as the company's larger sized motors. It is dead centre, height 4 inches, weight boxed 2 lbs., and is mounted on a mahogany base. It is fitted with a pulley to run toys and small machinery, and will run from one to two hours on one charge of battery. The manufacturers state that it "develops greater power from the same source than any other motor of its size."

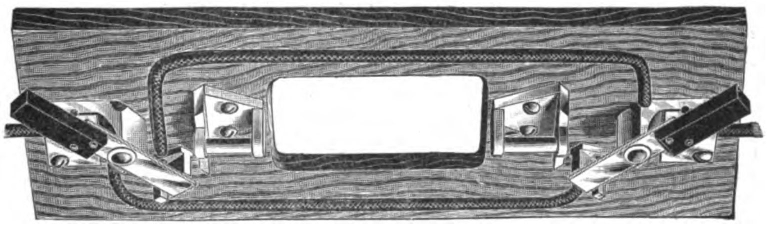


THE KNAPP ELECTRIC MOTOR.

The complete outfit—designated as No. 0 outfit—comprises a plant that is efficient for any experimental work. The battery accompanying the motor is easily refilled, and material that will suffice for several charges can be purchased for a few cents from any druggist. The price of the motor is $3.00; Knapp's Experimental Battery, 50 cents; five-inch fan, 25 cents.

The Dow Hanger Board for Arc Lamps.

In order to meet the demand for a first-class ceiling board to be used in connection with arc lamps Mr. Alex. Dow, the well-known electrical engineer, of Chicago, has designed one having a number of novel features which will commend themselves to those who have had experience with other hanger boards. It has a central opening through which the tubes project, the lamp itself being hung on brass supports next to this opening. The wires can be run into the binding clamps from the end, or they may be bent at right angles and inserted transversely, so as to allow of their being drawn taut without pulling them out of the clamp. Another peculiar feature lies in two simple but effective switches which make the board an absolute cutout. In ordinary practice only one of these would be used, but if the lamp is to be trimmed both switches are thrown to the "off" position, leaving the lamp entirely disconnected from the circuits.



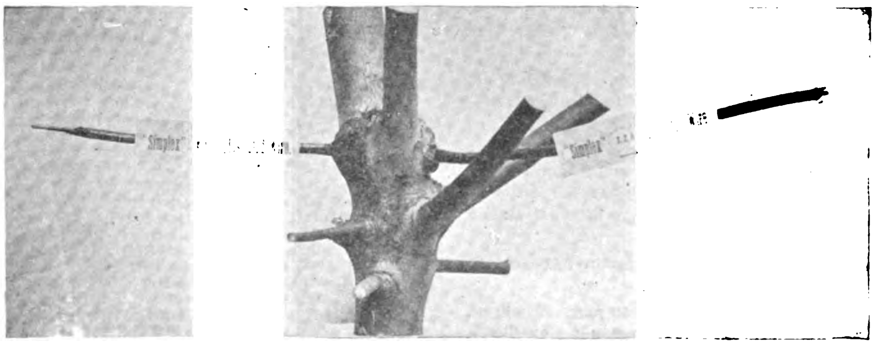
THE DOW HANGER BOARD.

The Dow Hanger Board is built in both the oblong form for double carbon lamps and in round form for lamps with a single carbon. It is being put on the market by George Cutter, of Chicago.

A Wire Curiosity.

Some time ago we called attention to a piece of Simplex wire that had retained its insulation intact notwithstanding the fact that it had got securely imbedded in the substance of a tree, right in the fork between two branches.

Believing that our readers would be interested in seeing how this piece of wire looks in the vise-like grip in which it is held, we publish herewith a cut showing it. Nearly six years have elapsed since this particular piece of wire was suspended on a line which runs through a number of trees in a city not far from Boston; and judging from the thickness of the timber that has grown around the wire, the enveloping process must have set in directly the wire fell into its position in the fork of the branches. Yet during all that time current has been flowing through the wire without a leak, and tests have been made since the limb was cut from the tree which show that the insulation is as good as ever. No wonder Simplex wire is so popular.

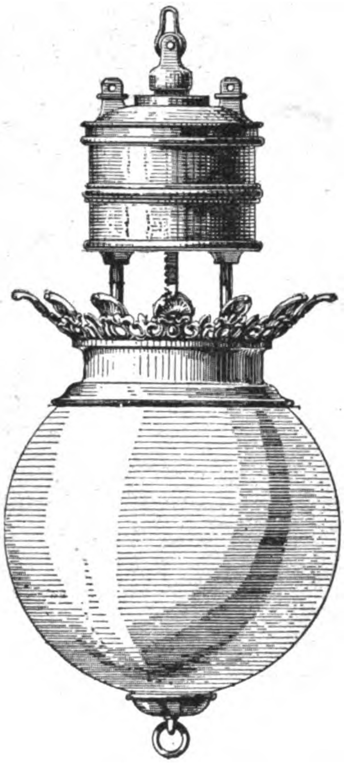


A WIRE CURIOSITY.

The General Incandescent Arc Lamps.

The latest aspirant for public favor in the matter of incandescent arc lamps is the General Incandescent Arc Lamp Company of this city, with factory and offices at Thirty-third street and First avenue.

Mr. Sigmund Bergman, the president of the company, is one of the best known men in the electrical trade, having been associated with Edison interests since early in the eighties. Mr. P. H. Kline, the secretary of the company, is also one of the old Edison guard, who knows the business thoroughly, and who has a host of friends among the trade throughout the country.

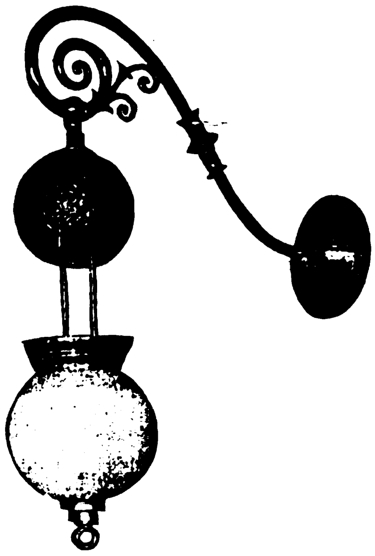


GENERAL INCANDESCENT ARC LAMP COMPANY'S RIBBON LAMP.

Although in business but a few weeks, this company has made rapid headway, and has a full line of its goods on the market. The possession of a large factory building, already practically equipped for its purposes, was a decide advantage.

The show room is one of the most attractive in th country, there being on exhibition arc lamps in variety o styles to suit all purposes of the trade, many of them o high artistic merit.

The lamp mechanism is exceedingly simple, consisting practically of only three wheels, a single magnet, and a spring, and it has no dash-pot. This simplicity means less liability to trouble and getting out of order. The German-silver resistance wires, which are mounted on the outside of the lamps, are insulated with porcelain, which renders the resistance both fire and water proof.



GENERAL INCANDESCENT ARC LAMP COMPANY'S BIJOU LAMP.

The standard 8 and 10 ampere lamps are arranged to run two in series on a constant circuit of 100 to 125 volts, but (up to 6 amperes at present) they can also be run three in series, and the readiness with which three lamps so placed get into perfect action is indeed remarkable. The light from these, as well as of the regular two in series 8 ampere lamps, is equal in steadiness to that of the incandescent lamp.

General Incandescent Arc Lamp Company's Ornamental Lamp.

A unique exhibit in the show room is that of a chandelier of artistic design, consisting of three Bijou lamps burning in series, giving a brilliant and steady light, taking 4 amperes of current.

The standard lamps weigh eighteen pounds, complete (without globe), burn twelve hours, and with an 8 ampere current give about 1,000 c. p. light, with 10 amperes about 1,800 c. p.

COMMERCIAL PARAGRAPHS.

Mr. Frank B. Rae has removed his offices in Detroit from the Cleland Building to No 49 Wilcox street. In addition to the usual run of engineering work, Mr. Rae will make a specialty of designing machines and apparatus for manufacturers.

Messrs. Taylor, Goodhue & Ames, Chicago, announce that they are ready to install Wagner power and fan motors for any exhibits, and to care for the same during the time of the Exposition.

The Bradford Belting Company of Cincinnati have just completed what is claimed to be the largest belt in the world, for use in one of the new power stations in Brooklyn. The belt is 6 feet wide, 116 feet long, and weighs 1,800 pounds.

A new arc lamp for use on incandescent circuits recently placed on the market by Mr. C. E. Bibber, manager of the Consolidated Electric Manufacturing Company, has just been improved in such a manner that it can now be run by means of an automatic feeding device, with a current varying from 90 to 150 volts, without the slightest flickering of the flame or arc, which remains as steady as if on a constant potential circuit. The lamp now as a whole is simplicity itself, and with the aid of this new automatic device the current on the main circuit is cut out from the lamp by the action of the carbon itself when the latter has been consumed to a certain point, thus effecting a great saving in current and an economic and safe use of the lamp.

Judging from the way in which the Massachusetts Chemical Company of this city is shipping its insulating compound, "Insullac," to all parts of the country, the electrical fraternity has fully caught on to its great merits as the best insulator ever introduced in the business since the advent of electricity as a commercial success. Nothing but complimentary things are reported about it, and everybody is more than satisfied.

INCORPORATIONS.

The Buffalo and Niagara Falls Electric Transit Land Company of Buffalo. Capital stock, $62,500. Directors: E. A. Kibbee, of Mayville; Myron B. Dunham, of Warren, Pa.; D. D. Dorn, of Jamestown; Arthur A. Johnston, of Buffalo and others.

The Essex-Hudson Light and Heat Company, at Trenton, N. J. Capital stock, $2,000,000. Incorporators: George R. Gray, Trenton; Emerson McMillan, of Columbia, Ohio, and Henry B. Wilson, of New York. The object of the company is said to be the absorption of gas and electric plants.

The Parkersburg Gas and Electric Company of Parkersburg, W. Va. Capital stock, $23,350. Incorporators: J. V. Rathbone, C. H. Shattuck, C. H. Turner, C. S. Despard and J. M. Jackson, Jr., all of Parkersburg.

The Delevan Electric Light Company, Delevan, N. Y. Capital stock, $5,000. Officers: President, W. F. Persons; secretary and treasurer, Manly E. King; superintendent of construction, James A. Morrison, of Philadelphia.

The Jackson Light and Power Company, Jackson, Mich. Capital stock, $100,000. Incorporators: W. A. Foote, A. N. Foote, J. B. Foote, J. W. Foote and John W. Allen, of Adrain.

The Coney Island and Gravesend Railroad Company. Capital stock, $300,000. President, S. S. Williamson; treasurer, John Curran; secretary, Fred E. Bader. The company expects to operate about thirty-five miles of surface railway in Gravesend and Coney Island, and will use electricity.

The Buffalo and Niagara Falls Electric Railway Company. Capital stock, $1,000,000. Directors: W. Carlyle Ely, of Niagara Falls; Frederick Swift and Wendell Goodwin, of New York City; Willard P. Whitlock, of Elizabeth, N. J.; George H. Wirth, James W. Norton and John S. Sheppard, of Brooklyn, and Joseph A. Powers, of Lansingburgh. The company will construct and operate an electric railway beginning at the easterly line of the City of Niagara and terminating at the point of intersection of Oliver street and the village line at Tonawanda.

The Hamilton, Waterdown and Guelph Electric Railway has been incorporated in Canada, with a capital of $500,000. Among the promotors of this railway are Sir W. P. Howland and other Toronto capitalists.

The Portable Electric Light and Power Company, Peoria, Ill. Capital stock, $250,000. Incorporators: Anson C. Trichenor, Isidor Mantz, Robert H. Walker and Frank R. Covey. The object of the company is the manufacture, sale and rental of electric machines in Peoria county, etc.

A corporation to be known as the Electric Association, Incorporated, has been organized at Portland, Me., for the purpose of establishing and operating electric plants and to furnish illumination, with $500,000 capital stock. The officers are: President, Charles H. Newhall, of Lynn, Mass.; treasurer, John S. Bartlett, of Lynn, Mass.

The Colchester Electric Light and Power Company, of Colchester, Ill., has filed articles increasing its capital stock from $6,000 to $12,000.

The Gordon Railway Signal Company, Denver, Col. Capital stock, $250,000. Directors: Angus C. Gordon, John D. Master and Edward B. Fenner.

The Pieton Chemical Electric Company, Chicago. Capital stock, $200,000. Incorporators: B. H. Ottinger, Harry W. Peck and Thomas J. Lesiour.

The International Pulp Company has filed articles of incorporation with the Secretary of State at Albany, N. Y. The capital stock is $5,000,000, of which $2,000,000 is preferred. The purposes of the company are to mine and deal in talc stone and minerals and for supplying electricity for light and power purposes. The operations of the company will be carried on in the town of Edward, St. Lawrence County, and the principal office of the company will be in Gouverneur. The directors are: Chauncey M. Depew, Touro Robertson, H. Walter Webb, Lewis C. Fuller, Geo. H. Daniels, Alfred Rindskopf, Thomas L. James, Augustus G. Paine, Edgar Van Etten and Thomas W. Bayne, of New York City; William J. Arkell, of Canajoharie; John A. Manning, of Saratoga, and John W. Welch, of Hartford, Conn.

The Queen Electric Company, Chicago. Capital stock, $15,000. Incorporators: David A. Bennett, John F. Schaeffer and Henry G. Hinkle.

The Committee on Incorporations of the Connecticut Senate have reported favorably on the resolution incorporating the Mather Electric Company of Manchester. The Senate has passed the bill incorporating the West Haven Electric Power Company.

The Cleveland Electric Railway Company, Cleveland, Ohio. Capital stock, $6,500,000.

The Kings County Electric Railway Company, Brooklyn, N. Y., of which Patrick H. Flynn is president, has filed a certificate with the Secretary of State at Albany, announcing that its capital stock is $500,000, and that $10,000 of the capital stock for every mile of the road proposed to be built has been subscribed, and 10 per cent. of such subscription paid in cash.

The De Pere Electric Light and Power Company, De Pere, Wis. Capital stock, $30,000. Incorporators: John Dousman, Wm. Armstrong, C. G. Wilcox and J. S. Chase.

The Geneva and Waterloo Railway Company, Geneva, N. Y. Incorporators: S. M. Hamill, Berry T. Miles and Jas. F. Hughes, all of Cleveland, Ohio; Robert W. Henson, Phillip Becker, L. G. Hoskins, F. A. Malette, C. E. Coon, T. E. Truesdale and W. H. Boyer, of Geneva. The route defined is North Main street, Geneva, Main street, Waterloo, and the highway in the town of Waterloo which is a continuation of and connects the said streets. The motive power is not mentioned, but it is probably electric.

ELECTRICAL PATENT RECORD.

Letters Patent Issued March 28, 1893.

ELECTRIC RAILWAYS AND APPLIANCES.

494,281. Electric-Car Fender. Edwin Rochester, Ottawa, Canada. Filed Oct. 18, 1892.

494,344. Controlling Device for Electric Cars. James H. Neal, Boston, Mass Filed Dec. 30, 1891.

494,477. Electric Railway. John C. Henry, New York, N. Y. Filed Aug. 19, 1890.

494,478. Driving-Gear for Motors. John C. Henry, New York, N. Y. Filed Dec. 12, 1891.

494,479. Electric-Car Truck. John C. Henry, New York, N. Y. Filed Jan. 2, 1892.

494,505. Car Brake. Milton E. Campany, Hamilton, assignor of one-half to Horace B. Peck, Kalamazoo, Mich. Filed April 5, 1892.

ELECTRIC LIGHTS AND APPLIANCES.

494,149. Process of Manufacturing Filaments for Incandescent Lamps. Alexandre de Lodyguine, Paris, France, assignor, by mesne assignments, to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Filed Sept. 14, 1888.

494,150. Process of Manufacturing Filaments for Incandescent Lamps. Alexandre de Lodyguine, Paris, France, assignor, by mesne assignments, to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Filed Sept. 14, 1888.

494,151. Filament for Incandescent Lamps. Alexandre de Lodyguine, Paris, France, assignor, by mesne assignments, to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Filed Sept. 14, 1888.

494,348. Electric-Lamp Support. Charles E. Richardson, Springfield, Vt. Filed Nov. 16, 1892.

494,499. Globe-Holder for Electric-Arc Lamps. William A. Turbayne, Detroit, Mich., assignor to the Liggett, Turbayne & Company, same place. Filed July 1, 1892.

494,531. Electric-Lamp Vibrator-Regulator. Daniel M. Moore, New York, N. Y. Filed Nov. 23, 1892.

BATTERIES.

494,199. Pyroelectric Battery. Thurston G. Hall, Chicago, Ill., assignor to the Hall Chemical and Gas Company, same place. Filed March 8, 1892.

TELEPHONE AND TELEGRAPH APPARATUS.

494,185. Printing-Telegraph. John E. Wright, New York, N. Y. Filed Nov. 16, 1892.

494,385. Telephone and Signaling Circuit. Frank A. Pickernell, Newark, N. J., and Francis W. Dunbar, New York, N. Y., assignors to the American Telephone and Telegraph Company of New York. Filed Dec. 15, 1892.

MISCELLANEOUS.

494,146. Magnetic Lock. Alcuin E. Kinter, Painesville, Ohio. Filed April 4, 1892.

494,186. Lightning-Arrester. Alexander Wurtz, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, same place. Filed Jan. 14, 1892.

494,225. Electrical Meter. Gustaf Rennerfelt, Buffalo, N. Y. Filed April 1, 1892

494,231. Treatment of Metal Plates Prior to Electrolysis. Charles B. Schoenmehl, Waterbury, Conn., assignor of one-half to Alden M. Young, same place. Filed April 11, 1892.

494,232. Apparatus for Electrolyzing Copper. Charles B. Schoenmehl, Waterbury, Conn., assignor of one-half to Alden M. Young, same place. Filed April 11, 1892.

494,239. Electrical Excitation of Vacuum-Tubes. Harry T. Barnett, London, England. Filed Feb. 5, 1892.

494,278. Electric Bell. Frederick W. Manger and Otto H. Huebel, Brooklyn, N. Y. Filed June 8, 1892.

494,279. Circuit of Electric Signaling. Morris Martin, Malden, Mass., assignor, by direct and mesne assignments, to the United States Electric Fire Signal Company of Maine. Filed July 14, 1890.

494,286. Apparatus for Protecting Buildings from Lightning. Jonathan B. L. Bartlett, Boston, Mass. Filed Oct. 31, 1892.

494,291. Electric Heating Apparatus. Mark W. Dewey, Syracuse, N. Y., assignor, by mesne assignments, to the Dewey Electric Heating Company, same place. Filed March 24, 1892.

494,295. Induction System of Electrical Heating. Samuel B. Jenkins, Boston, Mass., assignor to the Butterfield-Mitchell Electric Heating Company, same place. Filed May 28, 1892.

494,301. Electrically-Heated Radiator. Willis Mitchell, Malden, assignor to the Butterfield-Mitchell Electric Heating Company, Boston, Mass. Filed June 8, 1892.

494,337. Electric Annunciating Push-Button. John King, Chicago, Ill. Filed June 24, 1892.

494,345. Electric Signalling Apparatus. Frederick Perce, New York, N. Y. Filed Nov. 2, 1892.

494,359. Electric Brush. Robert E. Williams, Hot Springs, Ark., assignor of one-half to Charles W. Israel, Paris, Ill. Filed Nov. 29, 1892.

494,451. Electrical Switch-Lock. Frederic C. Weir and Edward W. Harden, Cincinnati, Ohio; said Harden assignor to said Weir. Filed Dec. 20, 1892.

494,489. Electric Signal. Switch Moving and Inter-Locking Mechanism. Joseph Ramsey, Jr., and Edward W. Harden, Cincinnati, Ohio, assignors to Frederic C. Weir, same place. Filed Aug. 13, 1892.

494,495. Electric Bolt-Operating Mechanism for Safes. Emory Stockwell and Herbert C. Stockwell, Stamford, Conn., assignors to The Yale & Towne Manufacturing Company, same place. Filed July 11, 1892.

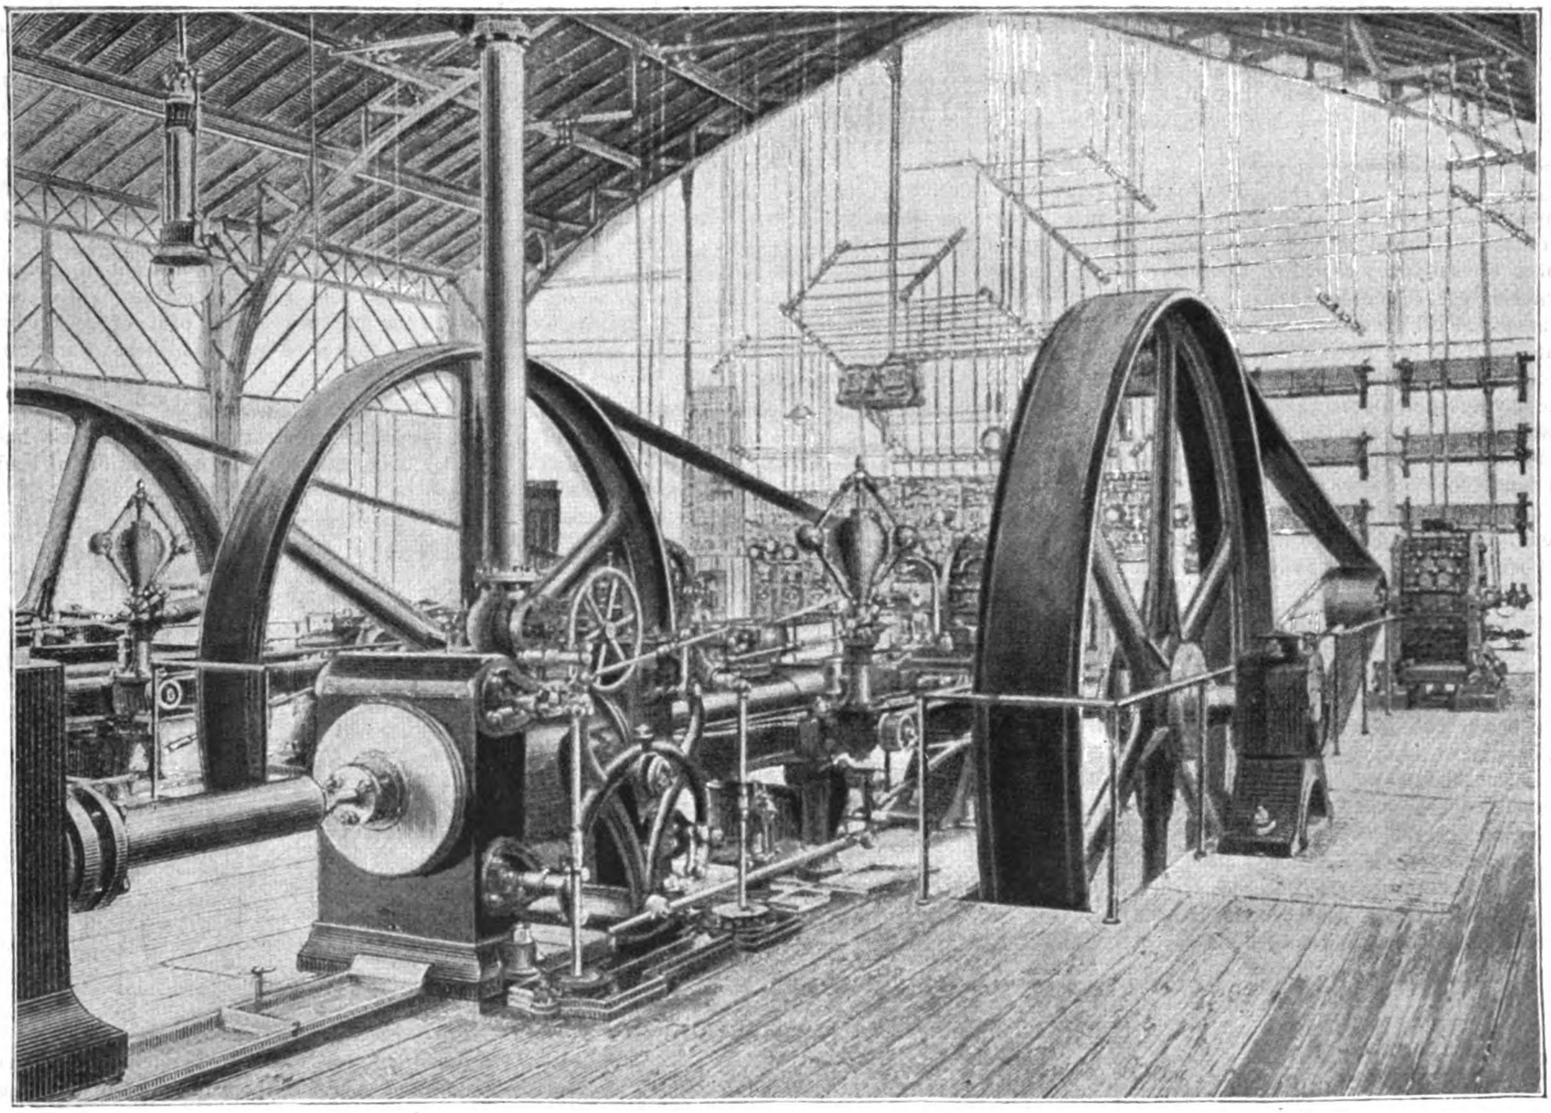
494,520. Electrical Instrument for Medical Purposes. Benjamin Y. Boyd, Wichita, Kan. Filed Dec. 15, 1892.

494,518. Alternating-Current Meter. William Stanley, Jr., Pittsfield, Mass. Filed Aug 11, 1892.

494,525. Block-Signal System for Railways. Eugene Fontaire, Detroit, Mich., assignor to the Fontaine Safety Signal Company, same place. Filed July 11, 1892.

ELECTRICITY.

VOL. IV. NEW YORK. APRIL 12, 1893. CHICAGO. No. 13



GENERAL VIEW OF STATION AT CLERMONT-FERRAND, FRANCE. (SEE PAGE 171.)

Electric Lighting.

The Alternating Current Plant at Clermont-Ferrand.

Clermont-Ferrand, which is distinguished as the first city in France to adopt the use of electricity for street-railway propulsion, also possesses an alternating current lighting plant which was put in operation in July, 1892, and has run without interruption since that time, furnishing the current throughout the city from the station over a distance of more than three miles.

This station is run in connection with the gas company, and is situated at the latter's works, in the outskirts of the city. This location has enabled the company to utilize the water from gasometers for condensing purposes, and this effects considerable economy of operation.

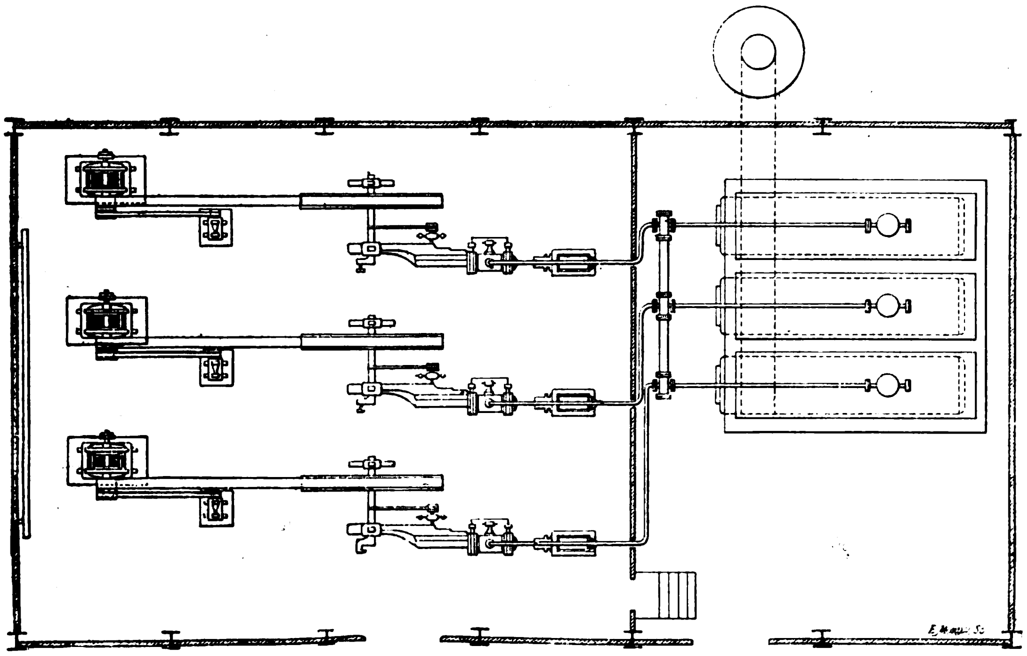


Diagram of Station. (Fig. 1.)

The building is described by *L'Industrie Électrique* as a brick structure with an iron frame having self-supporting arches, with a dividing wall which separates the machinery from the boiler rooms and which is provided with several open panels for doorways. The boiler room floor is on the ground level, and that of the dynamo and engine room is about three feet higher.

The stack is situated outside of the building opposite the main entrance.

The station is composed of three units of 50,000 watts, each comprising a boiler, steam engine and dynamo. The plan, Fig. 1, shows the general arrangement of the machinery. The setting of the boilers is placed so as to allow for the addition of two more in the same room if necessary. The engines are placed perpendicularly to the dividing wall, in the same manner as the boilers, in order to separate the dynamos as far as possible from the latter and allow the belts to interfere as little as possible with ready access to the dynamos. The switchboard is also placed conveniently near the dynamos.

The boilers are of the cylindrical fire tube type with interior grates, each having 100 square meters of heating surface, and can furnish enough steam for two engines on a forced run. They are furnished with two injectors and two feed pumps. The latter receive water under pressure from a feed water heater situated near the gas furnace. This water is raised to a temperature of about 80 degs. C., and conduces largely to the economy of operation of the station.

The heater is necessarily shut down a large part of the time to avoid the too rapid heating of the water and an overproduction of steam.

This certainly constitutes an important consideration for gas companies, and it is probable that the utilization of the wasted heat from the gas furnaces in the case of many gas works, especially those operating a number of furnaces, would provide without extra expense almost three-quarters of the steam necessary to operate an electric light station of considerable size. It must be remembered that in a battery of several furnaces the temperature reaches almost 1,500 degrees and over 600 degrees of heat is available for this work which is otherwise wasted. These considerations are of special interest for the gas companies, which are in many cases obliged to protect themselves by furnishing electric lights. In any case these works would find it of considerable advantage to utilize some of this wasted energy, if not for electric lighting at least for electric power transmission. Each boiler is connected to its corresponding engine by an independent system of pipes arranged so that any engine can be run from either of the boilers.

On account of the surplus capacity of the boilers they require only a minimum amount of attention, and moreover the facility with which steam may be produced insures against the possibility of trouble in case of an unexpected load on the station.

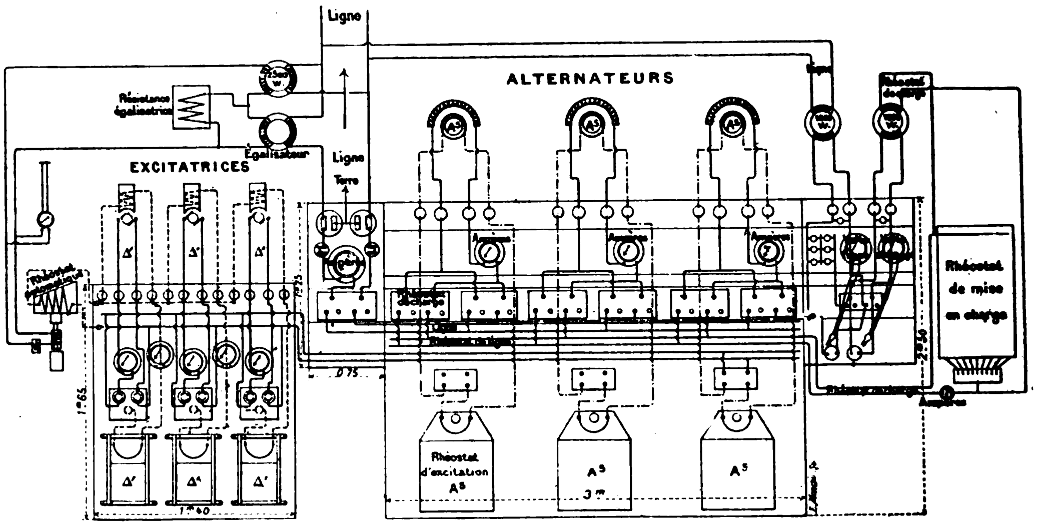

Diagram of Switchboard. (Fig. 2.)

The engines are of the horizontal Corliss type with steam-jacketed cylinders. The dynamos are belted directly to the fly-wheels of the engines. Each machine is provided with a condenser placed behind its cylinder and is operated directly by the piston rod. The valves of the Corliss system are entirely metallic. The steam comes from the boilers into the cylinder jackets where the water of entrainment is automatically separated, and in case of accident to the outlet from the condensers there are valves provided which permit the water to escape into the air.

The alternating current dynamos, of the Zipernowski, Deri and Blathy systems, which are driven from the engines, drive in turn the continuous current exciters which are placed near the engines.

The speed of the dynamos is 500 revolutions, and that of the exciters 900 revolutions per minute. The nominal power of each of the principal dynamos is 50 kilowatts, but they can easily be worked 20 per cent. higher if necessary. The primary distribution is at 2,000 volts pressure.

The exciters can furnish 30 amperes each at 110 volts, and one of them is sufficient to magnetize two of the main generators. All the dynamos are mounted on slides to permit tightening the belts, and these slides are bolted to wooden frames set in the foundations.

The Zipernowski, Deri and Blathy machines have the property of being able to run in parallel, which is an important advantage.

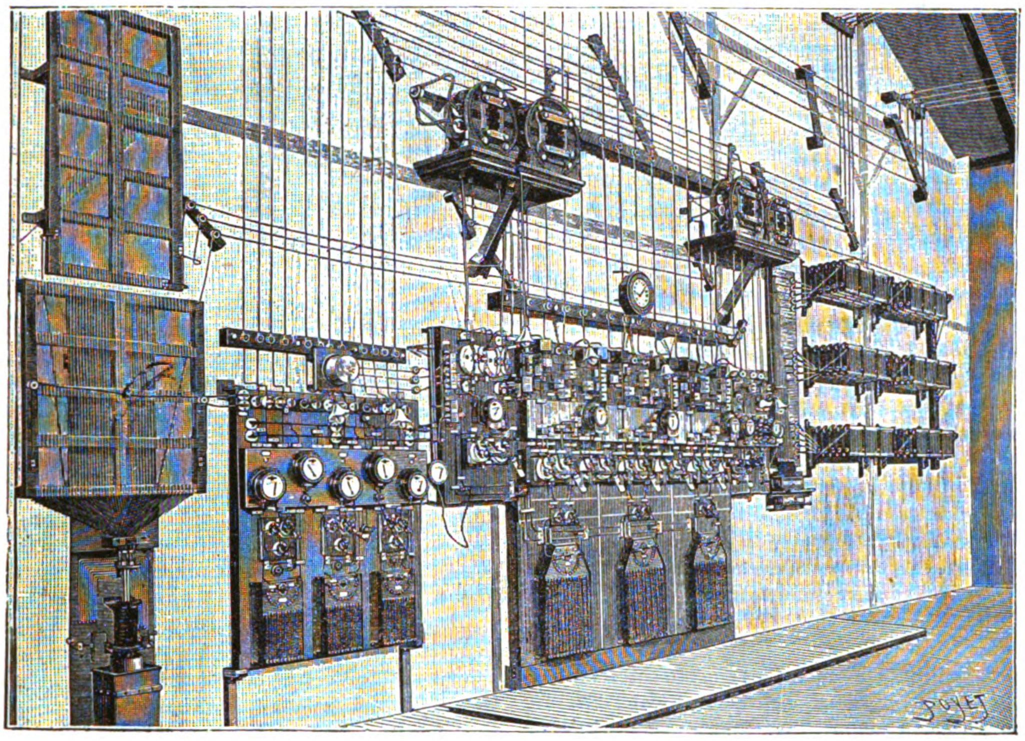
The separate circuits from each machine are brought to the switchboard, where all the work is regulated. The switchboard, which was constructed by Messrs. Lombard-Gerin & Company, of Lyons, is shown in Fig. 3. It is divided into several parts, the panel at the left hand side containing the apparatus relating to the continuous current exciters.

Each alternator has two main switches, one for the line and the other for the rheostat. There are also shown two lightning arresters and a main ampere meter which registers the total load and checks the indications of those on each machine. On the right the charging rheostats are shown, also an apparatus for indicating the phases. A pressure equalizer is used whenever the loss in voltage on the line exceeds two per cent.

The installation has been an entire success from the start, and it is of special interest on account of the gain in economy of its operation by the use of a source of power hitherto wasted in the gas works.

Electrolysis.

An ingenious application of electrolysis has recently been made in the purification of lead and the recovery of silver from argentiferous lead, which results in the production of chlorine—a gas which can be most advantageously employed in chemical manufactures. The chlorides of calcium and magnesium are decomposed with lead nitrate, and the lead chloride so formed is utilized for the electrolytic production of chlorine, whilst the nitrates of calcium and magnesium, which are also the results of the decomposition, are heated for the recovery of nitric acid, which is used for dissolving fresh quantities of crude oxidized lead to form lead nitrate. Silver and other metals may be precipitated from this solution by the addition of spongy lead. As an alternative way of working, hydrochloric acid is used instead of the chlorides for decomposing lead nitrate (or acetate), the products being lead chloride and free nitric acid, which may be used, as before, for dissolving fresh quantities of previously oxidized lead. The fused chloride is, according to the process, which has now been made practical by F. M. and C. H. Lyte, electrolyzed in a glazed earthenware or enamelled iron vessel kept at a suitable temperature. The cell is closed on the top, and is provided with a feed pipe for the lead chloride, a chlorine outlet pipe, and a syphon for drawing off the purified molten lead. The carbon electrodes—alternately anodes and cathodes—are securely fastened to the lid. In another arrangement the carbon plates are all anodes, the molten lead forming the cathode.



GENERAL VIEW OF SWITCHBOARD. (FIG. 3.)

The conductivity of the carbon electrodes may be improved by making them with a core of iron or other metal in the form of a plain, corrugated or perforated plate.—*Electrical Review* (London).

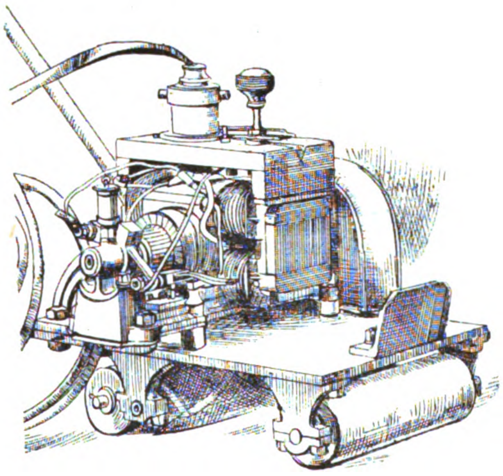
Large quantities of woollen and other goods are dyed in copper pans, and it is well known that in many cases the metal has a more or less deleterious effect upon the brightness of the shades. By coating the interior of the pans with tin this disadvantage may be prevented; but this device is costly, and when the tin is worn off it is often very inconvenient to have the vessels re-lined. The difficulty has now been successfully overcome, in a most inexpensive manner, by an application of an electrical principle. The remedy simply consists in bringing in contact with the copper a number of strips of sheet zinc, of such dimensions that about one-fifth of the surface of the copper is in contact with the zinc. These two metals form an electrical couple which absolutely prevents any copper from getting into solution and injuring the dye. As the zinc strips wear out they are replaced by new ones, an operation which can always be performed within a minute or so, thus involving no serious inconvenience to the continuity of the dyeing operation.—*Electrical Review* (London).

It is estimated that the total amount of light given by the electrical plant which will be used to illuminate the World's Fair grounds will be equal to that given by 12,500,000 standard candles.

A New Electric Tool.

The use of electricity for transmitting power has been steadily increasing during the last few years. Not only is it often found better than mechanical transmission, but in many cases it enables mechanical power to be applied to work where, without electricity, it would be quite impracticable to use anything but hand power. One of the latest machines of the latter kind, described in the *Electrical Engineer* (London), is an electric deck-planer, invented and patented by Mr. Malcolm Sutherland, electrical engineer to Messrs. Wm. Denny & Bros., of Dumbarton.

Our illustration shows one made by that firm, and used by them for planing the decks of the ships they build. It is so simple in construction that very little explanation is necessary. It resembles a lawn-mower in form, and is handled in the same way and with as much ease. A steel base-plate is mounted on rollers, and on the underside of this the revolving cutter is fixed. The electric motor is placed on top, and is geared to the cutter by means of toothed wheels. The latter is one of Rawlin's spiral cutters, and revolves at a speed of 3,000 revolutions per minute, the motor having a speed of 2,000 per minute. The hind rollers which follow in the cut are fitted with eccentric journals, so that, by moving a lever, they can be raised or lowered and the depth of cut nicely adjusted. It does very good work, is faster than hand planing, and relieves the men of a very disagreeable job, as the planing of decks by hand involves kneeling or sitting in a very uncomfortable position. Current is supplied to the motor by means of a twin flexible lead, and the whole machine is of a very compact and portable nature.



A NEW ELECTRIC TOOL.

A Hand Made Electro-Motor.

BY R. RADDATZ.

An electro-motor, as usually constructed, requires considerable lathe and planer work, and it is this that keeps many from building small motors for themselves; for this reason we present herewith the description of a small battery motor capable of giving from one-sixth to one-fifth horse power, and to be worked by a battery of ten bichromate cells—and which can be built without either lathe or planer work, requiring only such work as can be done at home, or as will be done at any blacksmith or machine shop for a few cents.

In several places those of our readers who have a lathe could proceed to advantage in a somewhat different manner from that described, as they will readily see and proceed accordingly.

The working drawings herewith are either ½ or ⅛ size, linear measurement, and the dimensions of all parts not given in the text can be obtained therefrom.

The armature is a Pacinotti ring, the core of which is built up of a number of laminations, one of which is shown in Fig. 3. These laminations can be cut out of Russian or any other soft sheet iron and shaped by means of a tinner's shears and chisel and file.

A sufficient number must be obtained to make a core three inches in depth. Through each lamination four quarter-inch holes must be afterward drilled, as shown in the figure.

Two spiders, of brass or gun-metal, and shown in Fig. 3, must now be obtained. A wooden pattern of these can be made a trifle larger than shown in the figure and one-quarter inch thick, except at the hub where it is about an inch thick, and sent to the brass foundry, where two castings are to be made from it. These castings are afterward finished up with a file, and an exactly central hole drilled to take a three-quarter inch shaft as shown. Then one-eighth inch holes are drilled near the extremities of the arms and corresponding quarter-inch holes drilled in the armature laminations, as already referred to.

Great care must be taken in doing this that the core, after mounting on the shaft by means of the spiders, may run exactly true.

If the first mounting should prove unsuccessful, four other holes can be drilled between those already in the core, with perhaps better success if done with more care. Into the holes drilled are now fitted four one-eighth inch bolts and completely insulated from the laminations by means of a paper tube slipped over each bolt.

The paper tubes may be made of brown wrapping paper wound around the rods and varnished with shellac varnish, and then baked in an oven until thoroughly dry. The laminations, with a spider at each end, are now strung on these insulated bolts, and washers of tissue paper placed between each lamination as well as between the spider and the core. A couple of extra holes must now be drilled through the laminations and fitted with insulated bolts to hold this core together when the spiders and their bolts are removed, as described further on.

A little time is now spent with a file in removing any unevenness in the laminations and in rounding the edges and corners of the spider arms where the wire is to be wound. In this way the core will soon resemble a smooth solid mass.

Care should be taken to see that during the filing and other working upon the core no metallic contact is established between the laminations by means of filings, and that there is no bending of two adjacent laminations nor tearing of the tissue paper, as upon the complete insulation of the laminations from one another and the spiders depends the prevention of eddy currents, which, among other things, produce a great deal of heat in the armature, often burning out the insulation of the wires. The armature here described, if built as directed, is entirely free from this danger, as it will not heat even when the motor is heavily overloaded.

A piece of three-quarter inch shafting is now procured, being twelve inches long as shown, but if space is of some consideration it could be made one and one-half inches shorter. To this shaft are now secured these spiders holding the armature in one of two ways. Keyways being filed in the three-quarter inch central holes of the spiders and two corresponding flat spots being filed on the shaft, the spiders are secured by means of a key driven home—or, what we consider preferable, a 3-16 inch hole is drilled through the spider hub, and the shaft and the spiders secured by means of a pin or plug driven into these holes.

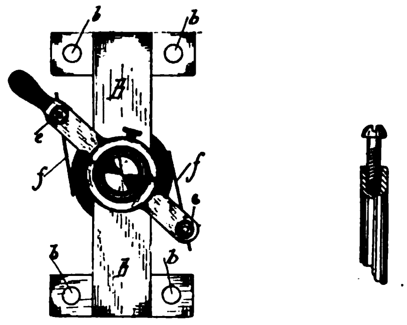


FIG. 1.

The armature core must now be removed from the spiders for winding. Where the arms of the spiders are bolted to the laminations, short pieces of wood of the same size and shape are to be substituted and bolted down, to prevent these spots being covered with wire. Every part of the iron core that is to be touched by the wire which is to be wound in the grooves or channels between the cogs must next be covered with silk applied with shellac varnish and allowed to dry.

The winding can now be proceeded with, using No. 18 cotton-covered magnet wire, filling each channel quite full—not so full however as to come above the top of the cogs and endanger the insulation on the wire, which would be rubbed off against the field magnet.

The beginning and ending of each coil should be on that side of the armature on which the commutator is to be, and the amount of wire and the number of layers, as well as the number of turns in each layer, should correspond in each coil.

Some four layers, with eight turns in each layer, will be about the amount put on.

The beginning of each coil should be marked or bent in such a way as to distinguish it from the ending of the coil.

The writer advises bending the beginning wire into a small loop or eye, and leaving the ending wire straight.

About 23 or 24 feet of wire will be required for each coil, which should be wound on a separate spindle or shuttle one and three-quarters inches wide, whittled out of a piece of cigar box, that can be easily passed through the central hole of the core.

About the method of winding nothing need be said as it is so simple as to defy mistakes.

A layer of wire is put on and may be to advantage covered with a coat of varnish before winding on another layer, which would bring us back to the starting point, and so on until four layers are on, which would leave us at the starting point with the ending wire, which may now be twisted lightly with the starting wire to prevent the coil from unwinding.

Some electricians prefer to wind these coils with an odd number of layers, thus leaving the ending wire on the opposite side of the channel to the beginning ready for direct connection to the beginning wire of the next coil, but this is not advisable in the present case, as the channels are hardly deep enough to hold another layer.

After all the coils are wound they should be covered with several coats of shellac varnish, with the threefold purpose of keeping the coils from unwinding, increasing insulation and keeping moisture, etc., out of the coils.

If the wire is in any way damp, or even if it is not thought to be, the wound armature can to advantage be placed in an oven and baked, which will expel all moisture as well as more firmly cement the layers of wire together.

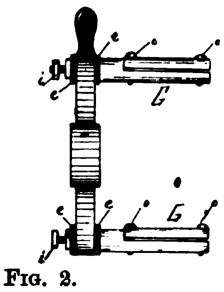

FIG. 2.

The spiders can now be permanently bolted to the armature, and the nuts may be prevented from working loose by burring the ends of the bolts or by solder, or both, although there is probably little danger of the nuts working loose even if not guarded in any particular manner. Two thin nuts could be used to advantage here.

The spiders may now be mounted on the shaft and the pins driven home and burred and we are ready for the commutator, C, Fig. 4, which has 16 segments or bars, as the armature has 16 coils.

An ebonite or boxwood core is mounted on the shaft, as shown, being secured by means of a pin of hickory, or some other tough wood, which is driven tightly into a $\frac{1}{4}$ inch hole through shaft and core. Upon the latter a piece of thick brass tubing is slipped tightly and spaced off by means of a pair of dividers into 16 equal parts, to form the segments or bars. Into each end of each segment a hole must be drilled—the holes at the end away from the armature being countersunk, to take flat-headed brass screws, $\frac{5}{8}$ inch long, the holes at the other end taking round-headed brass screws, $\frac{1}{2}$ inch long. Then the segments are divided or separated from each other by a fine hack-saw cut.

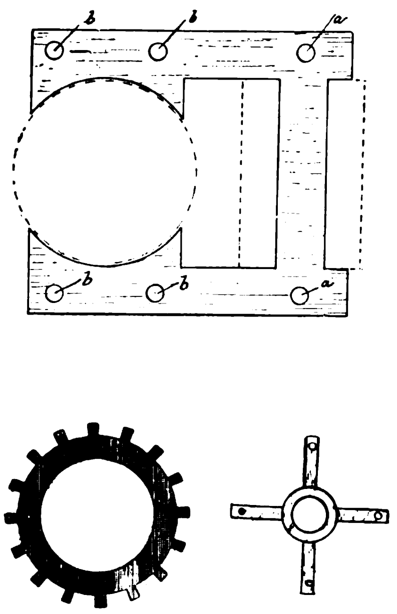

FIG. 3.

If this cut is extended $\frac{1}{16}$ inch into the core the segments can be more effectively separated by means of strips of mica, though this is not necessary.

The wires of the armature may next be fastened to the bars of the commutator as follows: The beginning wire of one coil is twisted together with the ending wire of the next coil and soldered, and one of these ends is looped under a brass headed screw on the segment nearest at hand and the screw tightened up, all superfluous wire being cut away. The beginning wire of the next coil and the ending wire of the coil further on are also twisted, soldered and connected with the commutator under a round-headed brass screw and the useless wire cut away.

In this manner all the coils are treated, the beginning of one being connected to the end of the other and then one of the ends carried under a screw, while all useless wire is removed. The insulation must of course be cut away where the joint is made and the end that is screwed to the commutator should be scraped bright and clean.

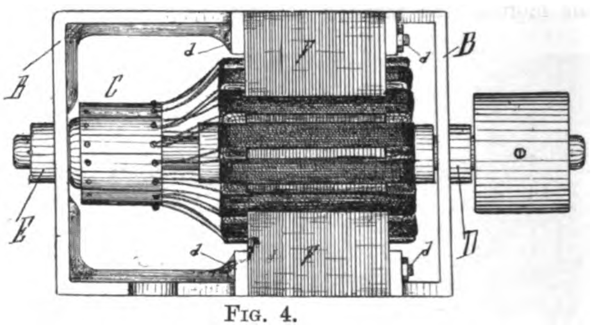

FIG. 4.

We can now turn our attention to the field magnet, an end view of which is given in F, F, Fig. 4. It is also built up of laminations of Russian or some other sheet iron, as was the armature. One of these laminations is shown in Fig. 3. This can be cut out entirely by means of a pair of tinner's shears or snips and a cold chisel and hammer. Holes can be drilled at a, a, as shown, and had better not be drilled at b, b, b, b, through which bolts are afterwards passed to hold the bearings against the field magnet, as well as to hold the laminations together. Through the holes a, a, stove rivets can be passed and the laminations permanently riveted together, or bolts and nuts can be used.

The bearings B, B, Figs. 1 and 4, must now be cast in brass, from wooden patterns as before. They are to be finished smooth with a file and a smooth $\frac{3}{4}$-inch central hole drilled through the hub to take the shaft. The four holes b, b, b, b, Fig. 1, must now also be drilled in each bearing, to receive the bolts d, d, d, d, Fig. 1, and must of course coincide.

The armature is now wound with several layers of paper and wedged into its space between the poles of the field magnet, in the position it is to occupy when running, and the bearings are slipped on the shaft, up against the field magnet and the holes b, b, b, b, Fig. 1, marked and drilled.

If the bearings do not fit snugly against the field magnet, a little filing and scraping will soon remedy this defect. The paper wrapping may now be removed from the armature and the latter mounted, by means of the shaft, in the standards and tried for freedom of revolution.

Supposing that everything works freely, the armature and bearings are removed and the bolts replaced in the holes in the field magnet and screwed up tight.

The field magnet core, where it is to be touched by the wire, is now covered with silk and wound with twelve layers No. 16 single cotton-covered magnet wire, as shown by the dotted lines in Fig. 3, and varnished and the armature replaced.

A solid pulley is now bought and fastened on the shaft by means of a set screw exactly where shown in Fig. 4. It is necessary to have this pulley solid, i. e., not recessed or webbed, as it is to form a bearing against the hub D to prevent the commutator rubbing or knocking against the standard near it.

The whole machine, as far as done now, is next mounted on a base board 10 x 12 inches, and, say, ¾ inch thick. The adjustable brush rocker, shown in Fig. 2, is next made, with a central hole to slip over the hub E, Fig. 4, upon which it may be fastened at any angle by means of the set screw as shown. It is made entirely of brass except the handle which is of hard wood or rubber.

The pins G, G (Fig. 2) are brass rods, threaded at one end to receive two nuts, and insulated where they pass through the rocker by means of ebonite or rubber washers, e, e, e, e (Fig. 2.

They are also sawn as shown, to receive the brushes in the saw cut, the part sawn out being screwed down upon the brushes by means of small brass machine screws, o, o, o, o, the brushes being made of thin sheet copper, three or four strips one inch wide being taken for each brush. Two binding posts are now fixed, i. e., screwed to the baseboard, on the side of the motor that the commutator is on, and between the latter and the field magnet. One of the ends of the field magnet wires is carried under the baseboard, in a groove cut for it, to each one of the binding posts and fastened, and each binding post is connected to one of the brushes by carrying a wire in a groove under the baseboard until directly under the brush pin, where it is carried through a hole, and after coiling around a round piece of wood to form a helio, is fastened under the nut i, i, Fig. 2, care being taken that a good connection is made.

If a tin cell battery is now connected to the binding posts, the motor will run at about 1,800 revolutions, and by means of a 1½ inch flat leather belt other machinery can be run, such as lathes, pumps, emory wheels, etc.

There is shown an easily made and efficient substitute for G, G in Fig. 2. If this form is preferred, a round-headed brass machine screw should be used, with a copper washer or two between the head and the insulating washer, e, e, Fig. 2.

In mounting the commutator core two pins of hard wood could be used instead of one.

These motors are self-starting and quite efficient, and anyone will be amply repaid by their performance for the little time and money spent in making them.

Legal Notes.

The Buffalo, Bellevue and Lancaster Railway Company, whose line is to be operated by electricity, has been empowered by a court order to lay its tracks across those of the Union Road of Cheekowaga, and those of the New York, Lake Erie and Western, and Buffalo, New York and Erie Railroads.

A bill has been introduced in the Tennessee Legislature authorizing all persons or companies using dynamos to furnish light and power to outside customers. It has already passed the lower House, having been recommended for passage by the House Committee on Corporations, The only objections which have been urged against the measure come from the managers of several electric light stations, whose reasons for opposing it are obvious.

The San Francisco and San Mateo electric road is in the hands of the sheriff on a writ of replevin secured by the Thomson-Houston Company for $100,000 of apparatus sold and delivered some months ago. This road is the owner of a right of way which is almost priceless, as it affords an entrance to the city for both passenger and freight business, entirely independent of the Southern Pacific Railroad, which has for years abused its absolute monopoly.

The Electrical Plant on the Steamship La Touraine.

La Touraine, which is the finest of the French ocean liners, is equipped with the most modern electrical plant of any of the company's vessels. The lighting on board steamers is divided into three distinct divisions, comprising, 1st, the permanent lights which are provided for places to which daylight does not penetrate, such as the machinery, boiler sections, holds, inside cabins, etc.; 2d, the indispensable lighting for evening and night in the salons, smoking rooms, corridors and cabins, and 3d, supplementary lighting for the evening up to 12 o'clock for the extra illumination of the salons, etc., when desired.

These three services are supplied by fifteen circuits, as equally divided as possible, each of which can supply an average current of thirty amperes. When the full number of lamps is in service the total lighting requires an output of 424 amperes, which is furnished by two dynamos each of a capacity of 220 amperes. A third machine of the same size is installed as a reserve in case of accident, and these three machines are driven by direct coupled engines, and are placed near the roof of the bridge promenade, upon the skylight grating of the boiler rooms. The dynamos are compound wound and vary about two volts above or below the normal according to the load. They are six-pole Dessozier machines, with the armature sections in series, using but one pair of brushes. The engines are of the compound type, running at 350 revolutions per minute, and the operation of the plant is almost noiseless.

The electric lighting is used in addition to the places mentioned for the mast-head lights and side lamps as well as the merchandise holds.

The Physics of Thought-Reading.

An occasional contributor, says the *Electrician*, has sent us more than one communication on the Physics of Thought-Reading, and claims that such inquiries should not be shirked. He suggests, as Prof. Houston has done, that ether vibrations may explain thought-transference. As soon as this or any other class of phenomena really comes within the domain of physical science we will try to find space for its discussion. One criterion of its inclusion should be a capability of measurement. Hertz's researches were nothing if not quantitative. When the wave-length of thought-transference can be even guessed at by the observation of stationary thought-nodes, or if, like gravitation, the action is found to be a definite function of the distance, the subject shall claim our attention. If thought be a form of radiant energy, it should obey the laws of optics. Reflection of thought is to be found in the phenomena of plagiarism, but how are we to measure the angles of incidence? Interference phenomena are abundant in the House of Commons, and if distortion or perversion of thought be a form of refraction, accompanied sometimes by chromatic effects, it is indeed too prevalent, though the refractive index, or, as it has been called, the coefficient of mendacity, may be difficult to determine. An elegant form of such refraction is known as hyperbole, but what is the focal length of a gross exaggeration, or the negative focus of a disparaging remark? Thought-reading may have its scientific aspects, but it does not at present come within those branches of physical science which are discussed in our columns.

Personal.

Mr. C. McL. Paine, who was formerly the business manager of Electricity, has accepted a similar position with the *Architects' Electrical Bulletin*, published by the Interior Conduit and Insulation Company. Mr. Paine is well and favorably known in the trade, and we congratulate our contemporary on his acquisition.

COMMUNICATIONS.

The Edison Feeder Patent.

To the Editor of Electricity.

Dear Sir: I have noticed in the daily press the announcement of what is claimed to be an important Edison victory in New Jersey in the establishment of the so called Feeder and Main Patent. I have no particulars of the decision, but cannot understand how any Judge should decide that such a patent covered anything worthy of the name of invention, provided the system of multiple distribution is considered a previous state of the art.

To illustrate more clearly, I have shown in Fig. 1, herewith, the simplest form of multiple distribution from dynamo, in Fig. 2 a single branch line, which, as I understand it, Mr. Edison claims is covered by his Feeder and Main Patent. The difference between Fig. 1 and Fig. 2, it seems to me, cannot amount to invention. It is the simplest possible modification of Fig. 1 which would suggest itself to any one wishing to extend that system. It is as natural as for the second leaf to grow on a tree after the first has got a start.

Furthermore, I have shown in Fig. 3 a system of distribution which seems to me quite analogous to that shown in Fig. 2. This is the ordinary arrangement for electro-plating in large works, and is in every respect similar to that shown in Appleton's Encyclopedia of Mechanics, published in 1878, under the article "Electro Metallurgy." A cut is given showing a plating room with vats arranged substantially as shown in Fig. 3.

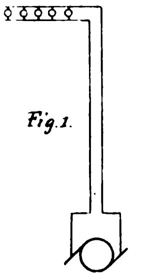

Fig. 1.

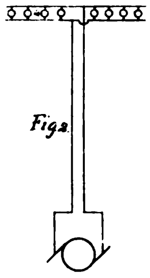

Fig. 2.

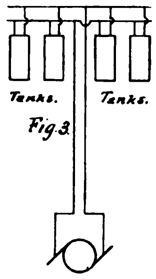

Fig. 3.

In this cut the copper bars or "mains" to which the tanks are directly connected are shown much larger than the wires or "feeders" connecting these bars or mains to the dynamo.

Mr. Edison must have been familiar with this system of connection, and the application of it to lamps cannot be considered an invention.

I predict that if carried to the Supreme Court, or to the new Court of Appeals recently established, this patent would be held invalid for want of invention therein. Yours very truly,

Morgan Brooks.

St. Paul, Minn., April 4, 1893.

To the Editor of Electricity.

Dear Sir: I notice your opinion in the last issue of your paper in regard to Edison's "feeder system" patent. Whatever the decision may be, I think that the importance you have given to this decision will depend entirely on the description of or definition of "the feeder system"; secondly, on the claims.

It would, so it seems to me, affect continuous as well as alternating current distribution, but I am of the opinion that there will be but little difficulty to get round this patent, by simply overcoming or keeping outside of the definition given to the "feeder system." Before, however, we are able to express any extended views or opinions, we ought to know the patent, its scope and claims. Having this information it may be easy to suggest through the technical papers how to evade this patent should it be a master patent. Very truly yours,

Ludwig Gutmann.

Cleveland, O., April 6, 1893.

The West End Road. For several weeks past the Boston press has devoted a good deal of space to rumored changes in the management of the West End Road in that city. The assumption has been that the road was a financial prize for which many syndicates and able financiers were struggling. Such is not the case.

When Mr. H. M. Whitney began the electrical equipment of the system, he was an enthusiast over the new motive power. He believed that he was laying the foundation for a reputation which would long survive him as a useful man in the community, a public benefactor. Those who know Mr. Whitney best have never doubted his sincerity or honesty of purpose. He believed, further, that the system would be a good financial investment, paying a fair rate of interest on the large capital necessary.

Mr. Whitney's ambition has not been gratified; his ardor has been more than dampened—it has been drowned; and his faith is an unpleasant memory.

In the first place, Mr. Whitney's standing in the community has not been bettered. He has received all the blame for the radical faults of the system, which ought not to have been laid at his door, and no credit whatever for his praiseworthy intentions. The daily press have jumped on him, visiting Thespians have guyed him, and the general public has been taught to curse him.

The company has been the constant victim of well-planned strikes from the Common Council, which have been expensive. It has had to meet a continued succession of attacks from the fire department and insurance people.

It has been put to an expense, moreover, to maintain its equipment in anything like working order which would have driven a weaker concern into bankruptcy. Frogs and track crossings have been renewed again and again, and as many as eighty armature winders have been employed at one time in the repair shops. Electrical men can easily see what this means. Leakages of current have been and are almost appalling.

In addition to this large outlay for repairs and maintenance, the road has been used for all sorts of experiments by the Thomson-Houston Company, and always at the expense of the road. Hundreds of thousands of dollars have been wasted by the West End Company in this way, and the Thomson-Houston people have been the only gainers.

Financially, the road has been anything but a success.

The difficulties in the way seem almost insurmountable, and some of the best engineering talent employed by Mr. Whitney, with practically unlimited means at their disposal, have given up the job, and handed in their resignations.

Mr. Whitney became absolutely discouraged, and got rid of his holdings some time ago. It is good opinion that to-day he holds only one share of stock.

For reasons which are well known to insiders, the Thomson-Houston Company was compelled to shoulder this load, at least temporarily and until Mr. Whitney was relieved. Mr. Coffin was too shrewd a man to saddle the financial responsibility, which included the possible wiping out of the entire equipment, upon the General Electric Company, and he has been casting about for a way to let the public in. The way has not yet revealed itself. Meantime, Mr. Whitney is pushing relentlessly, and with a diminishing patience which is entirely justifiable to those who know the facts; and Mr. Coffin is squirming in dread of the medicine which he must take if the public cannot be worked. It is understood that Mr. Whitney declines to be a party to any scheme whereby the stock is to be unloaded on small investors. He nevertheless insists on getting out, and Mr. Coffin is pretty sure to be his successor, willy nilly.

The weak spots of this system are radical and fundamental, and the situation is a serious one. not only for Boston, but for the entire electric railway industry of the world. A detailed statement of the facts in the case is in the possession of Electricity, and will be published later if it is deemed advisable for the best interests of the trade.

* * *

The Conflict. The *Electrical Engineer* last week gave up its entire editorial page to the subject of the present conflict between the Electric Trust and the independent concerns. The subject was handled in the wabbling style which the public has become accustomed to through the painful efforts of our contemporary to be on both sides of the fence at once. But while the editor has, as usual, drawn out "the thread of his verbosity finer than the staple of his argument," he has (unwittingly, no doubt,) performed a real service to the public. He has enunciated the platform on which he stands. He is "agin" the General Electric Company—if they can be beaten without his aid. He is with them body, soul and breeches if they can win. He sees no silly questions of right or wrong involved in the present problem. If large numbers of his constituency are driven into bankruptcy by the "astute and skillful" Trust, he may regret the stupidity of the constituency, but cannot censure the Trust.

After straining the dishwater, we have left the following, which may fairly be considered as the actual opinion of the *Electrical Engineer* on the one subject of vital importance to the electrical trade of America to-day:

"The General Electric Company will doubtless try to avail itself of every legal right it possesses, through the protection of the Edison patent or otherwise, to make the largest possible return upon its investment; should it not do so it would be false to the law of its being. . . . *Nor can its intentions in this regard properly be called nefarious.*

"The contest is simply between the 'ins' and the 'outs' at present.

"*If the 'ins' have the advantage just now, it is under the rules of the game—the patent law, and other laws of the country.*"

The appearance of such statements as to the American situation in a journal in Singapore or Shanghai would not have been surprising; that they should appear in a well-informed American journal is almost beyond belief. There are, however, two possible explanations, and only two, to account for these remarkable statements.

One is that the *Electrical Engineer* has decided that it could not survive the loss of the Trust's advertising patronage, and that it must keep it at whatever sacrifice of honesty, of journalistic obligations, and of truth.

The other is that it has no moral sense, no conception of right and wrong.

Is this contest simply between the "ins" and the "outs"? ELECTRICITY thinks otherwise.

There are in the United States scores of strictly scientific electrical men, men whose income in dollars and cents will not be affected whatever the outcome of this contest. It is this class of electrical men who are the chief constituents of the *Electrical Engineer*. Can a half-dozen of them be named who believe that this is *only* a contest between the "ins" and the "outs"—that the General Electric Company has a moral right to wreck its competitors by the hundred if it is possible for it to do so? Or that it has a moral right to stifle and retard the development of the art, which it is universally admitted would be the result of its full success?

If the present struggle is simply a "contest between the 'ins' and the 'outs,'" then no further justification is needed for the course pursued by all electrical journals save ELECTRICITY in keeping out of it. No trade paper is expected to take sides in a factional fight in its trade where no question of right or of the public welfare is involved.

On the other hand, no self-respecting trade paper will hesitate to take sides where either one or both of these questions is involved.

ELECTRICITY holds that both questions are involved in this matter.

We hold, first, that concerns outside the Trust have a moral right to a fair field in which to conduct their business, subject only to legitimate competition and patent laws; second, that the public welfare demands open competition in this as in all other lines of business where the public is the purchaser. And further, that it is the duty of the electrical press to expose and defeat, if possible, the corrupt and bulldozing methods adopted by the Trust to gain absolute and undisputed control.

* * *

WORDS may be multiplied into sentences, and sentences into columns, in discussing "Monopoly"; symposiums on "The Lamp Situation" may be begun by printing letters marked "Personal," and pages filled with rubbish. Yet "Great is TRUTH, and mighty above all things." And, thanks to the intelligence of the electrical trade, and to the efforts of ELECTRICITY, the truth as to the present situation is well known and cannot be buried.

* * *

DIED—In spite of constant nursing and heroic effort on the part of its parent, the *Electrical World's* symposium on "The Lamp Situation," at the age of two weeks. It would have been more creditable to that paper if it had died "a bornin'."

Electric Plants for Gas Works. Elsewhere we print a description of an electrical installation run in connection with the gas works at Clermont-Ferrand, France, which points to an important advantage that is within the reach of gas companies for supplying electric current for lighting and power. There can be no question at this time as to the demand for such an electric service, and it must be conceded that electric lighting has proved its superiority over gas lighting for many classes of service—notably for street lighting—to an extent which makes it a powerful rival of the latter.

Of this fact the majority of gas companies have seen ample evidence for some years past, but with the exception of a few isolated cases there has been little effort on the part of these companies to attack this branch of the business.

There appear to be reasons, however, that should lead to the operation of electric plants by gas companies, as the latter are in a position to produce their current with considerable economy, and moreover to afford a satisfactory service to customers. An illuminating company should be able to furnish as far as possible whatever its patrons may require.

The experience of electrical manufacturers in regard to the latter point is suggestive. At first most of these concerns manufactured a special system of electrical machinery and attempted to introduce it for every purpose to which it could be applied. In time, however, users of electrical apparatus came to distinguish between the values of these goods for different classes of work, and the progressive manufacturers saw the necessity of meeting these various demands and are now beginning to supply whatever is required rather than attempt to make a single system cover every case.

The same will undoubtedly be the experience of illuminating companies, and the gas works already established have seen the inroads which electricity has made into their business, but as yet have not taken advantage of the opportunities in this field which are open to them.

* * *

The Rapid Transit Situation. The plan for an underground electric railway evolved by the New York Rapid Transit Commission has so far met with little enthusiasm on the part of capitalists. The proposition submitted by Wilson & Company, bankers, of New York, is the nearest approach to a positive offer yet heard, but even this shows the lack of confidence on the part of the proposed company which has been manifested by capitalists generally.

The proposition of Mr. Wilson resolves itself largely into a request for the city to advance $35,000,000 for the building of this road, and leave but $15,000,000 to be supplied by a syndicate. This plan can hardly be carried out without special legislation, as the law expressly forbids the city to lend its credit to any private concern. But aside from this the proportion of capital to be furnished by the city is so large that it would be but a small step further to have the city undertake the entire work. It is generally conceded that although this work, if undertaken, will involve an expense of from fifty to sixty millions of dollars, there is every evidence to show that a fair return on this investment could be earned. The magnitude of the sum is probably the greatest cause of the shyness of capital, and it must be satisfactory to electrical engineers to see that the engineering possibilities which the scheme involves have not been seriously questioned, in spite of the departures from any present practice that would be necessary.

* * *

The Feeder Patent. We print elsewhere two communications in regard to the Edison Feeder Patent, recently sustained by Judge Green of the United States Circuit Court at Trenton.

The full text of Judge Green's decision has not been given out at this writing, and it is not likely to be until after the annual meeting of the General Electric Company.

A thorough investigation of this case, of the evidence introduced, and of the manner in which it was procured, leads to the conclusion that the only influence which this decision will ever have has been felt already—on the stock market.

If brought before a higher tribunal, the case would be tried under very different conditions from those which existed in the recent proceedings.

The relations of some of the leading manufacturing concerns have changed materially in the past two years.

If any attempt whatever is made to use this decision for the benefit of the General Electric Company in actual business transactions, we shall be greatly surprised. No such attempt will be made upon those who know the facts, and the facts are easily attainable.

* * *

IT LOOKS as though Monopoly would be taught a wholesome lesson in the city of Detroit.

* * *

THE annual statement of the General Electric Company will be a tip-topper. It will show a greater volume of business than has been done by the Westinghouse and General Electric Companies combined.

* * *

IN RESPONSE to several requests for information on the subject, we are pleased to state that the lamp referred to in our editorial of last week on "Alternating Current Lighting" was the Helios arc lamp, letters patent for which were issued to the Helios Actien Gesellschaft für Electrische Licht und Telegraphenbau, of Ehrenfeld-Cologne, Germany. The lamp is now made in this country under license by the Helios Electric Company of Philadelphia.

The graves of Benjamin Franklin and his wife are in bad condition through neglect, and G. Wilfred Pearce, of New Brunswick, N. J., has issued an address to the electricians of the country urging them to raise money to put the tomb in good condition. In his appeal Mr. Pearce says: "The estimated cost of repairing tomb and making fence and tablet is $1,000, and in order that all may contribute I would suggest that 10 cents be the sum from each subscriber. If there are others who care to give larger sums an endowment fund will be created and the income devoted to keeping the tomb in repair for many years to come."

Trust Methods.

They Make Their Own Discounts on Bills Payable.

An instructive example of the peculiar methods practised by the General Electric Company has recently come under our notice, which confirms what we have long maintained, that their manipulation of finances is a law unto itself.

Not long ago the Generalissimo of this huge octopus placed an order with a single firm for goods aggregating in value something like $200,000. The party who had accepted this contract, believing he had "struck ile," was boasting to a friend what a good deal he had made. His friend, who had been through the mill, replied, "Yes, that is all right, but wait until the General Electric Company has to pay for the goods and you'll find they will discount your bills in a lively way."

Thinking there might be some truth in the suggestion, before shipping the last instalment of the goods to complete the contract, the General Electric Company was written to for a settlement. A settlement was tendered in the form of a check made out for $12,000 less than the amount of contract. Promptly a reply was sent that until the balance of $12,000 was remitted the last consignment would not be shipped.

The usual amount of bluff, bluster, brag and bounce was at once resorted to by the Trust, who threatened condign legal punishment if the goods were not shipped at once.

They were not shipped, however, and when it was discovered that the bluff and bluster didn't scare, the balance was paid and the goods at once forwarded.

Shortly afterwards the General Electric Company wanted to place a much smaller order with the same firm. *The order was declined*, with the information that the contractor, having had one experience of General Electric methods, had no hankering for a second ; he could not and would not do any more business directly with the Trust ; if, however, the local company for which the goods were being ordered by the Trust cared enough for the goods to order them direct, the order would be accepted and filled.

And that was what had to be done. The General Electric Company had to come to time; it disgorged the $12,000, the local company ordered its goods and got them, while the Trust had found some one whose stricter and more honorable business methods it had to yield to.

Said the contractor himself only a few days after, "I believe that is only a typical instance of what they are doing right along, which means that the days and doings of such a Trust are numbered."

General Electric.

Common-Sense Statements from Boston.

(*From the Commercial Bulletin.*)

Of course the Electric Trust is different from the Whiskey Trust in the men who manage it if in nothing else. Yet there are points of similarity in each. The Electric Trust does not even enjoy the monopoly of its business to the same extent as the Whiskey Trust, and we record the prophecy right here that eventually General Electric stock will be selling for $50 per share. It may take months, perhaps even a year or two, but the drop will come. It will come slowly, because the stock is held in large blocks by rich men whose faith in it remains as yet to be shaken.

It may seem like heresy to say anything against the stock of this much watered Electric Trust, and we shall no doubt be roundly criticised, but the inherent weakness is there, and some day it is bound to be uncovered. Just consider the capitalization of this concern and what that capital represents. The preferred and common stock outstanding amounts to about $35,000,000; then there are $10,000,000 debenture bonds and $500,000 T.-H. collateral trust bonds redeemable at 105 after July, 1899, making a total of $45,500,000 interest bearing securities outstanding.

At the time of the consolidation the manufacturing plants and real estate of the Edison Company were valued at $6,057,368, and that of the Thomson-Houston could hardly have been any more if as much, but call it $15,000,000 as the value of plants and real estate of both companies and we have $30,500,000 to account for under the head of "water," "earning capacity," and "stocks and bonds of other companies." If memory is correct, these same stocks and bonds came pretty near putting the Thomson-Houston into the same hole which the Westinghouse Company got into at the time of the Barings failure in 1890. It was impossible to borrow money on them, and had it not been for the assistance of a State street house, the Lynn company might not have been any better off than its Pittsburg competitor who had no one to furnish assistance to tide it over the tight money period.

But to return to the subject in hand. Here is this immense load of water upon which to earn and pay big dividends, and people in the electrical business say that with increasing competition and the natural downward tendency of prices, it cannot be done, and sooner or later the question of reducing the 8 per cent. dividend rate on the common stock must be faced. Much talk of big surpluses earned each year is heard, but if these surpluses are not fictitious, why the necessity of constantly issuing the 5 per cent. bonds to provide working capital? The so-called surplus will doubtless be found to be analogous to that famous Whiskey Trust surplus of last December.

General Electric agents on the road acknowledge that their foremost competitor is taking business away from them here in the East, and a salesman familiar with the Western trade says that the company ran behind $500,000 at their Chicago office last year. The Chicago office is the third largest of the company in the country, but all through the West the General Electric is said to be not holding its own. Now with this keen and cutting competition going on all the time, and prices gradually getting down to a competitive basis, what must be the result to a company which is obliged to pay the enormous interest charges of the General Electric ? What, but an ultimate reduction in the dividend rate of the common stock.

Westinghouse Business.

The reorganization of the Westinghouse Electric Company went into effect April 1, 1892. A review of the company's business for the year ended April 1, 1893, published in the Pittsburg *Times*, shows that the number of employees has increased from 1,000 to 3,500. During March, the twelfth month of its fiscal year, the company manufactured and shipped goods to the value of $857,000, making the total output for the year about $5,800,000. The increase in the present capacity of the works as compared with the beginning of the year is nearly 100 per. cent., by reason of the addition of new machinery and the lease of the old Air Brake Works in Allegheny. The net earnings after providing for all ordinary and extraordinary expenses have averaged 25 per cent. of the amount of the sales, so that the earnings for the year ending March 31 will add between $1,100,000 and $1,200,000 to the surplus of the company after providing for the 7 per cent. dividends on the preferred stock.

Mr. Rae's Estimates.

They Rattle the Detroit Combine.

Much discussion has been stirred up throughout the country by the publication in ELECTRICITY of the estimates of Mr. Frank B. Rae on the cost of equipping and maintaining a municipal plant for the city of Detroit.

As was to be expected, the chief criticism comes from the officials of the company which endeavored to throttle Detroit, but which evidently overreached itself, and is now likely to be itself knocked out.

Mr. Rae has had occasion to reply to a criticism in the *Tribune* (Trust organ) and says in part:

> The cost of operation of the present lighting plant, which, however desirable it may be to justify to the directors of the Electric Light Company, is no criterion for a basis of cost of maintaining the class of apparatus upon which my estimates are made.
>
> It will certainly take any business man more than ten minutes to determine that these estimates are "unreliable in nearly every particular." No business man, not thoroughly conversant with the engineering problems involved, would undertake to criticise them at all; and criticism that attacks an engineer's reputation from behind the doors of the editorial column by simply calling his work "grossly inaccurate and unreliable" will hardly have weight with the few intelligent readers of the *Tribune*. It requires no brains to say an engineer's figures are wrong; but it will take more than are possessed by the writer of the editorial referred to to prove that a lighting plant cannot be put in and operated within the figures of my estimate.
>
> As stated in my communication to the Mayor, the estimates made are considered conservative; and capital could be induced to undertake the construction under them; and I understand that one of the largest contracting companies has already signified its willingness to undertake the work.
>
> I desire to say formally, as the papers have stated informally, that I am prepared to meet Mr. Fitzgerald or others of his company at any time and discuss the estimates and cost of operation item by item, which, it seems to me, is a more manly way of settling the controversy than is adopted by the *Tribune* man, who hides behind the editorial column fence and throws mud.

Mayor Pingree has received a communication from Siemens & Halske in which they say:

> "Assuming that length of 'pole line,' cost of 'real estate' and other variable quantities are correct, we have gone over estimate No. 1 and made careful determinations, and find that the total cost of the installation will not exceed the estimate, and that cost of operation, depreciation and repairs are very liberal. As contractors, we would be pleased to undertake the work at prices given in estimate No. 1."

The following, from the *Tribune*, is suggestive:

> Manager Fitzgerald of the Detroit Electric Light and Power Company held a consultation yesterday with Alderman Robinson, chairman of the public lighting committee of the Common Council. Mr. Fitzgerald informed the alderman that the company was ready to begin negotiations at any time for the sale to the city of the towers, poles, wire, lamps and dynamos used for public lighting, the price to be fixed by arbitration.

Current Items.

The "Low Sanitary Car" is undergoing tests at Chicago, Toledo and other Western cities to determine its suitability for summer traffic on electric street railway lines. It is a "reversible" car, and can be either open or closed. By a dexterous movement the sides of the closed car are converted into the seats of the open car, facing the residences along the street. The windows slide into the backs of the seats. The change can be made in three or four minutes.

Capt. W. H. Schley, U. S. N., has invented an electric buoy system which is intended to make navigation safer in entering harbors in thick weather and dense fogs. His plan is to have all the buoys in a harbor on a single electric circuit and to have electric lights and electric bells on each of the buoys. He is now at Chicago arranging for the establishment of an experimental plant which is to cost $25,000.

BOOK NOTICES.

WILLIAM GILBERT OF COLCHESTER, ON THE LOADSTONE AND MAGNETIC BODIES, ETC. TRANSLATED BY P. HENRY MOTTLELAY. PUBLISHED BY JOHN WILEY & SONS, New York.

This celebrated work of William Gilbert, physician, of London, written and published about the year 1600 in Latin, has come to be appreciated as the first authentic work treating of magnetism and electricity. *De Magnete* included not only all the previous knowledge and experiments in this field, but a wonderful amount of original research which placed this work so far ahead of its time that it is only in the light of modern science that its merits have been recognized.

It is probably for this reason that the name of Gilbert was allowed to fall into comparative obscurity, as notwithstanding the marked impression that his work created at the time, its real value was evidently unappreciated.

The present and only English translation of this work of Gilbert's, published by John Wiley & Sons, bears evidence of the most careful research on the part of Mr. Mottlelay, whose efforts to make this work complete have extended beyond a faithful translation to the collation of the numerous and obscure references contained in the original publication, as well as the more recent commentaries upon it.

The book is prefaced by a biographical sketch of the author, containing a large number of extracts from prominent writers which go to prove the esteem in which Gilbert was held as a scientist and philosopher in his day. The translation proper is divided into five books, which treat at considerable length of the phenomena of magnetism and show clearly the extent of the author's investigations and the logic of his deductions. The original illustrations are accurately reproduced as well as fac-similes of the title pages of the early Latin editions. The book is printed on heavy paper, handsomely bound and will be found a most acceptable addition to electrical literature.

THE VOLTAIC CELL. BY PARK BENJAMIN, LL.B., PH.D. JOHN WILEY & SONS, Publishers, New York. 526 pages. Price, $5.00.

This is a very complete description of the most important cells of various types, commencing with the earliest history of chemical generators. It contains a chapter on the general definitions of electrical units, and one on the method of measurements and the capabilities of the cells.

The remaining chapters are devoted to the various cells and their chemical reactions, which are classified according to their respective types, and also include considerable data and numerous tables compiled by recognized authorities which will be found of much practical use to the student in this branch of electricity. The book constitutes the most extensive treatise on this subject yet published.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. TRANSACTIONS, Vol. IX. JANUARY, 1892—DECEMBER, 1892. Published by the Institute.

The present volume of the Transactions of the Institute includes the papers read at the regular meetings, most of which have been published in ELECTRICITY in abstract. Volume IX is considerably larger than any of the preceding numbers and points to the constant extension of the researches embodied in the papers read. The membership has been increased by sixty-three names during the past year.

At a meeting of electrical workers held at Utica a few days ago, Henry Bond, of Buffalo, in some remarks said "he thought it a privilege to look into the faces of men who are dealing with a force almost akin to the force of God, akin because we do not know just what it is."

Chicago Notes.

The Cornish Electric Company have secured offices in the Monadnock Building, from which they will hereafter conduct their business. The company confine their work exclusively to electric light installation, and report an excellent business.

W. D. Packard, secretary and treasurer of the Packard Incandescent Lamp Company of Warren, Ohio, was in the city last week.

Wells Goodhue and William Taylor, of the firm of Taylor, Goodhue & Ames, spent a portion of last week in St. Louis, making arrangements for handling the Wagner direct and alternating motors.

The Electrical Installation Company have recently been organized, and have secured quarters in the Monadnock Building, from which they expect to conduct a large business in installing and equipping electric light and street-railway plants. The company will make a specialty of furnishing plans and drawings for complete plants, including generators, steam engines and boilers. J. I. Case has been elected president, C. H. Holmes vice-president, L. E. Meyers secretary and treasurer, and A. L. Shewmen general manager.

The Electric Light bill which is before the Illinois Legislature for its second reading is creating considerable interest, especially among stockholders in electric light companies and central station men. The bill provides that when 3,000 voters of Chicago, or one-quarter of the voters of any other city, shall petition the County Judge that officer shall submit the question of establishing an electric light or gas plant to the voters at the next regular election. The people shall then have the right to declare whether or not private consumers shall be supplied from the municipal plant. The application of the bill will be limited to such cities as have private plants. There is no opposition to the measure from the smaller towns and cities, because they have not as yet, with few exceptions, granted franchises to electric light companies. Representatives of electric light companies from Joliet, Jacksonville, Ottawa, and one or two other towns were on the floor of the Senate in opposition to the measure. The bill with the amendment will be taken up for discussion next Tuesday. Its chances of passing the Senate are reasonably good, particularly since the Thiele amendment relieves it of objectionable features. The only thing that will kill it will be the opposition of the electric light companies already in business. The bill is known to have been framed by a prominent Chicago man who has made municipal ownership of electric light plants a special hobby, and it is expected to apply more directly to Chicago than any other city of the State.

Boston Notes.

Work is being pushed on the new Union Depot on Causeway street, this city, that is to accommodate all the northern traffic. Some portion of it will necessarily have to be built on piles over the tidal water and several draws will have to be constructed for the convenience of shipping along the Charles River. It is expected that the lighting as well as power for operating the draws, elevators, etc., will all be electrical, which will necessitate one of the largest isolated stations in the world.

The town of Braintree, Mass., having adopted the Municipal Lighting Act, has built and equipped a central station plant, from which some ninety arc lights are being run for street illumination. At the present time two Westinghouse alternating current dynamos are being installed for supplying 2,000 lights. The citizens take to the new illuminant with keen relish.

There is great rejoicing among the men employed by the West End Railroad Company at its electric power station, Albany street, this city. The company has notified the men that in future the working time will consist of fifty-six hours per week, being a reduction of four hours, while their wages have been increased 20 per cent. The men fully appreciate this liberal concession.

Matters were more than a little interesting at the State House two days last week when hearings took place before the Committee on Street Railways on the petition of the Storage Battery Railway Company, of Cambridge, for power to run cars over the tracks of the West End railroad in that city. The latter company is determined to oppose the petition by every means at its disposal. During the hearings some interesting data, pro and con, were adduced and strong arguments were made by counsel for both sides.

Fast Day brought about a resumption of traffic on one or two electric roads in Massachusetts which connect with the popular beach resorts. Owing to the blinding fall of snow that set in early in the morning and continued for six or seven hours, the season's opening was not an auspicious one, but every one interested is sanguine that should the coming summer be a fine one the roads are sure to do a bigger and more profitable business than ever, and with this end in view extensions are being made on several roads.

The city of Lynn has long been known as one of the foremost shoe manufacturing cities in this country. It is fast becoming a race between leather and electricity as to which shall in future occupy first place there. Not only, as is well known, are the mammoth works of the General Electric Company located there, but several other electrical companies have recently organized and started in business in Lynn. Prominent among these is the Heinze Electric Company, which manufactures a complete line of high grade electrical measuring instruments, including volt and ammeters, and other station instruments, for which they are enjoying quite a brisk demand. Then there are several supply and construction companies. Quite recently too the enterprising young men connected with these various companies, together with some employed by the General Electric Company, have organized an electric club or society, somewhat in character like the Thomson Scientific Club, which is doing such useful work for its members.

Since the opening of the long-distance telephone line between Boston and Chicago, a few weeks ago, there has been a most satisfactory business done between the cities. Business men have not been slow to avail themselves of its aid, and though the rates at first appear somewhat high, the money made and saved and the expedition with which business can now be transacted demonstrates daily that it is a cheap and valuable medium of communication for all who use it.

General News.

What is Going on in the Electrical World.

Rockville, Md.—The Tennallyton and Rockville Electric Railroad is being double tracked to Bethesda Park.

Lansing, Mich.—The matter of equipping the Capitol buildings with an electric lighting plant is under consideration.

Buffalo, N. Y.—The Buffalo and Williamsville Electric Railroad was formally opened on the 4th inst. It is 4½ miles long.

Peekskill, N. Y.—The route of the new electric railway has been laid out and men will be set to work on the road in a few days.

Hastings, Neb.—The Hastings Electric Light and Power Company's plant has been sold at sheriff's sale to D. M. Leland for $15,000.

Pawtucket, R. I.—The Interstate Railway Company has begun work on the electric road that is to connect this city with Providence.

Urbana, Ohio.—An electric line between Urbana and Springfield is a topic of interest here which will probably result in the road being built.

Little Rock, Ark.—The conductors and motor-men of the City Electric Street Railway Company have petitioned the company for a reduction in working hours.

Ashtabula, Ohio.—At a recent town election the proposition to bond the town for $150,000 to pay for an incandescent plant was carried by a large majority.

Brazil, Ind.—The electric line between Brazil and Terra Haute is again engaging attention, and one of the interested parties is quoted as saying, "It will be a go."

Dowagiac, Mich.—An effort is being made by our business men to get an Electric Headlight

Manufacturing Company to remove from New York and locate here.

Newark, Ohio.—The signature of the Mayor has finally been attached to the contract for the installation of the Thomson-Houston electric light plant in the city.

Gloversville, N. Y.—Fred A. Caten has been appointed superintendent of the Cayadutta Electric Company. The office of the company will be located in Gloversville.

Addison, N. Y.—D. H. Darrin, electrical engineer, of Buffalo, is preparing plans for an electric light plant for this town to be in readiness for operation by August 1.

Brooklyn, N. Y.—The Grand street road is receiving its electric equipment, and Bowery Bay and neighboring places will shortly participate in the benefits of electric transit.

Florence, S. C.—Among the twenty-five buildings destroyed by fire here on the 3d inst. was the electric light station, and the destruction of the plant has deprived the city of electric lights.

San Francisco, Cal.—The W. A. Woods Manufacturing Company, dealing in mining and electrical machinery at 645 Mission street, has failed for $18,252. The assets as scheduled amount to $14,764.

Roseville, N. J. — The car-house of the Orange electric railway line was totally destroyed by fire on the 3d inst. Twenty-six cars, costing $3,000 each, were burned, and the total loss is over $100,000.

Wilmington, Del.—A meeting is to be held here on the 13th instant to organize the company, appoint its officers and take the necessary measures to begin the construction of an electric railroad to New Castle.

Toronto, Can.—The annual report of the Royal Electric Company showed gross receipts of $189,765, expenditures $118,967; leaving a balance of $70,798, being a fraction over 10 per cent. on the capital.

Trenton, N. J.—A scheme is on foot to erect a dam over the Delaware River, a short distance above this city, for the purpose of forming a water power for an electric plant for light and power service in this neighborhood.

Charleston, S. C.—The street railway cars of Charleston are still operated by animal power, but there is prospect of a change to electricity as it is reported the system has been purchased by outsiders with that purpose in view.

Butte, Mont.—The Smith Electric Company and Kinney & Jackson have sold their electric and construction business to the Montana Electric Company. This places the electric supply business in the hands of one company.

San Antonio, Tex.—A trial is to be made on the Southern Pacific Railroad of a storage battery for lighting the cars, an invention of Boyd Anderson, chief engineer of the Texas-Mexican Electric Light Company's power station.

Bridgeport, Conn.—A syndicate of capitalists, headed by Colonel N. H. Heft, formerly of Easton, N. J., has purchased the Bridgeport, Conn., Railway, now using horses for motive power, and will made an electric railway of it.

Cleveland, Ohio.—City Electrician G. M. Hoag has submitted maps and plans for a complete system of conduit for electric wires in the business part of the city. The plans of Mr. Hoag provide for 106,923 feet of conduits at an estimated cost of $91,803.

Long Island City.—$100 reward is offered by the president of the Electric Illuminating Company of Hunter's Point for information that will lead to the arrest of the thieves who cut and carried off 2,500 feet of copper wire from the poles of the company.

Brunswick, Ga.—The Brunswick and St. Simons Street Railway has been purchased by A. H. Lane, Judge A. J. Covatt and Judge Bolling Whitfield, of Brunswick, and William O. Allison, of New York, who will convert the road into an electric line.

Norwalk, Conn.—An attempt was made to wreck the engine at the electric light station a few nights ago by the placing of a quantity of emery in the oil cups of the eccentric rod. Fortunately the fact was made apparent in time to avert serious damage.

Tampa, Fla.—There are now three electric light companies in Tampa, the Consumers' Electric Light and Street Railway having gained a footing. As this company has a fine dam and powerful head of water it will have some advantages over its rivals.

Altoona, Pa.—A meeting will be held here on the 14th inst. to discuss "the advisability of making a donation to any electric street railway company that might feel disposed to accept their offer to assist in laying a street car track from some connecting point in Altoona to Newburg."

Franklin, Mass.—The Woonsocket Electric Company having absorbed the Union Electric Light Company, the office of the latter company in this place has been closed. The wires will be connected and current for our electric lighting service will be supplied from the Woonsocket line.

West Chester, Pa.—It is apparent now that the Lancaster and Philadelphia Electric Traction Company's road will be pushed forward, and if the predictions of the *News* are verified, before many months electric cars will be whirling alo the Chester Valley at the rate of fifty miles per hour.

York, Pa.—The Edison and Westinghouse Electric Light Companies of this city are indulging in a rate war. The Westinghouse Company started their plant about a month ago, immediately after which the Edison Company reduced rates. The Westinghouse people have made another cut.

Lebanon, Pa.—W. P. Coldren, of this city, has invented a device for controlling the brake and current of electric cars with one lever. It has been subjected to practical tests and worked successfully. Steps will be taken at once for its general introduction throughout the country, and for exhibition at the World's Fair.

McKeesport, Pa.—The electric light station recently burned is being temporarily restored. The boilers were found to be very slightly damaged. The old dynamos, which were entirely ruined, have been taken away and new ones are being installed. A new station will be built as soon as arrangements can be made to begin the work.

Long Branch, N. J.—Preparations for the new electric railway to run from North Long Branch to Red Bank are in active progress. The road will start at North Long Branch, connecting with the Pleasure Bay horse cars, and go to Red Bank by way of Port-au-Peck, Elkwood Park, Monmouth Park, Oceanport and the Scuffletown road.

Philadelphia.—The Mayor's message, given to the public last week, is strongly in favor of putting all electric wires underground; it praises the Municipal Electrical Bureau "as the finest equipped and most practical" body of the kind in this country, and advocates city ownership of electric lighting plant. The message states that there are 2,650 arc lights in use by the city and 700 will be added this year.

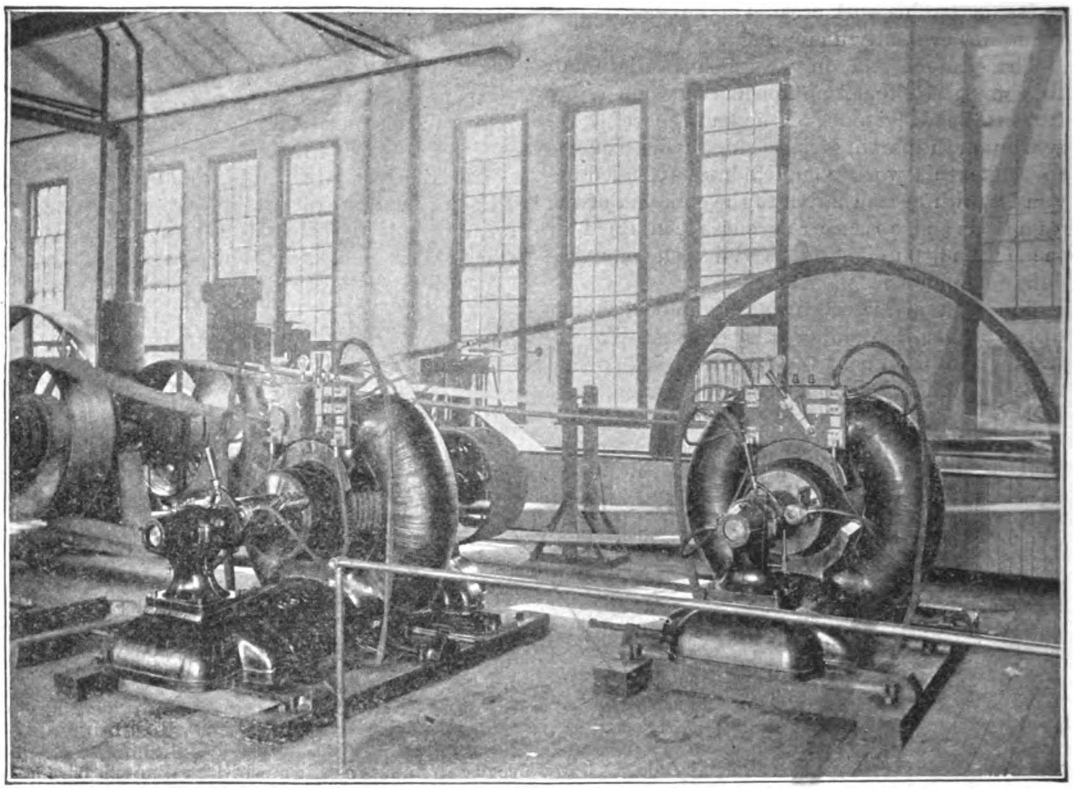
Montclair, N. J.—At the annual town meeting last week a motion was adopted to the effect that a town meeting must be called to act upon any franchise asked for by an electric railway company to lay rails in the streets, and no franchises is to be approved except such as provides for regulation of construction and rates of fare, for limitation of life of franchise, and for compensation to the town through a percentage of gross receipts.

New York.—The Telephone and Telegraph Company, which controls the long-distance lines, has again increased its capital, this time to $7,000,000. The increase is stated to be the outcome of continued growth of construction.—An attachment for $23,267 has been issued against the Ongley Electric Company, No. 1 Broadway, in favor of T. W. Robertson, the president of the company. The company was incorporated under the laws of New Jersey and has a factory in Hoboken, N. J.

Hoboken, N. J.—The West Hoboken council has granted the North Hudson Railroad Company permission to operate lines by electricity and the Jersey City, Hoboken and Rutherford Railway Company permission to lay track, erect poles and operate an electric road on the Paterson Plank Road and Summit Avenue.

Fall River, Mass.—The petition of the Fall River and Taunton Electric Railway Company for a charter for their proposed road to Taunton is in the hands of a legislative committee, where it has met opposition from the Taunton Street Railway Company, on the ground that the proposed line would parallel and compete with about four miles of the latter company's tracks. The entire length of the proposed road is 16½ miles, viz., 1¾ miles in Fall River; 6¼ miles in Somerset; 4¾ in Dighton; 3¾ in Taunton.

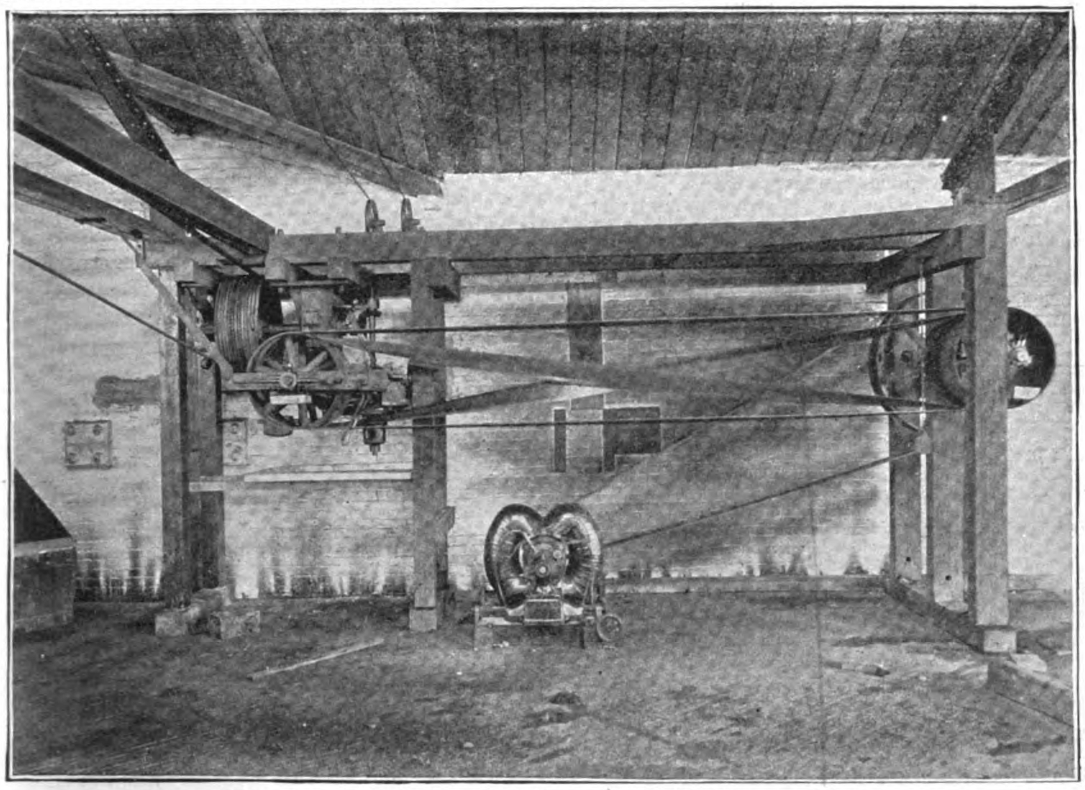
Hartford, Conn.—The *Courant* says: "The Waterhouse Electrical Manufacturing Company has recently been incorporated in London with a capital of $100,000. The Waterhouse brothers, the well known electricians and manufacturers of arc lamps, of this city, are in the London enterprise. Addison G. Waterhouse, the inventor, has been in England for several months overseeing the arrangements there. Mr. Gamble, the Ohio man, who is also in the firm of Waterhouse, Gamble & Company, is interested in the English concern. The new concern will go into a general electrical manufacturing business and looks for large orders in a field that is only just opening."



C. & C. DYNAMO. WORKS OF FRASER & CHALMERS, CHICAGO, ILL. (FIG. 1.)

Electric Power Transmission in Factories.

The advantages of equipping large mills and factories entirely with electric power are beginning to be appreciated by those interested in such work, and the number of such installations that will be put in during the next few years will undoubtedly be very large. Commenting upon this fact the C. & C. Electric Motor Company present several considerations. They first direct attention to the fact that where electric power is used the saving of power otherwise lost in belting, shafting and gearing is a very large item and increases rapidly with the size of the plant. Varying with the character and arrangement of the factory this loss ranges from 25 to 50 per cent. of the entire power generated and consumed in the factory. Again, in almost all manufacturing establishments the individual machines do not run constantly but are stopped or run idly for periods varying from a fraction of a minute to several minutes at a time. Here another great saving effected by the use of electric distribution is demonstrated. Under the old system the throwing on or off of small machines makes practically no impression upon the great moving mass of shafting. With electric power, however, the instant a single machine is stopped or runs for a moment on a lighter part of its work the current supplying the motor is reduced and the effect is felt instantly at the cut-off of the engine through the dynamos. Steam is thereby saved and the demand upon the coal pile lessened. Another point which merits attention is the cost of renewal and repairs of shafting and belting, which can be reduced to a minimum by means of electric distribution of power, as the line once put up never loses its initial efficiency.



4,000-lb. Elevator Driven by 20 h. p. C. & C. Motor. (Fig. 2.)

A good electric motor requires very little attention. No special knowledge is necessary and very little time is taken up in keeping it in good condition.

An advantage worth noting is that with electric power any part of the works may be run independently of the rest, and power may be obtained at any point with the greatest facility. For example, where one department is required to run overtime all the others can be cut off in the engine room, and no power is wasted, and where power is required for temporary use at different points, the motors may be moved about and connected into circuit where the work is to be done. When new machinery is to be put in, all that is required is to run a pair of wires. which can go anywhere around corners or through floors without difficulty or additional loss, and connect them to the motor.

Another advantage of electricity is seen in transmitting power from floor to floor or through walls, no belt holes being required, the wires being run through tubes of insulating material, thus avoiding any opening whatever. Openings in floors always tend to increase insurance rates and are likewise more or less dangerous to employees.

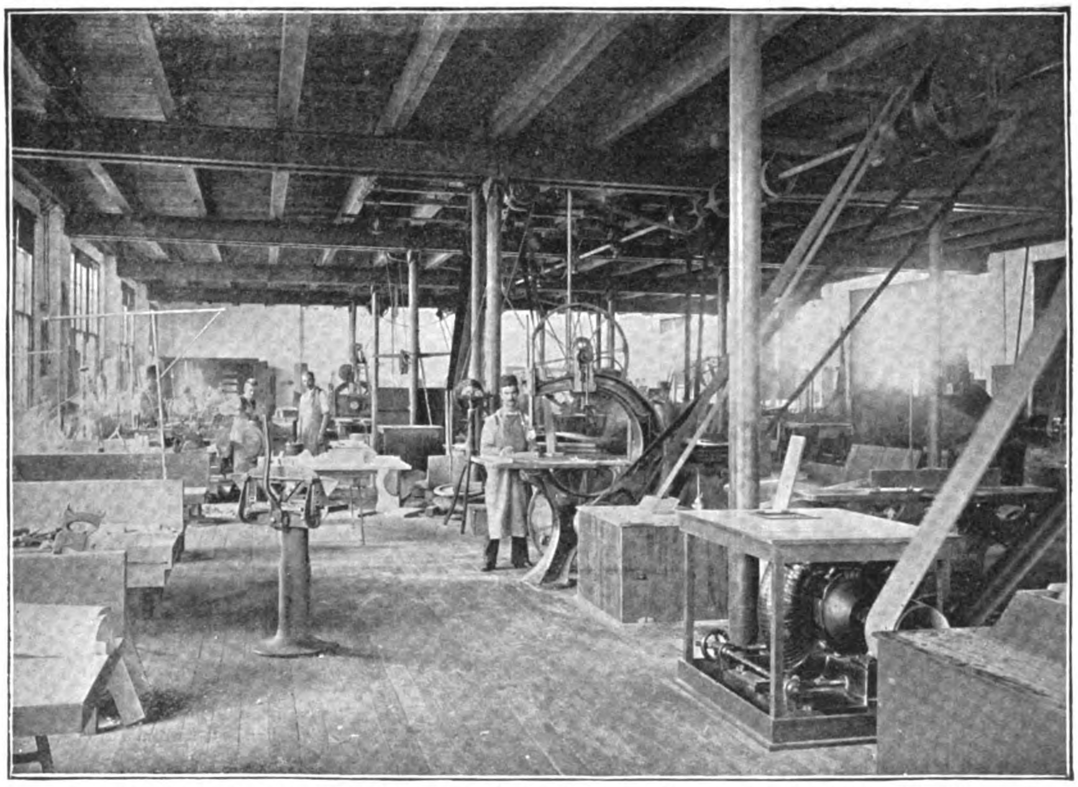
Still another feature of electric power is the opportunity afforded to measure accurately the power used in any department or in the whole factory. A recording wattmeter in the dynamo room gives a constant and accurate record of the daily consumption of power, while the ammeters on the switchboard give the power being used in any circuit at any time. One of the valuable results of this is that the attendant in charge is enabled to note any unusual load, which would lead to seeking and remedying the trouble.

The number of circuits from the engine room is, of course, determined by the nature and extent of the plant and of the work therein. A large number of separate circuits increases the first cost but may be more economical in the end.

By the use of electricity both light and power can be obtained with equal facility from one dynamo if desired. It is not necessary now as formerly to have a collection of various dynamos in the engine room for the purpose.

Electric power means perfect cleanliness in the factory, something particularly desired by many manufacturers; for example, in textile fabric mills and dye works, where the loss from soiled material is very great and largely due to dust and oil from belts and shaft hangers.

The illustrations shown herewith of the new works of the Fraser & Chalmers Company, at Chicago, Ill., furnish an excellent example of electric power distribution in works occupying a number of buildings and covering a large area.



Pattern Shop: Planer, Saws, Lathes, etc., Driven by C. & C. Motors.
(Fig. 3.)

This concern is one of the largest manufacturers of mining machinery, steam engines, boilers, etc., in the country and its works are entirely equipped with electric motors of the C. & C. Company's type.

To cover the ground occupied by any other method would require costly and wasteful mechanical contrivances which would be constantly liable to breakdowns.

Separate engines and boiler for each building can hardly be considered on either first cost or cost of operation, in comparison with electricity from a central power house.

The power house is located away from the main buildings and near the centre of the works. From the power house run three substantial circuits delivering current with a loss of from 2 per cent. to 5 per cent. to motors in the foundry, pattern shop and boiler shop. In the power house are two C. & C. 80 K. W. Standard Compound dynamos driven by two Fraser & Chalmers Corliss engines. These dynamos are designed to deliver current at 250 volts. regulating automatically for all loads, and supply power and incandescent light for the entire works.

Fig. 1 shows the arrangement of the dynamos, and Fig. 2 the switchboard, which is placed at a convenient point in the engine room. The three main circuits are brought to the switchboard and are connected through double-pole switches to the dynamo bus bars at back of switchboard. Each circuit has its independent ammeter showing the power consumed in each department at all times.

A voltmeter with switch for connecting to either dynamo is mounted in the centre of the board and regulators for changing the voltage if desired are placed immediately below, as shown.

The switchboard is arranged to be enlarged as more circuits are required. The motors throughout the shops are provided with automatic cut-off starting switches, so that when the current is cut off at the main switchboard each motor is cut off from its circuit. This prevents the possibility of injury to motors from the current being suddenly thrown on them from the power house.

In the foundry the 65 H. P. motor runs a 6 and a 4 Root blower, supplying blast for the cupola furnaces. The motor is belted to the blowers. Here is also a 4,000 pound Reedy elevator driven by a 20 H. P. motor, shown in Fig. 3. For handling heavy castings, moulds, etc., there is a Yale & Towne jib crane worked by two Standard C. & C. motors. The hoisting and lowering motor is of 7½ H. P. capacity, working up to 12 H. P. maximum, and the trolley motor is 5 H. P.

A general view of the pattern shop is shown in Fig. 4.

The power equipment consists of a 25 H. P. motor and a 20 H. P. motor which run a 24-inch planer, cross-cut and rip saws and 2 band saws, also 4 lathes and 1 grindstone. There is also a 15 H. P. motor running an elevator in this department.

Fig. 5 shows a view of the boiler shop looking from end to end. This shop contains a great deal of heavy machinery, and the freedom from line shafting and counter belts is noticeable. Most of the machines are divided into groups of two or three driven by one motor, though in some cases there is a separate motor for each machine.

There is a 5 H. P. motor running boiler-plate shear and large upright drill; 10 H. P. motor running large hand punch, bevel shear, turret lathe and 16-inch shaper; 10 H. P. motor running slitting shear and large boiler-plate punch; 5 H P. motor running boiler-plate punch, shear and small vertical drill; 10 H. P motor running 10 foot boiler-plate roll and 20 foot plate planer; 10 H. P. motor running a Williams, White & Company's bulldozer; 10 H. P motor running a large bevel shear, upright drill and punch; 5 H. P. motor running 2 sets of 5 foot sheet iron rolls and automatic sheet iron punch; and a 5 H. P. motor running a No. 1 Root blower supplying draught for forge fires.

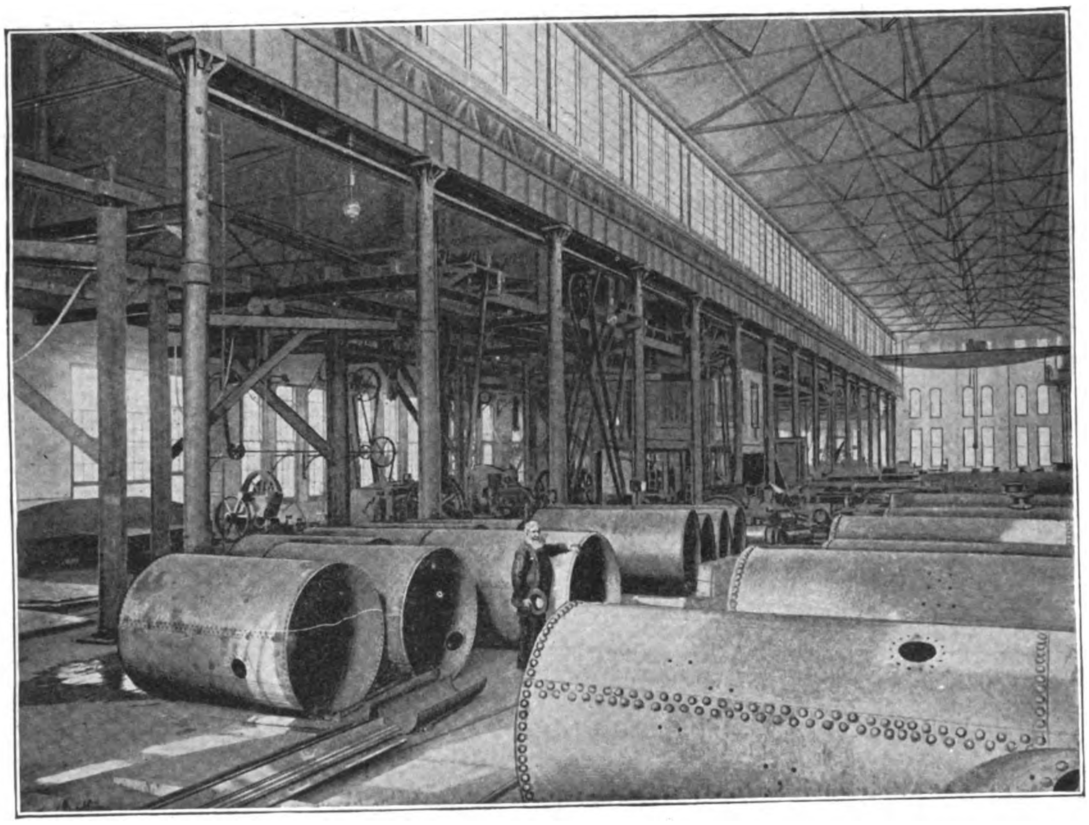
The C. & C. Electric Motor Company have also equipped the works of the De La Vergne Refrigerating Company at the foot of East Eighteenth street, New York City, and the Brooklyn Cooperage Company, Brooklyn, N. Y., with their machines, both of which plants have given perfect satisfaction.

Queen & Company, Incorporated.

Queen & Company, Incorporated, Philadelphia, are making a special drive of their "Magnetic Vane" Ammeters and Voltmeters, which instruments are favorably known throughout the country.

They are adapted for constant switchboard use, and will render service twenty-four hours per day without disadvantage. This is an important feature and will be appreciated by those familiar with the subject. A number of the larger manufacturing concerns use the meters for installation work as they present great advantages in being constant, accurate, durable, handsome in appearance and low in price. More than twice as many were sold in 1892 than during the previous year.

Circular No. 420, which contains full information, will be mailed by the makers upon application.



Boiler Shop, Fraser & Chalmers. (Fig. 4.)

COMMERCIAL PARAGRAPHS.

The United Columbian Electric Company have nearly completed the arrangement of machinery in their new factory at Kingston, and it will be in full operation in a few days.

It is pleasant to note the full success of the Keystone Electric Company of Erie, Pa. They have recently purchased a site for a new factory, and will at once erect a building 50 x 100, two stories in height. The capital stock has been increased to $50,000.

The Belknap Motor Company, of Portland, Maine, have shipped their ten-ton exhibit to the World's Fair. This exhibit includes dynamos, motors, coffee mills, electric fans, combined engines and motors, and many other electrical contrivances. Mr. Brown, manager of the company, has invented a revolving sign which is unique, and which will undoubtedly attract considerable attention. It is a triangular frame, over which is a sheet of tin painted red on one side and blue on the other. Letters, giving the name of the company, location of factory, and appliances manufactured, are cut through this tin. Under the tin revolves a sheet of canvas decorated in different tints. As this canvas revolves the letters appear in varying hues. On the top of the frame is a row of various colored electric lights, and at each end a colored fan revolves. The power is furnished by a small electric motor situated in the center of the frame.

The Brown Electric Company, which carries a full line of lighting and railway supplies at its new store, corner of Summer and Federal streets, Boston, reports business in all its branches as more than satisfactory.

The Mather Electric Company, whose well known system of lighting and power is in use in many of the largest stations in this country, continues booking orders at a rate that is taxing its extensive factory at Manchester, Conn., to the utmost. One of its traveling representatives has just returned from an extended tour through South America, where he has done most excellent business, and where the future promises to be unusually prosperous and profitable for this company, the merits of whose system are widely known in that part of the world.

Canvasite, the new canvas-covered wire manufactured and placed on the market by the Circular Loom Company of Boston, is meeting with well deserved recognition everywhere. Mr. Brooks, the enterprising manager of the company, has just returned from a long Western trip during which he booked many large orders.

The Eastern Electric Cable Company, Boston, still continues to run its greatly enlarged factory night and day in the main hope of catching up with its orders. Though it has not a single salesman on the road, the merits of its specialties are so well known that the mail alone brings all its orders, and at the present time it is working on several contracts each of which calls for several million feet of wires or cables.

The W. S. Hill Electric Company, Boston, is to be congratulated on the success it is achieving with its petite generator, the "Columbian," which is being shipped to all quarters, while the demand for Hill switches, cut-outs and motors shows no sign of abatement.

Mr. Harry Bishop, General Western Agent of the Massachusetts Chemical Company, reports the sale of eighteen barrels of Insullac as one week's work. For the short time Mr. Bishop has been in the West introducing the compound, it speaks well for his ability as a salesman and also shows the merits of Insullac.

The Norwich Insulated Wire Company of this city have recently closed a contract with the Canadian Bell Telephone Company for the cables which are to be used in the new underground lines in Toronto. The entire system of the city is to be run in conduits.

INCORPORATIONS.

The Northport Electric Light Company of Northport, Suffolk County, N. Y. Capital, $25,000. Directors: J. W. Fowler, J. W. Olmstead, Charles T. Sammis, O. Darling and others.

The Pontiac Electric Light, Heat and Power Company, Pontiac, Ill. Capital stock, $40,000. Incorporators: Henry A. Foster, C. M. Hamilton and A. P. Foster.

The Kankakee Electric Railway Company, Chicago, has increased its capital stock to $60,000, and removed its principal offices to Kankakee.

The Hartford Electric Light Company, Hartford, Ind. Capital stock, $8,000.

The Montana Electric Company, Butte, Mont. Capital stock, $50,000. Incorporators: John O'Rourke, George T. Schmelzel, Seth B. Smith, W. T. Jackson, V. E. Poissant, C. L. Smith. The objects of the company are to deal wholesale and retail in all manner of electric supplies, machinery and fixtures, furnish, equip and regulate all kinds of electric plants, street railways, central stations and isolated electric light plants and all kinds of electric motors, also to carry on a general electro-plating business.

The Buffalo and Niagara Falls Electric Transit Land Company, Buffalo, N. Y. President, G. D. March, of Sherman; vice-president, W. C. Lindsey, Jamestown; secretary, John J. Young, Buffalo. The trustees include the above and A. J. Dean, Sherman; L. Bordell, Jamestown; Arthur A. Johnson, Buffalo, and E. A. Kibbe, Mayville. The company has bought twenty-five acres of land between Elmwood Avenue, Buffalo, and the Military Road at $2,500 an acre.

The Electric City Promoting Company of Buffalo. Capital stock, $20,000. To deal in real estate and promote business enterprises.

The Hudson River Traction Company, Tarrytown, N. Y. Capital stock, $5,000. Directors: E. M. Davison, J. M. Wainwright, A. J. F. Van Deventer and G. E. Rose, of New York City, and John W. Graynor, of Morris Park, L. I. The object is to construct and equip railroads and other works of improvement in the counties of Westchester, Putnam, Dutchess, Columbia, Rensselaer and elsewhere.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 4, 1893.

ELECTRIC RAILWAYS AND APPLIANCES.

494,705. Electric-Locomotive Regulation. Rudolph M. Hunter, Philadelphia, Pa., assignor to the Thomson-Houston Electric Company of Connecticut. Filed July 12, 1892.

494,721. Electric-Railway Trolley. Edward Martyn, Detroit, Mich. Filed Sept. 19, 1892.

494,871. Trolley-Pole Catcher. Edward L. Langheinz, Brooklyn, N. Y. Filed Nov. 10, 1892.

ELECTRIC LIGHTS AND APPLIANCES.

494,995. Cut-Out for Brush Lamps. Benjamin Adair and Charles H. Klewer, Denver, Col. Filed Nov. 18, 1892.

DYNAMOS AND MOTORS.

494,565. Controlling-Switch for Electric Motors. Warren S. Hill, Boston, Mass., assignor to the W. S. Hill Electric Company of Maine. Filed March 31, 1892.

494,608. Means for Switching Generators or Motors In or Out of Circuit. Nathan Van Denburgh and Frederick H. Loveridge, Chicago, Ill. Filed Feb. 23, 1892.

494,629. Commutator-Brush for Dynamos. David W. Dunn, Pittsburg, Pa. Filed Aug. 13, 1892.

494,739. Brush-Supporter for Dynamo-Electric Machines. Axel Ekstrom, Lynn, Mass., assignor to the General Electric Company of New York. Filed Nov. 16, 1892.

494,781. Circuit-Controller for Electric Motors. Warren S. Hill, Hyde Park, assignor to the W. S. Hill Electric Company, Boston, Mass. Filed May 16, 1892.

494,836. Dynamo-Electric Machine. Arthur S. Baxendale, Selangor, England. Filed April 22, 1892.

494,856. Electric Generator or Motor. Walter T. Goolden and Llewelyn B. Atkinson, London, England. Filed Jan. 3, 1893.

494,978. Electric Motor. Francis B. Crocker and Schuyler S. Wheeler, New York, N. Y., assignors to the Crocker-Wheeler Electric Company, same place. Filed June 20, 1892.

BATTERIES.

494,849. Separator for Battery Elements. Chamsonovitz P. Elieson, New York, N. Y., assignor of one-half to Francis A. Pellas, Oggebbio, Italy. Filed July 9, 1892.

494,852. Galvanic Battery. Derrick H. Fitch, Cazenovia, N. Y. Filed Nov. 22, 1892.

MISCELLANEOUS.

494,562. Telautograph. Elisha Gray, Highland Park, Ill. Filed July 16, 1887.

494,585. Means for Electrically Heating Crucibles. Willis Mitchell, Malden, assignor to the American Electric Heating Company, Boston, Mass. Filed June 13, 1892.

494,586. Apparatus for Electrically Heating Crucibles. Willis Mitchell, Malden, assignor to the American Electric Heating Company, Boston, Mass. Filed July 28, 1892.

494,587. Electric Coal-Mining Machinery. Edmund C. Morgan, Chicago, Ill. Filed July 6, 1891.

494,610. Electric Switch. George W. Webb, Wilkes-Barre, Pa., assignor of one-half to Walter Gaston, same place. Filed April 20, 1892.

494,657. Electric Meter. Milton E. Thompson, Boston, Mass. Filed May 19, 1891.

494,750. Switch for Electrical Currents. Henry P. Ball, Schenectady, N. Y. Filed July 1, 1892.

494,762. Electrical Annunciator. John B. Rogers, Washington, D. C. Filed May 31, 1892.

494,765. Means for Closing an Electric Circuit. Harry L. Tyler, Corning, N. Y. Filed Aug. 20, 1892.

494,786. Automatic Cut-Out for Electric Signalling-Boxes. Jacob F. Mehren, Chicago, Ill., assignor to the Gamewell Fire-Alarm Telegraph Company, New York, N. Y., and Chicago, Ill. Filed Jan. 8, 1892.

494,787. Automatic Cut-Out for Electric Signalling Mechanisms. Jacob F. Mehren, Chicago, Ill., assignor to the Gamewell Fire-Alarm Telegraph Company, New York, N. Y., and Chicago, Ill. Filed Jan. 8, 1892.

494,807. Coin-Operated Phonograph. Ellsworth E. Flora, Chicago, Ill., assignor to George B. Holt. Filed May 5, 1890.

494,827. Voltaic Cell. Edward Weston, Newark, N. J. Filed Nov. 24, 1891.

494,828. Electrical Measuring-Instrument. Edward Weston, Newark, N. J. Filed Jan. 14, 1892.

494,829. Recording-Voltmeter. Edward Weston, Newark, N. J. Filed March 18, 1892.

494,830. Ground-Detector for Electric Circuits. Edward Weston, Newark, N. J. Filed Sept. 10, 1892.

494,832. Electric Clock. Herman Wubbeler, Beaver Falls, Pa. Filed May 21, 1892.

494,956. Ammonia or Other Pump. Nils Johnston and John Stocker, St. Louis, Mo. Filed Aug. 29, 1891.

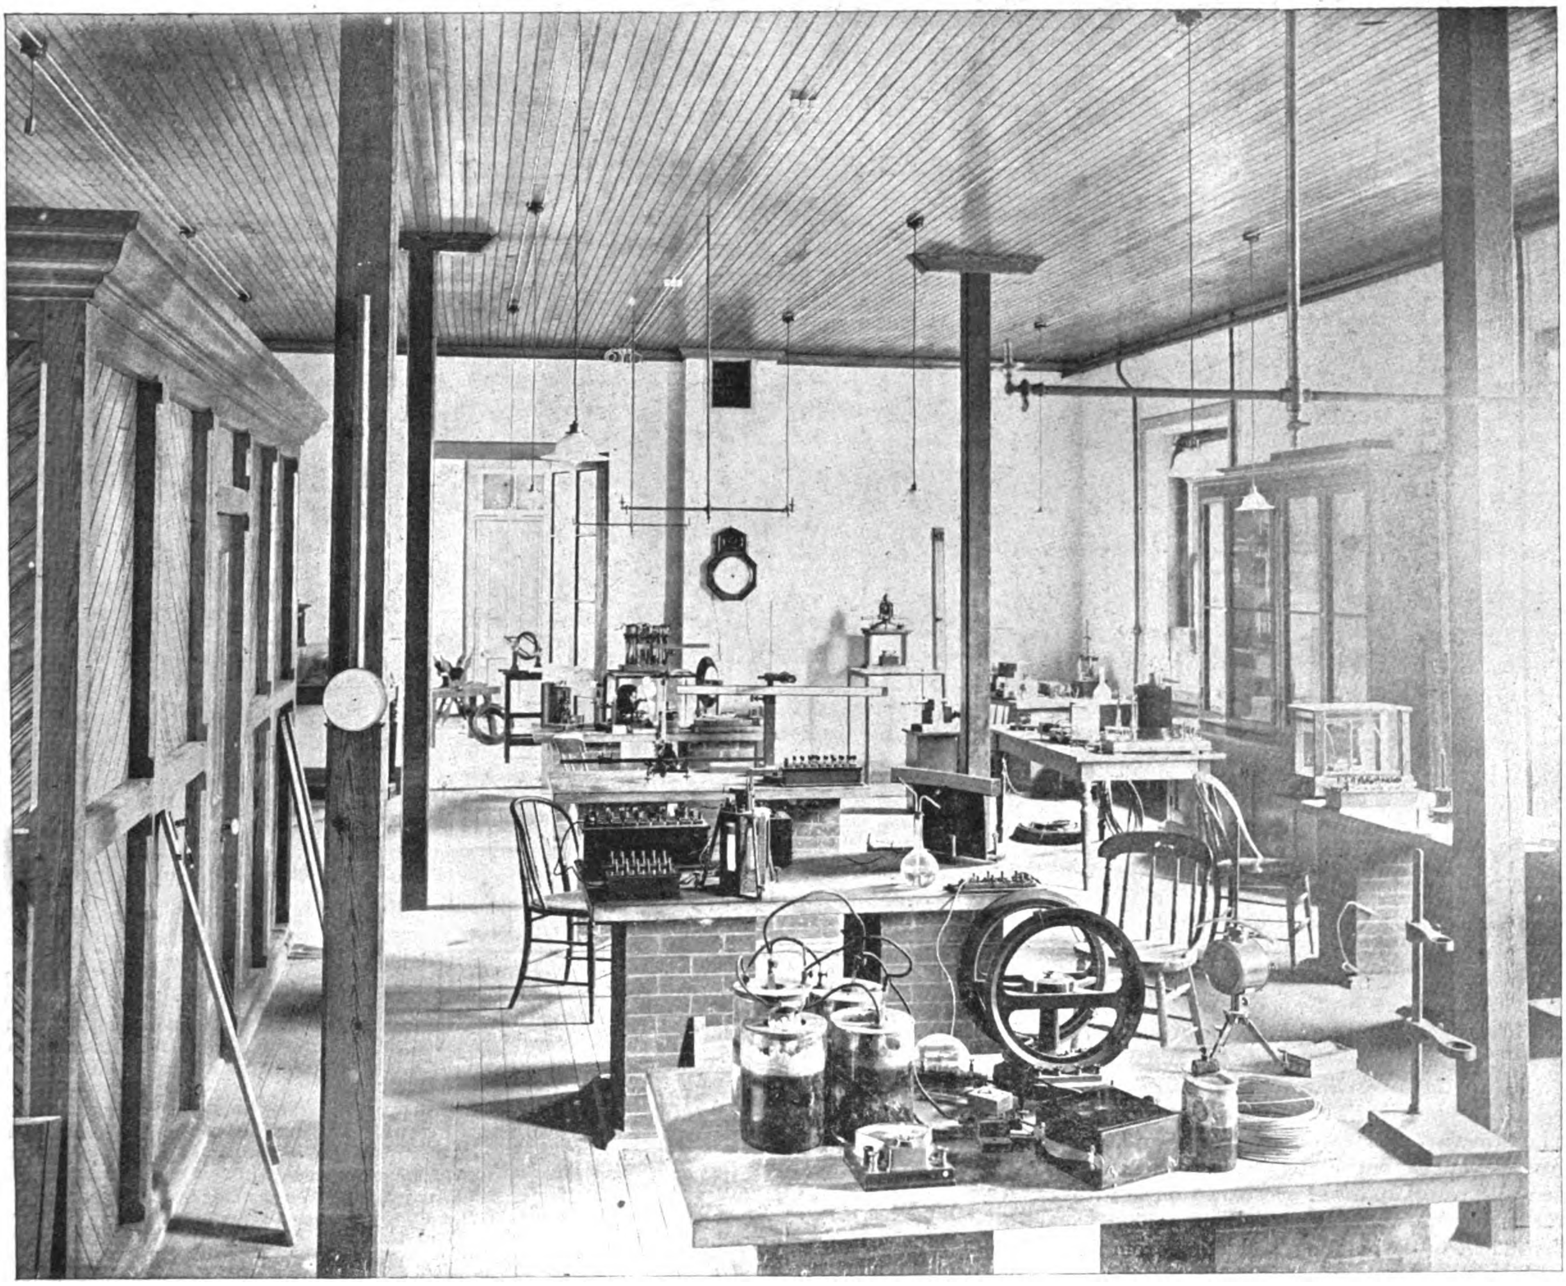
494,961. Electrical Measuring-Instrument. Adolf Koepoel, Berlin, Germany, assignor to Siemens & Halske, same place. Filed Nov. 17, 1892.

494,964. Galvanometer. Edwin F. Northrup, Ardmore, assignor to Samuel L. Fox and Edward B. Fox, Philadelphia, Pa. Filed Nov. 5, 1892.

494,966. Circuit-Closing Clock. Herbert S. Page, Medford, assignor to Edmund D. Spear, Boston, Mass. Filed Oct. 3, 1892.

ELECTRICITY.

VOL. IV. NEW YORK. APRIL 19, 1893. CHICAGO. No. 14



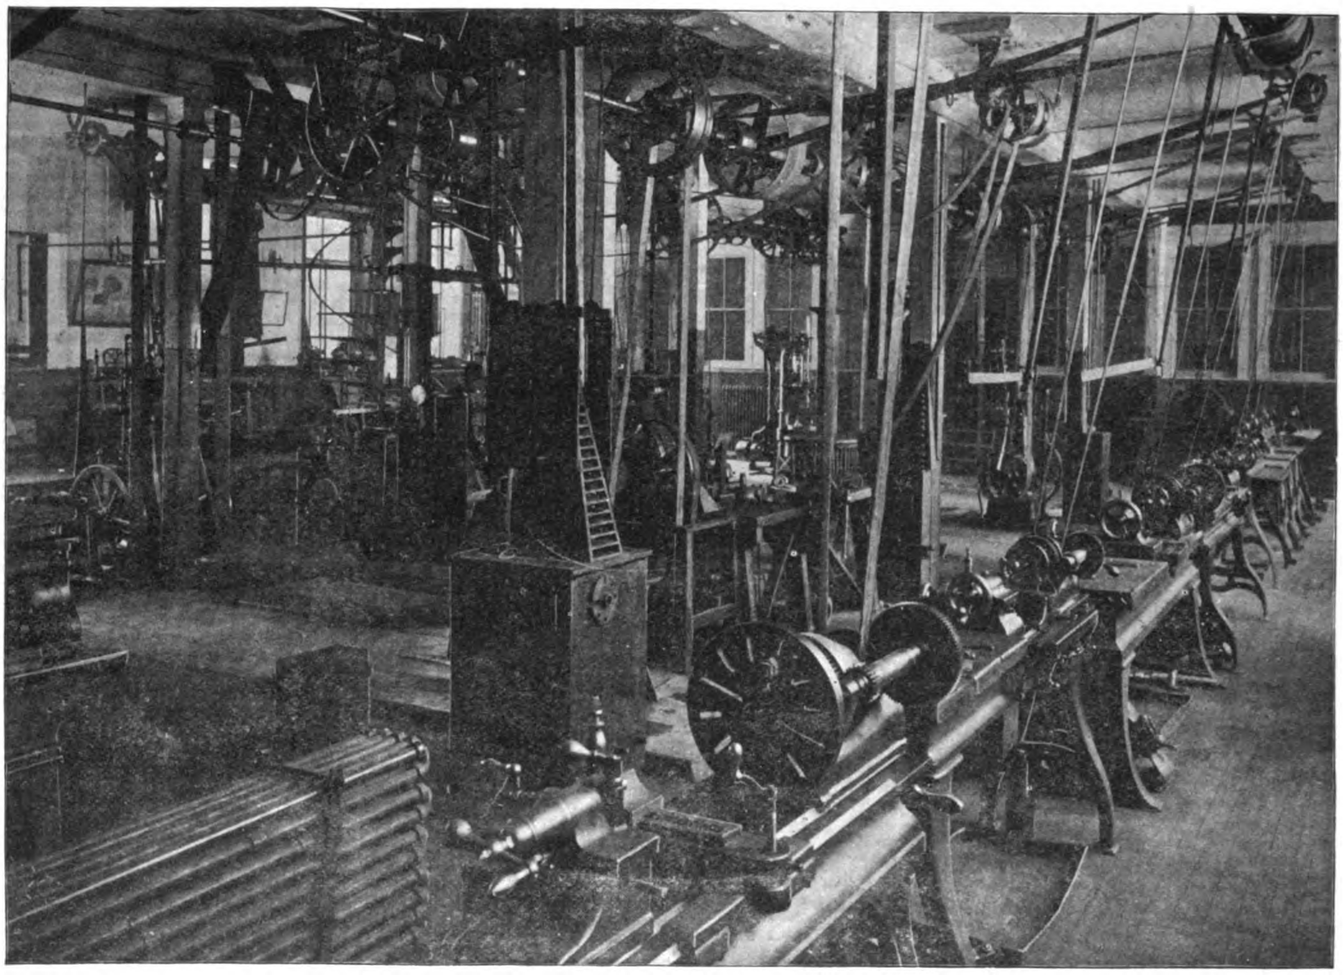
ELECTRICAL LABORATORY, STEVENS INSTITUTE OF TECHNOLOGY. (SEE PAGE 182.)

A Practical Course.

The Electrical Branch of Mechanical Engineering Established at Stevens Institute.

The Stevens Institute of Technology, which is recognized as the pioneer in the line of engineering schools, while adhering strictly to the scope originally prescribed for its course, has not failed to keep pace with the rapid advances which have characterized the science of engineering in recent years. The application of electricity to numerous mechanical problems has been such an important factor in engineering work that courses have been established in many places which are devoted exclusively to electrical engineering and which must necessarily be pursued at the expense of a more general technical education.

The question of establishing such a course at the Stevens Institute was decided in the negative only after careful consideration, in which the importance of this branch was in no way ignored. The subject, however, was considered as a legitimate branch of mechanical engineering rather than as a distinctive science, and the important positions in electrical work held by many Stevens graduates is evidence of the wisdom of this decision. A department of applied electricity has since been included in the regular course of mechanical engineering, for which the Institute is indebted to the liberality of its president, Dr. Henry Morton. The electrical laboratory, situated on the ground floor of the building, is shown in part in our Frontispiece. This room is provided with several piers of masonry capped with stone slabs, the whole being set on foundations independent of the building, and is free from the least jar due to the vibrations of the floors. From each table three sets of wires are run beneath the floors to a switchboard so that any desired connection between the tables can be made without running wires between them.



MACHINE SHOP, STEVENS INSTITUTE OF TECHNOLOGY.

Two sets of wires are run from each dynamo to a switchboard, from which another set of wires is run to the laboratory. This arrangement permits any part of any machine to be connected and controlled from any part of the laboratory. The dynamo room, which is situated in a gallery directly over the workshop, is equipped with a large Westinghouse alternating current machine and several types of constant current dynamos.

The dynamo room contains facilities for the precise measurement of power consumed by the generators, the most noticeable of which is a Webb floating dynamometer. This instrument, which is a somewhat novel one, consists of a wooden float placed in a tank which is but slightly larger, and upon which the machine to be tested is mounted. The shaft of this machine is connected by a flexible coupling to the end of a rigid shaft, and while running the machine and float are tilted according to the power transmitted, the principle being the same as that of the cradle dynamometer although the apparatus is much easier to adjust and operate. It may also be adjusted to any required degree of sensitiveness by the addition of enough extra weight on the float to raise its centre of gravity as near the point of unstable equilibrium as may be desired. In addition to this there are Brackett cradle dynamometers and prony brakes.

The laboratory instruments include the usual equipment of galvanometers, electrometers, condensers, rheostats, ammeters, voltmeters, etc., selected from different makers with the idea of familiarizing the students with as great a variety of instruments as possible.

During the junior year of the course the students attend lectures by President Morton, and in the senior year practise laboratory work and experiments under Dr. Geyer.

The general course in mechanical engineering, combined with a thorough system of manual training in the machine shops, has resulted in turning out a class of engineers many of whom are well known in the electrical field, and who thus exemplify the remark of Lord Kelvin, that the electrical engineer should be nine parts mechanical and one part electrical.

There can be no better proof of the value of this course than the fact that applications for admission are now so numerous that the present facilities of the building and the modest endowment of Stevens Institute have caused the necessary exclusion of a large number of students, and an earnest effort is now being made by her faculty and alumni to provide this needed addition to the Institute, which the following extract from a letter from President Morton fully explains:

"The desire of the faculty and trustees not to refuse the benefits of our course to worthy applicants has led us to strain every mode of accommodation to its utmost limit, and the position now is such that not only is it physically impossible for us to accommodate the increased numbers certain to apply next season, but we are prevented from making numerous improvements in various departments, which are most desirable, in order that we should hold our leading position among technical schools, for lack of space within our present buildings.

"We are in fact in the position of a manufacturing concern whose business has outgrown its 'plant.'

"With a manufacturing establishment the remedy would be simple, because the increase in businesss would warrant an increase in capital investment, which, under such circumstances, could be readily secured by the usual financial methods.

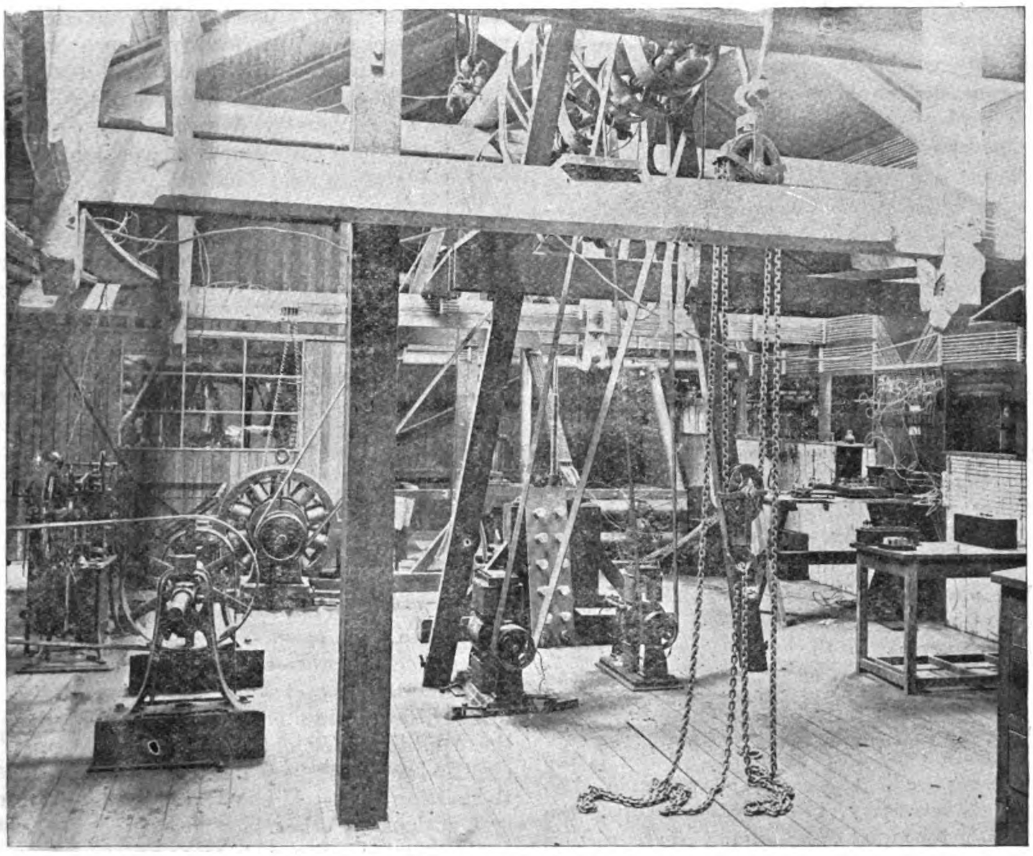
"But with an educational institution the case is different. No such institution for the higher education has in the history of the world been a source of financial profit. On the contrary, all such institutions the world over have required large endowments or equivalent Government support.

"We may well feel proud when we compare what we are doing with only a modest endowment as measured by the funds at the command of other institutions; but there is a limit to what the best of management can accomplish with limited means, and it is hardly necessary to say that our trustees would not be authorized to diminish our small endowment-fund by taking from it the amount necessary to erect additional buildings, the filling and maintenance of which are not unlikely to constitute a further draft on our resources.

"We must then look to the liberality of our friends (among whom none I am happy to say are more sincere than our alumni) to carry on and supplement the good work of our founder by supplying us with at least the additional buildings needed to carry on our work with increasing efficiency, and thus to maintain our pre-eminent position, as well as to extend our range of usefulness.

"What it is proposed to do, if the means can be provided, is to erect an additional building, at a cost of $50,000, which shall accommodate the departments of chemistry, physics and languages, and thus give us space in our present building for the much needed extension in our departments of drawing, mathematics, engineering and applied mechanics.

"The interest already exhibited by the alumni in this matter has been most gratifying, and I do not doubt that their good example will be followed on all sides. For myself I can only say that what I do towards this work will be only limited by my ability, and I am sure that many others have the same inclination."



DYNAMO ROOM, STEVENS INSTITUTE OF TECHNOLOGY.

Electrical Quackery.

Our electrical contemporaries across the water it seems are determined to do all in their power to expose the frauds and business methods of electrical quackery establishments in England.

In our issue for March 15 we gave a short account of an action taken against the London *Electrical Review* by one Dr. Tibbits, who had written a handsomely-paid-for testimonial regarding the Harness Electropathic Belts as provided by the Medical Battery Company. This case, our readers will remember, was decided in favor of our contemporary. We since learn that another very important case has also been heard in the London Law Court, in which the said belts were the articles questioned. This case was taken by the *Electrical Review* against the suppliers of the belts, the Medical Battery Company, and damages were claimed by the editors for libel against them. The libel was contained in a circular letter which had been distributed among nearly all the London news-vendors—at any rate to the extent of 500 copies—and read as follows:

"Sir: Having been consulted by my clients, the Medical Battery Company, Limited, the proprietors of Harness's Electropathic and Zander Institute, of 52 Oxford street, London, W., with reference to some malicious libels published in the *Electrical Review* and *Science Siftings*. I beg to give you notice that if these or any future publications containing defamatory articles or paragraphs are sold or circulated by your firm, my clients will hold you responsible. In the same way you will be held responsible for the exhibition of any libellous bills or placards."

This letter was signed by the solicitor to the Medical Battery Company, and naturally made all the news vendors rather unwilling to trade in the journal mentioned—in fact, evidence was brought to show that some booksellers had absolutely refused to sell any more copies.

The action came on for hearing on March 7 before the Lord Chief Justice of England and a special jury. Counsel for the defendants were Sir E. Clarke (one of the most eminent of English counsel) and Mr. Germaine, while for the plaintiffs there appeared Mr. Finlay, Q. C.; Mr. Lawson Walton, Q. C., M. P., and Mr. Banks. This of itself shows that our contemporary was prepared to fight to the last.

Mr. Finlay in his opening speech strongly condemned the belts, as will be seen by one or two sentences which we cull from his remarks:

"These belts are utterly and absolutely useless." . . . "Defendant was seeking to stifle what he knew or suspected was a well-deserved criticism."

Mr. Finlay called evidence to show that a number of news agents had refused to continue the sale of the *Electrical Review* on account of the letter, and he was about to call a number of witnesses who had worn belts, to prove that they were worthless, and the whole business of the company an absolute fraud. The appearance in the box, however, of a Mr. Jeffery (who was known to the belt people, having had an action taken against him formerly, in the Bloomsbury County Court, for the cost of a belt supplied him, in which case the Judge ordered to be returned to him the amount he already had paid, called from counsel for the defendants the remark that evidence of this sort was irrelevant to the case. The Judge, however, ruled that it should be brought in. Mr. Finlay was again preceeding to bring in this evidence when counsel for the defendants stated that he was instructed by his clients to say that if this evidence were to be brought in they would plead guilty to the libel and leave the question for the jury to assess the damages.

This was quite an unexpected collapse of the case, as it had been hoped that the whole of the exhaustive evidence collected by the plaintiffs would be made public in this manner, and thus help to expose the whole business.

The following morning the Lord Chief Justice summed up the case for the jury, who without leaving the box, after about two minutes' consultation, gave judgment in favor of our contemporary, the *Electrical Review*, with damages £1,000.

The thanks of the electrical fraternity are due these publishers for so courageously endeavoring to suppress such frauds and impostures.

We understand that there are other actions pending against another London scientific journal which has also a counter action against the Medical Battery Company for damages for trying to stop its circulation.

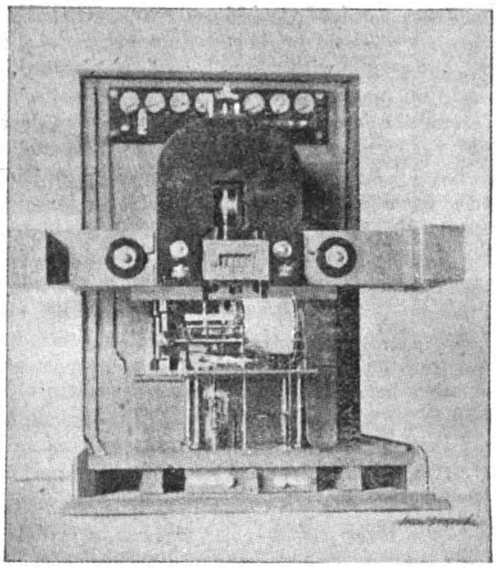
Electric Safety Curtains.

The description of a new electric safety curtain at the Comedie Françaís, Paris, which appeared in our issue of February 22, was a paid contribution from an occasional foreign correspondent of ELECTRICITY, Mr. F. W. N. King. The matter was in type in this office before the issue of *La Nature*, containing a description of the same device, had appeared in Paris.

In the issue of ELECTRICITY for February 22 there was another very interesting item, entitled "An Open Letter." Has our conscientious contemporary also overlooked this?

A Large Wattmeter.

We give below an illustration of a joulemeter for 800,000 watts, taken from London *Industries*. It is a Brillié type of meter recently made for the Société Normande d'Electricité at Rouen by the Compagnie Anonyme Continentale pour la Fabrication des Comptoirs à Gaz et autre Appareils, of Paris. It is to be expected that a company with such a formidable name should make something large, but they have done more than could reasonably be demanded in making an 800 kilowatt joulemeter. It is a registering instrument, designed for a three-wire system. By a registering meter is meant that at any instant it acts as a wattmeter and registers the power, and it also intergrates the power, thus reading in kilowatt hours. The principle is the same as in the Brillié meter.



Electric Heating and Forging.

The economy and importance of the electrical heating and forging processes which are being carried out in Boston under the Burton patents appear to have been proved under practical conditions, and the description of some of the details of this system, given below, which are abstracted from a paper recently read before the Harvard Lecture Club by Mr. G. D. Burton, are as follows:

One of the most important features in connection with this subject is that we are enabled to heat and work metals successfully by the electric current, and our ability to do so lies in the fact that the operator is enabled to absolutely control the current while the bars or pieces are heating, so that they will not become overheated, and to that degree that each succeeding piece, if necessary, can be heated to the same temperature, and also, if required, the operator can instantly regulate the current so that several bars can be heated at one time, and while they are heating he can continue his forging operations either by hand or machine tools.

In most all cases the electric regulator is placed in the working or high potential circuits, and is constructed so that it contains a sufficient amount of electrical resistance to take the full strength of the current produced by the dynamo.

From this regulating point the current is conducted over the main line for light, heat and power in a given quantity, measured by volts and amperes.

Therefore, it must be admitted that this electric resistance, or rheostat, is to the dynamo what the governor, or regulator, is to the steam engine, which has never been operated economically and successfully unless provided with a device of this character.

Now, I have told you that all of the electric regulators are placed in the high potential circuit, and I believe that I am right in this assertion. If I am not, I hope some one will correct me, and in making this statement my object is to show you wherein we differ in the construction of our apparatus and in the manipulation of the electric current from other systems in general use.

When I made known my ideas regarding the heating of a bar of metal by electricity, many stated that it could not be done, and, if done at all, the power required would be so expensive that the process would never become a commercial success, the people with whom I conferred having in mind the enormous power required to heat a bar of metal, believing that it would require at least 75 H. P. to heat a piece 1 inch square and 8 inches long, and that there must be a power source back of the dynamo sufficient to compel it to generate continually its full capacity; that the regulator, or rheostat, must be introduced into the high tension circuit in order to control the current, otherwise it would be so intense that, when the bar was placed in the circuit, it would either burn the bar of metal, or burn out the machine. On the other hand, they took into consideration that when there were no bars heating the machine would still be generating this enormous current, which would be consumed by the resistance, or rheostat, and thereby lost.

In this case, to show you where the theory was wrong as regards the methods we use, I will explain to you our system of heating metals by electricity, and will show you that with our method of placing the regulator it does not act as an obstructor to the current, and that it is so located that when there are no pieces heating there is no power generated excepting about 1 H. P., which is necessary to overcome the friction of the apparatus, and that the size of piece or pieces heating determines the power required to heat said pieces within the capacity of the machine. Why I use the expression—with the capacity of the machine—is that I desire to make clear to your minds if a metal bar was inserted into the metal holders, larger in cross-section than the conductors, or metal holders, the machine would not furnish power sufficient to heat the bar, for the bar would not offer proper resistance to the path of the current, in which case the power would immediately drop down, and very little would be generated, and what there was generated would pass unobstructed around each endless ring of the converter, through the bar held within the metal holders.

Therefore you see the impossibility of overheating or burning out any of the electrical connections employed in the construction of our apparatus.

We have tried many times to find a weak spot, and have inserted in the metal holders bars of large area in cross-section, for the purpose of determining the possibility of burning out, or short-circuiting, some part of the apparatus, but thus far we have not succeeded in doing so.

The difference in the application of our system as compared with the systems in general use for lighting and power purposes, is found in our method of generating, converting and regulating in an economical manner the current produced.

We do not use a resistance or regulator in any of the working of high potential circuits in connection with any part of the apparatus. We regulate our supply of current according to the work to be done, the work itself acting as the governor. The larger the piece, and the shorter the time required in heating the piece, the greater is the power required. If the time is extended, less power is necessary, the bar calling upon the generator through the medium of the regulation of the exciter current for what power is required to heat the piece, be it large or small and within the capacity of the machine.

This connection of mechanism enables us to perform all the valuable heating effects of the smith's forge without its wastefulness and other disadvantages which occur in working metals by the old methods.

We are also enabled to do work by the electrical process which it is impossible to do by the ordinary forge.

We find that if the rheostat is placed in the circuit between the alternating dynamo and the converter, or in the circuit leading directly from the exciter to the dynamo, any attempt to use the rheostat to regulate the current, so as to fully control the heat in the bars, at once interposes so much resistance in that circuit that it heats and lowers the voltage, which arrests the progress of the heat in the bar or pieces held within the metal holders, which we believe to be due to the resistance of the rheostat itself, and this heating of the rheostat varies its resistance to the current so rapidly that it becomes beyond the control of the operator to use it as a governable rheostat. We find also that the bars under heat require a higher voltage to be delivered as they become hotter in the current of the secondary coils of the converter, so that if the rheostat is placed in the main circuit it still operates against the requirements of the process to be performed. It is also found that the rheostat when placed in the secondary circuit of the converter is utterly incapable of regulating the current of such immense volume and low potential as our mechanism produces, so as to heat the metal evenly and control its heating to that degree that the proper heat is always obtained. Therefore, we have always placed the rheostat, or regulator, in the shunt wound circuit of the exciter, for the purpose of exciting the field coils of the generator in proportion to the amount of heat that it is desired to produce in the pieces of a determined size held in the metal holders connected to the secondary coils of the converter.

By this method we have found that it is possible to transmit the current from the transformer to the metal holders for a considerable distance with very little loss. We use, for conducting the current when carried to a great distance, as for the distribution of the current to various forges in a large factory, copper bars 3 inches in diameter, which are sufficient in size to carry around such a shop the current produced by a 100 H. P. generator. With conductors of this size, no difficulty will occur from over-heating of the conductors or the machines.

The voltage and amperage delivered to the metal holders by these conductors from the transformer varies according to the size of the pieces heating from 4 to 30 volts and from 6,000 to 10,000 amperes.

For illustration: the average horse power required to heat 72 cubic inches of metal in four minutes is less than 53 mechanical H. P. Three bars of iron, 1 inch x ½ inch and 4 feet long, are heated at the same time to a forging heat with our 50 H. P. apparatus. We have heated 108 cubic inches of metal to a working heat with the same machine in eight minutes with an expenditure of 47 mechanical H. P.

Three pieces of steel, 3 feet long and 1 inch square, composed the 108 cubic inches of metal referred to.

Our electric process is used for heating iron, steel, brass, copper, etc., and for welding, forging, brazing, hardening and tempering, and where the conditions for obtaining power are equal, electric heat is cheaper than coal, oil or gas, for the heating process is more rapid by the electric system than any other.

The metal is improved because a more uniform heat is obtained. In most work several reheatings of the piece are required when the customary forge is used.

The electric process avoids this, for the piece is evenly heated all through, and retains the heat about three times as long, and can be worked into the desired shape without subjecting it to the usual process of reheating. The product, when finished, is better, and the liability from over-heating is not as great as by the old methods.

We have produced a rheostat made upon a different principle, using a liquid instead of wires, thus avoiding the possibility of the rheostat heating, and, when constructed upon this principle, we find it is possible to use it for governing the current in some circuits where it is now impossible to use a metallic resistance on account of its heating. The liquid rheostat is much cheaper to construct, and responds instantly to the action of the current, performing the same functions.

A New Electrical Association.

The formation of a new electric light association, to include the electrical lighting interests of the entire State, brought together a number of prominent men at Harrisburg, Pa., a few days ago. Among those present at the meeting were Hon. Robert E. Wright of Allentown, Senator J. S. Hess, C. A. Wolle and G. H. Wolle of Bethlehem, Hon. J. F. Cox of Homestead, J. F. Geeser of Waynesboro, W. H. Friday of Pottstown, W. H. Rosensteel of Johnstown, Robert F. Crowell of West Chester, and Secretary Robert D. McGonigle and G. H. Blaxter of Pittsburg.

The proposed organization is to be named the Electric Light Association of Pennsylvania, and is formed for the purpose of exchanging views and discussing matters relating to the electric lighting business. There are now in Pennsylvania about 150 electric light plants.

A committee of five on organization was appointed, of whom C. A. Wolle of Bethlehem is chairman and Robert D. McGonigle is secretary, either of whom will give any information desired in regard to the association.

"Chicago in the Front Rank."

The New Sunbeam Lamp.

We recently called attention to the new incandescent lamp patented by John Van der Kammer, and as the lamp has now appeared in the market under the name of "The New Sunbeam Lamp," the same being for sale by the Star Electric Lamp Company, it will no doubt be matter of interest to many to know something of the peculiar qualities of the lamp in its commercial form.

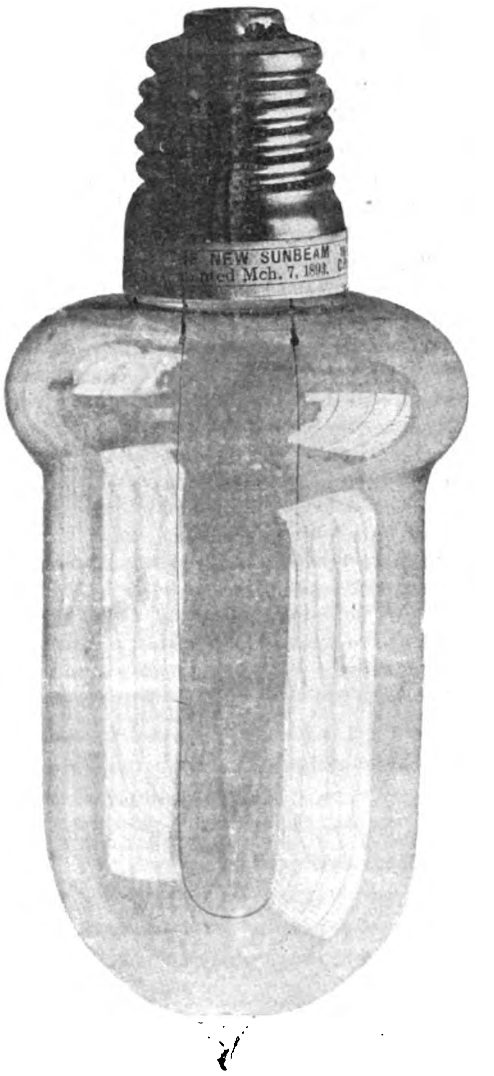
It will be remembered that the mechanical construction of the lamp embraces the features of a glass globe combined with a metallic base, somewhat after the manner of some of the very early lamps which preceded the vacuum lamp, the circuit being formed by wires secured to the inside of such base, and the burner itself, the two ends of which are connected to the two inside wires in much the usual manner. Thus the conductors pass through the metallic portions of the receiving chamber, as in some of the earlier lamps. Mr. Kammer's method of securing the metallic plates to the glass portions of the receiver is novel and exceedingly ingenious, and at the same time is said to be thoroughly practical and quite sufficient for the purpose.

The difference in expansion between the metal base and the glass globe is of no consequence in a lamp constructed in this manner, for there is sufficient flexibility in the metal to permit it to accommodate itself to the expansion of the glass. The metal base can therefore be made of some of the baser and cheaper metals, as for example, copper. This lamp, however, not being a vacuum lamp, the character of the gas is such that the base can be most easily made of some metal which will resist the action of such gas, as for example, platinum. The manufacturers promise soon, however, to employ in place of the platinum some cheaper metal, preparing it in advance so as to resist the action of the gas.

The fact that the New Sunbeam has a comparatively high pressure of gas within it, renders the maintenance of a perfect vacuum chamber of less consequence than in the vacuum lamp, and therefore permits the change in the construction which is set forth in the mechanical patent on the lamp. A seal which might not be satisfactory for a vacuum lamp, and perhaps could not be used for that purpose, might be entirely satisfactory for a gas lamp. The metal seal at the base obviates the necessity of joining glass to glass in the usual manner and also the use of the internal seal piece, so that if the lamp is slightly damaged in the process of its manufacture it may be conveniently repaired and resealed at the lower end. Moreover, this form of base and construction permits the re-using of the bulb itself, and the manufacturers offer inducements to users for the return of unbroken bulbs. Since these metal plates are of comparatively large size, no platinum wires being employed, manufacturers also offer inducements to users for the return of such metal plates or the butts containing them.

While the novel features in the mechanical construction of the lamp are striking, the results attained by the use of gas in the lamp, both as to the properties of the complete lamp and as to the methods of its manufacture, are both surprising and gratifying.

The inventor of this lamp has abandoned the idea of perfecting the vacuum lamp for the reason, as he claims, that a perfect vacuum being absolutely impossible, the vacuum lamp necessarily has a limit to its degree of perfection. In other words, the vacuum lamp being based upon the idea of a perfect vacuum, and a perfect vacuum being unattainable, the vacuum lamp must of necessity retain within itself the cause of its own early destruction, and in practice it is found that the vacuum lamp, as ordinarily made, is quickly destroyed by comparatively slight excess of current. This inventor therefore set himself to the task of constructing an incandescent lamp on the principles set forth in the earlier gas lamp patents and publications concerning the incandescent lamp. Gas lamps were well known prior to the production of the vacuum lamp, and various kinds of gas were employed in them and at various degrees of density. Several difficulties were found with the earlier gas lamps, as for example it was found that the gas in the lamp, even though greatly attenuated, would tend to disintegrate or destroy the burner, possibly by the impact of its highly heated particles upon the surface of such burner. It was also found that there took place a process, which has been described as electrical carrying, which rapidly destroyed the burner. It was also found that with such gases as were then known there was great loss of energy from the heating of the gas in the lamp. There were many other difficulties with the gas lamps, which finally resulted, as it appears, in the abandonment of the idea of producing a gas lamp and the substitution therefor of a vacuum lamp. This inventor has turned again to the gas lamp as a means of avoiding the weaknesses of the vacuum lamp, and has endeavored to produce a gas lamp which should not have the objectionable features of the early gas lamps. It often happens that a process for a long time abandoned as impracticable is revived and rendered of greater utility by the ingenious effort of some inventor who is not intimidated by the general adverse opinion, and so in this case, although the gas lamp has for years been declared impracticable, the inventor, by the employment of sundry ingenious expedients, has produced a lamp which does not appear to show any of the objectionable features of gas lamps as formerly made, and which is not liable to the weaknesses shown by the vacuum lamp. The new lamp, though containing a considerable quantity of gas, appears to be even cooler while burning than the ordinary vacuum lamp. There is no disintegration of the carbon, and no electrical carrying incident to overwork, even when greatly over-run. For example, when a 100 volt lamp is run at 150 volts for a considerable time, the burner will be found to be of its normal color throughout, and practically unchanged. Moreover, the character of the gas employed is such that whatever injury the burner receives or tends to receive from such over-running is promptly and completely repaired by the gas itself, so that in most instances when the lamp has thus been over-run it will be found not only that the burner is unchanged in its form and appearance, but that its resistance is actually slightly diminished, so that, for example, a 110 volt lamp burned at 160 volts for a short time will give the full candle power at 109 volts instead of 110.



THE NEW SUNBEAM LAMP.

Some of the delays in producing the lamp are attributable to the difficulty of obtaining the gas-producing substance in sufficient quantities to answer the purpose of the manufacturer. The gas which is employed is produced from a very rare substance, and one which the inventor and the chemical experts of the company assert has never before been used in connection with incandescent lamps and which it is very difficult to obtain. It appears now that all such difficulties have been removed, and the lamp will therefore be manufactured in quantities. The manufacturers of this lamp claim for it great utility for certain uses, on account of the quality above referred to, as for example on all such circuits as are supplied with currents of varying pressure.

The fluctuation of several per cent. in the current will not vitiate the lamp or increase the resistance of its burner, at least not until such fluctuations have extended over a long period, or in other words, the practical life of the lamp.

But not only does the lamp show such peculiarities in its service as above suggested, but the manufacturers claim that there is a great change in the method of manufacture. Gas being constantly present in the lamp, and the means of preserving or repairing the carbon being constantly at hand, the lamp requires no such elaborate process of manufacture as does the vacuum lamp. In the vacuum lamp every effort must be put forth to secure an initial vacuum of the highest possible degree, and to drive out of the lamp and the parts contained therein the last trace of such occluded gases as may tend to remain therein, and this requires an expensive process of pumping and electrically energizing the lamp during such process of pumping. Moreover, after this high degree of vacuum has been obtained it is necessary that the lamp should be so constructed as to retain the vacuum and permanently exclude all atmosphere from the lamp and close it against practically the whole of the atmospheric pressure. Now, in the New Sunbeam Lamp, since there is a gas left permanently in the lamp, it is plain that such perfect exhaustion of the lamp and its parts is unnecessary.

The Danbury, Conn., electric street railway is to be equipped with Westinghouse apparatus and work will begin at once on fitting up the cars to be used.

Electricity Does Kill. M. D'Arsonval, the French scientist, has lately published in the *Moniteur Industriel* an extended argument in support of the theory that the electric current does not kill, and that the subjects or victims might be resuscitated by proper methods, no matter how powerful the shock received.

A review of M. D'Arsonval's statements has been printed in the New York *Sun*, and his views are supported by Messrs. Joseph Wetzler and Dr. W. J. Morton, in interviews with a *Sun* reporter.

A summary of the labors of Prof. D'Arsonval on deaths and accidents caused by high-tension currents has just appeared. The results obtained have been presented to the Biological Society of France, together with the conclusions of an experiment made by M. Francis Béraud at M. Lacassagne's laboratory at Lyons, and have been embodied in a monograph. The conclusions deduced are strongly confirmatory of the claims made by M. D'Arsonval:

"Electricity is shown to kill in two ways.

"1. By producing mechanical lesions of the vessels and nervous system.

"2. By inhibiting the great functions wholly or partially (stoppage of respiration, of the heart, of the exchanges between the tissues of the blood, etc.)

"D'Arsonval holds that a person struck by an electric shock should be treated exactly as one drowned, and the formula which he has given to electricians has called back to life a number of men since its publication. MM. D'Arsonval and Bérand stigmatize the putting of criminals to death by electric shock as a complicated, barbarous and unreliable proceeding, and they dare American doctors to practise artificial respiration upon the criminal after his so-called 'death.' D'Arsonval maintains that the use of dynamic electricity produces in man a kind of anæthesia, under cover of which he is mangled alive, and must be so in order to really become a corpse."

This subject is worthy of careful investigation by our State authorities and by the Prison Reform Association. There is no limit to the possibilities involved in the thorough establishment of M. D'Arsonval's claims.

If the murderer can be resuscitated after receiving his shock in the death chair, further observation might prove that the shock had been beneficial. He might wake up a regenerated man, free from his predilection for crime, and become thereafter a useful member of society. If this latter theory is borne out, the application of the misnamed death penalty might be well adopted for minor offences. It would be cheaper and better than the present barbarous methods of prison confinement.

If we mistake not, however, there have been very conclusive experiments conducted on this side of the water, on men and animals, proving that the electric current does kill, and that it kills instantaneously and without pain to the victim.

We doubt very much if any of these scientists would be willing, for the love of pure science and the dissemination of knowledge, to undergo a shock such as is administered at Auburn, and take their chances on resuscitation.

* * *

"Figures won't lie, but liars will figure."

The Feeder Patent. One instance has come to our notice where the General Electric Company has tried to use the decision of Judge Green at Trenton to frighten intending purchasers of competing railway apparatus.

For any bearing which this decision can have on railway or alternating current work it is not worth the paper on which it is written.

The leading expert for the plaintiff, Prof. Chandler, took pains to assert that the patent had no such wide scope; and furthermore it expires next year.

Intending purchasers will do well to read the electrical journals, and especially Electricity, more carefully. They can save themselves much annoyance from being handicapped with inefficient apparatus by acquiring a clear understanding of the patent situation.

* * *

The Boston *Commercial Bulletin* estimates that a fair valuation of General Electric common, based on the figures presented in the annual statement, is $42 per share.

Twelfth Annual Exposition of the American Street-Railway Association.

The Executive Committee of the American Street-Railway Association has announced that the Milwaukee Industrial Exposition Building has been secured for the exhibition of supplies and manufactures of every nature used in the street-railway business, in connection with the Twelfth Annual Meeting of the Association, to be held in the city of Milwaukee, Wis., commencing the third Wednesday in October, 1893, and lasting three days.

The building has been engaged for two entire weeks, beginning October 9th and ending October 23d, thereby giving ample time for the setting up and removal of the largest and heaviest exhibits.

The hall for the meeting is also in the same building, on the second floor, and delegates will be enabled to examine the exhibits with much greater satisfaction than heretofore on this account.

An advantage which will be appreciated by those desiring power will be found in the 150 H. P. engine on the premises. The only additional charge therefor will be that which the cost of furnishing the same will amount to pro rata among the exhibitors using power.

The nearness of Milwaukee to Chicago is considered to be a great advantage this year for making a satisfactory and extensive exhibit, as everybody will, of course, attend the Chicago Exposition; and it is believed not to be necessary to submit any argument setting forth the advantages of taking part in this exhibit, to be made under so much more favorable circumstances than any other previously held.

The heaviest machinery and largest castings will all be under cover, and can, of course, be inspected much more advantageously than when in the street.

Applicants for space are requested to notify the secretary, Wm. J. Richardson, as early as possible.

In the Federal Court at Trenton, N. J., Merit Thorn has recovered $12,000 damages from the Western Union Telegraph Company for injuries received through picking up an unguarded wire belonging to the telegraph company which had dropped across an electric light wire. The boy received a shock that affected his nervous system, so that his memory was entirely destroyed. The jury also gave the boy's father $125 for loss of services. It is thought likely that the case will be appealed to the United States Supreme Court.

General Electric's First Annual Report.

The Financial Condition of the Company.

A Remarkable Statement.

The first annual meeting of the General Electric Company was held at Schenectady on April 11.

A somewhat singular report was presented, ostensibly showing the results of the first eight months' business of the company.

In view of the facts that the existence of this company is a standing menace to the conservative business element in the electrical trade, that it has from the first sailed under false colors, that its success in establishing a monopoly, if possible, would result in an inevitable cessation in the development of the art and in debarring the public from the great benefits of electric lighting and motive power at low cost, we feel justified in devoting considerable space to this statement.

As far as it has been able, this company has endeavored to create the impression that it is the only one having a moral right to engage in the business. From the very magnitude of its stock-jobbing operations it has attracted the attention of the investing public. Investors who have given much thought to the matter perceive its weakness, its rottenness, the absurdity of its claims, and thereby discredit and suspicion are thrown upon the entire range of electrical investments, hundreds of which would be found, if investigated thoroughly, to be worthy of confidence.

The utter collapse of the General Electric Company is as sure to come as the seasons are to follow in their destined order. The sooner it comes, the sooner will the atmosphere be cleared, the honest and conservative men in the electrical trade have a fair show, and the public receive the full benefits of the development in the electrical art.

If the publication of this, the first annual statement, does not precipitate that collapse, it will be because the stockholders do not use their brains and their lead pencils.

Following is an abstract of the report, with the financial tables in full:

THE REPORT.

The General Electric Company was incorporated April 15th, 1892, and began active business on the first day of June, 1892; so that the report presented by your directors at this meeting of stockholders covers a period of eight months ending January 31st, 1893.

LOCAL LIGHTING AND RAILWAY COMPANIES.

While your company has about 6,000 customers included in the different departments of its business, the interesting and important development is in the direction of local lighting and railway enterprises.

The following information, with respect to local illuminating and electric street-railway companies using your apparatus, will be of interest to the stockholders.

LIGHTING COMPANIES.

The total number of such central station companies using Edison and Thomson-Houston apparatus is 1,277, supplying about 2,500,000 incandescent and about 110,000 arc lamps.

The growth of these companies has been phenomenal, and it is very satisfactory to note that those which have been established longest are making the most rapid increase in size of plant and volume of business.

During the past year there has been a very marked appreciation in the value of the securities of local companies, especially in the larger cities, testifying to the increased confidence of investors in such properties.

	Feb. 1, 1891.	1892.	1893.
Total number of roads operating and under contract	151	214	435
Total number of cars in actual operation	1,578	2,790	8,386
Number of miles of road in actual operation	1,252	2,315	4,927

LICENSEES.

The relations between your company and its various licensees, and between it and those of the underlying companies, are of the most satisfactory character. Your directors appreciate that the interests of the company are closely connected with the welfare of its licensees, and there is a corresponding recognition on the licensees' part that the cordial co operation of your company is essential to the fullest development of their business.

No effort will be spared to secure from the recent patent decisions in your favor the greatest possible benefit to these licensees. The public, through them, will be distinctly benefited, because of the concentration of local illuminating and power business in the licensed central stations equipped for supplying light and power at minimum rates.

The prices at which apparatus and lamps are now furnished by the General Electric Company, for use of such stations, are, in many instances, lower than those which prevailed prior to sustaining the lamp patent, while the quality and efficiency of the apparatus are largely increased. Thus the licensees are enabled to cheapen their production and their prosperity is greatly enhanced—a prosperity in which your company has a direct and permanent share.

PATENTS.

The patent situation is encouraging and promising. The decision of the highest court sustaining the fundamental incandescent lamp patent, which decision has been followed by many other tribunals, has vested in your company the right to the incandescent lamp business of the United States, a result of great value to the company.

The strenuous efforts made by your competitors to develop an incandescent lamp which will not infringe this patent have been thus far wholly without success, and there is no reason to believe that any different results will be achieved in the future.

The decisions heretofore rendered in favor of the Thomson-Houston and Brush companies, covering the double carbon arc lamp, automatic current regulation and electric storage are of very great value to your company.

Although it is well known that the patented inventions of Edison, Thomson, Brush, Van Depoele, Rice, Sprague, Bentley, Knight, and other inventors now or heretofore connected with your organization, are the basis of substantially the entire arts of electric lighting, electric railways and electric motive power now in general use, the situation up to the date of the organization of the General Electric Company was not favorable to the best development of business under these inventions.

Suits against infringers are now in active progress on many important patents, other than those already sustained by the courts, covering essential features in electric railway, lighting and power apparatus. These suits will be pushed as vigorously as possible.

In dealing with the numerous past infringers, your directors are of the opinion that the substantial interests of the shareholders can be protected without a harsh or offensive exercise of your rights, and in such way as to greatly benefit the company and to satisfy consumers and the public of its desire to act in an entirely fair and liberal spirit.

FINANCIAL.

There are annexed to this report the company's condensed balance sheet and statement of profit and loss as of January 31st, 1893, showing that in the eight months during which your company has been in operation its profits amount to $1,024,954.59 in excess of three quarterly dividends on the common and one semi-annual dividend on the preferred stock.

In order that the stockholders may understand the position of the company, the following explanation as to the general character of the items in the balance sheet is submitted.

INVESTMENT ACCOUNTS.

Under this head will be found the assets now represented by the stocks of the three underlying companies, substantially all of which have been acquired by your company.

Details in regard to these companies are presented, from which it will be noticed that the basis upon which they were acquired by your company represents a cost of about $8,000,000 for all their patents, other valuable rights, licenses and other contracts. This is after writing down the assets they still own—manufacturing plants, factory inventories, etc., to conservative valuations.

The transactions of your company are to a considerable degree with local companies working under contracts licensing them to use the patents, about two thousand in number, under which your company operates. Your company is now supplying apparatus to about thirteen hundred local companies, the royalties from which run from $1,500,000 to $2,000,000 per year. It is believed that the royalties will be greatly increased in the future, so that $8,000,000 would appear to be far within the actual value of the patents, contracts, etc., which are represented thereby.

Your company has to a large degree acquired the business, other than manufacturing, of the Thomson-Houston and Edison General Companies, and has liquidated a large part of their liabilities. This course will be continued during the present year.

The preferred stock of the United Electric Securities Company has been sold since the close of the fiscal year at a price in excess of the value at which it appears in the balance sheet. The common stock of the same company—$825,500 out of a total issue of $1,000,000—is taken in the balance sheet at par. The company is making large profits and paying regular quarterly dividends.

The stock of the Canadian General Electric Company, a manufacturing and selling company controlling the Edison and Thomson-Houston patents in Canada, is taken at par. Its sale at an early date is expected, it being now under option to a Canadian syndicate at above par.

The stocks of the Fort Wayne Electric Company and Northwest General Electric Company are paying eight per cent. dividends on the value at which they stand in the balance sheet.

Stocks of "Miscellaneous Companies" carried at $71,566, comprise holdings in various corporations not considered local or licensee companies.

OTHER ASSETS.

With reference to these items it may be stated that in the judgment of your Board they are taken at safe figures. They consist of stocks, bonds, cash, notes and accounts receivable, merchandise on hand and work in progress; and it will be noticed that they amount to $29,559,600.61 as against total current liabilities of $5,246,219.

The stocks of local companies which appear in the balance sheet at $5,772,622.80 (par $11,632,011.65) have been valued carefully with the intent to carry them at a figure which can easily be obtained for them. As a further margin in this respect, stocks amounting at par to $1,301,940 (most of which accrued to this company under license contracts with recently organized companies) are taken in the balance sheet at the nominal value of $1.00 for each block, although there is reason to believe that within a moderate time these will develop a substantial earning capacity.

The bonds are almost entirely those of local companies. They are nearly all first mortgage bonds, payable in gold, and stand in the balance sheet at about seventy per cent. of their face value. All of these bonds excepting $439,000 at par value—$251,088.07 book value—are regularly paying their interest, and the comparatively small amount in default is carried at prices lower than it is believed will be realized.

Some of the bonds carried in the balance sheet have been sold since the close of the fiscal year at prices in excess of their book value, and the rest will be sold from time to time through the United Electric Securities Company and other channels as heretofore.

The amount now being paid in dividends (exclusive of those received on the stocks of the underlying companies) and interest on your company's holdings of stocks and bonds shown in the balance sheet exceeds the amount required to pay interest on your company's $10,000,000 outstanding debenture bonds.

After careful examination, deductions have been made from the notes and accounts receivable to cover fully all bad and doubtful items.

The item "Inventories" represents all the company's stock of apparatus, material, machinery, fixtures, etc., in the offices and storehouses of your company's seven districts, and includes the machinery, tools, and material in the various repair shops connected with such district offices.

"Work In Progress" represents the actual cost to date of all labor, material, etc., on unfinished contracts now in course, which, when completed, will afford a considerable profit.

The cost of patents acquired by your company during the eight months has been charged off as an operating expense.

CONTINGENT LIABILITIES.

Your company makes a practice of endorsing and discounting some of the notes it takes from its customers. Such endorsed notes are not included in notes receivable in the balance sheet, where only those now held by your company are taken into account. The outstanding notes receivable which had been endorsed and discounted on January 31st, 1893, amounted to $3,787,312.69.

C. A. COFFIN, President.

UNDERLYING COMPANIES.

EDISON GENERAL ELECTRIC CO.

The cost of acquiring 149,699 shares of the capital stock of the Edison General Electric Company was		$14,969,900.00	
Less net amount credited to that company, after charging it with money advanced, and with an arbitrary amount of $695,000 as a guarantee against its customers' notes and accounts transferred to the General Electric Company, and after crediting it with sundry assets taken over by this company		6,336,691.54	
Making present cost, as shown on the Balance Sheet			$8,633 208.46
This amount represents the following:			
Manufacturing plants, being the investment in lands, buildings, machinery and tools at Schenectady, N. Y., and Harrison, N. J.		$2,677.548.09	
Machinery and materials sold to U. S. Wire and Cable Company but not yet paid for		282,147.76	
Schenectady and Harrison factories inventories		2,576 887.14	
Cash and notes and accounts receivable		409,117.86	
Total		$5,945,700.85	
Less debt		1,551,660.71	4,394,040.14
Leaving			$4,239,168.32

represented by patents which have cost the Edison Company about $2,000,000; and by holdings of the entire capital stocks of Edison underlying patent owning companies, under contracts with which all large Edison licensees give to the Edison Company a percentage of their entire issue of stocks and bonds.

THOMSON-HOUSTON ELECTRIC CO.

The cost of acquiring 399,347 shares of the capital stock of the Thomson-Houston Electric Company was		$18,381,970.00	
Less net amount credited to that company, after charging it with money advanced, and with an arbitrary amount of $1,000,000 as a guarantee against its customers' notes and accounts transferred to the General Electric Company, and after crediting it with sundry assets taken over by this company		9,965,118.22	
Making present cost, as shown on the balance sheet			$8,416,851.78
This amount represents the following:			
Manufacturing plants, being the investment in lands, buildings, machinery and tools at Lynn, Mass.		$1,240,006.77	
Lynn factory inventory		2,263.347.59	
Cash and notes and accounts receivable		428.126.91	
Raw copper		135,525 94	
Consignments		8,396.71	
Stocks of the Brush, Excelsior, Fort Wayne and Schuyler Electric Companies, and stocks of other manufacturing and patent owning companies, par value $7,312,980, carried at	$4,013,420.11		
Stocks of the Central Thomson-Houston, Eastern Electric Construction, Northwest General Electric, Thomson-Houston Electric Light and Thomson-Houston Motor Companies, par value $1,468,350, carried at	891,750.00		
	$4,905,170.11		
Liquidation value, say		2,500,000.00	
		$6,575,463.92	
Less debt		1,547,964.21	5,027,499.71
Leaving			$3,389,352.07

represented by patents, including Brush patents on double carbon arc lamps, storage batteries and patents on current regulation, all of which have been sustained in the United States Courts, and by about 1,400 other patents owned by the Thomson-Houston Company and manufacturing companies controlled by it.

THOMSON-HOUSTON INTERNATIONAL ELECTRIC CO.

The entire capital stock of the Thomson-Houston International Electric Company was acquired at a cost, as shown on the balance sheet, of		$1,212,000 .00
This amount represents the following:		
Stocks of other companies	$13,139.00	
Cash and notes and accounts receivable	468.076.02	
Charges against its branch offices	468,914.69	
Inventory and consignments	39,019.98	
	$989.209.69	
Less debt	307,953.32	681,256.37
Leaving		$530,743.63

represented by the rights in foreign countries under patents of Thomson, Rice and others, including contracts for delivery of $100 000 stock of the Canadian General Electric Company and substantial interests in other manufacturing and exploiting organizations in foreign countries.

CONDENSED BALANCE SHEET—JANUARY 31, 1893.

ASSETS.

INVESTMENT ACCOUNTS.

Stocks of Underlying Companies:			
Thomson-Houston Electric Co	$8,416.851.78		
Edison General Electric Co	8,633.208 46		
Thomson-Houston International Electric Co	1,212.000.00	$18,262,060.24	
Real Estate:			
Edison building, N. Y. City	410.804 62		
Less mortgage thereon	200,000.00

	$3,356,593.10

EARNINGS.

Net profit from the business of the eight months, over and above all expenses, deductions for bad debts, etc.	$3,356,593.10	$3,356,593.10

To show the rottenness and corrupt business methods of the greatest electrical concern in America, a concern which ought to be the pride of every electrical man, is an unpleasant task. The best interests of the trade, of the art, and of the general public, demand it, however, and it has remained for ELECTRICITY to perform the work.

It is pertinent at this point to call attention to the fact that the firm of Woodhouse & Rawson, who occupied in England a very similar position to that occupied by the General Electric Company on this side, has at last been driven to the wall by reason of the continued exposures of the British electrical journals, and that the most serious and damaging charges of the latter have proved to be well within the bounds of truth.

Now let us look at the statement with the eyes of common sense, and in the light of undisputed facts—facts known to every one who has conducted a manufacturing business of any magnitude in any line.

When a combination of smaller concerns is formed, and the stock taken over into a trust, the natural and invariable rule—a rule without a single exception—has been that the net assets of the component companies were placed at the highest figure possible. It was so in this case.

Now Mr. Coffin has said that the assets of the General Company have been written down to a conservative estimate. Yet how plain it is that this is not the case.

The original assets of the underlying companies appear in the balance sheet at a higher valuation than the one at which they were taken over.

In addition we find that $580,216 of stocks of manufacturing and other companies appears twice over. This cannot be a typographical error.

In the statement of assets of the Thomson-Houston Company there appear the items of:

Stocks of the Brush, Excelsior, Fort Wayne, and stocks of other manufacturing and patent-owning companies (par value $7,312,980), carried at	$4,013,420.11
Stocks of the Central Thomson-Houston, Eastern Electric Construction, Northwest General Electric, Thomson-Houston Electric Light, and Thomson-Houston Motor Companies (par value $1,468,350), carried at	891,750
	$4,905,170.11
Liquidation value, say	$2,500,000.00

By referring to the assets of the General Electric Company in the condensed balance sheet, we find the following items, which require some explanation:

Excelsior Electric Company	$1.300
Fort Wayne Electric Company	352,350
Northwest General Electric Company	155,000
Miscellaneous companies	71,566
	$580,216

These securities have already appeared in the $8,416,851.78 of assets of the underlying Thomson-Houston Company in the same column, and it is hardly fair to call on them for double duty.

A conspicuous feature of this statement is the omission of the item of the volume of business done in the eight months. Financiers and investors may be thrown off the track by this omission, but not so with men engaged in similar lines of business.

The bulk of business can, however, be estimated approximately—probably within $50,000 of the actual figures.

We find as assets:

Notes	$5,151.950.64
Accounts	7,078,879.15
	$12,230,829.79

Assuming that these items are correct in the balance sheet, and estimating, as is customary among electrical manufacturing concerns generally, that one-sixth of the gross business for the year is carried on the books at a given time, we see that the General Electric Company has done nearly $75,000,000.00 of business for the year, or more than any twenty concerns (including itself) in the electrical trade in this country.

In the assets of the companies taken over to form the General Electric Company there were book accounts (notes and accounts receivable) aggregating over ten millions.

It is probable that these accounts, or a large part of them, go to make up the twelve millions of similar assets in the balance sheet. They were book accounts a year ago, are book accounts won, and will be, very likely, ten years hence.

The probabilities are that the General Electric Company has done at the rate of about $15,000,000 of business. Has it been compelled, in order to do any business, to do it all on paper ?

Our estimate of $15,000,000.00 of business for the company is based on the opinions of men of sound judgment in the trade, and furthermore—The item of "Work in progress, $2,207,982.75," which, as is stated in the report, covers "the actual cost to date of all labor, material, etc., on unfinished contracts, now in course," may fairly be multiplied by six to get at the total business. This is based upon the actual experience of those in similar enterprises.

Indeed $15,000,000.00 is a very liberal estimate, as the company's exhibit at the World's Fair is a large one, valued at nearly a million dollars, and it is not entirely fair to call this contract work, as the machines are not sold.

The next items to which we desire to called attention are perhaps the most remarkable in the entire report. Cash on hand appears to be $3,871,033.58, and the notes and accounts payable are given at $4,554,347.68.

Is it credible that in a business where the average discount is 3 per cent. for thirty days payment (offering an opportunity to make 36 per cent. a year), any concern with over $3,000,000 cash on hand should allow bills and notes to accumulate to this amount ?

We think not.

Moreover, the figures given, $4,554,347.68, force the conclusion that the company is ninety days behind in the payment of its bills.

Scarcely one of the items of assets but deserves careful scrutiny. No railroad company whose stock is listed at the New York Stock Exchange would have the presumption to present so vague and incomplete a statement of its affairs.

The Thomson-Houston International Company is not an earner, and it is doubtful if it ever will be.

The Brush Company, properly managed, might be a good property. It has, however, been practically wrecked by Boston control, and last year lost over $30,000. It cannot do even as well this year.

The stock of the United Electric Securities Company is entirely problematical in value. What value it has is based upon various collateral, "cats and dogs" of local companies, not over 50 per cent. of which are likely to prove profit earners. Bonds of plants like the one in Syracuse, costing not over $300,000 and bonded at $750,000, and never earning interest as yet on even $300,000, cannot be considered gilt-edged securities.

A detailed list of the stocks and bonds of local companies which the Securities Company holds as collateral against its own issues might show that fifty cents on the dollar was about the actual value of the $825,000 of common stock, or it might show, as electrical men generally believe, that the common stock has no value.

If the experience of similar companies is a fair precedent on which to base opinion, the notes and accounts receivable, amounting to $12,230,829.79, will shrink 25 per cent. This would reduce the most substantial part of the assets in liquidation by over $3,000,000, or nearly as much as the cash on hand at present.

Our estimate of the value of these various assets is somewhat below that given in the balance sheet. It is as follows:

The plants and property of the Brush, Ft. Wayne and Schuyler Companies, $1,000,000.00. Central T.-H., Eastern Electric Construction, Northwest General Electric, T.-H. Electric Light and T.-H. Motor Company, *no value*, all expenses being paid by the General Electric Company; they are simply selling agents, showing shortages, which are made up by the General Electric Company.

The T.-H. International Company is also simply a selling agent, and its stock has no solid foundation for value in any amount.

The United Securities Company is also practically a selling agent, only it sells stocks and bonds instead of apparatus.

Stock of the Canadian General Electric Company may perhaps be worth 50 cents on the dollar.

Stock of the Excelsior Company is worthless.

The items of assets, seven and one half millions, for patents owned by the underlying companies, are absurd. Only one patent is owned by these companies covering a result which is not obtained by dozens of other manufacturers without infringing. This is the incandescent lamp patent lately sustained. There is already one non-infringing lamp on the market, and within sixty days there will be four.

The patents will all expire in the next few months, at least all of the important ones.

These patents are not worth $100,000 in a lump. It has cost twenty times that for the patent litigation of these companes, and the returns are nil.

In brief, we believe that a correct and honest statement would show the total liabilities to be twenty millions above assets available in liquidation, and that the common stock is to-day worth less than fifty cents on the dollar.

We will stand by this opinion until the day comes—and it is not far distant—when disinterested parties will make up a statement of the actual condition of the company.

Detroit Electrical Works.

A Receiver Likely to Be Appointed.

A chattel mortgage for $185,500, covering the plant, fixtures, patents, notes and money of the Detroit Electrical Works, has been filed to secure Hugh McMillan, the president of the company, for advances made.

The stockholders have held a meeting to protest against this action, and will contest the legality of the mortgage. They will also petition for the appointment of a receiver.

The troubles of this company have been known for some time. The chief difficulty has been that the present management has been totally ignorant of the requirements of the business, and has dispensed with the services of those who did know.

ELECTRICITY will have something further to say on this subject in an early issue.

The large driving wheel of the Brush Electric Light Works at Niagara Falls burst recently, doing considerable damage but fortunately in juring none of the workmen. The accident was found to be due to the tremendous centrifugal tension caused by the accelerated motion of the wheel owing to some of the mills closing down on the hydraulic race. The wheel was of cast iron, weight 25,000 pounds, with 18-inch face. A similar accident happened at the works last fall by which one man lost his life.

Legal Notes.

The following petition has been forwarded to the United States District Attorney concerning the Berliner Telephone patent. "The Trades League of Philadelphia, an organization of some 1,200 of the largest firms of the city, and which is actively engaged in an effort to decrease the exorbitant telephone charges imposed upon the subscribers in Philadelphia, and which movement is endorsed and supported by nearly every business organization in this city, would respectfully suggest that you would be warmly commended from one end of the United States to the other by the business men who have to use this, at present, high-priced business accessory, the telephone, if you would press with all diligence the suit commenced by your predecessor, Attorney General Miller, in the Circuit Court of Boston, Massachusetts, February 8th, to annul the so-called Berliner patent, which was applied for June 4th, 1877, by Emile Berliner, and issued to the American Bell Telephone Company, as assignee of Emile Berliner, on November 17, 1891, under which patent the American Bell Telephone Company claim the right to protection for fourteen years more to come. As this matter is one of grave importance, and in which we feel a deep interest, we will very much appreciate an early reply."

Application was made to Justice Bartlett of the Supreme Court last Wednesday by Cardoza & Cardoza for a preliminary injunction on behalf of Mary Ryan, as plaintiff, against Michael J. Coffey, president of the Board of Aldermen, Mayor Boody and the Brooklyn City Railroad Company. Mrs. Ryan sues as a property owner along the line of the proposed route for which the Board of Aldermen has voted to grant a franchise for the construction of an electric road.

Judge Bartlett declined to grant the motion; but he intimated that upon the presentation of proper papers he would grant an order to show cause why an injunction should not issue.

Speaking of the suit brought by the Thomson-Houston Company against the San Francisco and San Mateo Railway Company, the president of the railway company, Behrend Joost, said:

"After taking the contract to build and equip the road the S. S. Construction Company sublet the job. One of the sub-contracts was made with the Thomson-Houston Company, that corporation agreeing to supply all of the electrical appliances we required. The bills aggregated $163,000, and of this amount we have paid $113,000.

"In this suit the value of the supplies is estimated at $100,000. There has been wear and tear, and I dare say the figures were put low because the indemnity bond in a case of that kind must be in a sum double the amount stated as the value of the property involved.

"The amount actually due the plaintiff is only $40,000 or thereabout, but I am informed that it is the intention of the Thomson-Houston Company to seek to regain the property transferred to us, utterly ignoring the payments already made.

"The suit has been brought against the railway company, that corporation having possession of the appliances supplied to the S. S. Company. But the question as to whether the railway company is bound by the contracts of the construction company will probably be raised should the litigation proceed."

The injunction by which the Wyandotte Electric Light Company prevented the Western Electric Company of Chicago from operating the new public lighting plant installed in Wyandotte, Mich., by the latter company, has been dissolved by a decree of the court.

The case of the Lynn Gas and Electric Company against the Connecticut Fire Insurance and twenty-two other insurance companies has been finally decided in favor of the electric company in the court of last resort. The amount of the verdict was $12,000. The case was based on the destruction of the engine room and a big Corliss engine, caused by a fire in the tower of the company (trifling in itself and soon extinguished) short-circuiting an electric current connected with machinery in the engine house, fifty feet away; the short circuiting strained and broke a pulley and a flying fragment from the broken pulley struck and disabled the governor of the engine, in consequence of which the engine destroyed itself and the building. The Gas and Electric Company insisted that the whole damage was a loss by fire, and the court agreed with that view. The verdict covers the entire loss.

World's Fair Notes.

Whether the World's Fair will be ready to be formally opened by President Cleveland on May 1st depends upon how fast the exhibits can be placed in position more than upon their reception at the grounds, as is shown by the report of the Superintendent of Installation. Last week a daily average of three hundred cars of exhibits and about 500 wagon loads were received from city exhibitors. Extra men have been hired to install the goods and get them in shape for the opening day. Most of the foreign exhibits from electrical firms are in the Electricity Building, and are being placed in position as fast as they are unpacked. About 200 boxes of the German exhibit are already in position on the second floor of the building. Since the extension of the time for receiving from April 10 to May 1, the American exhibitors have realized that it is necessary to have their goods on the grounds if they are to be installed at all before the last mentioned date.

The Westinghouse Electric Company are working two shifts of men in order to have a portion of the incandescent plant ready for the opening exercises. Two of the large 5,000 light alternating dynamos are ready to be run as soon as steam can be turned onto the engines. The switchboard from which all the circuits are to be operated is nearly completed.

Up to the present time, of the arc light plant which is to light the grounds and buildings the following machines have been installed: 6 Excelsior, 26 T.-H., 20 Standard, 12 Ft. Wayne, 12 Brush, 6 C. & C., 4 Mather and 4 Eddy.

Work on the generating station for the Intramural Railroad is being rapidly pushed, and it is expected that a trial trip will be made during the coming week.

C. D. Wyman, general manager of the Columbia Electric Launch Company, came to the park last week and is superintending the installation of the storage batteries in the boats. Fifteen of them are to be ready May 7 and the remainder as soon as possible thereafter.

The firm of Stranahan, Riley & Wilkinson have been granted the concession in the Electricity Building and Machinery Hall to demagnetize watches.

BOOK NOTICES.

Electrical Measurements and other Advanced Primers of Electricity. By Edwin J. Houston, A. M., New York; The W. J. Johnston Company, Ltd., New York. 429 pages. Price, $1.00.

This is the second volume of Prof. Houston's elementary treatises, and it presents the subjects of electrical measuring instruments, electric batteries and electric lighting in a non-technical manner.

The work confines itself to descriptions and explanations of the principles of various kinds of apparatus rather than to their practical applications, and for this reason is chiefly adapted to the use of students.

A third volume, now in preparation, will complete the series, but there is no necessary connection between the several volumes, each one being complete in itself, as are the several primers in each volume as far as possible.

The subjects of electric lighting and power occupy some 200 pages, and the various systems and apparatus in general use are described very completely.

Boston Notes.

As the time approaches when the hen that is on should have hatched out her brood and "come off," interest and excitement throughout Boston electrical circles increases, and almost everybody is craning his neck to catch an early glimpse at the callow brood. Just to pacify the over-anxious ones we wish to say that by special wire we learn the old lady is feeling comfortable, is sticking close to business; receives no callers, and promises to do her level best to present to the anxious and waiting world, within a few days, a large family of brilliantly plumaged chicks. They will be spring chickens, too.

The paper on "The Fire Hazards of Electric Lights," published in another column, which was read by Captain Brophy, the veteran insurance and electrical expert, before the Boston Society of Arts, Thursday evening, drew together an unusually large attendance of members, including men who are prominently identified with electrical interests, and some of whom joined in the subsequent discussion.

As is well known, Boston has passed through a fiery ordeal since the beginning of the present year, which has cost her fire underwriters or the companies they represent well on to $5,000,000 in losses. In consequence the insurance people have held repeated meetings, discussed these fires and endeavored to trace their origin. Of course some one has started the usual hue and cry against electric wires as the primary cause of all the trouble; insurance rates have been increased no less than 1 per cent., and general excitement prevails. The question is beginning to be asked, Where is the New England Electric Exchange, which during its existence did so much to improve the quality of all electric work, licensed only good men to engage in the business, increased public confidence in the use of electricity and did good all round? It may be that useful organization will have to be resuscitated unless the fraternity is prepared to see its business seriously if not permanently jeopardized by blind, ignorant and unfounded prejudice.

General News.

What is Going on in the Electrical World.

Wheeling, W. Va.—The electric street car strike has been settled.

St. John, N. B.—The electric railway has begun operations and is doing a rushing business.

Roanoke, Va.—The Street Railway Company intend to change the Salem dummy line into an electric line.

Baton Rouge, La.—The electric street-car belt line has been completed, and the cars are running regularly.

Rockville, Md.—A company is to be formed to light Rockville with electricity. The capital stock will be $20,000.

Cleveland, Ohio.—The cable company has let the contracts for the equipment of the St. Clair street line with electricity.

Charleston, Mo.—The Charleston Electric Light Company advertises for sale a new electric light plant which cost $10,000.

Ft. Worth, Texas.—The present street railway will be converted into an electric line as soon as arrangements can be made.

Albany, N. Y.—The Legislature has passed the bill extending the term of the New York City Board of Electrical Control another year.

Phœnix, Ariz.—The Phœnix Light and Power Company has become the successor by purchase of the Phœnix Electric Light Company.

Akron, Ohio.—After a long contest the city council has renewed the contract for lighting the city with the Akron General Electric Company for five years.

Hanover, Pa.—The stockholders of the Hanover and McSherrytown Street Railway have decided to put the road under contract at once; it will be electric.

New Hampton, Iowa.—At the election held here on the 10th inst. the question of putting in an electric light plant was voted upon and carried by a large majority.

Omaha, Neb.—The amended city charter, among other things, authorizes the city to build or buy gas works and electric light plants, and to issue bonds for the purpose.

Athens, Tenn.—There is probability of the Athens Street Railway Company being reorganized and the motive power of the line changed from horses to electricity.

Northampton, Mass.—The bill giving the Northampton Street Railway Company the privilege of extending its tracks to other towns in Hampshire County has been passed.

Richmond, Ind.—It seems probable now that an electric light plant will be established here as soon as arrangements can be made with the gas company, whose contract expires in two years.

Charleston, W. Va.—People here are dissatisfied with mule motive power, and the Street Railway Company will probably have to succumb to the popular demand for electrical propulsion.

Wauwatosa, Wis.—The Wauwatosa Street Railway Company has been granted a franchise for an electric railway line in certain streets of the town. The road will connect with the Pabst electric line.

Wilmington, Del.—The Harlan & Hollingsworth Company are placing trolley wires around their various shops by means of which trucks electrically connected will be moved to any part of the buildings.

Brooklyn, N. Y.—The Board of Aldermen last week granted valuable street-railway franchises to the Nassau Electric (P. H. Flynn's), the Brooklyn City and the Kings County Electrical Railroad companies.

Leadville, Col.—The Leadville Water and Power Company has secured a franchise to erect another electric plant in this city. The company will furnish power for running mining machinery as well as electric light.

Chamberlain, S. D.—Some capitalists have decided to put in an electric light plant here, and intend getting their power from an artesian well, which, in combination with a local mill-owner, they are now having sunk.

Chillicothe, Ohio.—The plant of the Chillicothe Electric Railway and Lighting Company has been sold to a New York syndicate for $140,000. The new company will add two miles to the railway line, and make other improvements.

New York.—The Atlantic Postal Telegraph Cable Company held its annual meeting on the 11th inst. and re-elected the old board of directors, as follows: A. B. Chandler, W. H. Baker, E. C. Platt, J. O. Stevens and T. L. Cuyler, Jr.

Butte, Mont.—At a recent meeting of the Montana Mutual Electric and Telephone Company the following officers were elected: Patrick Mullins, president; J. P. Reins, vice-president; W. McC. White, secretary; Fayette Harrington, treasurer.

Dubuque, Iowa.—The foreclosure sale of the Allen & Swiney electric light and street railway plant to the Old Colony Trust Company of Boston, having been confirmed by the court, the trust company through the General Electric Company of Boston will reorganize the company.

Chester, Pa.—This city is becoming a great trolley centre. Besides its own street lines, it will have two or three lines connecting it with Philadelphia. The Philadelphia and Delaware Street Railway Company is now endeavoring to get an entrance to the city, and if it succeeds, it will give us a through line to Wilmington.

Indianapolis, Ind.—The draft of the electric street-railway franchise to be submitted to competing companies occupies several columns in the local papers. There are now four companies aiming to get a franchise, but it is considered likely that the Citizens' Street Railroad Company will secure the plum.

Laurel, Md.—A company composed of local capitalists has petitioned the city council for permission to lay and maintain an electric railway along the principal streets of the town, the cars on the same to be propelled by electricity generated at the power house of the Laurel Electric Light Company.

Stockholm, Sweden.—An electric railway will soon be constructed from Stockholm to Djursholm. The electric appliances are to be furnished by a firm in Manchester, England, while the boilers and the steam engines will be made at Eskilstuna. The work will be pushed so that the line may be opened for general traffic next fall.

Marshallton, Md.—The citizens of Mill Creek, Christiana and Brandywine, hundreds living along the route of the proposed Wilmington and Brandywine Springs electric railway, held an enthusiastic meeting here a few evenings ago, the object of the meeting being to urge the immediate passage of the bill and to censure the Senators for their tardiness in taking action on the measure.

Middletown, Conn.—The Thomson-Houston Electric Company held its annual meeting at the office of the Schuyler Electric Company in this city on the 10th inst. The following directors were elected: H. A. Pevear, C. A. Coffin, J. N. Smith, V. F. Spinney, S. A. Barton and C. H. Newhall, all of Lynn; E. E. Griffin, T. Jefferson Coolidge, Jr., and S. E. Peabody, of Boston.

Baltimore, Md.—It is reported that all franchises and rights of way for an electric railway between Baltimore and Washington have been secured and that work will begin at an early date. A prominent banking firm of Baltimore is pushing the enterprise and Boston and New York capitalists are interested in it. The road is to be thirty-eight miles long, and is distinct from the Traction Company's projected road and boulevard, which seems to hang fire.

Springfield, Ill.—The People's Electric Street Railway has been sold to a St. Louis syndicate, the same that recently purchased the Springfield City Railway. The roads will be consolidated under one management and will eventually be connected and transfers issued from one line to the other. C. K. Minary has taken control of the roads. It is said that the new company has no connection with the People's Electric Lighting and Heat Company, lately organized.

Philadelphia.—A charter has been applied for by the Electric Traction Company, a new organization, which intends to lease the Frankford and Southwark Passenger Railway Company's road and leased lines, and convert the Frankford and Southwark road into an electric system. There are 100 miles of road, and it is estimated that it will require between $6,000,000 and $8,000,000 to install the trolley on the entire system.

York, Pa.—The Edison Electric Light Company having announced through the press that all persons using incandescent lights that were not acquired through them were infringing on their rights and would be prosecuted, the Westinghouse Company has assured their customers and the public that they need have no fear of prosecution as the company would assume responsibility of any action brought against consumers of their light.

Atlantic City, N. J.—The extension of the electric railway system to Longport by the Pennsylvania Railroad necessitates the enlargement of their electric power house, and in a few days work will be started on the same. A new 300 horse power dynamo is to be added to the already large plant. Instead of motor trains being run every hour this summer, electric cars will probably leave this city every fifteen minutes or so.

Pittsburg, Pa.—A committee of electricians, consisting of John Ridall, of the Brush Electric Company; G. H. Blaxter, manager, and J. H. Willock, director of the Allegheny County Light Company; Superintendent Morris Mead, of the Bureau of Electricity, and others, have gone on a tour of inspection of underground wire systems in the cities of Chicago, St. Paul and Minneapolis. As soon as the committee returns from its tour of investigation, a conference will be held with the city officials in regard to the style of the work to be done here.

Martinsville, Ind.—A syndicate composed of Eastern men are reported to have devised a scheme to make Martinsville a centre of attraction, the waters of the springs here, said to possess medicinal virtues of a high order, suggesting the enterprise. The syndicate propose to build an electric line to Indianapolis, if they can get a franchise for a street railway in Martinsville, and to make such improvements in this neighborhood as to make it a pleasant summer resort for Indianapolis people and the residents of intermediate places.

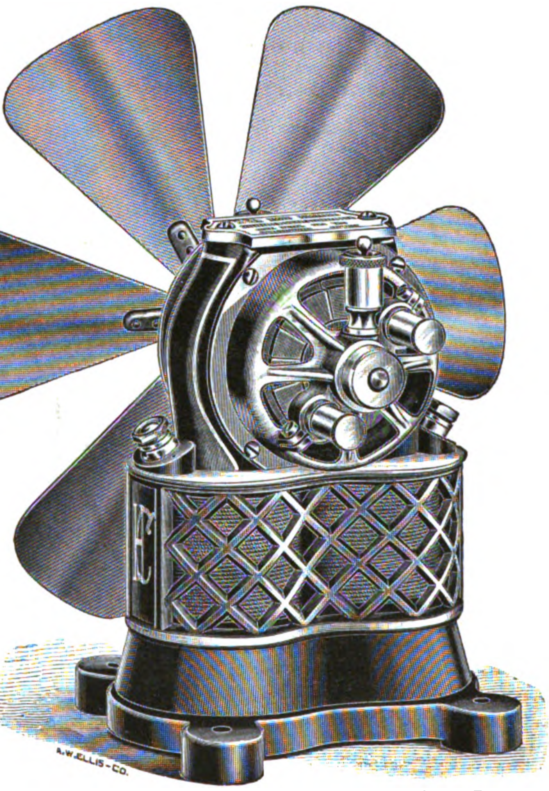
Oakland, Cal.—It is doubtful if there is another city in the world so well supplied with street railroads as Oakland. "When all the franchises have been utilized," says the *Enquirer*, "there will be no less than six electric routes to Berkeley (counting four branches of the Oakland Consolidated Company), four electric routes to West Oakland, four to East Oakland (besides a horse car road), two to Alameda and one to San Leandro and Haywards. Near the centre of the city the lines cross and recross like spider webs."

Winona, Minn.—The Winona General Electric Company, an offshoot of the Northwestern General Electric Company, now own in fact as well as nominally all the public electric light, heat and power plants in the city, as well as the Winona City Railway. The company have filed an amendment to their articles of incorporation, increasing the amount of indebtedness which they may legally incur from $250,000 to $500,000. This company was originally organized as the Winona Light, Heat and Power Company, but on October 10th last its articles of incorporation were amended and the name changed to the Winona General Electric Company.

Mobile, Ala.—The manager of the Mobile Street Railroad has effected arrangements for changing the motive power of the road to electricity.—The Mobile Electric Railway Company and the Mobile Electric Light and Power Company have been consolidated under the name of the Mobile Light and Railway Company. The capital stock of the new company has been fixed at $500,000. The officers elected are as follows: John Wilson, of Leavenworth, Kansas, president; J. H. Wilson, of Mobile, vice-president and general manager, and A. J. Peaper, secretary; John Wilson, J. H. Wilson, J. C. Lysle, W. E. Gordon and A. J. Peaper, directors.—The council has passed an ordinance taxing all telephone, telegraph, electric light and street car poles.

The Lundell Motor.

The 1893 model of the Lundell Fan Motor embodies a self-oiling and self-aligning bearing. The new design of fan guard gives the outfit an artistic appearance, and the black japanned finish is proving popular. This new model is a striking exposition of the character of the electrical novelties of the Interior Conduit and Insulation Company.



The Holtzer-Cabot Fan Motor Equipment. (See Page 192.)

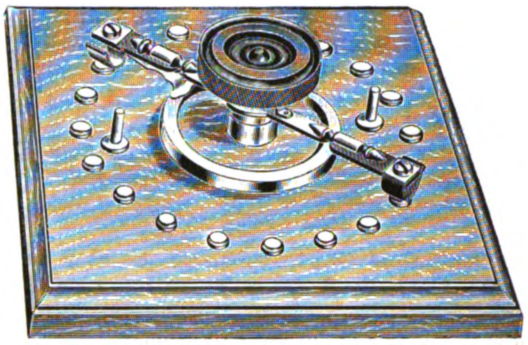
The E. E. & S. Voltmeter Switch.

With the increasing number of isolated plants, electrical practice and apparatus in this line becomes more important. Nearly all large buildings of modern erection maintain their own plants, often very extensive and complete, and usually including a switchboard of slate or marble holding the apparatus for the control of the plant. The grouping of a number of machines in this way, feeding into common bus bars, renders necessary means of controlling each one at any time, and uniting its action, especially with reference to voltage.

For the latter purpose the Electric Engineering and Supply Company of Syracuse, N.Y., have recently placed upon the market in connection with their switchboards and voltmeters the voltmeter switch—illustrated in the accompanying cut.

As the name indicates, the instrument is to be used in connection with a number of generators in place of the primitive strap switch or the cumbersome plug method adopted when the number of circuits becomes too large for the former. They are made in two styles, "single" and "double" pole. The arm is brass, of two pieces, insulated and mounted on the central support. A light spring contact piece is carried on the lower side at each end, and as the arm is rotated by the corrugated hard rubber disk at the center, these touch diametrically opposite posts. One contact spring is lengthened to bear on the ring on the base, and between this ring and the other arm through the center post the voltmeter is connected. The test wires from the circuit are brought to opposite posts, and by turning the arm the voltmeter may be connected to any circuit or cut-out. Stops are provided to prevent reversal of the current.

The switches are shipped of any number of circuits, on wood bases for templates, or are put upon slate or marble bases.



The E. E. & S. Voltmeter Switch.

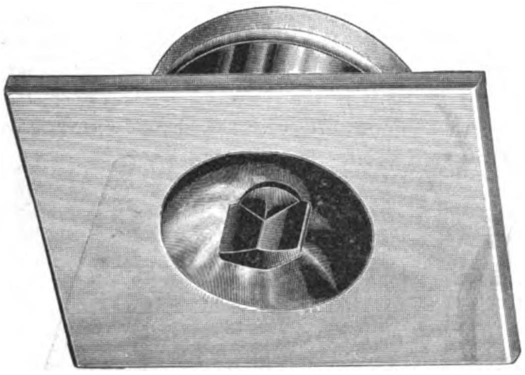
While there is nothing especially new in this instrument it fills a long felt want, and its convenience, neat appearance and workmanship commend it to all station men and electrical users who look after the details of their plants. This is shown by the fact that contractors specify it on boards of their construction.

A Handsome Catalogue.

The J. T. Case Engine Company of New Britain, Conn., manufacturers of the Case Automatic High Speed Engine, have printed for distribution an exceedingly handsome catalogue, letterpress in two colors, containing illustrations of the machinery they manufacture and full and perspicuous descriptions of their celebrated engines and their various parts. Among the practical qualities which they claim for the engines are simplicity, direct action, compactness, lightness of moving parts, large wearing surfaces, automatic lubrication and perfect regulation, and these points are classified under their proper headings and fully described in the catalogue, which also contains tables giving the dimensions, capacity and all the particulars of the machinery manufactured by the company.

The Hart Flush Switch.

The switches manufactured by the Hart & Hegeman Manufacturing Company, of Hartford, Conn., have worked their way into the high estimation in which they are held by the trade by their intrinsic merits. They are elegant in appearance, efficient and reliable, and are finished in any style that may be desired. The switch of which the accompanying cut is an illustration is the Hart Flush Switch, one of the latest productions of the Hart & Hegeman Company. It is attached by screws to a plate of cast brass, and is enclosed in a brass shell fastened to the cast plate, which protects it from injury from dust or any extraneous cause. It can be easily detached for wiring. The plate with the switch attached is screwed to the wall, and is



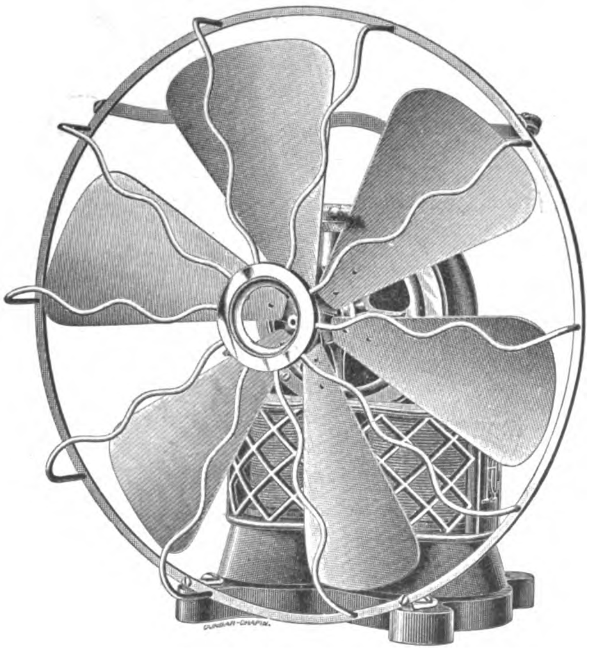
covered with a cap of finished sheet metal flanged at the edges, this being held in position by the switch handle. No screw-heads appear on the surface, as the method adopted to hold the exterior plate renders visible screws unnecessary and gives it a much neater appearance. Common flat head screws may be used for holding the plate to the wall.

The Hart switches are made single and double pole and three-way, and are for sale by all supply houses.

A Unique Fan Motor Equipment.

As the season advances and time hurries us along to the hot days and close nights of summer, the designers and manufacturers of electric motors and fans are hurrying along with their endeavors and plans to meet what will undoubtedly prove to be the biggest boom that has ever yet been known in this branch of the electrical business. As in past years, many new and elegant designs will be placed on the market and all secure a share of public welcome.

The time has arrived when the community can no longer do without these necessary aids to comfort, whether in the home, the church, the theatre, the office, warehouse or factory. A realization of their necessity has been growing from year to year, until at the present time they are in all but universal demand; hence it is that there are now so many varied types bidding for popular favor, and prominent among the most artistic, compact and efficient is the outfit we herewith illustrate.



THE HOLTZER-CABOT FAN MOTOR EQUIPMENT.

It is a new type, pattern 1893, direct current motor, manufactured by the Holtzer-Cabot Electric Company, Boston, a firm enjoying a fine reputation throughout the country for the varied forms and high grade character of its manufactures.

From the accompanying cuts, which clearly indicate the style and character of this equipment, it would appear as though a lengthy description were needless, for it is an artistic piece of mechanism, and as efficient as any device of the kind can be made. This motor consumes but a comparatively small amount of current—only 85-100 of an ampere—and being provided with a commuting switch it produces either a gentle breeze or a cyclonic volume of wind when provided with a 12 inch fan made for the purpose. This motor is wound for either 1,200 or 1,700 revolutions per minute, and when so ordered is supplied with a three speed switch, which is a novel feature of unusual advantage seeing that it enables its owner and user to adjust its cooling and ventilating power to the varying temperatures that occur in the summer season. The motors made by this firm, of which this is a new and improved type, had an enormous sale last year, and already the orders booked for the coming season ensure an unprecedented sale.

As we have stated above, this unique outfit is only one of many devices made by the Holtzer-Cabot Electric Company, one other of their efficient and popular machines being an alternating fan motor, which it is claimed is a powerful machine, economical in the use of current, and runs without heating. So popular has this machine become that the company reports having sold its entire output for the coming season, for it, too, is equipped for ventilating purposes.

INCORPORATIONS.

Commercial Electric Supply Company, of St. Louis. Capital, $15,000. Incorporators: W. F. Carter, H. D. Ames, M. A. Knapp.

The Ashton and Clarksville Electric Railway Company, Ellicott, Md. President, Alban G. Thomas; vice-president, Dr. Hardey; secretary, Philip T. Stabler; treasurer, Charles G. Porter. The proposed line is to start at the terminus of the Ashton, Colesville and Washington road, one and a-half miles east of Sandy Spring and extend about five miles to Clarksville, Howard County, Md., where it will intersect with the electric railway that is to be built from Baltimore to Ellicott City.

The bill to incorporate the Fall River and New Bedford Street Railway Company has passed the Massachusetts Senate.

Articles of incorporation have been filed at Pasadena, Cal., by the Consumers' Gas and Electric Company of Pasadena, with a capital stock of $100,000. The company was organized simultaneously with the Consumers' Gas and Electric Company of Los Angeles, with a capital stock of $1,000,000. The board of directors of the Pasadena Company is composed of Messrs. A. F. Mills and J. A. Buchanan, of Pasadena, and L. A. Fish, George L. Arnold and George B. Shaffer, of Los Angeles.

The Atwater General Electric Company, Columbus, Ohio. Capital stock, $14,000. Incorporators: Arthur S. Atwater, Frank B. Maney, Leonard Case, Geo. M. Schombs, of Cleveland, and others.

The Buchanan Power and Electric Company, Buchanan, Mich. Capital stock, $100,000.

The Electrical Fireworks and Construction Company, Chicago. Incorporators: Emil Giroux, Alfred Guillaume and Elmer E. Barrett.

The Hyattsville Electric Heat, Light and Power Company, Hyattsville, Md., has been organized and a charter applied for. The incorporators are L. D. Wine, Joseph A. Blundon, Charles A. Wells, Henry M. Morrison, W. W. Smith and F. H. Smith. In its operations the company will include Riverdale, Highlands and Bladensburg.

The Armstrong Telephone Company, Dayton, Pa. Capital, $3,000. Directors: George G. Borland, A. K. Goodhart, G. S. Morrow, Dayton; Simon Black, Echo; H. H. Weylman, Kittanning.

Crescent Electric Light Company, McKees Rocks. Capital, $25,000. Directors: John C. Reilly, William J. Burns, Thomas S. Bigelow, James D. Catling, Pittsburg; Frank Thompson, McKees Rocks, Pa.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 11, 1893

ELECTRIC RAILWAYS AND APPLIANCES.

495,035. Electric-Railway Trolley. Frank Heath, Minneapolis, Minn. Filed July 11, 1892.

495,388. Overhead Contact Device and Switch. Charles J. Van Depoele, Chicago, Ill.; C. A. Coffin and Albert Wahl, administrators of said Van Depoele, deceased, assignors to the Thomson-Houston Electric Company, Boston, Mass. Filed June 18, 1888.

495,443. Traveling Contact for Electric Railways. Charles J. Van Depoele, Chicago, Ill.; C. A. Coffin and Albert Wahl, administrators of said Van Depoele, deceased, assignors to the Thomson-Houston Electric Company, Boston, Mass. Filed Mar. 12, 1887.

495,456. Conduit Electric Railway. William R. De Voe, Shreveport, La., assignor of one-fourth to C. W. Dawley, Dennison, Tex. Filed Sept. 6, 1892.

ELECTRIC LIGHTS AND APPLIANCES.

495,077. Electric-Arc Lamp. Addison G. Waterhouse, Hartford, Conn. Filed Nov. 28, 1892.

495,240. Incandescent Lamp. George H. Benjamin, New York, N. Y., assignor to Siemens & Halske, Berlin, Germany. Filed Nov. 14, 1892.

495,318. Globe-Holder for Arc Lights. Thomas H. Faben, Toledo, Ohio. Filed Oct. 14, 1891.

495,461. Electric-Arc Light. Rudolph M. Hunter, Philadelphia, Pa., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Aug. 23, 1892.

495,463. Electric-Arc-Lamp Carbon. George M. Lane, Asbury Park, N. J. Filed Sept. 11, 1890.

495,467. Incandescent Lamp. Henry Green, Hartford, Conn., assignor of one-half to Geo. S. Miller, same place. Filed Oct. 16, 1891.

DYNAMOS AND MOTORS.

495,046. Electrical Motor. August Knoche, Elberfeld, Germany. Filed July 22 1892.

495,138. Magneto-Electric Machine. Joseph N. McLeod, Brooklyn, assignor to the McLeod Electric Manufacturing Company, New York, N. Y. Filed April 15, 1892.

495,139. Magneto-Electric Generator. Joseph N. McLeod, Brooklyn, assignor to the McLeod Electric Manufacturing Company, New York, N. Y. Filed April 27, 1892.

BATTERIES.

495,107 Electrode for Secondary Batteries. George D. Coleman, Chicago, Ill., assignor of nine-twentieths to Craig R. Guerin, same place. Filed June 10, 1892

495,176. Electric Battery. Frank M. Archer, New York, assignor, by mesne assignments, to the Hero Electric Company, Jersey City, N. J. Filed Nov. 25, 1891.

495,177. Electric Battery. Frank M. Archer, New York, N. Y., assignor, by mesne assignments, to the Hero Electric Company, Jersey City, N. J. Filed Nov. 25, 1891.

495,306. Galvanic Battery. Clyde J. Coleman, Chicago, Ill. Filed June 6, 1891.

TELEPHONE AND TELEGRAPH APPARATUS.

495,030. Means for Telegraphing. William H. Fahrney, Chicago, Ill. Filed Oct. 22, 1892.

495,087. Central-Office Apparatus and Circuit for Telephone Exchanges. Edward J. Hall, Morris, N. J., assignor to the American Telephone and Telegraph Company, of New York Filed Oct. 13, 1892.

495,090. Granulated Material for Transmitting Telephones. William W. Jacques, Newton, assignor to the American Bell Telephone Company, Boston, Mass.

495,179. System for Protecting Telephone Apparatus from Lightning. John J. Carty, New York, N. Y., assignor to the Metropolitan Telephone and Telegraph Company of New York City. Filed Aug. 5, 1892.

495,180. Telephone-Gage. John J. Carty, New York, N. Y., and Frank A. Pickernell, Newark, N. J. Filed Aug. 31, 1892.

MEASURING INSTRUMENTS, INDICATORS, ETC.

495,047. Electrical Indicator for Rudders. Charles V. Knowles, Somerville, N. J., assignor to Edwin Holmes, New York, N. Y. Filed Feb 16, 1892.

495,066. Voltmeter and Ampere-Meter. Eugene Gengenbach, Schenectady, N. Y. Filed May 13, 1892.

495,127. Electric-Annunciator System. Edmund R. Wilder, Kansas City, Mo. Filed June 23, 1892.

495,148 Electro-Mechanical Steam Engine Recording-Indicator. Reuben G. Collins, Dollar Bay, Mich. Filed May 2, 1892.

495,175. Dynamometer. Edgar J. Wood, New York, N. Y. Filed March 31, 1892.

495,225. Potential-Indicator. George A. Lintner, Minneapolis, Minn. Filed Nov. 17, 1892.

MISCELLANEOUS.

495,026. Spool for Electric Coils. George W. Demmick, Lynn, Mass., assignor to the General Electric Company of New York. Filed Nov. 23, 1892.

495,088. Multiple Thermal Cut-Out. Warren S. Hill, Boston, Mass., assignor to the Thomson-Houston Electric Company of Connecticut. Filed Aug. 10, 1889. Renewed June 2, 1890.

495,058. Commutator-Connector. Edward D. Priest, Lynn, Mass., assignor to the General Electric Company of New York. Filed Nov. 16, 1892.

495,125. Electro-Magnet. Simon H. Stupakoff, Pittsburg, assignor to the Union Switch and Signal Company, Swissvale, Pa. Filed Sept. 5, 1892.

495,136. Cummutator-Brush. Karl Koch, Elsey, near Hohenlinburg, Germany. Filed Nov. 10, 1892.

495,193. Railway Danger-Signal. Arthur W. Berne, New York, N. Y., assignor of one-half to William H. Walsh, same place. Filed Aug. 5, 1892.

495,229. System of Electric Conversion. Edwin W. Rice, Jr., Lynn, Mass., assignor to the Thomson-Houston Electric Company of Connecticut. Filed June 18, 1888.

495,287. Electric Alarm-Clock. Thomas P. Adams, Rico, Colo. Filed May 23, 1892.

495,321. Electric Street-Railway Sweeper. John W. Fowler and John Hutton, Brooklyn, N. Y., said Hutton assignor to the Lewis & Fowler Manufacturing Company, same place. Filed May 6, 1892.

495,393. Apparatus for Electric Welding. Charles L. Coffin, Detroit, Mich. Filed June 11, 1891.

495,394. Machine for Electrically Welding Metals. Charles L. Coffin, Detroit, Mich, Filed Aug. 6, 1892.

ELECTRICITY.

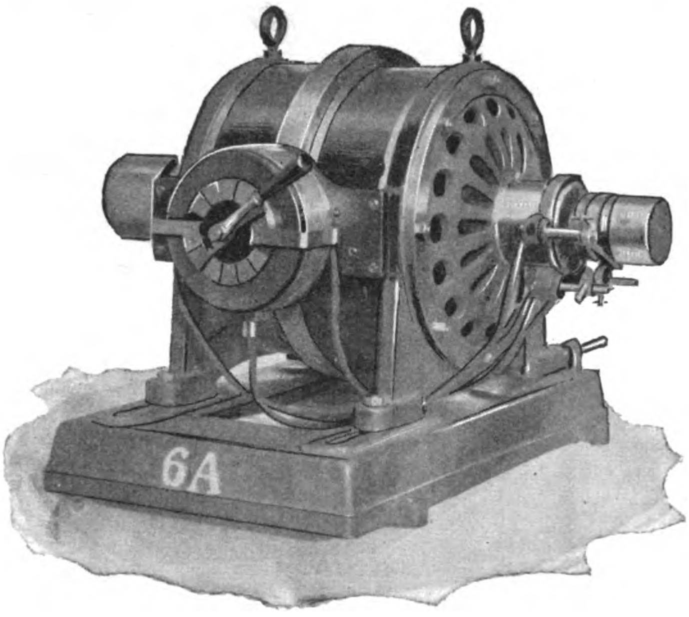
VOL. IV. NEW YORK. APRIL 26, 1893. CHICAGO. No. 15

INTERIOR VIEW—DRAKE, PAYSON & WHITTIER'S SUPPLY HOUSE. (SEE PAGE 206.)

A Practical Success.

The Stanley-Kelly Motor for Two-Phase Alternating Currents.

The alternating current, although possessing great flexibility in its applications to industrial problems, has been greatly handicapped in its competition with direct currents on account of the difficulties experienced in producing practical motors adapted to this system. Although synchronous motors have been used for several years on the ordinary single phase alternating current in general use for lighting, the fact that no torque is exerted by these motors until they reach about their normal speed, and that the current consumption is excessive on light loads, has precluded their general adoption on lighting circuits.



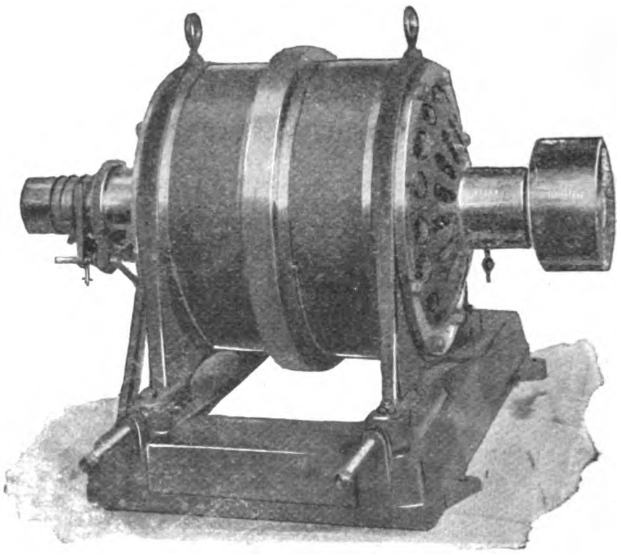
The Stanley-Kelly Motor.

To overcome these defects, the Stanley Electric Company of Pittsfield has introduced a motor of an entirely new design, to be operated on two-phase alternating current circuits, their idea being to introduce a system from which either incandescent or arc lighting as well as power can be furnished. Up to the present time the multiphase alternating systems are the only ones which have been demonstrated to be successful for the distribution of both light and power from the same circuits, and the two-phase current has been selected in this case as being the simplest and requiring the fewest changes in construction of the lines.

The new Stanley motor, shown in Figs. 1 and 2, differs from the rotary field types which have been invented by Tesla and others, and is constructed on entirely different lines. The machine is in principle a species of transformer in which the fields correspond to the primary and the armature to the secondary circuits. The fields are composed of laminated sheet iron forming a ring with interior projecting pole pieces. This field is divided at the centre of its length, and one side is advanced so as to bring its poles midway between those of the opposide side. To avoid the demagnetizing of the fields by the induced armature currents, heavy copper conductors forming a closed circuit are set in the field, and act to neutralize the effect of the armature upon the field.

The armature is wound with two wires corresponding to the two phases, and these windings form closed circuits which have no connection to the field circuit. The two inside ends of the armature coils are connected to one brush, and the outer ends to two others, a three-ring collector being used in order to allow resistances to be thrown in the armature circuit on starting. The brushes and collector, however, are only in service until the motor comes to its normal speed and they are then short-circuited. At the standard frequently adopted in this country, 133 P. P. S., the false currents developed in an alternating current motor are very excessive, and make it generally impracticable to produce a system for both light and power fed by the same dynamo and circuits. These false currents have made regulation impossible, and have made necessary generators, lines and transformers so disproportionately large for the work to be done that it has been uncommercial. In a commercial system for distribution of light and power widely throughout a city, motors which take current about proportionate to their load are essential, and with the various multiphase motors which there has been so much effort to introduce this has not been accomplished.

To avoid this difficulty in the Stanley motor condensers are placed in multiple with the fields of the motor, and the false currents, instead of going back through the transformer through the line to the generator and disturbing the whole system, simply flow in a local circuit through the condensers. Much study has been given for the past two years to the manufacture of condensers for commercial use and with the result that they can now be made thoroughly reliable and at reasonable cost.



The Stanley-Kelly Motor.

The Stanley-Kelly motor is claimed to be as much better on lower alternations as any other type of motor, so that if it is better than other types of motors on 133 P. P. S. it should be correspondingly better on lower frequencies, but by reason of the condensers and the compensating winding of the field it works perfectly and commercially on 16,000 alternations. The condenser does not complicate the system materially, as when it is once set up there is nothing more to do to it and it should require no more attention than a transformer.

Some of these motors have been in practical operation doing work from day to day for the past six months, and for the past two months an 80 H.P. two-phase generator has been running in the station of the Pittsfield Electric Company supplying about 40 H. P. of lights and about 40 H. P. of motors (seven in number, in sizes of from 10 H. P. down), in practical use without a hitch or accident of any kind.

The Stanley-Kelly motor makes it possible for stations at comparatively small expense to add power to their lighting service, no matter where the power is located, and get all the benefits of long-distance distribution of power in connection with their lighting circuits without throwing away much of their present apparatus. It would be better in the case of a new installation to use a lower frequency, say 60 or 65 P. P. S., and it should be borne in mind that the total efficiency of the system with this lower number of alternations would be somewhat better than with 133 P. P. S., although so far as reliability of operation is concerned one is equally good with the other.

The shops of the Stanley Electric Company in Pittsfield are operated throughout by these machines which are apparently giving great satisfaction. The motors start with a good torque, and come up to normal speed as quickly as a direct current machine, and the absence of a commutator or any parts requiring adjustment makes them extremely handy to operate. The heating of the fields in these motors is also very slight, and a burn-out is almost impossible even with a heavy overload. The accompanying diagram shows the general plan for distribution of incandescent and arc lights and power on the same circuit which is being practically demonstrated in Pittsfield.

The area over which power can be economically distributed from a central station in this way is greatly increased, and the cost of the lines is only a fraction of what is necessary with direct current systems.

Electricity as a Reformer.

(*From the Roanoke Times.*)

What a difference the electric lights make in the town! There is hardly a point within the semi-circle of half a mile radius south from Henry street and Salem avenue where reasonably coarse print may not be read at midnight. Little groups of three or four ladies do not hesitate now to attend the theatre without escorts. Next winter the result will be even more visible in the same direction. There have been less offences of a police character since the lights were turned on. It is even believed that it is safe for our esteemed friend, W. P. H., to again attempt the cultivation of chickens. His last herd of hens eloped with a colored party, who loved them not wisely but too well.

The Fire Hazards of Electricity.

BY CAPTAIN WILLIAM BROPHY.*

I have been requested by your secretary to prepare a short paper on the Fire Hazards of Electricity, in which I am to present the insurance side of the question. This I have attempted to do in as brief a manner as possible, as I understand the matter is to be fully discussed by gentlemen who, I have no doubt, will deal with this subject in a manner befitting its great importance.

On the introduction of the electric telegraph as a means of communication between distant points, the few wires stretched from pole to pole were not looked upon as a means of increasing the fire hazard, as their number was so few as not to be a serious hindrance to the fire department, and the cases where atmospheric electricity followed the wires to the switchboard and instruments causing small fires were so rare as to hardly attract attention. By slow degrees, as the benefits of this great invention began to be appreciated, the wires began to increase; still, while they proved a hindrance they were not looked on as a hazard to be seriously considered.

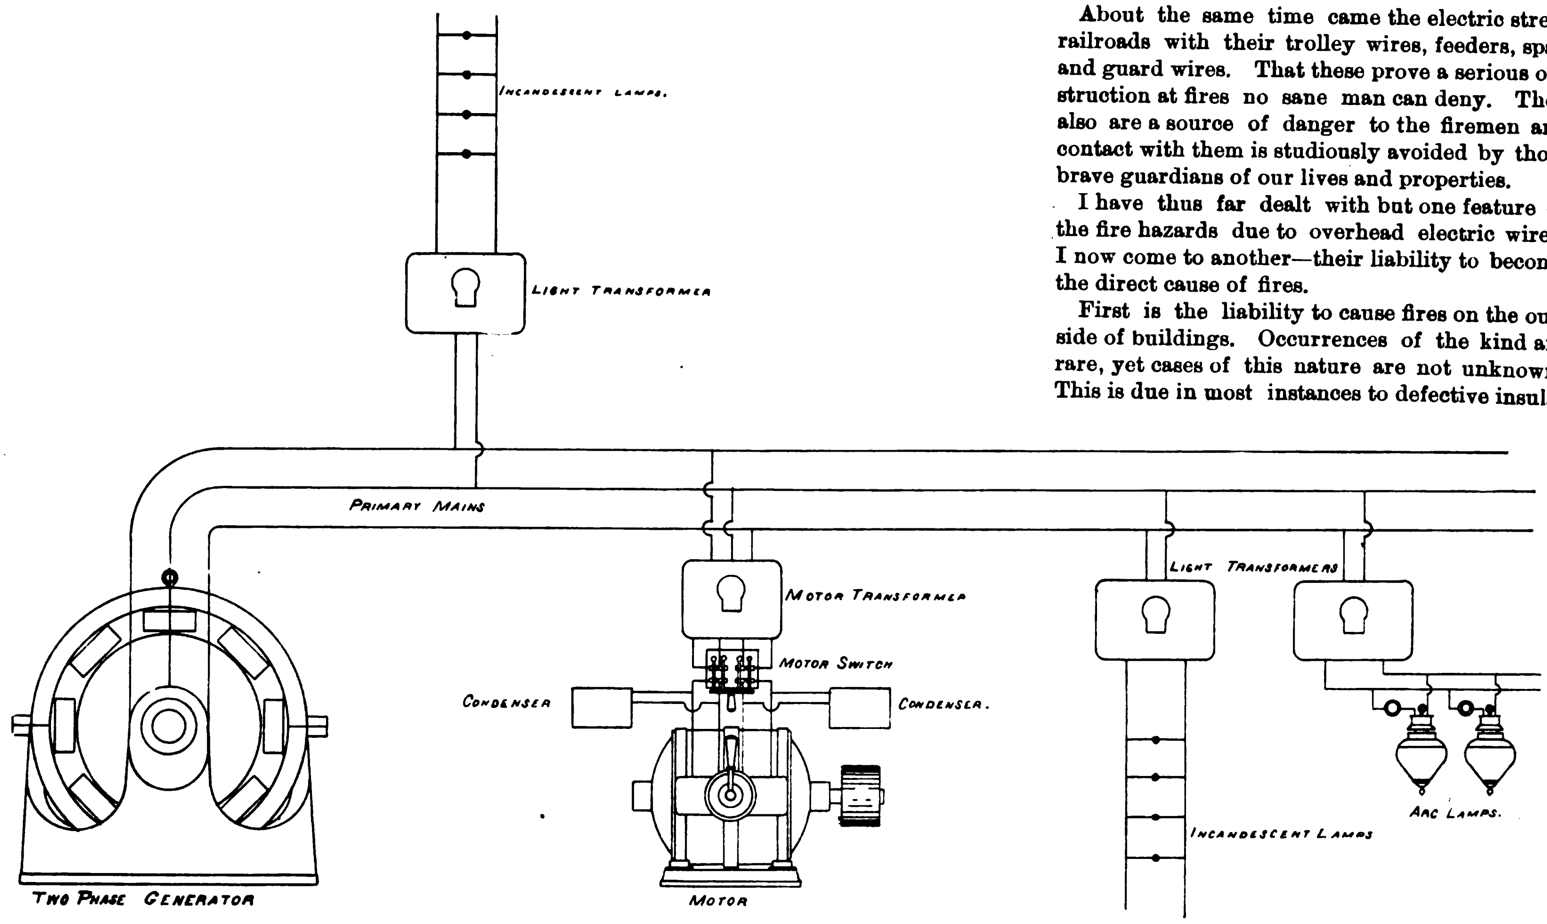


DIAGRAM OF CONNECTIONS FOR TWO-PHASE ALTERNATING SYSTEM.

Later came the dial telegraph for communicating between local points, and the stock-ticker for sending out market quotations, but these increased the number of wires only slightly.

But after the invention of the speaking telephone and the perfection of the exchange system, then the increase of aerial wires was enormous; every available spot on roof or front of buildings was eagerly seized on by the busy linemen, often without due regard to the rights of owners or occupants. Lines of poles sprang up at all points, sometimes during the hours of night, and met the astonished gaze of the law-abiding citizens for the first time as they wended their way to their places of business. The location of these intruders was not always selected with a view to the comfort or convenience of these same good people, and often their protests were met by that trite saying, "Well, what are you going to do about it."

With this enormous increase of electric wires the delays to the fire department became more frequent and losses by fire were often greater than need be, due to this cause; yet they did not endanger the lives of the firemen to any great extent, and were handled without fear.

Later came that new form of electric energy—the electric arc light. Gradually it worked its way into public favor and gradually its power for mischief to the fire underwriters and owners of property became manifest by reaching the pockets of both. This was inevitable owing to the first crude methods resorted to for the transmission of this new form of energy. The existing forms of insulation were not equal to the task of confining this greatly increased force within bounds, and in fact no other people in the world but our own would have permitted the introduction of an element fraught with such possibilities of danger to life and property with no real means for keeping it under control. But we are ever ready to take chances and assume risks in order to gain time or secure some improvement that will contribute to our comfort or add to our wealth.

With the introduction of this class of wires came another obstruction to the efforts of the firemen in extinguishing and preventing the spread of fires, and also a certain amount of demoralization in their ranks. Men who would face the flames, inhale poisonous gases, and stand beneath tottering walls without flinching, stood in wholesome dread of the arc light wires. The former elements of danger they were familiar with and could to some extent avoid them, while the latter contained hidden and to them mysterious dangers that they knew very little of. To handle such wires or come in contact with them meant injury or death. In addition to this they soon learnt that the wires they had been accustomed to handle with impunity, and remove when an obstruction, were liable to become dangerous also, and as a matter of fact firemen are justified in refusing to handle electric wires in towns or cities where an arc light plant is installed unless during the hours when it is not in operation.

Next in order came the incandescent electric light, direct or low tension system. While the wires for this system proved another obstruction they were not dangerous to life and limb; yet firemen who are not expert electricians looked upon them with mistrust. Later still came the electric power circuits. At first no greater than the usual 110 volt current was used, which is not dangerous to life or limb. Later this was increased to 220 in order to reduce the cost of conducting wire.

Next came the transformer system of electric lighting where a current of 1,000 to 2,000 volts is used in the primary conductors from dynamo to transformers. These were another obstruction and dangerous to person.

About the same time came the electric street railroads with their trolley wires, feeders, span and guard wires. That these prove a serious obstruction at fires no sane man can deny. They also are a source of danger to the firemen and contact with them is studiously avoided by those brave guardians of our lives and properties.

I have thus far dealt with but one feature of the fire hazards due to overhead electric wires. I now come to another—their liability to become the direct cause of fires.

First is the liability to cause fires on the outside of buildings. Occurrences of the kind are rare, yet cases of this nature are not unknown. This is due in most instances to defective insulation at one or more points of the circuit permitting a derived circuit through or on the surface of inflammable material and imperfect contact at binding posts and cut-out switches.

Next we come to the greatest fire hazard from the overhead wires—the danger of electrical contact between the harmless low tension and the dangerous electric light and power wires. The arc, incandescent, power, railway and alternating wires are capable of doing great damage in this way by sending currents greatly in excess of the safe carrying capacity of the smaller wires, and heating them sufficiently to cause the ignition of any inflammable substance in the immediate vicinity.

I will now consider the wires in the interior of buildings as a fire hazard, and will begin with those of the arc lighting system. For the sake of securing sufficient mechanical strength the size of wire used for this system has a much greater amount of conductivity than is necessary for safely conducting the current, so that no danger need be apprehended from overheating them. Where an abnormal amount of heat is produced in one of these circuits, it is due to imperfect joints or connections, thus introducing an excessive amount of resistance at such points. There is also more or less danger from the arc lamp, due to broken globes permitting pieces of hot carbon to drop on to inflammable goods, also from improperly trimmed lamps, which permits the burning out first of the carbons and then the metal holders. This latter will surely cause trouble in many places.

---

* Read before the Society of Arts, Boston, Thursday, April 13, 1893.

Fortunately those engaged in the business of electric lighting recognize the wisdom of the practice of not concealing from view this class of wires, thus rendering the task of installing them with a reasonable amount of safety comparatively easy, and rendering their inspection less difficult.

Fire hazards from the incandescent system are confined wholly to the wires or conductors. The danger from the lamp need not be considered. Trouble can and does arise at times from the lamp socket.

I will now treat of the direct system, where a system of circuits, mains and branches are supplied from a central station from one or more dynamos delivering current into one common conductor and thence through a system of feeders to the distributing mains. The electromotive force necessary for the distribution of current in this system is not sufficient to cause serious injury by reason of shock to the nervous system, as it does not exceed 220 or 230 volts at the dynamo. But the quantity of current is sufficient to seriously burn a person under some circumstances, and would also under favorable circumstances cause serious loss by fire. The amount of current flowing from the generating station is limited only by the capacity of the dynamos and the number of lamps in use. The potential or pressure is as nearly constant as is possible to make it, but the amount of current is in proportion to the number of lamps. Whence may be asked comes the fire hazard from this system? A very natural question, and one that suggests itself to a great many people. But the fire hazard can be much greater from this than from the arc system. Hundreds of amperes of current are sent out over this system of feeders to supply lamps and motors, sufficient to melt down nearly if not all the interior wires in many buildings, if by reason of one of the many causes that suggest themselves to those familiar with the subject an abnormal flow of current takes place over them.

You may ask, how can this occur? Current flow is regulated by the electromotive force or pressure and resistance, or, if you please, friction. To supply a given number of lamps or given size of motor, a given size of wire is necessary. The filament in the lamp affords a path of very high resistance for the current. As they are connected up in multiple the greater the number of these parts are the less the total amount of resistance.

If through ignorance or motives of economy the supply wire is too small, heat is generated in the wire, and if the number of lights is sufficiently in excess of the safe carrying capacity of the wire, it can be brought to a white heat or melted even—a dangerous process near inflammable material.
